

# Proyecciones provinciales de población por sexo y grupo de edad 2010-2040

**N° 36**  
**serie**  
**análisis**  
**demográfico**

La presente publicación describe el proceso a través del cual se elaboraron las proyecciones de población de las provincias que componen la República Argentina, así como también se presentan los principales resultados.

Esta publicación integra la serie **Análisis Demográfico**, orientada a la difusión de los resultados de las actividades realizadas en el marco del Programa de Análisis Demográfico (PAD) de la Dirección Nacional de Estadísticas Sociales y de Población del INDEC.

Para la elaboración de estos resultados se contó con el asesoramiento técnico del experto internacional en demografía, Eduardo Arriaga Ph.D. Asimismo, la tarea fue llevada adelante por el equipo del Programa de Análisis Demográfico bajo la dirección del licenciado Rubén Nigita, Director Nacional de Estadísticas Sociales y de Población y con la coordinación del licenciado Leandro de la Mota.

## SIGNOS CONVENCIONALES UTILIZADOS POR EL INDEC

Para la sustitución o complementación de un dato numérico el INDEC utiliza los siguientes signos, según el caso:

- \* Dato provisorio
- Dato igual a cero
- Dato ínfimo, menos de la mitad del último dígito mostrado
- . Dato no registrado
- ... Dato no disponible a la fecha de presentación de los resultados
- /// Dato que no corresponde presentar debido a la naturaleza de las cosas o del cálculo
- s Dato confidencial por aplicación de las reglas del secreto estadístico
- e Dato estimado por extrapolación, proyección o imputación

# **PRIMERA PARTE**

## **Informe técnico**

## 1. Introducción

Las proyecciones provinciales de población fueron elaboradas mediante el método de los componentes, que consiste en proyectar de forma independiente las variables determinantes de la dinámica poblacional: mortalidad, fecundidad y migración, a partir de una población base. Las mismas fueron realizadas con los programas RUPLEX y RUPAGG desarrollados por el U.S. Bureau of the Census (Arriaga, 2001), donde además de la población base para el año 2010, se requieren estimaciones de la mortalidad, fecundidad y migración interna e internacional para todo el período de la proyección. Estos programas brindan resultados de las proyecciones de población según sexo y edades simples para cada año calendario del intervalo de proyección. A los fines de esta publicación se presentan agregados en grupos quinquenales de edad.

A continuación se presentan aspectos ligados a los datos básicos, la metodología utilizada, las estimaciones y proyecciones de mortalidad, fecundidad, y saldos migratorios internacionales e internos. Además se proporciona un análisis de los principales resultados.

## 2. Evaluación demográfica del Censo 2010 y definición de la población base

La elaboración de proyecciones de población supone la evaluación previa de los datos disponibles mediante la aplicación de diferentes técnicas que permiten analizar temas tales como la omisión censal de población, la declaración de la edad y la relación entre los sexos. Como ya se ha explicitado en el informe de la proyección nacional (INDEC, 2013), la omisión del Censo 2010 fue de 1,99% para el total del país. Con respecto a las provincias, el procedimiento de evaluación demográfica tuvo en cuenta los mismos criterios, es decir:

- Se realizaron pruebas de consistencia demográfica entre el Censo 2010 y los relevados precedentemente.
- Se consideraron los registros de estadísticas vitales de defunciones y nacimientos.
- Se realizaron estimaciones de migración internacional e interna con base en datos censales de nuestro país y de otros países. También se utilizó información de registros migratorios.

Como resultado de la citada evaluación y corrección, se obtuvieron las siguientes poblaciones corregidas por sexo, grupo de edad y jurisdicción, a la fecha censal tal como se presenta en el Cuadro 1.

**Cuadro 1.** Población corregida por evaluación demográfica por sexo, según provincia, al 27-10-2010

Provincia	Ambos sexos	Varones	Mujeres
<b>Total del país</b>	<b>40.930.448</b>	<b>20.012.478</b>	<b>20.917.970</b>

### 3. Proyecciones de la mortalidad

Para el análisis de esta variable se tuvo en cuenta la información correspondiente a las tablas de mortalidad provinciales construidas para el período 2008-2010, por sexo y grupo de edad. Estas tablas de mortalidad arrojaron los siguientes valores de esperanza de vida al nacer:

**Cuadro 3.** Esperanza de vida al nacer por sexo, según provincia.  
Período 2008-2010

Provincia	Esperanza de vida al nacer	
	Varones	Mujeres
Años		
Ciudad Autónoma de Buenos Aires	74,11	80,43
Buenos Aires	71,87	78,69
Catamarca	73,27	78,85
Chaco	69,50	76,41
Chubut	72,25	79,96
Córdoba	72,48	79,23
Corrientes	71,49	77,54

Tierra del Fuego, Antártida e Islas del Atlántico Sur	74,24	79,92
Tucumán	72,23	78,20

**Fuente:** Tablas abreviadas de mortalidad por sexo y edad 2008-2010. Serie Análisis Demográfico n° 37.

Para la proyección de la mortalidad, se extrapolaron las esperanzas de vida al nacer de acuerdo con la tendencia nacional. El procedimiento utilizado para estimar los niveles futuros de las esperanzas de vida al nacer por sexo, tiene en cuenta la tendencia de las esperanzas de vida del total del país y supone que los cocientes de los incrementos relativos observados al momento (t) y al momento inicial (0) respecto de las tablas óptimas, son iguales en el área total y en cada una de las provincias componentes.

En fórmula se expresa como:

$$\frac{E(A,t) - E(L)}{E(A,0) - E(L)} = \frac{E(P,t) - E(L)}{E(P,0) - E(L)}$$

Donde:

E(L): esperanza de vida al nacer de la tabla de vida óptima (L) para el sexo correspondiente.

E(A,0): es la esperanza de vida al nacer de la tabla de vida para el total del país (A) para el año cero (0) (2009 en este caso), para el sexo correspondiente.

$E(A,t)$ : es la esperanza de vida al nacer de la tabla de vida del país (A) para el año (t) y para el sexo correspondiente (años extrapolados con la función logística).

$E(P,0)$ : es la esperanza de vida al nacer de la tabla de vida de la provincia (P) para el año cero (0), para el sexo correspondiente.

$E(P,t)$ : es la esperanza de vida al nacer de la tabla de vida de la provincia (P) que será estimada para el año (t), para el sexo correspondiente.

De la ecuación anterior una vez despejado el valor de  $E(P,t)$  se obtienen los valores futuros, ya que el resto de los valores son conocidos. Las esperanzas de vida al nacer de las tablas óptimas son de 82,56 y 88,40 años para hombres y mujeres respectivamente.

Este procedimiento evita cruces de las tendencias provinciales y supone que todas tienden al mismo valor óptimo en el infinito. Los resultados de las proyecciones de las esperanzas de vida a nivel provincial se presentan a continuación:

**Fuente:** INDEC. Proyecciones elaboradas en base a resultados del Censo Nacional de Población, Hogares y Viviendas 2010.

#### **4. Proyecciones de la fecundidad**

Para estimar el nivel inicial de esta variable se calcularon las tasas específicas de fecundidad y la tasa global de fecundidad del año 2010, tomando como numerador a los nacimientos provenientes de estadísticas vitales corregidos por registro tardío y como denominador a la población femenina proveniente del Censo 2010 corregida por el proceso de evaluación demográfica. En el cuadro 5 se presentan los resultados estimados.

**Cuadro 5. Tasas específicas de fecundidad por grupos quinquenales de edad y tasa global de fecundidad, según provincia. Año 2010**

**Fuente:** INDEC. Proyecciones elaboradas en base a resultados del Censo Nacional de Población, Hogares y Viviendas 2010.

Para la proyección de la fecundidad, se extrapolaron las tasas globales de fecundidad de acuerdo con la evolución esperada para el total del país, procedimiento similar al que se usó para proyectar las esperanzas de vida, teniendo en cuenta los complementos relativos de las provincias en el total del país. La proyección de las tasas globales de fecundidad se presenta a continuación:

**Cuadro 6. Tasa global de fecundidad por provincia. Período 2015-2040**

Provincia	Tasas global de fecundidad (TGF)				
	2015	2020	2025	2030	2040
	Hijos por mujer				
Ciudad Autónoma de Buenos Aires	1,8570	1,8549	1,8537	1,8540	1,8571

## 5. Proyección de saldos migratorios 2010-2040

### 5.1. Saldo migratorio internacional

La proyección de la migración internacional fue estimada sobre la base de varias fuentes. Las fuentes principales fueron: a) los censos de población de 2001 y 2010 que permitieron establecer el saldo intercensal de personas nacidas en el exterior y b) el número de personas del Censo 2010, que hace 5 años residían en otro país. Además se contó con información de otros países sobre el volumen de argentinos enumerados en sus territorios o del saldo intercensal de argentinos que viven en ciertos países tradicionalmente receptores, que fueron utilizados para obtener una estimación aproximada del movimiento migratorio internacional.

Teniendo en cuenta los supuestos expuestos en el informe de la proyección nacional (INDEC, 2013), el saldo migratorio internacional estimado para el total del país fue de sólo 15.000 personas e irá descendiendo linealmente hasta hacerse cero en el año 2040, como se muestra en el cuadro 7.

**Cuadro 7.** Saldo migratorio internacional por sexo. Total del país.  
Período 2010-2040

Año	Saldo migratorio internacional	
	Varones	Mujeres
2010	7.401	7.567
2020	4.933	5.046
2030	2.468	2.521
2040	0	0

**Fuente:** INDEC. Proyecciones elaboradas en base a resultados del Censo Nacional de Población, Hogares y Viviendas 2010.

En cuanto a la distribución esperada de los migrantes internacionales por provincia, se hizo proporcionalmente sobre la base de la información censal, de acuerdo al volumen de migración internacional recibida en el quinquenio anterior al censo.

### 5.2. Migración interna

La migración interna provincial utilizada fue proyectada en base a la información sobre lugar de residencia cinco años antes del censo, por sexo y grupos quinquenales de edad. Sobre la base de esta información se obtuvo el total de inmigrantes internos a cada provincia por sexo y grupos de edad quinquenales; y la emigración de cada provincia, también por sexo y grupos de edad quinquenales. La diferencia entre inmigración y emigración constituye la migración neta interna requerida para realizar la proyección.

**Cuadro 8.** Saldo migratorio anual interno por sexo, según provincia. Año 2010

Provincia	Saldo migratorio interno	
	Varones	Mujeres
Ciudad Autónoma de Buenos Aires	-6.019	-5.316
Buenos Aires	5.841	5.911
Catamarca	-432	-469
Chaco	-1.839	-1.762
Chubut	1.891	1.449
Córdoba	2.820	2.839
Corrientes	-1.907	-1.879
Entre Ríos	196	103
Formosa	-1.542	-1.540
Jujuy	-345	-450
La Pampa	64	102
La Rioja	277	284
Mendoza	-91	-51
Misiones	-1.731	-1.840
Neuquén	187	302
Río Negro	1.025	886
Salta	-1.195	-1.037
San Juan	-115	-281
San Luis	560	541
Santa Cruz	2.193	1.832
Santa Fe	685	795
Santiago del Estero	-1.290	-1.264
Tierra del Fuego, Antártida e Islas del Atlántico Sur	1.000	923
Tucumán	-233	-78

**Fuente:** INDEC. Estimaciones elaboradas en base a resultados del Censo Nacional de Población, Hogares y Viviendas 2010.

Debido a las dificultades para estimar la migración y a los cambios que se observan en esta variable se optó por mantener constante el saldo de cada provincia por sexo para cada uno de los años del período proyectado, al igual que en proyecciones anteriores.

## **Definición de los indicadores demográficos**

Tasa bruta anual de natalidad: es el cociente entre el número medio anual de nacidos vivos ocurridos durante un período determinado y la población media de dicho período.

Tasa global de fecundidad: representa el número medio de hijos por mujer que tendría una cohorte hipotética de mil mujeres expuesta durante su vida fértil a las tasas de fecundidad por edad del período en estudio, bajo un supuesto de mortalidad nula desde el nacimiento hasta el término de la edad fértil.

Tasa bruta de reproducción femenina: es el número medio de hijas por mujer que tendría una cohorte hipotética de mil mujeres expuesta durante su vida fértil a las tasas de fecundidad por edad del período en estudio, bajo un supuesto de mortalidad nula desde el nacimiento hasta el término de la edad fértil.

Tasa neta de reproducción femenina: es el número medio de hijas por mujer que tendría una cohorte hipotética de mil mujeres expuesta durante su vida fértil a las tasas de fecundidad por edad del período en estudio y a los riesgos de mortalidad por edad observados en esa misma población.

Tasa bruta anual de mortalidad: es el cociente entre el número medio anual de defunciones ocurridas en una población durante un período determinado y la población media de dicho período.

Tasa de mortalidad infantil: es el cociente entre las defunciones de menores de un año y el total de nacidos vivos durante un período determinado.

Esperanza de vida al nacer: es el número de años que en promedio se espera que viva un recién nacido en las condiciones de mortalidad por edad definidas en la tabla de mortalidad del período correspondiente.

Tasa de crecimiento natural: es el cociente entre el balance de nacimientos y defunciones ocurridos en una población durante un período determinado y la población media de dicho período.

Tasa anual de migración neta: es el cociente entre el saldo neto migratorio anual ocurrido durante un período determinado y la población media de dicho período.

Tasa anual media de crecimiento: expresa el ritmo de crecimiento de una población, es decir en cuánto aumenta o disminuye en promedio esa población anualmente durante un período determinado.
