KELLEY: We were enjoined against contact with the communists, by the Embassy. My knowledge of the communists was limited to what I would get from socialists. It was hard not to make contact with the socialists and the trade unionists. Often the protest delegations that would come in, where we had to meet with them because it was our policy not to turn anybody away. The communists were essentially just beyond the pale.

Q: Are you saying it was hard to make contact with a socialist?

KELLEY: It was really their problem more than ours. They felt that they would be ostracized if they were seen in our presence or were too chummy with us. They thought that we were out to subvert them or that their political careers would be at risk if they were too close to us. They really hadn't had any exposure to Americans, except to left-wing Americans, and anybody who represented the United States Government was a political danger to them. It was very hard to make contact. Some people, to their credit, were open minded about reaching out, or at least were receptive to my approaches. I did have a few contacts, but they were pretty hard to establish.

Q: Did you find that American cultural influence was strong? I'm thinking of movies and T.V.

KELLEY: Extremely strong. It was a love/hate relationship. It was a modernizing effect. Everything American was modern and everything modern was American. We benefitted from the symbiosis and so our movies had a tremendous impact, not necessarily for the good. There was a tremendous interest in what we were writing. During the Kennedy years there was a tremendous interest in our politicians and tremendous antipathy for our politicians after Kennedy. Just an incredible amount of interest in the way we lived, our standard of living, what we emphasized real concern about, the level of influence that we exercised. Some concern about American bullying in certain areas, both of defense and of trade. I remember Japanese oranges and tangerines were a particular subject at the time that I was in Fukuoka, being threatened by California oranges, orange juice, etc. We were very large on their horizon and they felt that they were very small on ours and they were very anxious about that.

Q: Other than the airplane crash, were there any other major incidents or events that happened during this time?

KELLEY: There were a lot of demonstrations against the visit of the Enterprise, a nuclear-powered aircraft carrier, to Sasebo. I didn't go down to Sasebo during that time, we had a principal officer who handled most of that. That was earlier in my stay there. This got attention all over Japan and so Kyushu was in the spotlight. There were massive demonstrations in an effort to stop this visit. It took place, but under very controlled circumstances. The idea was that we were going to break the ice by bringing a nuclear carrier in, and we did. Successfully, although there was tremendous stereotypical resistance. A lot of demonstrations and breast beating and shouting and so forth. There were people running around wearing helmets and scarves wrapped around their faces and so forth, in this quasi-military fashion. The usual Molotov cocktail throwing and this sort of thing, and trying to pick up paving stones and throwing them at the police. Really the Japanese police interposed themselves between the Americans and the demonstrators very effectively. It was really a Japanese problem for the most part, we stayed pretty much out of it.

Q: Did you find that you had any entree to the Universities?

KELLEY: It was very tough. The Universities were the center of the opposition to our ship visits and to our military presence, the security treaty, the war in Vietnam. You always felt a little threatened if you were an American going on a university campus, at least I did. The bigger universities were harder to make contacts, the professors were either left wing or afraid of the left wing guys. Our contacts tended to be with the smaller universities, where they're more conservative or less political. We had good contacts with them, or we had good contacts off the campus. It was very hard to get on the campus.

Q: Was it the usual pattern that is often in many countries, where the students get to be quite radical when they are students at the university and as soon as they get out they become company men or something like that?

KELLEY: Absolutely. It was the most amazing transformation you ever saw. Reporters would

sit there and talk to you and point to these students and say, "That was me two or three years ago and did I ever go through a transformation fast." The system in Japan actually exacerbated the problem because the big problem with the university was getting in. Once you got in you were virtually guaranteed of graduating and getting a job with a good company. So there was nothing that you could do almost, to jeopardize your student status, so you went out and demonstrated for four years, in effect. That's unfair. Obviously they did study, but not all that much.

Q: This is true also in Korea. Did you find that in dealing on regular matters with the Japanese or their dealing with you that ties from same class at the university, or same class in high school, got to be very important. I mean to know whom was with whom and that sort of thing?

KELLEY: Very much so. We didn't know enough about that, probably. You can always exaggerate the importance of these things, but the Japanese thought it was important and they would always keep very close track of it. I know from my own personal experience with my friends (the people that I taught English to and the people that I knew) that these people kept in touch with their classmates. School ties were fairly important, but also the year that you came into the company was very important. The company ties would also then take over this.

Q: You mean that there was sort of a year -- if you were the class of 1963 or something?

KELLEY: As far as coming into the company, then that was also extremely important. You sort of measured your progress against your peers in the company or in the bureaucracy. It was always understood that when you reached a certain point in the company, a couple of guys would be tapped for the top jobs or the fast track and the rest of the guys would be given a sort of golden parachute -- they wouldn't be let out of the company necessarily, but they would be farmed out to lesser jobs. In the government, that would even take place even earlier. There would be guys on the fast track within the Ministry and then lesser jobs. Once you reached the point where one of your guys was tapped to be the Parliamentary Vice Minister, the highest civil service job in the ministry, all of the people who were his classmates would leave for a job with an associated organization. Which is what they called "Ama Kudare" the sweet downward staircase. So where you were in the flow as your cohort group moved up the ranks was always kept track of and was very important. Then the ceremonial departure as one or two or three might be anointed for top jobs. People would take care of each other in that context, but the cohort group was an important relationship. There were other important relationships, obviously, between seniors and juniors.

Q: Was there much in the way of demand on consular things such as VISA's or help of something like that?

KELLEY: The business got political only to the degree, to my knowledge, that you had somebody who had a politically sensitive past who wanted to get to the United States and you'd have to jump through all kinds of hoops to get these guys cleared to get them in. The political section wanted to get them in and there would be all kinds of information out there, and you couldn't tell what the validity of it was and you had to get around this to get people in. That was one of the constant considerations I think, that became important. It was most important to us when I was in the political section certainly. People would come to you from outside or from the

society and tell you about their VISA problems, and would hope that you could do something to smooth the way. What you would do essentially, was say sure give me your card, or give them an introduction to somebody who was a consular officer, that was about the extent of it.

JOHN B. RATLIFF, III
Assistant Director, FSI Language School
Tokyo (1963-1967)

John B. Ratliff III was born in Louisiana in 1935. He graduated from Southeastern Louisiana College and Georgetown University. He served in the U.S. Army from 1954 to 1957 in Japan and Korean Language Training. After postings at language programs in Bangkok and Tokyo, Ratliff became Dean of the Foreign Service Institute in Arlington, Virginia. Dean Ratliff was interviewed by Charles Stuart Kennedy in 1997.

Q: Well, let's move to Japan. You were in Japan for 11 years?

RATLIFF: No, I served first a tour of four years '63 to January '67. I served that as Assistant Director of the FSI Japanese School in Tokyo. Then the consulate general in Yokohama closed down except for one consular officer, and the school moved out of rented quarters in Tokyo near the Olympic Village to the consulate general building in Yokohama.

Q: Let's talk about this '63-'67 period. What was your job?

RATLIFF: My title was assistant director of the school. That meant running things in the absence of the director who in fact left for Washington immediately after my arrival on a long delayed home leave. My job was very similar to the director's in terms of the evaluation of students, the training of teachers, the determining of the curriculum of the program. As it turned out, I was also developing new training materials and coincidentally in another capacity of regional language supervisor, overseeing the part time programs at the consulates, and part time and intensive programs through the U.S. Embassy in Seoul.

Q: About how many students at any one time?

RATLIFF: About 30.

Q: How was this split? Were they all State Department?

RATLIFF: No. There was a large State Department contingent in those days and there were some military though they had a tendency to be civilians in the military, and of course, the United States Information Agency [USIA] was very large. At that, there were cultural centers all over Japan. USIA officers represented as much as 40% of the enrollment.

Q: From your perspective, what were the major challenges in teaching Japanese to these

students?

RATLIFF: First of all, I experienced the same challenge that I did at Georgetown, that is no really good Japanese materials had been developed since those WWII days, so the materials we were using were not that relevant to the needs of foreign service personnel. As a makeshift intermediate text, we were using a Japanese social studies textbook used in grammar school, which was quite lacking in terms of a textbook to train diplomats in the use of Japanese. It was natural; it was there, but it wasn't suitable. There was nothing whatsoever in terms of text materials that addressed political, economic or cultural. Well, cultural, yes by the nature of the social studies and the like, but nothing written for adult Americans and certainly not for adult American diplomats. Dr. Eleanor Jordan had written a couple of texts since the war. Those were in use for the beginning students, but for the advanced students the material situation was pretty sad. There were a lot of raw materials. I don't want to paint it bleaker than it was. We had the advantage of television and a lot of tapes from radio. We were very active with things like radio news and commentaries. We used a lot of what people like to call now, authentic materials to train people. We were certainly taking advantage of the environment in which the students were fortunate enough to study.

Q: I would have thought this was not a time of strict budgets, this was the sort of thing that the FSI could have just gone either to Georgetown or somewhere in Japan, some university and contracted for text materials to be produced.

RATLIFF: If you look back over the period say in the '50s, '60s, '70s, various government agencies did exactly that, went to universities and sometimes private contractors and asked that materials be written for government requirements. Much of that money was wasted because the people outside of the government found it very difficult to understand the true requirements of the Foreign Service and the requirements of the Foreign Service officers particularly in terms of training against what we called at the time the FSI proficiency scale and also the subjects that are needed for diplomacy and diplomatic assignments.

Q: I would have thought that over time the scale that we train people in, the tests, I'm not talking about just Japanese but in general, that a fairly solid template could have been developed for all languages. Here, diplomats need to know this and that.

RATLIFF: I think that's right, but for the most part, FSI took on that task itself, and if you look even today at the list of textbooks used, you will see two kinds: those developed at FSI or those bought off the shelf. You won't see any texts to my knowledge, that were developed on contract or by request by FSI to a university.

Q: Is this something that could have been done or are there really two different mindsets.

RATLIFF: Today it could be done; in those days it was very difficult. Today there is more sophistication out there in universities about this kind of training and these objectives. For example, the commercial language school that I founded after my retirement could develop appropriate training materials easily, and in fact we have produced a fairly large number on contract.

Q: What about as you were working with the students, how well were they coming out at that time?

RATLIFF: Many were coming out very well. I was very impressed with a whole string of Foreign Service officers that came out of the training. There was a problem which crept up from time to time in which personnel officers in making selections considered the ongoing assignment first and linguistic aptitude second, so occasionally somebody ended up in Japanese language training who had no business there through either improper screening but more commonly because someone felt that this was a good officer and those officer qualities were more important on whether he could get a 3 or a 3+.

Q: We are talking about the language rating, which goes from zero to five. Tell me, what was your impression then, and as time has developed, about the language aptitude test that is given. Could you talk a little about the language aptitude test and your impression of its validity?

RATLIFF: As you know, there was a test that was developed by John Carroll at Harvard called the Modern Language Aptitude Test. It is a rather old test at this point; it probably goes back to some time in the '50s. I believe it was FSI that developed a new scoring system for that test, with a maximum possible score of 80. FSI was able to make certain rough estimates about aptitude scores necessary to predict success depending on the difficulty of the language. Primarily we are dealing with four different levels of difficulty of languages within the Foreign Service. They have gone down to three now. What we used to call the "world languages," a term that is now considered chauvinistic, included languages like Spanish, French, German. These are the easiest for the native speakers of English to learn. A typical study program for world languages is six months of intensive study to attain a level three, which is described as professional proficiency. Then there are so-called hard languages like Thai and Russian and Turkish. A course in a hard language is typically 44 weeks to attain that same score, the three level in both speaking and reading. Then the third category – the "super-hard" languages consists of four: Chinese, Japanese, Korean, and Arabic. Normally for those languages we figure a minimum of 18 up to 22 months to achieve that same level three competence. That's kind of how it sorts out.

Q: Most of the people being trained, had they taken the language aptitude test?

RATLIFF: Most had and now we get back to the validity of the test. Typically FSI felt that a person needed a minimum score of 60 in order to go into a language like Japanese, ideally at least 65. Sixty to sixty-five was kind of like no man's land. Anecdotally, I saw people who scored 58 and below who had quite a bit of difficulty with the language. There were exceptions – that is important to note. There were exceptions that were based primarily on motivation and hard work. I think that everybody has concluded now that modern language aptitude tests should be one measure or one indication but it should no longer be the basis on which someone is assigned or not assigned to a particular language.

Q: Typically your student who came to the Japanese language school already had language prior to coming there, is that right?

RATLIFF: I think for the most part, but not always. I think there were cases where people were hitting a foreign language for the first time, certainly a hard language like that. My impression was that not everyone had already demonstrated the ability to learn a foreign language.

Q: Had they had any Japanese at the Foreign Service Institute before being sent out?

RATLIFF: Yes and no. At that time there was a full two year program going on in Tokyo and subsequently in Yokohama when the school moved there. Persons were assigned without any particular system that we could perceive, either being assigned six to twelve months in Washington and then on to the advanced school, or assigned for a full two years to the school in Tokyo or Yokohama. Certainly it was based to a degree on the level of the officer and the rank of the officer. First-tour officers didn't get two years of training and consequently always got their training in Washington. There was a very good system which was observed occasionally which worked superbly. That was to give an officer six months of Japanese, in some cases twelve and then ship them off to Japan for a junior office assignment in the Embassy or a consulate. Then on to another tour in a second country, and then bring them back for advanced Japanese language training. I have always advocated you needed to train X number of officers at the beginning level in order to have some field of officers to choose from for advanced Japanese training or any of the other super hard languages. In other words, you have to put more people in the pipeline initially than you expect to need in the future, to account for individual preferences, language aptitude, and resignations.

Q: What was your impression of how it worked out by having the FSI language school in Japan, because I think some of the other countries like the French or the British tended send their officers to a university in Japan, or something like that. What was your impression of putting the people there but in sort of an American teaching environment?

RATLIFF: I think there are two issues here. One is what are the advantages of having the training take place in Japan versus taking place in the U.S., and there were distinct advantages to being in Japan and walking out and being able to speak to the Japanese and to interact. In those days, and to this day, I'm happy to note that students were required to live within the Japanese community. They were barred from embassy housing; consequently, they were coping with day to day life in Japan, learning in some cases reluctantly, how to get things done. That's one aspect.

As far as going into say a Japanese university or in the case of the British, working with a tutor or possibly combining private instruction with some university classes and the like, those of us at FSI in those days felt strongly that system represented what was done in the Foreign Service before the war, and that we learned a lot about language training since then. The structured program with kind of guidance and discipline that FSI provides was a distinct advantage to sending someone off on his own to learn a language. People like Ambassador U. Alexis Johnson before the war learned Japanese from people like Naganuma (who went on to found one of the largest Japanese language schools in Japan) in those kind of relatively unstructured conditions. Some learned it well, and some didn't learn it so well, and sometimes we didn't know whether the student had mastered the language until it was too late to do anything about it.

Some students can learn the language in a very unstructured program. But if you want to be sure

that the majority of the people to the necessary proficiency, then the kind of structured program found in an FSI school is the best procedure.

Q: Did you have problems in fending off the embassy from trying to raid your students from time to time?

RATLIFF: Very rarely. I was very pleased and very impressed with that. I remember we did duty at the embassy when John F. Kennedy was assassinated. The entire time I was in Japan which subsequently turned out to be nine years, that is the only time I remember people in the school, Foreign Service officers, being asked to serve any kind of capacity. There was an early period when I arrived when the school was still in Tokyo when students were required to be duty officers. That rather conveniently went by the boards when the school moved to Yokohama because it became unworkable after that.

The Embassy provided support, and occasional meetings. They would send somebody down to talk to students and invite people up, but it was pretty strictly hands off, and I was pleased with the support from the officers at the embassy, starting with Ambassador Reischauer, who was a noted Japanese scholar and was the ambassador when I arrived there. By the way, at the reception for newcomers at the Ambassador's Residence, I introduced myself to Ambassador Reischauer. Upon hearing my Louisiana accent, he asked me, "Are you going to teach them Japanese with a southern accent?"

Q: Was there any debate going on about what type of Japanese to teach?

RATLIFF: Well, the debate had come and gone. The type of Japanese to teach was Tokyo dialect, and we were in the Tokyo area. Now it subsequently arose at a time when there was discussion about moving the school, but that was in the '70s. The decision was basically taken that we wanted to teach people standard dialect or Tokyo dialect.

JAMES D. MINYARD
Assistant Agricultural Attaché
Tokyo (1964-1967)

James D. Minyard was born in 1930 and raised in Lubbock, Texas. He joined the Foreign Agricultural Service in 1957 and served as assistant agriculture attaché to Japan. He was interviewed by James O. Howard in 1990.

Q: Time you got some foreign experience. What happened?

MINYARD: They decided I should go to Japan to replace Don Nouotny, who was being transferred to New Zealand. I was to be the Assistant Assistant Assistant Agricultural Attaché. I thought that would be fine. My wife, Billie, agreed. So all of the preparations took a whole month and a half to complete and get everything done and be on our way.

We got to Japan, and I found out that being the lowest assistant meant that I did all of the commodity work. I had the responsibility for livestock, for fruits and vegetables and for feed grains. I had commodity responsibility for everything except tobacco, soybeans and wheat.

Clyde Keaton was Assistant Agricultural Attaché. He did tobacco, wheat and soybeans. Russ Strobel from the Trade Center more or less did poultry because he came out of the Poultry Division here. The rest of it, I had to do.

The work was quite interesting. My first exposure really to cooperators.

Q: Tell us what cooperators are.

MINYARD: Cooperators are the people who've signed market development agreements with the Foreign Agricultural Service to do export market promotion under PL 480, Public Law 480, Title 2, I believe it was. It provided funds for commodities that were sold overseas to be used to promote the consumption of US agricultural products.

Generally, these agreements were with commodity organizations which represented across the board commodity interests rather than specific individuals or companies. There were several offices there in Japan that these people had set up -- covering wheat, feed grains and soybeans. The cotton people worked with the Japan Cotton Traders' Association, so they more or less had an office there. Poultry had an office, and I think there were some others.

The rest of them were handled on a visit-by-visit basis. I think at one time, we had twenty-two cooperator organizations working there. Some of them were very small, like two or three of the livestock associations which would get a couple of visits a year of three or four days each. Others were fairly substantial projects, spending several hundred thousand dollars. What I was surprised to find was that they were integrated fairly well with the Agricultural Attaché's office. They regularly communicated back and forth on a broad range of issues -- not just narrow cooperator interest, but much broader interests.

Q: In other words, they were intelligence suppliers, was that it?

MINYARD: They provided a lot of information. In some cases, for example, they acted as a go-between between the Attaché's office and government people. Sometimes the government people would feel that they didn't want to approach something officially, so they could talk to one of the cooperator people. That cooperator person would then come and talk to the Attaché, get an answer and go back.

If the answer was positive, then they'd come directly to the Attaché. Otherwise, they would drop it. Then nobody was embarrassed for having been turned down for proposing something.

Q: No loss of face.

MINYARD: No loss of face. I don't know if people realize it, but that is very important in Japan. Quite frankly, it's very important in the United States, too. People don't look at it that way, but

it's there.

Q: You were working with the rest of the Embassy. You really had some exposure, then, to the State Department.

MINYARD: Yes, and it was a very bad experience, as far as I was concerned. Edmund Reischauer was the Ambassador at the time, and he was a real nice fellow, but his interests were in the political and the cultural side of things, not in the economic.

The economic side of things was sort of ignored. It puzzled me because the Japanese were in this process of what they called "income doubling" at the time, which was really going to pull Japan out of the doldrums. It was a very successful program. It probably tripled their income in a ten-year period there.

In 1964, while they were doing that, they became so prosperous that they lost their GATT protection. This had been under the category for trade with developing countries that gave them special dispensation to apply restrictions and so forth. The Japanese at that time still had all kinds of restrictions on imports that were basically illegal under the GATT. So I figured that when they lost that, the Embassy should really go after them and make them start removing these restrictions. There was no higher level interest in doing that in the Embassy. They just more or less ignored it. It was that way all along.

I remember once when the "Maid of Cotton" visited Japan. We had some fairly important Japanese involved in some things that she was doing. I talked to the USIS (United States Information Service) people about getting some publicity out of this. I was told that they weren't interested in that because it was strictly a commercial deal.

And so those are the kinds of things which really kind of turned me off on the State Department in dealing with the world. I don't know if it's changed. I've heard a lot of lip service about changing, but I don't know if it has or not.

I even got in trouble once. The Japanese were talking about liberalizing grapefruit imports, but they weren't planning to do anything about it. So I found out that the U.S. was going to lift the restrictions we had on mandarin oranges coming into four Northwestern states. There was a problem with citrus canker, a plant disease. They concluded that they could ship those mandarin oranges into Washington, Oregon, Montana and Idaho without endangering citrus or the US becoming infested with citrus canker.

So I went over to the Ministry of Agriculture and talked to some people about what a wonderful opportunity this would be to make a trade. They could liberalize grapefruit imports, and we could ship those mandarin oranges in. The Ministry of Agriculture thought that sounded good. They understood this kind of thing.

The next thing you know, we got a phone call from the Embassy. Some of the State Department people were upset and were raising Cain. They said that citrus canker was a technical matter and shouldn't be used to trade for something that was not technical. It was already worked up, and the

Japanese were willing to do it.

It took ten years after that to get grapefruit imports liberalized, when we could have done it so easily and much earlier.

Q: Were there some trade-oriented people in the State Department -- the Commercial Attachés or some of the Economic Analysts?

MINYARD: There were some nice people there, but they were a long way down the totem pole as far as importance in the Embassy is concerned.

On one or two occasions, when everybody else was gone, I went to the Ambassador's staff meeting. They'd never mention anything about the economic side. If someone brought up an economic question, nobody would ever ask a question about it. They'd early move on to quote somebody's political position on this, that, or the other thing.

It was just a total mystery to me.

Q: Were our agricultural exports to Japan increasing during these years, or did the cooperators have any impact?

MINYARD: I'm not sure what the impact was, but Japan was more or less "discovered" by agricultural exporters during the period I was there. Agricultural exports from the U.S. to Japan went from less than \$500 million a year to almost \$1.0 billion a year during the year that I left. Of course, it was mostly soybeans, feed grain and wheat. They were the big items, but there was a very broad range of commodities, mostly unprocessed products. I handled skins and those kinds of things.

They did liberalize lemon imports while I was there. That, of course, became quite a booming market. Not people eating lemons but because the feeling in Japan was that if you wipe lemon juice on your skin it turns white. Japanese ladies like to have real pale skin. That's probably by far the biggest market for lemon. But it's okay, let them buy lemons!

I can't remember the numbers, but during the time that I was there, the number of trade people that came through the Attaché's office tripled. They would want some help in meeting people or making contacts. Then they reported in on what they discovered or found out.

Q: Did you work shifts during the years that you were there? You started off with commodity analysis.

MINYARD: The work wasn't done on a shift basis. I had commodity analysis, trade policy and market development responsibility for all these commodities. I was responsible across the board, though there was a lot more activity going on there.

I guess that one of the major scandals in the market development cooperator program occurred while I was there. I'm still not sure, and I guess nobody else figured out exactly what happened,

but in the Feed Grain Council Program, they had a Japanese-American over there running it named Bill Hattori. Bill Hattori was accused variously of making off with \$40,000 to \$70,000 in market development money -- but not for his personal use. He didn't put it into his pocket. He just did things that weren't very well accepted by U.S. standards. He was taking people to these *geisha* parties, which sometimes would cost \$400 to \$500 per person per night -- things like that.

He didn't have enough entertainment money in his program to do it, so he was spending money on entertaining that was supposed to be spent on publications and those kinds of things. There were some other things that he was doing that weren't above board as far as the U.S. side was concerned. He was trying to out-Japanese the Japanese in the way they entertain people. We had people from the OIGP (Office of the Inspector General-Program) come to Japan and spend a lot of time trying to figure out or sort out what was real and what was not real. The number two guy in the OIGP came to Japan and spent about a month. I think they finally agreed that the Feed Grain Council owed the project about \$40,000, and they paid that back.

Bill Hattori went to Alaska and was tried there for misusing funds. He was actually found guilty, but they decided that they wouldn't put him in jail. They put him on probation. He had to pay the Feed Grain Council back \$100 a month, which would have taken him years to pay off his debt (actually, about thirty-three years at this rate). He worked in Alaska for two or three years and then sort of disappeared.

Q: I remember that story. I remember how proud Hubert Dike was that he found him in Alaska. That was, as I recall, one of the few scandals that ever took place in that rapidly growing program.

Are we ready to bring you back from Japan? Is there anything else there that added to the education of Jimmy Minyard or to the betterment of the FAS?

MINYARD: I learned a lot of things in Japan, not all of them necessarily for the betterment of the FAS, but it was a very interesting time to be in Japan. First, they had the Olympics in 1964. As a result of that, Japan decided that they didn't win any medals because their nutritional standards were so poor. They decided that they had to improve the nutritional standards for children substantially. And so the school lunch program suddenly became a big deal. These market development cooperators were able to cash in on that.

So sometimes something as esoteric as the Olympics can have a very substantial impact on market development. These were the kinds of things that I think most people tend to miss when they try to figure out what's going on as far as markets and marketing are concerned.

Q: What was that statistic about the increased height of the Japanese over a certain period?

MINYARD: I'm not sure about that, but I know that between 1950 and 1963, compared to 1974 or 1975, they had to increase the size of the desks of the first graders three times because the kids were getting much bigger. They attributed this to the nutritional benefits.

JOHN C. LEARY
Economic/Commercial Officer
Tokyo (1964-1968)

John Charles Leary was born in Connecticut in 1924. He received a BA in 1947 and an MA in 1959 from Yale University. He served in the U.S. Army overseas as a lieutenant from 1943 to 1945. His postings abroad have included Cherbourg, Dusseldorf, Istanbul, Tokyo, Ottawa, Vienna, Sao Paulo and St. George's. Mr. Leary was interviewed by Raymond Ewing in 1998.

LEARY: I was assigned to Tokyo and right before I left for Tokyo, I was assigned to FSI for the mid-career course. I spent three months in that course and it was during that time that President Kennedy was assassinated. At that time I remember precisely what happened when it occurred. It was in one of our sessions, shortly after lunch when our course director came into the back and whispered to someone and he stood up and asked the class to stop for a moment and he reported the events in Dallas and got a very emotional reaction from everybody. We had the rest of the day off and the next three or four days in Washington were the burial ceremonies. But then we arrived in Tokyo, actually the beginning of 1964.

Q: Again you were assigned as an economic/commercial officer?

LEARY: Right. At the time of the Kennedy assassination, there had been scheduled a Cabinet level meeting in Tokyo between our Secretary of State and various other cabinet ministers and their various counterparts of the Japanese side. This is something that had been going on for a couple of years, alternating meetings between Washington and Tokyo. Involving the direct presence of a great number of our cabinet officers. Well our group had been on its way to Tokyo and turned around so the meeting was canceled, but about a week after I arrived in Tokyo, it finally occurred. It was a very interesting introduction to Tokyo. It was something to be observing what was happening and having a chance to meet with the Secretary and other senior officials who were there. Get briefings from them briefings on what was happening in Washington and so on.

Q: As well as to see the Japanese government operating at a high level of interaction with us. When I was assigned to Tokyo in 1959, the first thing I did there was to participate in the U.S. delegation of the annual, the contracting parties meeting of the General Agreement on Tariffs and Trade was taking place in Tokyo. I had a similar experience, although not at the Secretary of State level. Who was the Ambassador when you got to Tokyo?

LEARY: The Ambassador was Edward Reischauer. He was a wonderful man who had been appointed by President Kennedy. He had been a professor at Harvard and there couldn't have been anyone more qualified for the job. He had been born in Japan of missionary parents and lived there most of his youth and had become one of the countries foremost experts in Asia, Japan in particular. His wife was Japanese, the daughter of a distinguished family in Japan. He was always referred to by the Japanese as Professor Reischauer, not Ambassador Reischauer, as a sign he was well respected.

I recall two incidents. One shortly after I arrived, I was asked by our Information Service people to participate in a series of discussions they had arranged with Japanese students, mostly graduate students who had been in the States and spoke some English, but wanted to improve and maintain their English language faculty. They would set up meetings, usually at Tokyo University in a room with usually six or seven Japanese students and a two or three Americans and they would have a topic of the evening. One of the Japanese would present this topic in English and then we would discuss it. The first night I was there the topic was “The Changing Values of Japanese Youth.” During his presentation, the Japanese speaker kept referring to the well renowned expert so and so. Then when we finished, I asked him to tell me who this expert was that he kept referring to and he said, “Oh, that was Professor Reischauer.”

Another time, which was later in my career, involved the Vietnam War. We had begun the bombing of North Vietnam and the Japanese press were very negative about our actions. In fact, most of their reporters on the scene were in Hanoi rather than Saigon. Ambassador Reischauer was invited to speak at the newspaper publisher’s association. During the course of his talk, he was quite critical of their coverage of the Vietnam War. Their very one-sided coverage and he was urging them to take another look at things. The next day, instead of criticizing him for interfering in Japanese affairs, the local newspapers came out with editorials saying, Professor Reischauer said so and so, so we must self-reflect. So he was a very good representative for the United States.

Q: He had tremendous influence as you were saying, and a great expertise and wisdom for the job.

LEARY: Also he used his staff very efficiently. Aside from his representational activities, he didn’t do his own work, he turned to his staff to prepare the reports.

Q: How involved, how interested was he, in the economic side of things?

LEARY: I would say very much so. Of course more on the political side, but also in the economic side. He was writing a book, at the time, which came out later. I can’t remember the title now, but a part of that involved the economic power positions in Asia. I recall that he asked me one day to develop some tables, population and GNP [Gross National Product], and then he devised two sets of maps in which he drew countries to scale depending on population and GNP. The population of China, for example, covered a large part of the map but when you used the GNP, it was very small. Japan was quite a bit bigger than China. So he was interested in that sort of macro aspect of economics.

Q: Were economic trade issues in our bilateral relationship as they later came to be?

LEARY: I would say, yes they were. We had some of the same issues that you still see today. Japan was not yet as important in our market in terms of Japanese imports, but they were beginning to be. I recall, for example that auto trade became quite an issue. The Japanese had just begun to develop special ships to ship cars into the United States, where the cars could drive on to the ships and when they got to the United States drive off again. Our industry was

concerned that their sales in Japan would, as Japanese auto production increased, that our sales would drop off to practically nothing. Although American cars got to be quite popular in Japan in earlier years. They had delegations come over and debate these things. It proved a number of things. One was that the Japanese were building cars for the American market, while Americans were not building for the Japanese market, where they drive on what we call the wrong side of the road and so on. And that our cars were being shipped in such small quantities. You know, each one was separately boxed where the Japanese had gained some efficiencies from their method of shipment. It cost us probably ten times more to ship a car to Japan than it cost the Japanese to ship to the United States. So those issues were being debated and we had issues about trading oranges and rice.

Q: Textiles?

LEARY: Yes, textiles too. Very much so. I recall we had a delegation headed by Warren Christopher, who later became Secretary of State, but he was the advisor on economic matters that came to talk about trade in textiles and tried to persuade the Japanese to enter into some restraint arrangements. That resulted in a rather difficult situation when one of the Japanese, after some strong presentations from Christopher, was reported to have said, "We are not North Vietnam. You cannot threaten us." At this point the U.S. delegation decided to leave the room and they came back and talked to Professor Reischauer. He got a hold of the Foreign Ministry who apologized for the man from the Ministry of International Trade who made this comment, pointing out that he was not attuned to political niceties. Eventually things were straightened out. In most cases we worked out at least temporary accommodations.

Also during that time Japan had become a candidate for membership in the OECD and did become a full member in about 1967, during my tour there and we were engaged with the Foreign Ministry in discussions about this.

Q: They were already participating in the work with development assistance of OECD. I don't know if they were a full member of that.

LEARY: Yes, assistance. I'm not sure about full membership.

Q: But they began to have their own aid programs in southeast Asia.

LEARY: Yes. That was also a project that I became involved in. We had phased out our aid program and most of the staff of the aid program in Japan, so it was a small office that was handling residual matters, the sale of surplus equipment and that kind of thing. So, our section became responsible for dealings with the Japanese on aid matters, both involving the development assistance committee and particularly, at this time, aid in Southeast Asia. The United States had a regional AID mission in Bangkok which worked very closely with other countries in trying to get multi-lateral cooperation on a number of issues including dams on the Mekong River and so on. The Japanese were quite active, although not as active as we would have liked. We were continually urging them to look at another project and consider making another contribution.

Q: Why don't you talk a little bit about exactly what your job was in the embassy in Tokyo and how that related to other parts of the embassy.

LEARY: When I first went to Japan, I was assigned as Chief of what was called the External Economic Unit, which dealt with Japan's relations with international organizations and third countries. But rather quickly, as a result of a number of things, including position cut-backs and transfer of individuals and so on, we merged the Internal and External Units, so I became senior officer in that area, reporting to the Economic Counselor and an Economic Minister. We also had a commercial counselor at that time who was from the Department of Commerce, and a separate Commercial Section, and a Trade Center operation. We also had, in the embassy, a number of specialists, such as an Aviation attaché, a Fisheries attaché, and a Treasury representative.

Q: Agriculture?

LEARY: Agriculture. Agriculture had a separate section and they were physically located in another building. In those days the embassy had outgrown its original space, so some of the population were scattered within a few blocks, but separate from the main embassy building. I became something of a liaison, with these people as well. Reporting to the economic counselor. So it was a very busy active job that pretty much cut across the board.

Q: Who was the Economic Minister?

LEARY: The Minister we had...well there were three...when I was first there it was Arthur Gardner. He had considerable background in southeast Asia. He had been, I think, minister in Vietnam at one point. Then came Larry Vass, who was a career Foreign Service officer, that spent important parts of his career dealing with aviation matters. He was head of Aviation Division of BD at one point. And finally at the end of my tour, Herman Barger came in, who also had experience in southeast Asia. He had been Deputy Executive Director of the Asian Development Bank and later became Deputy Assistant Secretary in that department.

Q: So it was a big section. As you say, there was both a minister and two counselors.

LEARY: A minister and two counselors. There was the commercial and economic counselor and then various other specialists.

Q: And you were, in effect, responsible for the State Department Economic section.

LEARY: That's correct. As well as, not directly, but having a hand in the coordinating with other sections.

Q: And your unit was involved both with Japan's external economic relations and reporting on the Japan economy.

LEARY: The bulk of our work was on the external side. We did internal economics reporting in a general way. So much was being written about the economy, to a certain degree additional reporting from us was superfluous.

Q: The Treasury did some of that.

LEARY: That's right. They dealt particularly with the international aspects.

Q: And the commercial counselor was involved in some of the concrete trade issues.

LEARY: Right. The Commercial Section was fairly large, we had several officers there. Some operating trade centers which put on trade shows probably on an average of once a month, maybe more. Which tended to be either sometimes outright trade shows, in the sense of displaying American products, and other times a seminar type thing. One time, I recall, and this involved commercial as well as agricultural assets, but we had a show where we had soy beans. And we had experts describing new uses for soy beans, and so on.

Q: What were some of the other primary issues that you and the embassy were seized with during that period of the mid-1960s?

LEARY: Japan was already becoming a formidable competitor in world markets, not quite to the extent that they did a few years later, but they were beginning to become more active in international areas and we were encouraging them to take a more positive position. One of the areas was assistance to southeast Asia. We had a regional AID office in Bangkok which was largely responsible, together with the AID missions in the various individual countries for a very large economic development program which paralleled our effort to support the South Vietnamese government on the military side. We were encouraging Japan and other countries to participate with us in these areas. Japan was becoming more active. Much of their aid was directed towards areas which complimented their commercial interests in the area, which was not unusual for countries to do, but we were encouraging them to take a bit broader approach on those issues. They made contributions to a number of the infrastructure projects in the Mekong, for example. I recall one relatively minor issue was a foreign exchange operations fund which we established to assist Laos to finance its imports. Japan, as well as several other countries made a contribution to that fund.

During my time in Tokyo I attended two meetings in Bangkok, or what was then called ECAFE, the U.N. Economic Commission for Asia and the Far East. I think the name has been changed in more recent years, but I was a member of the U.S. delegation for those meetings which dealt largely with trade and commercial issues in that region as well as some aid matters. Because of my position in Tokyo, which involved liaison with the Japanese government on some of these regional aid programs, the aid Mission in Bangkok amended my travel orders to enable me to stop in several of the other southeast Asian countries to take a look at aid projects and to consult with our own aid people and the Japanese aid people in the various places, including Laos and the Philippines.

One specific thing that happened where the Japanese did take a substantial initiative, I believe it was in 1965 that the Sukarno government in Indonesia was overthrown. The Western developed countries undertook to provide assistance to the new government, headed as I recall, by President Suharto, who in recent days has fallen on hard times. But the Japanese agreed to host a meeting

of donor countries in Tokyo. The group became known as the Tokyo Club and did put together a package of assistance to Indonesia. We and the western European countries were pleased that the Japanese had taken this initiative and because they had done so they, of course, made a substantial financial contribution to the package.

As a minor note on that, I recall after the first day of the meeting, the Japanese being hosts were responsible for preparing summary records for the next days proceedings. I had gotten back to the embassy after the conclusion of that days session and my phone was ringing. It was the Japanese foreign office saying, "Leary-San, we noticed that you were taking notes. Could you please come and help us prepare our summary records?" They had people taking notes who were perhaps somewhat unfamiliar with the issues and also whose English was not entirely fluent and the records had to be prepared in the English language. I went to the Foreign Ministry and spent until some time after midnight helping them put the records together. Interesting effort.

Q: One of the things that strikes me is that all of this was going on approximately 20 years after the end of the second World War, where Japan, of course, had very different objectives and goals in Asia. As it began to take a more responsible leadership role, with our encouragement, it also had to overcome a lot of history and resistance, I would think on the part of some of the Asian countries that still saw them as the aggressor, not too many years earlier.

LEARY: Quite so. In fact, I recall, in particular on one of my southeast Asia trips, spending a couple of days in Manila and there I found the memories of the Japanese occupation still very much alive and a good deal of resistance to the Japanese. Although, in due course, they did welcome the financial assistance that came. But there was still a great deal of animosity in many of these countries about the Japanese, where memories of World War II were quite fresh.

Q: I guess our objective was to encourage them to do what they could, but we also recognized that these realities existed. That they could go as far as they could, but...One of the other things that was happening in that period were the Kennedy round of trade negotiations conducted under the GATT. Were you involved with that much?

LEARY: To a limited degree. Most of the negotiations were conducted in some areas and were closely held in Geneva, but we did meet with the Japanese periodically in Tokyo to exchange ideas. One of our handicaps was because the negotiations were closely held, some of the lists that were exchanged among countries were not made available by our side to our embassies in those countries, so sometimes we were working in the dark. I recall once mentioning to my Japanese counterpart that I was handicapped if I didn't have the list about which he was talking. He then made a copy which he then gave to me and from then on we were able to communicate on a much better basis. But there was a good deal of exchange on those issues and we were reporting what we heard in Tokyo about the Japanese positions on various aspects of the Kennedy Round negotiations.

Q: On a bilateral level, certainly a lot in the last couple of decades, in terms of the U.S.-Japan relations has been dominated for considerable periods over both Japanese imports... imports from Japan into the United States and the perception that Japan was not giving fair and equal access to the Japanese market for our products. Had that become a significant issue or issues at

the time that you were there or was that later?

LEARY: That was becoming a significant issue. Not nearly so much as later, but the Japanese were already exporting a large number of consumer electronics, television sets and tape recorders and this sort of thing. Their automobile trade was beginning to develop as well.

As a matter of fact, I recall one session with a group of negotiators from Washington on automobile trade. It was basically a fact finding affair. They couldn't understand how the Japanese were able to compete so successfully in the United States while our car sales in Japan were extremely limited. This brought out a lot of things. Including the fact that the Japanese had developed very modern trans-oceanic transportation for their vehicles. They had the roll-on and roll-off ships which they were able to use because of the volume of their shipments to the United States. Whereas most American cars were being sent individually on the deck of a freighter. That meant that our costs of shipping a U.S. car from North America to Japan was about ten times the cost of shipping a car from Japan to the United States.

Another major factor was that Japan was building cars to the specifications of the U.S. market, whereas our sales to Japan were so small that most of the American and Canadian production was not geared towards Japan. The roads, the fact that they drive on what we call the wrong side of the road. We were continually trusting the Japanese to open their markets more to foreign goods. I did in fact attend a meeting in Geneva during my tour in Tokyo, a bilateral meeting with the Japanese where we were going over a list of quantitative restrictions that the Japanese had maintained on certain products, and listening to their explanations on why they must continue to do this and they listened to our demands that they begin to accelerate the removal of these restrictions. So that was a continuing thing. I think the bitterness which seemed to enter into our relationships more recently was not yet present at that time. Japan was still considered to be coming out of the wartime crisis and still developing. Although, as I said earlier, they eventually became a much more competitive supplier of goods to world markets.

Q: Were you in Tokyo at the time of the 1964 Olympic Games?

LEARY: Yes we were. We arrived in Tokyo in January of 1964 and the games took place in October. At the time we arrived, the Japanese were engaged in numerous building projects to prepare for the Olympics: extending subway routes, building highways, building stadiums. Just a tremendous effort. And when the games were ready to begin everything had been completed. They had two weeks of the most marvelous weather you could ever imagine. The games were held in October, rather than in the summer because Tokyo tends to have summers which are somewhat equivalent to Washington's very hot and humid. They decided that October would be the best weather for these games. They went off in fine fashion. Everything went like clockwork. They had organized the populace to assist the foreign visitors. People walking around the streets with labels saying, "I speak English." and "Je parle français." So that the visitors could, if they were lost, converse with someone. It was an impressive display.

Q: I left Tokyo in December of 1961 and they were just beginning to gear up and had major plans to be finished by 1964. And they were.

LEARY: After the games many of the facilities that had been built for the games became public and the locations were... For example, the large auditorium which had been built for swimming and diving events was open to the public for swimming during the summer and during the winter they put a floor over the swimming pool and turned it into an ice-skating rink which was open to the public. Other facilities were used in a similar fashion.

Q: I don't think that you had much Japanese language training before you went to Tokyo. Was that a significant handicap for you?

LEARY: I didn't find it so in my job. It was a bit of a handicap for day-to-day living, although over time we picked up enough to order meals in restaurants and tell the taxi driver which way to turn. But I was not getting any Japanese language training. We had some occasional language training in the embassy but not enough to get anywhere near carrying on a professional conversation. Most of our economic officers were in the same situation. On the other hand, most of our political officers had been to the Japanese language school where they spent up to two years in Washington and in Japan, I believe in Yokohama at a language school, where they became reasonably fluent in the language. I found that in my own job I was dealing mostly with the Ministry of International Trade and with the Foreign Ministry where the Japanese I was dealing with spoke English quite well. We had some Japanese English-language newspapers... English language abridged editions which were helpful.

Q: Well, is there anything else that we ought to be covering in regards to your assignment in Tokyo? I realize that it's a... you and I are both having a little bit of trouble remembering exactly what we talked about three weeks ago. We may want to add some things later, but is there anything else that really stands out about that assignment? It sounds like it was a very interesting and satisfying assignment.

LEARY: Oh, absolutely. It was very nice. We were there for almost five years and it was a very professionally satisfying assignment. One thing that happened near the end of my assignment, which led to my next assignment-indirectly-was a meeting in Tokyo at the ministerial level of ECAFE. It was either late '67 or early '68 and one of the issues that appeared on the agenda, as it did on the agendas of all of the UN Regional Commissions and other international bodies where developing and developed countries came together, was the issue of developing a system of tariff preferences for the benefit of developing countries. At the same time the meeting was taking place in Tokyo, there was a ministerial meeting of the OAS in Punte del Este, Uruguay. We had learned that President Johnson, who was attending that meeting for a day to deliver the principle U.S. address, had decided that we would reverse our long-standing opposition to preferences and agree to study the possibilities of instituting a system of preferential treatment.

Our delegation leader in Tokyo, Tex Goldsmith, as I recall, he had come from the U.S. Mission in New York, wanted to be able to mention this turn-around in our policy at the meeting in Tokyo and was attempting to get through by telephone to Uruguay to find out precisely what the President said because he didn't want to overstep his bounds. Communications had improved greatly from what they had been earlier, but they still were not up to today's standards and we spent many an hour trying to patch through the telephone call. He finally was able to get through and got the language that the President had used which he was able to repeat in our meeting in

Tokyo to great applause from developing country representatives who were present.

Q: I guess the key aspect of that was whether the announcement of our change in policy related to only the western hemisphere countries, such as Latin America, or was it going to be applicable world-wide.

LEARY: No, I think the language was quite clear that it applied world-wide, but it was delivered in a Latin American forum because we were attempting to, I understand, improve our relations with the Latin American countries at that time. But this was something that they were interested in as well as the other African nations and developing countries.

Q: You mentioned that had a connection with your next assignment. What was that and where did you go from Tokyo?

LEARY: Well, I returned from Tokyo to Washington for my second assignment in the Department. I was assigned as Chief of what was then called the General Commercial Policy Division. This was in April of 1968. That division had become responsible for the President's commitment on generalized preferences. My assignment, as I said, this was a coincidence that I moved into this job relating to what had happened in Tokyo. But I spent the next four years in that position dealing with a number of interesting issues, but that was perhaps the most time consuming and important issue that we had. The issue was several fold.

STUART P. LILLICO
Public Affairs Officer, USIS
Sendai (1964-1969)

Stuart P. Lillico was born in Seattle in 1909 and joined USIS in 1953. During his career Mr. Lillico was posted to India, Ethiopia, Zanzibar, Rhodesia, and Japan. He was interviewed by John Hogan in the fall of 1998.

LILLICO: I began getting quite a few inquiries and openings from places that we could work. At that moment, I was offered a transfer to Japan, which I could not resist, and so we left Kitwe -- and Africa -- in late September, 1964.

Q: Well, Stu, it seems to me your whole background had a great deal more to do with Asia than it did with Africa. But, be that as it may, you went from Northern Rhodesia to Japan. To what city did you go in Japan?

LILLICO: We went to Sendai, which is about two hundred miles north of Tokyo and is generally regarded as the center of the Tohoku area of Japan -- a large chunk of the main island of Japan.

By a happy coincidence, this is the area in which my wife had been brought up. Her parents, American missionaries, had been stationed in Sendai at the time of her birth, and they remained there for nearly ten years. Later, they were transferred to another city, also in Tohoku. Her family

was well-known as educators and was still very affectionately remembered by many people in Sendai.

Q: You speak and read Japanese, and I understand that during World War II, you used that knowledge to good advantage?

LILLICO: Yes, both my wife and I worked for the old Army Map Service outside Washington, translating Japanese maps and producing new romanized maps for the Armed Services. We were with a fairly large group of *nisei* Japanese and some *issei* doing this translation work. I greatly increased my knowledge of Japan's geography at that time, which was a big help when I went back in 1964.

The USIS in Sendai was a heritage, I guess you would say, of the post-war CI&E operation. It had established libraries and done a great deal of work that USIS came to do later. CI&E was in a large mausoleum of a building -- a great big place almost like the state capitol -- and had a program of films, which was very popular, and scholarships and lecturers. I inherited all of this from a series of excellent people -- they are not PAOs, but were called center directors -- that were there before me.

We remained five years in Sendai, the two-year balance of the tour that had been broken off from Africa and then a second three-year tour that ended in 1969. During that time, I traveled extensively around northern Japan. We worked closely particularly with publishers and radio people. We had a series of seminars for newspaper men, correspondents, editors and publishers, bringing in American newsmen to work with them. We moved this seminar series around from one city to another each year. I think it was an excellent operation, and it continued after my departure and after USIS Sendai closed down. Mrs. Lillico's family had been missionaries in Sendai; she had a good entree into Sendai circles. I feel very relaxed about the job in Sendai. For one thing, I felt at home there. Secondly, my wife's family was relatively well-known so that I had an entree.

Also, by that time, I was sufficiently senior, with a bald head, so that I had automatic standing in Japanese society. People were beginning to refer to me as an elder rather than as a youngster coming in. It was a very happy tour.

Q: Wasn't that area the seat of educational institutions?

LILLICO: Yes. Sendai has four big important universities. Two are government institutions: the Tohoku University, which used to be an imperial university, and hence very prestigious, and a prefectural university of education, which was slanted more toward teachers. Then there were two prominent Christian schools. One had been run by my wife's father many years before. The second was a girls' school. All four were important, and we worked closely with the faculty and the student groups there.

Among other things, it was always easy to start an English class. It is amazing how many ideas you can sell if you do it in a form of teaching English conversation.

Q: Well, you have been through the mill, I can see that, and your name is probably as well-known now in Sendai as it was then. Do you ever revisit Japan?

LILLICO: Yes, we went back in 1985, which happened to be our fiftieth wedding anniversary year. We visited Sendai again and met many of our friends of former days. We met the USIS staff, which is now scattered through a lot of other offices. We had an opportunity to talk to a number of people with whom I had been working closely in education, and just buttonholing and shaking hands during my time there.

It was an extremely happy visit. Unfortunately, the weather was poor, which is par, I guess, for Sendai. Here in Hawaii, quite a few of our former contacts in Tohoku pass through on their way to mainland U.S. Very often, they stop over, and we have an opportunity to entertain them.

I have not left Tohoku, Japan behind me by any means. It is still very much a part of my life.

ANDREW F. ANTIPPAS
Consular Officer
Kobe (1965-1966)

Andrew F. Antippas was born in Massachusetts in 1931. He received a bachelor's degree from Tufts University and entered the Foreign Service in 1960. His career included positions in Africa, Japan, Vietnam, Cambodia, Thailand, Korea, Canada, and Washington DC. Mr. Antippas was interviewed by Charles Stuart Kennedy on July 19, 1994.

Q: You were there from 1965 to 1967. What were you doing in Japan?

ANTIPPAS: I was actually sent to be the Administrative Officer. However, the Consul General was John Stegmaier, a senior Foreign Service Officer, who had been in Japan forever. I sometimes thought that he had forgotten whom he represented, the U. S. or the Japanese. Mrs. Stegmaier was even worse. Her family had been missionaries in Japan for generations. She spoke better Japanese than the Japanese. Anyway, it was decided that I would be a Visa Officer and Vice Consul. John Coffey, who had been in charge of the Consular Section, would also be the Administrative Officer. So I basically did consular work for two years. Eventually, when John Stegmaier left, I was made chief of the Consular Section. Kobe was good to me. I received two, back to back promotions in Kobe and found a wife.

The Consulate in Kobe was basically a "visa mill," but those were the days when vice consuls signed every visa, before we had plates with signatures on them. I remember that in one year I signed 13,000 visas by hand. That was a big workload in those days. I don't know what it would be now--maybe half a million. We have a visa waiver with Japan now. During my time the Consulate was "split." The Consular Section was in the Consulate building in the compound that we had in Kobe. The CG and the Commercial section were in Osaka.

This shows you how the old Foreign Service worked. We had had a Consulate in Kobe since the "opening" of Japan [in 1854]. It's a wonderful town--the most Westernized town in Japan, up until the 1960's, I think. We had a Consul General in 1958 who decided that the Consulate would be in Kobe, because he thought that Kobe was a much more pleasant town. In point of fact, most of the work in the office was in Osaka, which is where the commercial center of gravity was. The Department built this compound--the office was an architectural award winning structure--in Kobe, along with an apartment building providing housing for most of the American staff. But, as I say, most of the work was over in Osaka, so another building was provided in Osaka.

Q: How far away was it?

ANTIPPAS: 25 miles away to the North East. Osaka then had a population of four million people. Kobe had one million. Commuting was really something. Talk about "mob scenes" at the trains. Try riding the subway in Osaka in August--or in winter, for that matter. So I spent one year in Osaka and one year in Kobe.

Eventually, another Consul General decided that everyone should move over to Osaka. Now, I think, they've decided to compromise, since the Consul General's residence was in Nishinomiya, which is halfway between the two. We've now built an office building in Nishinomiya. If you have work to do down at the port, you go in one direction. If you have work to do in Osaka, you go the other way. The train service is excellent.

Q: Did you get any feel for how the Japanese felt about us at that time?

ANTIPPAS: Yes. It's interesting that you say that, because it depended on the turn of the generations. I remember that the American impact, the American occupation of Japan, was very strong after World War II. Remember that, first of all, I was a consular officer. I was involved in protecting American citizens. I remember a senior police officer calling me up at 4:00 AM one day to say that they had some guy in jail for some reason or other. I said, "Fine, I'll be down there first thing in the morning." He replied, "Oh, you must come now, because under SCAP [Supreme Command, Allied Powers--the command headed by General MacArthur] rules we must inform you immediately upon the arrest of your citizens. You must come immediately." In the 1940's and 1950's, SCAP meant MacArthur. I remember getting up and going down to the jail, because they took it so seriously. There are countries, including the United States, which would let weeks go by before the police informed a foreign Embassy or Consulate that they were detaining one of their nationals. Who was I to refuse the police officer's request? But at that time the people in authority still remembered the American occupation, which had been over for about 13 years, at that point. The occupation ended in 1952.

Q: I remember. I was there. I stopped occupying Japan and started protecting it.

ANTIPPAS: That's right. But there were relationships established, and we were still very much a powerful influence in that country, although there were lots of pro-Communist, anti-war demonstrations. If you haven't been in a Japanese demonstration, you really haven't seen anything. Until you see 100,000 people show up for a demonstration, snake dancing down the street, linking arms and chanting, with police five ranks deep in front of your office building,

with water cannon and teargas to turn people back, you really haven't lived. And you know that they're looking for you.

I remember one time in Kobe. I was in the office at lunchtime. pro-Communist demonstrators showed up, walked into the office, and started reading a communist manifesto--in Japanese, of course--at the top of their lungs. I remember how absolutely infuriated and humiliated I felt at these guys. I just went into my office and closed the door. What else could you do? When they tried that the second time, we locked the door on them and wouldn't let them in the building. They would always come at lunchtime. They complained bitterly to our local employees that they worked at the post office. They said, "We do this on our lunch hour." I felt, "Well, screw you. I don't want you in my office." I've got slides of these demonstrations, taken from inside the building. It was really something to see.

Q: Why was it that in the course of these demonstrations--and I did not serve there at that time--no buildings were burned down, and so forth?

ANTIPPAS: No. They were very careful about property damage. I recall that they painted graffiti on the office wall of this prize-winning building, which is very much in the Japanese style. The wall was made of cinder block--lava type rock. It was very porous, and we had a hell of a time getting those red-painted slogans off the wall. But there was no real property damage. They didn't burn vehicles or hurt anybody. Still, 100,000 people! After you get past 10,000, chanting anti-American slogans, what difference does it make? One of the things that we had in that area, just North of Kobe, was a large, aircraft repair plant. The U.S. Navy and Marine Corps used to bring their aircraft there from Vietnam for refurbishing. It was an aircraft "rebuild" facility. I can't remember the name of the place. We had a constant stream of Marine Corps and Navy pilots coming through. This was in 1965-66 at the height of the Vietnam War. The pilots would come up to collect the airplanes.

WILLIAM CLARK, JR.
Principal Officer
Sapporo (1965-1967)

Ambassador William Clark, Jr. was born in California in 1930. His career included posts in Sierra Leone, Japan, South Korea, Egypt, and India. He was interviewed by Thomas Stern in 1994.

Q: Let me now move on to Sapporo. You have mentioned that you had been offered a position in Kobe, which you turned down. How did the transfer to Sapporo come about?

CLARK: It followed the normal procedure. The Embassy people knew me; I was a language officer; I was the right grade to be the Consul -- principal officer -- in Sapporo. Sapporo had two American officers and an American secretary. So my move to Sapporo was not unusual. The only interesting aspect of it was that I had been offered the Vice-Consul job in Sapporo two years earlier, as I mentioned earlier.

Much of the job was "showing the flag". We tried to focus on what was going as Hokkaido was trying to catch up with the rest of Japan, particularly on the economic front. We tried to find investment opportunities. We did a lot of work on establishing "sister cities" relationships between Sapporo and an American city. I had the usual workload of a principal officer in administering an American consulate. Even though we had a Vice-Consul, I had to do some consular work; we provided the full range of consular services. While I served in Sapporo, there was one American in jail, whom we visited periodically. I also spent a lot of time touring the consular district which covered the whole island of Hokkaido and the three northern prefectures of the main island of Honshu: Aomori, Akita and Ito.

As I said, we worked on commercial matters. That was not a subject that engaged many foreign service officers at the time. At the time I was designated as an economic officer. I liked economics. I did political reporting, although Hokkaido was not in the mainstream of Japanese politics. We provided interesting regional footnotes and sometimes we picked up an interesting tidbit, but our political reporting was only a small contribution to the very few who followed Japanese domestic politics in Tokyo. I doubt whether many of our insights ever reached Washington. As an indication of what was important, I should mention a couple of economic reports that I submitted directly to Washington. That did not sit well with some of the people in Tokyo. The Commercial Counselor in particular was upset because they had not been filed through him. The Political Counselor told me to file reports directly to Washington, with copies to him. I think that difference in approach was a sign of what was important to the Embassy and to Washington.

We were involved in mounting a commercial exhibit in Tokyo. The Embassy had tried to have it done, but had failed. The exhibit was intended to be displayed in second-rank department stores. I knew the man -- Mr. Imai -- who headed the merchants' association; he also directed the largest Hokkaido-owned department store. I went to talk to him to see what could be done. He said he thought he could make the appropriate arrangements and he did. So we actually worked out the Embassy's problem from Sapporo. I was thanked for my efforts by the Embassy official, but somewhat grudgingly.

I was in Sapporo when the city fathers decided to apply for being the Olympic hosts. One of the members of the Imperial household came to the site. Then the Japanese delegation went to Rome to plead its case. Upon their return, I was sent an invitation to a "welcome back" reception. There was an entrance fee for the reception -- not very much, but unusual. I sent one of my staff over to buy the ticket and went. It was probably the first time that an American Consul had ever paid for anything in Sapporo. But it gave me a lot of good publicity. It showed people that the Americans were interested in what was going on. I had already volunteered in messages to Tokyo and the Department that Sapporo was worthy of American support. I became a Sapporo fan, as I became a Naha fan, a Tokyo fan, a Osaka fan -- although always remaining an American fan. Of course, the Olympics were a super special event for them. The final site selection occurred only a few weeks before we left Sapporo. so that I didn't witness any of the preparations. I knew where the various Olympic sites would be. In fact, the 12 meter ski jump took place right next to the old Consulate building -- which was a combination office-residence. If I had remained in that office, I could have just turned my chair and looked out at the jump competition. My successor certainly

had a good view of that event.

Sapporo had suffered very little damage during the war. That was generally true also of Kobe. Hakodate was more damaged because it was a port. But in general the northern cities escaped major damage. We did have a major military presence in Sapporo after the war some of which was still there when I served there. We had an Army detachment at Shitoysa, where the airport is. We had an Air Force detachment at Wakkanai which is at the north-west tip of the island. It used to be the departure point for the ferries to Sakhalin Island, when half of it belonged to Japan. We had a large airport base at Misawa in the Iwate Prefecture. I spent a lot of time with the military, particularly those stationed at Shitoysa which was only twenty-five miles away. I tried to involve them in some of my activities in Sapporo; they in turn involved me in base activities. We did get to Wakkanai; it was very isolated. That was interesting because there had lived a famous American who had been in Hokkaido soon after the Meiji restoration. His name was William S. Clark. He taught at the Agricultural School, which later became Hokkaido University, one of the Imperial Universities. He only stayed six months, but as when he left, his students -- most of them sons of Samurai families -- walked him to the port. The story goes that his last words to them was : "Boys, be ambitious". So there is now a statue to him on the campus. I don't believe that a solid Victorian gentleman as Clark was, would have said anything as crass as that, but that is the Japanese myth. He may have said : "Boys, be ambitious in Christ", but somewhere the last two words dropped out. He is still well known for his comment. As I said, William Clark's statue was on campus; my name was William Clark; the commander of our military base in Shitoysa was a Colonel William Clark; the commander of the Air Force base in Wakkanai was James Clark. We were never able to convince the people of Hokkaido that all of this was a coincidence; they were convinced that all Americans named Clark were sent to their island. They were convinced that the American government intentionally sent Clarks to Hokkaido as a tribute to the first one. I have a picture somewhere of the four Clarks standing in front of the statue of the first one.

My days as Consul were very varied. I spent about one fourth of my time traveling around. I liked to drive around Hokkaido. At the time we still used a "one-time" pad -- that is a device by which you manually encode and decode messages. It was great fun, although hard to imagine today, thirty years later. It was particularly aggravating when you had to decode a twenty page message, the essence of which could be read in the following day's newspaper. That work-load wasn't too great and the secretary and I used to take turns. I did a lot of the administrative work -- accounts, personnel, etc. I saw a lot of people who used to drop in to the Consulate. I did some visa work, although that was the main responsibility of the Vice-Consul. I wrote reports. We did a little of everything.

With rare exceptions -- e.g. when talking to my American colleagues -- I spoke only Japanese for my two years in Sapporo. No one expected me to speak English; we conducted all of our business in Japanese. I could not have asked for a better opportunity to become immersed in the language. Hokkaido attracted people from all parts of Japan. So the islanders spoke Japanese very close to "Hojungu" -- that is the Japanese used by NHK broadcasting system -- which is considered the "true" language. So the Japanese that I learned and used was as devoid of dialect as I could have hoped.

The social life was quite active. We had a Japan-America Society; I was a member of the Rotary Club, where I met a lot of people. I used to speak to Lions' Clubs, many of which were in remote towns throughout the island. A lot of the social life was work-related; it was another opportunity to meet people and to make a pitch for whatever US policy was on the top of the agenda at the moment. The Japanese in Hokkaido were perhaps even more friendly than those in Kobe. They had a long connection with the US, starting with the Maji restoration. At that time, they asked a former US Secretary of Agriculture, Forrest Caplan, to bring a team to Hokkaido to assist in the planning for the economic development of the island. That team -- sixty people -- actually assisted in drawing up the city plan for Sapporo; it is based on the "grid" concept which was later also used for Nara and Shinten in China. It was in fact a very ancient concept, but the "wheel was reinvented" for Sapporo. The story goes that the team laid out a North-South "grid", but then someone came along and pointed out that the "North" was the "magnetic North" and not the "true" North, making it three degrees off. The planner thanked the kibitzer profusely, revised the plan so that it is now six degrees off. I can't vouch for the accuracy of the story, but it is an enduring tale. The Caplan team laid out the railroad that goes to the port of Otaru. It conducted a geological surveys. So it was a very active mission; I think Caplan's diaries are still in the Department of Agriculture. So our relationships with Hokkaido go back many, many years, although we didn't open a Consulate in Sapporo until after World War II.

Q: I would like to ask you about the local staffs both in Kobe and Sapporo. Were they competent?

CLARK: It was competent. By the time I arrived in Kobe-Osaka in 1963, most of the staff had probably been working for the US government for about fifteen years -- that is, right after the war. So we had some first class personnel because working for the US Consulate was the best job in town. It paid well and seemed to have an assured future. Even after the local economy took off, these people stayed with us, although, for example, when Tupperware came to Kobe, they hired two of our best employees. One became general manager and the other the plant manager. Most of our employees were bilingual to a degree, although their reports required considerable editing. The Sapporo staff was much smaller. There we had an administrative assistant, two women in the Visa Section, two boiler men and a driver and two political assistants -- one was very good, the other had been with the Consulate for a long time. The latter was essentially a Russian linguist who spent much of his time reading Russian newspapers. He was not terribly productive, but he was the senior local employee. He used to tell me that before the other fellow as hired that he used to perform those functions. One time, after we had sent the new employee to the US for training, we faced out annual Fourth of July party. I told the older man that this was his opportunity to show me what he used to do before the new man was hired -- that is introduce the guests, etc. He promptly got drunk. We finally found some way to ease him out without appearing to be heartless employers. As in the Kobe case, we had no trouble employing local staff when the Consulate was opened; as the Japanese economy developed, it became increasing harder to attract the top talent. In Sapporo, we had no local staff working on economic-commercial matters; in Kobe, there must have been ten professionals working together with five American officers. Today, Kobe has one reporting officer -- the Consul General.

Q: I would like to discuss Japanese political development, starting with your Kobe experiences and then your Sapporo tour. What are your recollections about those local political situations?

CLARK: I think we now understand that as, Tip O'Neill was so fond of saying, all politics are local. It was relatively easy to see in Japan who did things for a city or a prefecture. There were plaques on buildings which not only provided the name of the sponsor, but what his job was at the time. So everybody knew who was doing the city a favor and that did not go unnoticed. The government was and still is highly centralized, but governors and assemblies for example are elected by their prefectures. The mayors are elected by city residents as are city councils. So there is some local autonomy, but taxation is centrally controlled and mostly collected by the center and then distributed back to the localities.

The Japanese have a custom which requires that if you wanted people to turn out at the polls or at a demonstration or some public gatherings, they had to be paid "Karumidi", which covered their transportation and eating costs for the day. That was not viewed as a payment for services received; it was just a fair and just compensation for out-of-pocket expenses. That meant that people who wanted to be candidates were expected to have enough means to make such payments.

The local assemblies focused essentially on how they wanted their prefecture to develop. During the early 1960s, manufacturing in Japan was much more centralized than it is today. It existed primarily around Tokyo and Osaka. In other prefectures, funds were used to develop industrial estates -- preparing the land, putting in infrastructure (roads, utilities, etc) -- in an effort to attract manufacturing plants. That became an effective strategy. Eventually, plants were built away from Tokyo and Osaka, partially because the central government also accepted the concept of decentralization. But this Japan-wide development was largely the doing of the prefectural assemblies. Before the end of the year, one would invariably see a lot of infrastructure work because they needed resources to buy the traditional year-end gifts. It always took a lot more time to fill in the holes after New Year's than it did to dig them before the end of the year. But people got paid mostly before the end of the year. The arguments in the assemblies were primarily which geographic areas would get that year's projects. These were small projects because the large ones, such as port improvements for example, had to be led and funded by the central government. The taxation system in Japan is known as "kofusei" in which the central government basically taxes prefectures according to their abilities to pay and then distributes the funds according to needs. The poorer prefectures therefore get more tax money back than they paid in; all prefectures have their own taxing authority. For example, sales taxes go to the prefecture, but the percentage to be levied is decided by the central government. Some of the funds that were returned from Tokyo were designated for specific expenditures; some could be allocated by the prefectural government.

Sapporo was supported in part by the Hokkaido Development Agency, as a reflection, I think, of its lag in development behind the rest of the country. It got therefore special assistance and consideration. It was the poor part of Japan.

In Kobe-Osaka, we used to meet with the socialists and the communists, but they were not that anxious to interact with us. They kept pretty much to themselves. We were encouraged by our people in Tokyo to meet all sections of society, regardless of party. In Kobe, I relearned an important lesson. There was never a restriction in Japan in meeting opposition parties as I ran

into later in Korea, for example. We were encouraged to meet a large variety of Japanese; our problem was much more with the lack of interest of certain Japanese groups to meet with Americans. Sapporo was somewhat different; I got to know people much more on a personal basis because it was a much smaller community. I got to know the spokesman for the Communist Party because he was a student of Abraham Lincoln. So we used to spend the middle part of our conversation talking about Lincoln; the first part of the talk was devoted to the petition or complaint that brought him to the office in the first place. We would discuss that, then we would talk about Lincoln. When he decided that he had spent enough time in my office, he would say something outrageous. I would say that he couldn't make comments like that in my office and there upon he would get up to leave. It was a well choreographed discussion. I rather liked him and we along well. We were almost at a point on a couple of occasions in working out a couple of joint programs - debates -- but we could never quite put it together although we did get close. The tough crowd was the young socialists; they were militants. They would come to the office and march upstairs and then we would go through a routine that left them well frustrated. This was the period when Vietnam was a hot button in Japan; we would have demonstrations against our policies. Those demonstrated would usually march on the Governor's office; the route passed right in front of the Consulate. So, even if we were not the main target, we would get some side effects. The police came to me on a couple of occasions to request that our gates be closed. I told them that since it was during working hours, that such action would be inappropriate. I would only do so if they would declare that leaving the gates open would endanger the Consulate; they were never willing to go that far. So we left the gates open; sometimes I would even stand by the gate and watch the demonstrators go by. They would chant slogans, then stop and wave and then move on chanting their slogans again. In Kobe especially, the presence of the "Akusa" -- "Yamagucigumi" -- was noticeable. This one of the larger Japanese gangster gangs. That was not true in Sapporo; there you knew they ran some prostitution rings, but the gangs were not that visible.

When tension really began to build up in Osaka -- that was in my second year at the post -- we had a number of demonstrations in the building, part of which we occupied. Our offices were on the ninth floor. The building had two elevators. It was a public building and that prevented the police from stopping people -- according to their interpretation of the law. On the ninth floor, we had a small lobby where one existed from the elevators. Then there was a large desk for the receptionist which blocked the entrance to our offices. Demonstrators would take the elevators, get off and then block further ingress to our offices by just sitting down in the lobby. When I first arrived at the post, the Consul General had decreed that no Americans could be visible to the demonstrators; just members of the Japanese staff. I suggested that we couldn't send the Japanese employees to face any risks that we were not willing to take ourselves. So I went to the lobby, which was very instructive. The demonstrators would chant that they wanted to see the Consul General. They overlooked me; that is not whom they wanted to see. So I sat on the desk and listened. At some point, they would start singing "The Internationale". I found that if I could make eye contact with the demonstrators, they would stop singing. So that is what I tried to do and eventually, they stopped singing. They stood up for the singing; when they stopped, they would all sit down again. Finally, the police would come up and ask them to leave. When the police arrived, the demonstrators would all link arms. Then the lieutenant would point to one of the demonstrators and the police would cart him or her off. It was always rather jovial at the beginning of the demonstration. But after a half hour or so, the police would begin to become fed

up and got a little rough. This process of carting off a demonstrator one at the time went well until the police got to the ring leaders. They would invariably stand up, tell the police not to touch them and then majestically stalk off to the elevator and leave. So it was only the followers who got beaten up. It was a process that was repeated over and over again.

These experiences led me to the conclusion that the socialist-communist support both in Kobe-Osaka and Sapporo was essentially formalistic; beyond the leaders, there was probably not much intellectual commitment. As I mentioned earlier, no one ever instructed me not to interact with socialists or communists. Soon after I arrived in Japan, Douglas MacArthur 2nd was replaced by Edwin Reischauer. The two had entirely different perspectives about Japan and its politics. John Emmerson, who was the DCM, was a target for Japanese conservatives because while he served in SCAP, he was responsible for insuring that political prisoners were released from jail. So he was at the jail's door when the communists and socialists were released and therefore was called the "Red Dean" by the conservatives. Emmerson was also a McCarthy target because he had been one of the "China hands"; he had transferred from there to be part of MacArthur's staff in Japan. Then he came back to Japan as DCM thirteen years later.

The debate in the Embassy in the early 1960s was more about when the Socialists might take power or more likely, when might they win enough seats -- one-third -- in the Diet so that they would be able to block legislation. The Embassy was concerned with socialist-communist influence in the labor movements. The largest supporter of the Socialist Party was Sojio -- the labor union that mainly represented government employees. But this did not prevent us from talking to the socialists. I have never been in the communist headquarters in Tokyo, but I have certainly visited all the others. The unions were not anti-American per se; they did object strongly to our Vietnam policy. Up to a point, they were anti-capitalist; that is as long as it didn't interfere with their own capitalist enterprise. Some communists were theologically committed to their cause, but I think most were like a young student I met who attended Ottaro Commercial College in Sapporo. He was studying economics in a department that had a good reputation. The faculty was essentially Marxist. On one occasion, I pointed out to the student that he was going to college, learning Marxists economics and living in a society which was booming under a capitalist philosophy. I asked why he was studying Marxist economics. He told me that it was easier. Keynesian economics were very difficult. He was going to work for a private concern and make his fortune, but in the meantime, he would learn the "easier" economics.

The US military bases were not subjected to many demonstrations in the 1960s. Certainly the one in Wakkanai was protected because it was the mainstay of the community. The same was true for Misawa because it was also was a large employer. This was true even while we were being subjected to anti-Vietnam demonstrations; the military was left relatively unscathed. There were some efforts by the socialists and communists to generate anti-American feelings. I remember once being at an American Coast Guard station in Hokkaido; it had a big antenna and a Loren system which was used to assist to assist ships at sea to know their positions. It was a useful installation for ships of all nations. The communists started to voice complaint about the antenna tower on the grounds that its electronic emanation would sterilize all the women in the area and would lift all the umbrellas within its reach and gobble them up. As far as I know, no umbrella ever got stuck in the tower.

Q: Let me ask you how the majority party, the Liberal Democratic Party, operated in the 1960s?

CLARK: Pretty much as it does today. The basic unit of the Party was a faction. Each faction centered on one man and because of that tended to have geographic allegiances. (Inaudible), for example, was strong in Kansai and Kyushu. He used to collect on every lemon that was grown. The factions were built around strong men. At the time, the party machine was very predictable. I did not generally talk to the senior Party members; I talked mostly to the junior members. Most people knew who the next Prime Minister would be and who would succeed him. It was a ritual with strict rules and therefore completely predictable. That system broke down starting with Tanaka, which was in the late 1970s. The Sapporo-Hokkaido faction was not influential; it had adherents, but few financial resources. It was important that the island remain in the LDP fold. So the Party sent a heavy hitter to the island soon after the war, when the island had elected a socialist governor and assembly. So the LDP sent the man who had been the Chief of Police in Tokyo when the Emperor surrendered. Before the war, when governors were appointed, he had been a governor. His family came from Hokkaido, so he was sent by the LDP to contest the next election. He ran and won the governorship, which he held for twelve years. He gave up a promising career in Tokyo where he would probably have become a Cabinet member, but became a major political force in Hokkaido.

Money in the 1960s was not as important as it became in later decades. Elections did not cost as much, so that the need was not fully there. We knew pretty well who was getting paid in Sapporo, but it was no a major concern. It didn't take a genius to figure how the money was collected -- mostly from businesses -- and to whom it was then paid. We are now talking about sixteen years after the war; families had not become rich. The Dodge plan had redistributed the wealth; it took the money class a few years to recover and return to its pre-war prominence. So it was not the issue that it later became. In fact, money had always flowed in the Japanese political system, but in the 1960s, as I said, campaigns were not as costly, life styles were simpler and therefore politicians were did not spend as freely as they did later. Eventually, the political-financial system got out of hand, but that was much later. Like so many matters in Japan, a business and later a family, had a status to maintain; people felt intuitively what was "right" in terms of amounts of donations to political leaders. Businesses were not only donating to the LDP. I spoke to a lot of businessmen who told me that they supported the LDP, but that they also gave some donations to the Socialists, to "cover their bets". As I said before, Hokkaido did not have many financial resources. Okinawa had not yet been returned to Japan; so that the island at the northern and southern tip of the chain did not share the benefits that the larger islands enjoyed.

Sometime later on, the British made a big fuss over the tariff that was being applied to their scotch. Their whisky sold well, but they wanted to sell more by reducing the price. A bottle of Johnny Walker's Black cost about fifty dollars at the time. The British finally convinced the Japanese government to lower the tariff; the prices were reduced significantly. The sales plummeted. Johnny Walker's Black was a known item; everyone knew what it cost. Once the price was reduced, people thought that they were being given cheap merchandise.

Q: Let me ask you about your relationship with the Embassy. Who was your supervisor?

CLARK: It was the DCM, as I recall. The Embassy had a supervising Consul General, but his jurisdiction had been the subject of many vigorous debates. When I was in Sapporo, the DCM supervised the constituent posts. In fact, there was not much supervision at all. The Embassy requested very little of us; most of our work was self-generated. It was also true that we were probably not kept current by the Embassy. But you must remember that this was before modern communication facilities. So our expectations were not as high; we didn't expect to be "fully" informed. That is not true today, of course. Officers today feel that unless they see all of the daily cable traffic, they are somehow deprived. We got the information that we needed. I got to Tokyo finally, after having been in Sapporo for a year, for a principal officers' meeting. The DCM said that he hadn't seen for a year. I told him that we had no need for anything and the Embassy had not asked for anything; so that I had not seen any need to visit. He was surprised that I had not come to Tokyo before, but I was spending all of my travel allotment touring my district. I thought it was a very good situation; I was happy with the Embassy's lack of supervision.

Q: Let me ask you about Japanese attitudes in the 1960s. Did you get many comments about rearmament?

CLARK: Not really. I got more comments about the whether the Japanese should even have a Self-Defense Force. The Self-Defense officers used to go to work in Tokyo in civilian suits; their uniforms were kept in a locker at their offices. If they were seen in uniform, people would point to them and call them "tax worms". People did not hold the Americans responsible for this Self-Defense force. Sometimes, there would be a discussion on why we had written in Article 9 of the Constitution -- barring Japan from a military establishment that could be involved in off-shore actions -- and then support the establishment of a Self-Defense Force. But there was not much of that even. The communists were of course adamantly opposed to any military. I used to tease them by asking to name one communist country that did not have an armed force. To them, that was a different issue and not related to Japanese affairs.

The American military presence was not much of an issue either. For example, there is a little town in the middle of Hokkaido, called Nayoro, which was the home base for a Self-Defense Force unit. In the mid-1960s, our Special Forces were stationed in Okinawa. An arrangement had been made between the military which permitted our Special Forces to come to Nayoro for joint winter exercises in the snow. The Mayor of Nayoro was a socialist. He came to my office and slammed a protest on my desk. I asked him what did he want me to do about it. He said that he didn't expect any action; he had delivered his protest and returned to Nayoro, undoubtedly telling his supporters of his vigorous efforts. So the Socialists had a position, but their defense of it was hardly vigorous or credible. Of course, Hokkaido was in a somewhat different situation from the rest of Japan. It was the closest island to the USSR; some of its fishermen were picked up by the Soviets for fishing in the wrong area or to pass information. My driver had been a prisoner of war in the USSR for five years; he was not very happy with his former captors. There were people in Hokkaido who had been forcibly removed from the Kurils by the Soviets. So many islanders were anxious and bitter about the Soviets; there was a different mood on Hokkaido then there was in the rest of Japan. It was certainly different from that which the Japanese in Kobe-Osaka exhibited.

There was one interesting development during the fifteen year span between my service in

Sapporo and later in Tokyo. When I was in Hokkaido, it was the stronghold of the Japanese drive for the return of the northern islands from the USSR. Later, when I served in Tokyo, the center of that sentiment shifted to Honshu -- the main island and south of Hokkaido. The attachment to the northern islands did not stem from family ties, as some does in the Koreas. All the Japanese had been evacuated from the northern islands. There were family graves there which was one reason for the drive. The other was that the islands had been traditionally part of Japan. Furthermore, those island provided good fishing grounds. I must say that, even while I was in Sapporo, I had the feeling that if the northern islands had been returned to the Japanese, very few, if any Japanese, would have returned there. These islands were not paradise. If they were to be returned today, they would be developed as fishing grounds, but there won't be many settlers. The issue is mostly one of national pride.

MARGARET J. BARNHART
Consular Officer
Tokyo (1965-1968)

Margaret J. Barnhart was born in 1928 in Greensburg, Pennsylvania. She graduated from Goucher College in 1950 with a major in international relations. She joined UESCO and was employed there between 1951 and 1955. Following that she worked for the State Department in the Speakers Bureau. In 1961 she enlisted in the Foreign Service and held positions in Paris, Tokyo, Jerusalem, Bangkok, and Rio de Janeiro as well as several positions in the Department of State. She was interviewed by Charles Stuart Kennedy in 1998.

BARNHART: Before they left, the assignment changed to Kobe-Osaka, Japan. Following home leave, so I was assigned to Japanese area study. I was on home leave when we got word that I was assigned to Tokyo instead. I went to Tokyo. I got there in March of '65 and stayed till March/April of '68. It was a three-year assignment then.

Q: *What were you doing there?*

BARNHART: I started out in the Visa Office for a year. I spent a few months in the Passports- in the Passports/Citizenship. It was pretty routine work. Because there were a lot of military in Japan, stacks of passports would come in since they wanted to travel outside of Japan. Anyway, there was just an awful lot of routine work on that section. So I then got down to the Welfare Whereabouts section and worked as a deputy there. There were just two officers, and then when the head left - Lou Gallo, I think - I replaced him as head of Welfare and Whereabouts, and I loved that. Lots of interesting things there, plane crashes. On a Friday night we had word that a CPAL had crashed at the local airport, and that there were six, seven, or eight Americans aboard. The head of the office was visiting, so I had this disaster. Japan being a place where you do not bury, there is no such thing as embalming. Cremation is the only thing. At Tachikawa we had an Air Force base with a mortuary, and so they agreed to take the six or seven Americans and take care of embalming, and preparation for shipping the remains to the U.S. The very next morning I was called. There was another plane crash. The first was a CPAL, this one was a BOAC that

flew into Mount Fuji. 89 Americans aboard, all from Minnesota's Dairy Queens. Despite rules to the contrary, I suggested we call Washington, since most were constituents of the Vice President, Hubert Humphrey. In those days you sent Western Union messages on death cases. But that was a very bad crash.

Q: *Oh, yes.*

BARNHART: Two of them, one within 12 hours really. And the instructions from Paris didn't apply really. That's where we had group of transvestites, an entertaining group. There's when we found the clothing and identification of Mary Jones, and we found the passport was John Jones. There were all kinds of interesting things in Tokyo, too.

Q: *Did you have to deal with the police at all there?*

BARNHART: Yes, we dealt with the police, and it worked very well. I inherited a police group from my predecessor who left, and so I held weekly English conversation classes at my residence. I had policemen come in, and they would say, "Oh, you bad people. Look what you did to Hiroshima and this family," and I said, "Oh, you bad people. Look what you did to Pearl Harbor." "Oh, we didn't do that. Those are bad people we had." What can you say? "This was done by our bad people, but you, the United States, are to blame."

There was a lot of military there. And most of our prisoners would be in military jails. I used to visit them frequently. I used to lace fruitcake at Christmas time with rum, because I could get that past the prison officials. I had all kinds of interesting prisoners there, and a lot of deaths and just a little bit of everything.

Q: *Were there any particularly bad cases of people arrested?*

BARNHART: There was one man who was on the - Ringwald, I think - he was on the FBI 10 Most Wanted List as a forger, and he was caught forging checks in Japan. Eventually he went to jail. He insisted he didn't want an attorney. He wanted to conduct his own defense. Fascinating. "I didn't hurt anyone," he said. He called in the bank teller, the owner of the bank, all kinds of people. I think the checkbook was also a forgery. He wasn't hurting anyone, and he said the insurance company paid the bank, so no one lost any money. It's not a crime. They didn't buy that. So I used to visit him, and I said, "You know, when you get out of here, you go back to the States with this charge." He said, "Don't you worry about me." He had five passports. But he said, "Not to worry. I can get out." I'm sure he had six or seven more passports.

There was one, however, a murderer who moved back and forth between military and civilian jails. My predecessor taught the Japanese jail how to make hamburgers for our American men, and they did, but by the time I took over, they said, "We can't do this any longer. It's too expensive." They were using ground beef, period. And I said, "Well, you know, bread crumbs, put some things in it." "Oh." Fun things to do.

The one death that I remember - the first one I went to was in a hotel in Tokyo. It was late at night when they called. When I arrived at the hotel, the Japanese police were there. I said, "Well,

I have to take this and this and this." "All right, fine." The Japanese never gave me any trouble for being a female, really. But then they started to do an autopsy on the spot, and I said, "I'll wait outside." He was a visiting businessman.

In Tokyo I took judo lessons, I took Chinese cooking lessons, I gave English language classes. There was so much going on all the time. It was a very active post.

Q: *Who was the Consul General then?*

BARNHART: Tom Murfin.

Q: *How did he run things?*

BARNHART: Just fine. He left you on your own pretty much. He was very, very friendly and very low key. Barbara Watson, Assistant Secretary for Consular Affairs, came through on one of her first visits. I had decided I wanted to stay in Tokyo for another two years. She said she'd support a request for an extension of at least another year. The Department came back and said, "Absolutely not. We already have her assigned, and the NEA Bureau will not release her."

EDWARD M. FEATHERSTONE
Staff Aide to Ambassador
Tokyo (1965)

Director, American Cultural Center, USIS
Niigata (1966-1968)

USCAR Officer
Okinawa (1968-1970)

Mr. Featherstone was born in New York City and raised there and in Japan. After graduating from the University of Pennsylvania and serving in the US Army, in 1961 he entered the Foreign Service. As a Japanese language and area specialist Mr. Featherstone served primarily in Japanese posts, including Kobe-Osaka, Yokohama, Niigata, Okinawa (Consul General) and Tokyo. He also served in Barbados and in Washington. Mr. Featherstone was interviewed by Thomas Dunnigan in 1999.

Q: *Well, at the end of your language training, you were moved to Niigata, I understand, on the other side of Japan.*

FEATHERSTONE: I did go to Niigata, but first I spent a year (1965-1966) at the embassy in Tokyo. It was sort of a fluke that I was assigned to the USIS post at Niigata. The only reason I got the job is, I sat next to a chief of USIS, at the ambassador's staff meeting. I was the ambassador's staff aide. The USIS chief told me he had this fellow coming in who was some

kind of a hippie. He was dope smoking, and a no-goodnik, in his opinion. I don't really know what he was like.

Q: In 1960s, could have been.

FEATHERSTONE: That's right. He didn't want this guy. Apparently, he investigated it. The only way he could avoid taking him was to get somebody onboard who was already in the country. He turned to me at the meeting and said, "Featherstone, do you want to go to Niigata?" I said, "Well, why not?" He arranged it, and I went to Niigata. He didn't have to take Mr. pot smoker. My wife and I went up there. Probably, out of all the tours we had, it was the most enjoyable.

Q: You were Director of the American Cultural Center?

FEATHERSTONE: Yes.

Q: That was quite a possibility for a young officer.

FEATHERSTONE: Well, we had about eight or nine cultural centers at the time. We had one in Sendai, one in Niigata, one in Hiroshima. Later on, of course, when the budget thing got bad, we closed all these. I don't think we have anything now to speak of, except the consulate, I suppose. In those days, we had cultural centers. Indeed, I had a budget. I had about five employees. I had a little van, and we used to drive around to give talks. I would arrange shows on American art work and so forth. Actually, it was one of the best tours I ever had.

Q: Were any other countries represented in Niigata?

FEATHERSTONE: Niigata, no. There were no others. We had visitors occasionally from the embassy. Occasionally, we would get other foreign people, diplomats from other countries. There were none stationed there.

Q: Did you do the usual thing? Did you have a library?

FEATHERSTONE: We had a library. We had books. As a matter of fact, I remember one case with Russians. There were a lot of Russians there because Niigata is a port city and a lot of ships came from to the Soviet Union. They used to come into Niigata to go shopping. You couldn't buy anything in the Soviet Union. They came in all the time. They came into my cultural center one time and wanted to know if they could borrow some books. I gave them Milovan Djilas and all sorts of things. I figured this was probably a really good opportunity to get with these people. I gave these books away. Later on, I got some flack for it. Eventually, my boss took care of them.

Q: Did you do such things as teach English there?

FEATHERSTONE: No. My wife taught some English, but we really didn't do any English teaching. It was set up for English teachers. We could get people in touch with English teachers and what not, but we didn't do any of it ourselves.

Q: How about reporting. Did you do any reporting, because you were in a unique spot out there?

FEATHERSTONE: Not much. I used to write occasionally, if we had big things, like an earthquake, or some kind of fire or a big scandal of some sort. I would write a monthly letter to the consulate general or to my superior. I used to jot things down and write to him, but it would be a stretch to call it reporting, I think.

Q: You must have had a chance to perfect your language skill out there too?

FEATHERSTONE: I did. There was virtually no one who spoke English. Well, there were a few academic types who spoke English, but almost all the people I dealt with were Japanese. It was a good opportunity to learn the language.

Q: What was the local reaction to our involvement in Vietnam?

FEATHERSTONE: It was overwhelmingly negative. The Japanese, for the most part, thought it was foolish. They thought we were getting into something that we would regret, which turned out to be the case, indeed. They had also been involved in southeast Asia for many years in many different ways. They were of the view that we would come to grief and they failed to understand what our interest in being there. When I say it was negative, we had some demonstrations and some protests. But, it was not ugly.

Q: Nothing violent.

FEATHERSTONE: No, nothing violent. We had people send us letters and occasionally there would be people who would demonstrate holding placards around the cultural center. But, we had no real trouble.

Q: Was Communist influence noticeable in Niigata?

FEATHERSTONE: There certainly was Communist influence. I won't say it was a hot bed of Communism, or anything like that, but we had unions who were very leftist. Their propensity was to side with the people against us, whoever that happened to be, whether it was the Russians or whomever. We had no trouble with it, but you had to be aware of it at all times.

Q: Any Red Chinese or North Korea presence or influence out in that region?

FEATHERSTONE: I guess there was but we didn't come in contact with them at all. Occasionally, there would be a Chinese visit, but they usually were going to Tokyo or someplace like that. It didn't affect us much, where we were.

Q: Did the ambassador visit? I think it was Alex Johnson then, wasn't it?

FEATHERSTONE: Alex Johnson came down several times while I was the director of the cultural center. Of course, Alex Johnson is an old Japan hand. He knew people and spent time

there. In fact, he had been there, I believe, before the war.

Q: He has. In his biography, he talks about that. Any U.S. military bases in the area there?

FEATHERSTONE: Not in the Niigata area, but there are many in the Tokyo area. The largest naval base in the world is at Yokosuka, Japan. It is the largest U.S. naval base. That is still the case, as a matter of fact. It has the largest dry dock in the world. The Japanese built it for the Imperial Navy. Somebody knew what they were doing back then. We didn't bomb any of that stuff. We have used them in about five wars since then. I was always amazed. We always think that Americans aren't very forward looking, in the sense that we aren't anticipating what is going to come up. But, somebody had done that all right.

Q: Was there much criticism in Niigata about the Japanese security relationship with the U.S.? It was getting stronger at that time.

FEATHERSTONE: Right. Leftist agitators, of course, were very strongly opposed to that. At demonstrations, they would come to protest the cultural center. They would drop their letters or whatever they had to tell us. They were always reasonably polite. There was no unpleasantness about it. There was a heavy communist element in all this, and still is. Some of the labor unions in Japan are very leftist. Communist may be going a bit far, but they are certainly quite leftist.

Q: How about our racial policies? Were you attacked in that regard?

FEATHERSTONE: No, I never was. I don't think that ever came up. A lot of Asian Americans served, from Hawaii and what not. The Japanese are racists themselves. They look down on anyone who is darker than they. They treated people like Eurasians and others when they occupied them, very badly. The Japanese are not real keen on opposing racism. I don't think in their heart they do oppose it.

Q: Well, at the end of this tour, which seems to have been a very pleasant one, you went to Okinawa. Did you ask for that or did that just happen?

FEATHERSTONE: They offered it to me. I think maybe it was Owen, I can't really remember, but they had this job opening. In Okinawa, the big issue then was we were holding it, and Japan wanted it back. We were holding it for good reason. We had strategic interests there. It was weighing very heavily on us, though. This was in the height of the Cold War. We had a situation whereby the Japanese wanted Okinawa returned to Japan and the U.S. wanted to retain all of its bases in Okinawa.

Q: Well, they got reversion.

FEATHERSTONE: The thing about the reversion of Okinawa was the Japanese wanted Okinawa back, in essence. We wanted to keep it. In fact, we wanted to keep it for a number of good reasons. This was a major issue during the entire time I was there, as to what we would do. The United States' key military people wanted to keep Okinawa and wanted to keep it as long as possible. Of course, The State Department had determined that it would be injurious to our

interest if we got into a situation where the Japanese got angry at us or very dissatisfied with this whole thing or the Okinawan people themselves wanted Okinawa returned to Japan. They would have rather been under Japan than under us. It was a very peculiar situation. The Okinawans hate the Japanese. Here they were, in a situation where they wanted to go back to Japan, but I believe their reasons for wanting to go back were more economic than anything else. The Japanese could provide much more aid, and, of course, they spoke the same language. They were easier to deal with and so forth. I think these were the reasons that motivated them, more than anything else. There was no question, the Japanese wanted to have Okinawa revert to their control.

Q: What would you say Okinawa's status in international law was at the time?

FEATHERSTONE: There was no question that it was under the authority of the United States of America. We controlled it. I don't think the Japanese questioned that. They questioned whether we should keep it as long as we were, but I don't think there was any doubt that they knew we controlled it, legally and any other way. Of course, we used it. We had all kinds of stuff, including nukes in Okinawa at the time. We had a huge armament situation there. We had airfields. I believe Kadena was the largest airfield in the world where B-52 bombers took off during the Vietnam War. All this would have vastly complicated our military situation if we had to revert Okinawa.

Q: What was your job title in those days in Okinawa? You weren't vice consul anymore.

FEATHERSTONE: I wasn't vice consul anymore. I was an officer with USCAR [U.S. Civil Administration of the Ryukyus].

Q: Were you a political advisor?

FEATHERSTONE: No, I wasn't a political advisor. I was with the U.S. Civil Administration in the Ryukyu Islands, what they called USCAR. I was simply a USCAR officer, I guess you could say. We had the civil administrator, who at that time was Stanley Carpenter.

Q: Oh, Stan. I know Stan.

FEATHERSTONE: He was the civil administrator. I worked for Stan, actually. It was exciting, I must say. For all the problems we had, and the tensions with the Japanese, it was an exciting place to be. We were doing things, and we wrote reports that really made an impact.

Q: Were your reports sent to Tokyo or to the department, or to both?

FEATHERSTONE: Well, they were mostly in the form of cables. They did go to Tokyo, of course. We sent them to other places as well. Sometimes, for various reasons, it was cut-off. On the whole, I thought it was a very exciting time. We were trying to work toward convincing the armed forces of the United States that reverting Japan back to Okinawa would be a good thing. In the last part of this, I worked directly for the commanding general of Okinawa. At that time, it was a man named James B. Lampert. He was a three-star U.S. general. I think his last job before coming to Okinawa was as the commandant at West Point. He was, in fact, a West Pointer

himself. But, General Lampert was quite a perceptive fellow and good to deal with. It was a little dicey for me, because of course I had to take care of his interests, while at the same time, take care of the Department of State's interest, pushing for reversion. I found him to be very understanding. I had a great deal of respect for him. He is now dead, God rest his soul.

Q: *As is Stan Carpenter.*

FEATHERSTONE: As is Stan Carpenter.

Q: *Well, while you were there, they had their first election, I believe, the first one after the war. They elected a socialist, as chief executive. Were we surprised, first of all?*

FEATHERSTONE: No, not terribly. We anticipated that he was probably going to be elected. It didn't matter all that much. The United States forces continued control over Okinawa. Whoever the chief executive was, he couldn't do much more than cause some trouble with us, by hosting demonstrations, or fomenting them and so forth.

Q: *Of which, there were a number, I guess.*

FEATHERSTONE: Of which there were a number. But, they were never violent. Beyond putting up with them, there was no real trouble. The man's name was Yara. He was an educator, basically. He became the chief executive. He was a decent fellow. I met with him a lot of times. I met with General Lampert regularly. I would be the translator. I should say that they had a man named George Sankey there, who was a Japanese American. He did the translating and I did the writing up of the report. I did the cable that went out. It was an exciting time, and I certainly enjoyed it.

Q: *Did you get involved in the labor grievances at the bases there? I gather there were a number of those.*

FEATHERSTONE: There were a number of those. Peripherally, I did, yes. We had a labor section. They had about four or five people in it. They did most of the labor work. Of course, it impinged on our area too, because what labor did affected the political situation, with regards our bases. I maintained a fairly close liaison and I had a lot to do with the labor people. Occasionally, I had disagreements with them. I wanted to further with regards to giving the Japanese more leeway. They wanted to be more restrictive, so we sometimes had conflicts there. Well, not conflicts, but disagreements. I will say that most of the time the Civil Administration won.

Q: *There was a problem with nerve gas munitions too, I gather.*

FEATHERSTONE: Yes, I wasn't too much involved with that, Tom. But, we had nerve gas as well as nukes on Okinawa. This, of course, was unknown to the Japanese, at least officially, although some had suspicions, I suppose. The actual taking out of the nerve gas from Okinawa happened after I left. So, I wasn't involved in that other than I sort of anticipated the issue as it was to come up. I myself was not involved.

ROBERT E. FRITTS
Economic Officer
Tokyo (1965-1968)

Japan Desk Officer
Washington, DC (1968-1971)

Ambassador Robert E. Fritts was born in Illinois in 1934. He received his B.A. from the University of Michigan in 1956 and served in the U.S. Navy overseas from 1956 to 1959 as a lieutenant. His postings abroad have included Luxembourg, Sudan, Rwanda, Indonesia, and Ghana. Ambassador Fritts was interviewed in 1999 by Charles Stuart Kennedy.

Q: To take Japanese language training means to almost take the vows to become a Japanese specialist, doesn't it?

FRITTS: In theory, yes, but I received a truncated version. Because my assignment was spur-of-the-moment and I was an economic officer, the Department offered only four months at FSI rather than the standard package of six months at FSI followed by a year at the FSI language school in Yokohama. After FSI, I went directly to the embassy in Tokyo.

But going back to your question of "vows." It became quickly apparent that there was a social and professional schism in the embassy between those who spoke Japanese, that is to say Political Officers, and those who didn't. The gulf was elitist and exclusionary. Sort of "Only we (Japanese speakers)" are qualified to speak with the gods and thus handle policy. I recall once when Ambassador Reischauer at a staff meeting directed the Political Counselor, Owen Zurhellen, to have the Political Section do an urgent canvass of its contacts to report on what the Japanese thought of some minor crisis. An hour later, I went to Owen's office on an errand and found him putting the final touches on the cable. I was quite impressed. "How did all of your officers canvass your contacts so fast," I asked. "What canvass," he replied, "I always know what all the Japanese think!"

Serving in Japan confirmed previous thoughts that the Department's practice of de facto limiting language training to political officers was an effort, perhaps even unconscious, to maintain the cult of presumed political officer superiority. Thankfully, language training was progressively opened up to a broad spectrum of functional skills and abilities. I understood at the time that the embassy Tokyo attitude was not unique. Chinese, Russian and Arabic speakers were similarly restrictive.

Fortunately for me, even though an economic officer, I knew just enough Japanese to be considered acceptable by what became to this day some of my very best friends in the Foreign Service. I added to it by wangling a mid-tour two month stint at the Yokohama school.

Q: How did you find learning Japanese?

FRITTS: The language is not difficult to speak in a rudimentary way. The easy aspects are that Japanese uses the same sounds as American English and is not tonal. The problems come from a lack of cognate vocabulary hints, the agglutinative process of multiple syllables before and after roots, and the hierarchical changes based on to whom you're speaking. Plus, of course, the difficulty of a goony writing system. One can only go so far in a language if illiterate.

So you went to Japan, I guess about '65?

FRITTS: Yes, 1965 to 1968.

Q: What did you do there?

FRITTS: Half the tour was as an assistant attaché on international finance and the second half in the Economic Section following Japan's economic presence in Southeast Asia. As an assistant financial attaché, I was on loan to the Treasury Department. There was also a Treasury assistant financial attaché - so it was a three-man office, of which I was the State component. I worked with the finance ministry and Japanese banks on some issues and was also involved with the financial aspects of negotiating the reversion of Okinawa to Japan.

Q: Let's talk about the first portion first, working for the Financial Attaché, who was a Treasury official focused on international financial stuff. What were the concerns of the financial attaché and how did you fit in?

FRITTS: The financial attaché was primarily concerned with liberalization of Japanese trade and capital flows and the maintenance of Japanese Government purchases of U.S. Treasury securities for its foreign reserves. To pursue those goals, he and the assistant financial attaché analyzed the Japanese economy and spent most of their time with the Ministry of Finance, which called the shots on virtually all aspects of the Japanese economy. We also were the main embassy contacts with Japanese and American banks and financial institutions. The two Treasury officers were professional financial economists and their analyses were more sophisticated, in both macro and micro terms, than the State side produced. The financial attaché believed the Japanese Government was myopic about its impact on the world economy and short-sighted on domestic economic and financial policies. The embassy view was similar, but broader. It stressed that U.S.-Japanese economic issues should not drive or overshadow our bilateral security interests, impinge on the U.S.-Japan mutual security treaty or affect our policy coordination in Asia, the UN and elsewhere. That U.S. dichotomy has remained consistent to this day, encompassing U.S.-Japan frictions, U.S. interagency fights and, even, intra-State office tensions.

Q: Did you find yourself in sort of a different culture working for the Treasury Department?

FRITTS: Of course. Every bureaucratic group has self-perceived elites. In general, Treasury officers considered themselves elite within the USG and, within Treasury, the international guys considered themselves the elite foreign service of the Treasury Department. As a result, I was not fully trusted by the financial attaché and there were a number of meetings between him and the other assistant I did not attend. And whenever Treasury officials came from Washington, I rarely

attended those meetings or would be asked to leave at some point. Treasury had a strong "We-They" attitude.

Q: Well, with that Treasury attitude, did they have their own contacts and operate separately from the embassy?

FRITTS: Very much so. The financial attache was very protective of his contacts, even by usual standards of interagency turfdom. He considered the Finance Ministry to be a Treasury fiefdom. Even the embassy economics minister was chary about calling upon or entertaining senior MOF officials. When it couldn't be avoided, such as a clear instruction from State for someone higher ranked than the financial attaché to do so, the Financial attaché would set up the appointment, but I was pretty sure he briefed MOF officials on the substance and that they could more-or-less just listen politely unless and until the message was confirmed by him from Treasury. MOF officials liked that as it was a mirror image of themselves.

Q: Did you find that you were having a problem serving two masters? I mean, was the economic minister saying, "What's going on there?"

FRITTS: Well, Pelikan and his successor, Victor Mack, could be pretty smooth when they wished. Although they liked being secretive, they stroked their embassy peers, DCM and the ambassador on occasion. No heat came my way, possibly because I attended the economic section staff meetings and did some reporting directly for that section.

Q: There was a period when the Japanese shifted from a poor country to a growing economic competitor. Had this started by your time there?

FRITTS: Yes. It's hard to recall now, but Japan had only a few years before stopped being a formal foreign aid recipient of the United States. Indeed, Secretary Dulles once told Prime Minister Yoshida that Japan should not consider exporting to the U.S. as "...Japan cannot make anything that the U.S. would want to buy." So much for his insight!

Our bilateral economic concerns then, in the mid '60s, were growing U.S. imbalances with Japan abetted by its variety of formal and informal trade and capital flow restrictions. The USG and American firms did not have the sophisticated understanding of Japan then which is common knowledge today. Thus, the embassy and Treasury office were constantly seeking to break down barriers, separate economic mythology from reality, negotiate special access arrangements and, where feasible and without a blink of paradox, force Japanese "voluntary restrictions" on selected exports to the U.S.

Capital flows were a similar story. We favored "free flows of capital" on universalist economic grounds, but specifically so that American banks and firms could invest directly in Japan and Japanese firms and tourists could invest and spend dollars in the U.S. Again, paradoxically, as the Japanese loosened up and began to invest massively in the U.S., we changed our tune and sought to discourage their investments in certain sectors and areas. The usual "Where you stand depends upon where you sit" approach to national interests.

Japanese economic analyses of their own economy, while public, were opaque and data suspect. Our financial attaché office thus maintained its own inferred and interpretive data charts and made independent analyses. As this was before computers, it was labor intensive although quite sophisticated. I wasn't really competent in that process, but I learned a lot. It helped immensely that I shared an office with an assistant financial attaché, Jon Gaaserud, who had been an assistant professor in economics. Over eighteen months, we often just sat and talked economics. He was a wonderful person and is a lifelong friend.

Balance of payments [b/p] issues were prime concerns and the Treasury office focused on it - b/p trends, the implications, recommendations for Treasury policy responses, etc. While there was some coordination with the embassy, to my eye, the really important stuff was done by letter between the financial attaché and his Treasury superiors. Those letters, to my knowledge, were never shared with anyone in the embassy and, certainly, not with me.

Q: What was your impression of the Japanese bureaucratic system, particularly as it pertained to finance?

FRITTS: In those days, as until most recently, the Ministry of Finance (MOF) called all the shots on the economic-financial side. It ran the economy and thus, to a large degree, the political environment. Usually, MITI, the Ministry of Trade, the Foreign Office and other ministries and the commercial banks, in the end, had to defer to MOF. The MOF folk believed they were the elite of the elite and held the keys to the Japanese kingdom. And they usually did.

All of us studied the Japanese bureaucratic culture and how to work in and around it. We developed and followed a number of guidelines on what to do and not to do, whom to approach and not to approach - all that kind of tradecraft. Actually, we knew a great deal more than most corporate Americans. But what we, as experts, knew then is now common knowledge and can be bought at the bookstand of any international airport.

The embassy had many officers expert in their field and some had deep, even pre-WWII, Japan experience. We respected our ambassadors (Edwin Reischauer and U. Alexis Johnson) and DCMs (John K. Emmerson and David Osborn). We built a Japanese official consensus up through their cultural system, which, in contrast to otherwise common wisdom, also meant building pressures on them. Washington, of course, was always impatient. Indeed, Washington is always impatient. It wants instant results now. But our ambassadors had sufficient clout to make their writs more-or-less run.

Q: Did you deal directly with the Ministry of Finance?

FRITTS: Yes. My niche was primarily the commercial and development banks and their relevant MOF offices. I made demarches at my level, carried out modest representation, and drafted reports and cables which were released by the economic counselor, although cleared by the financial attaché. But then, the financial attaché rarely used embassy communications over back channel letters to Treasury.

I was rather heavily involved on foreign direct investment issues and Japanese capital flows to

Southeast Asia. As the reversion of Okinawa loomed, I became sort of the economic guy on aspects of that and went to Okinawa several times to verify economic assessments made by the office of the U.S. High Commissioner. Frankly, I was still a self-taught economic officer and I wouldn't relish looking at those reports now. However, I don't recall that either the Economic Minister or Counselor had any significant professional training in economics, other than just doing it. The State generalist approach was a major weakness, which was later redressed by recruitment and in-house economic studies at the Foreign Service Institute (FSI). Eventually, I would study economics at FSI.

Q: What was the feeling at that time about Okinawa, at least within the embassy, your office? That it was about time and all that?

FRITTS: Our internal view was the Dick Snyder view, who was then the Country Director for Japan. It was simply put. The USG either moved to give Okinawa back and negotiate to our favor the use of the bases or maintain the status quo and see the bases become untenable. The Pentagon originally resisted reversion tooth and nail on military grounds e.g. any negotiated use would be less favorable, and emotionally e.g. the "Rock" had been bought with American blood.

I was not in Washington when Dick Snyder began the process, but we understood it was his idea. He pursued it within the USG against all odds with smarts, wiles, persistence, courage and a high-profile crusty impertinence. One anecdote I often heard repeated was that when Dick first got authority to discuss the issue at the Pentagon, he naturally received a very chilly reception. After outlining the concept, the Army general who chaired the large meeting stated declaratively that the Pentagon would never agree to Okinawa reversion. It was American territory, etc. Dick reportedly replied, "Well, General, the Pentagon has already agreed to return Okinawa." "What? General MacArthur never agreed to return Okinawa to Japan. That never happened!" Dick listened calmly and then said, "Oh, yes, he did. He expected reversion when he made the express decision to retain Japanese as the language of school instruction." ...

Q: How about students? Were they at all in your purview?

FRITTS: Students were not my responsibility. We would, of course, have periodic student demonstrations ("demos") outside the chancery, particularly over Vietnam and suspicions that the U.S. had nuclear weapons in Japan. In that pre-terrorist age, we didn't take demos seriously - just noise, bother and inconvenience. I remember being late to a Foreign Office appointment because of a "demo." My counterpart, it turned out, had been prominent in the major demonstrations in the '50s which forced the cancellation of President Eisenhower's trip to Japan. "Oh, yes," he said, "I remember demos at your chancery well from my student days. It's what we did then; it's what Japanese students always do." He then added wistfully, "And now, I'm a bureaucrat here. In the elections, I vote Liberal Democratic (conservative), although in my heart I'll always be a socialist. But I'm in the government now."

Q: How was living in Tokyo at that time?

FRITTS: It was fine - Americans were very much liked in Japan as being somewhat special. Tokyo was very urban and crowded, of course, with lots of pollution. We lived in an embassy

compound within walking distance of the chancery. Compound living was okay, because most Japanese professionals, including my contacts, lived in compounds and considered it perfectly normal. The yen was 360 to the dollar, so we could easily go to restaurants, Noh and Kabuki performances, and have a maid for childcare. I was working up to my ears, but we could occasionally travel or ski as a family and use Japanese accommodations. Snuggling down with my family in a Japanese ryokan, I thanked FSI for even my modest Japanese capability.

Q: So you left Embassy Tokyo. Where next?

FRITTS: I went to the Japan Desk in State for about three years. I was the economics guy and later became deputy director, but still the main economics guy. I was there about three years - to 1971.

Q: Let's see, in 1968 Richard Nixon was elected with political debts to the textile states of the South with, I recall, an impact up on Japan. But first, let's talk about when you arrived in Washington. How were our economic relations with Japan? What were the concerns?

FRITTS: Basically, our economic concerns with Japan were more-or-less what they had been and still are since Commodore Perry "opened" Japan in the 1850s - how to open Japan up internationally and to ensure that openings benefited American interests particularly. As it evolved, Japan's layers of formal, informal and cultural barriers were difficult to penetrate. Each advance uncovered a new problem. We believed that it was in Japanese, American and global interests e.g. the international financial and trading systems, that Japan be a major constructive player. Our specific policy approach for a decade or so was to induce the Japanese to end their insularities as in their interests and ours. At times we were a mentor, in others a friendly advocate, and in others, such as textiles, a fierce aggressor. To degrees, the same policy exists today.

The United States, of course, was hardly the open economic society we purported to be. We had our own array of protectionist exemptions and procedures. A favorite weapon was to theoretically negotiate, but actually to force, Japanese imposition of "voluntary export controls" on whatever products were impinging upon American producers at the time.

Q: And that brings us to textiles...

FRITTS: Economically, textiles was a receding industry in the U.S. Becoming increasingly outmoded, American producers had sought initially to stave off their decline by moving to the less-unionized South. However, labor-intensive textiles remained under pressure from "unfair and cheap" modernizing producers, such as Japan. The elected representatives in the South became more Republican with great political clout in the Nixon Administration. Thus, we sought to negotiate a series of "voluntary" Japanese export restraints on textiles and ease the pressures on the American market at the cost, of course, of the American consumer. The Japanese resisted strenuously.

The State Department had the great good fortune in those years of having Phil Trezise as the Assistant Secretary for Economic Affairs. A career officer, he had formerly been our

Ambassador to the Organization for Economic Cooperation and Development (OECD). He knew the issues inside and out and had also served in Japan. He's just about the finest FSO role model I ever knew. A man of great knowledge, infinite patience, common sense, courage and impeccable integrity. He resisted interagency and highly charged political pressures. He got us through difficult times with Japan, the White House and volatile Cabinet members by patient, calm, wry wisdom.

For reasons I don't entirely know, he decided I had some talent and that it suited his purpose to have an occasional confidential action officer on Japan outside his own Economic Affairs Bureau. He thus called the Assistant Secretary for East Asian Affairs, Marshall Green, to borrow me on those issues. He also told Marshall that I would not always be able to divulge what I was doing, but that Marshall could check with him on any qualms. Marshall agreed. On a couple of occasions, that constraint bent my immediate boss, the Japan Country Director, considerably out of shape. The arrangement lasted about two years.

Thus, I frequently worked directly with Phil and was part of the formal commodity trade negotiation delegations he led to Japan, which included other agencies, Congressmen and trade reps. His understanding of Japanese officialdom was superb. They trusted him. He had a conceptual long-range vision of how the trade and economic issues fit into U.S.-Japan relations, which he considered vitally important. That trade issues did not crash the U.S.-Japan relationship in those was due in no small part to his skills. While he was respected within the USG and on the Hill, knives were frequently out.

The Secretary of Commerce, Maurice Stans, was a major political supporter of American textile producers and a formidable adversary of State and Phil. He would send Commerce or even private industry emissaries to Japan in secrecy with instructions to avoid the U.S. Embassy, threaten the Japanese Government with dire acts, and instruct the Japanese not to inform us about the discussions. The last stricture would last about twelve hours after arrival when the Japanese would let Phil know, followed by their media. The USG looked divided, weak and foolish. An already bad political-economic situation would become worse.

After being caught several times, Stans switched to sending reps who would check in only with our ambassador, who wasn't supposed to report back. The ambassador, Armin Meyer, was put between a rock and a hard place. He was a Middle East expert newly arrived in Japan and thus without much clout in Japan or within the USG. Secretary Rogers reportedly had trouble confronting Secretary Stans or NSC Advisor Henry Kissinger, so the burden really fell on Trezise as Stans and others, including southern Congressmen, rode roughshod and tried to call the shots directly on trade and financial matters. It was a tough period.

Eventually, Trezise was able in his way to attain Japanese acquiescence on voluntary textile export restraints and openings in commodities, such as beef and citrus. His scenarios on other products and issues became the future models. One prescient Trezise insight was his prediction to the Japanese that within ten years, they would adopt the same approach as the U.S. when sectors in their economy became pressed by imports from Korea and Southeast Asia. And so it was.

Q: You mentioned that you'd be doing things that you couldn't tell your colleagues in the East Asia Bureau. Like what?

FRITTS: Given the adversarial environment within the USG, Trezise would often seek informal understandings with the Japanese before surfacing them within the USG. Trying to work out cooperatively what might fly or not. What was or wasn't negotiable. He was a master at building an eventual consensus within the USG, with American commodity interests, and with the Japanese. However, premature formal consultation meant leaks, sabotage and dangerous failure.

How often Phil spoke with Marshall, I don't know, but I do know that Marshall trusted Phil. The issues were so sensitive and the stakes so large politically that I don't think Marshall passed much on to his Country Director for Japan, Dick Finn. Dick and his successor, Dick Ericsson, were very perturbed when I couldn't tell him what I was up to.

I remember literally racing back to my office from Phil's office one night having been given forty minutes to draft a letter from the President to Prime Minister Sato. Once in my office, I had writer's block. Then Dick Finn came in and wanted a briefing on what the crisis was and what I'm writing. I couldn't tell him. It was tense. I still met the deadline.

Bear in mind I'm not a major actor in all this. I'm neither conceptualizing new policy nor negotiating trade-offs. I'm still mid-level. I was a "go to" guy who drafted quickly, understood the issues, could integrate disparate facts, add a few creative licks, and report well. Most of the really substantive stuff came from Trezise's own people. While they didn't always know his full purposes, they trusted his wisdom and integrity. Trezise used some wiles, but he did so to sustain negotiations against the rogue actors roaming around.

Q: During the Nixon period, there were several shocks or, as the Japanese said, shokkus, in U.S.-Japan relations. What were those all about?

FRITTS: The short answer is non-consultation. Advance and cooperative bilateral consultation had been a prime policy mantra toward Japan for decades. It was a key bedrock to Japanese attitudes toward their U.S. relationship. They gave us considerable policy slack across-the-board assuming we would consult with them on any initiative or situation involving their key national interests. We issued repeated assurances. We even set up annual Economic Cabinet meetings to testify to it.

Unfortunately, the U.S. talks a good advance consultation game, but often doesn't play it. Then or now. Just recently (2000), Clinton overflowed Japan to go to China. It was the first time an American President going to China had not stopped in Japan. It was a major shock and demeaned the U.S.-Japan relationship. Each time the U.S. insults Japan in that manner on key issues weakens the special relationship from which the U.S. so benefits.

But back to the "Nixon shokkus". They were three in number and hit the Japanese in key areas of their national interest.

First, the U.S. announced a successful secret opening to China. Japan had consistently held back

on its long-standing desire to improve relations with China in deference to our hostile stance. Every time they wanted to loosen up, we essentially forbade it. Then we moved and left them hanging.

Second, the decision to float the U.S. dollar by negating U.S. adherence to the gold standard at \$35 per ounce. We had labeled that policy as a linchpin in our huge financial relationship.

And third, the U.S. embargoed soybean exports because of short supply. We had a virtual international monopoly on soybeans. Soybean products are a major part of the Japanese diet and their consumers went into panic. An unintended result was that the Japanese determined never to be caught short again, made massive investments in soybean production in Brazil, and the U.S. created a major competitor in soybeans.

Q: How did you find Japanese negotiating techniques when working at the Trezise level on these narrow, although sensitive, issues?

FRITTS: Well, all of us working on Japan had to adjust to the fact that not much would ever remain confidential on either side for very long. There were so many actors with axes to grind. On our side, some thought that public Japan-bashing was the way to progress with the not inconsiderable goals of enhancing their own image, careers or political ambitions. And strangely, up to a point, we agreed.

To create their needed consensus, the Japanese often require a measure of being backed into a corner before their various groups can agree upon concessions as "unavoidable." They need a catalyst and sometimes a series of catalysts. That may sound counter to what I said before about rogue negotiators and mismanagement of U.S.-Japan economic relations. However, there were times when forcefulness was necessary to provide a means of agreement. Sometimes the Foreign Office even wanted it and would infer how it should be applied. On the other hand, gratuitous insults, overblown rhetoric and threats stymied or reversed progress. Given American culture and our governance system, it's almost impossible for State to fine tune policy, particularly in trade and finance where the Congress and interest groups participate directly. Trezise came as close as anyone.

Q: The Japanese were/are occasionally accused of not implementing trade agreements. Was that the case?

FRITTS: Frankly, both sides would occasionally renege under some subterfuge or other. We would often cite revised legal interpretations, such as on initiating anti-dumping actions against Japan.

The Japanese reputation derived from the fact that after negotiating the removal or easing of formal barriers, various informal and cultural barriers would then be uncovered. Our exports and investments thus didn't increase as expected or Japanese "voluntary" export restrictions would lag.

There were also serious misunderstandings. President Johnson twisted Prime Minister Sato's

arm, or possibly literally squeezed it, to force his approval to carry out "voluntary" textile export restrictions. The meeting at the White House was private with only Sato's interpreter present, a serious Johnson error. There are about fifteen shades of "yes" in Japanese. The one Sato used was translated as "Yes." Actually, when reconstructed after the fact, we thought it more akin to "I understand what you're saying and will do my best to consider how it might be done". Johnson later reportedly went ballistic about Sato when the Japanese Government denied privately and then publicly there had been any "agreement."

Japanese has many nice-sounding but non-binding phrases that they often sought to insert into communiques and agreements. In English they come out as "full and proper consideration", "best efforts", and that kind of approach. We knew what it meant e.g. "We'll try, but progress will be slow". The uninitiated either didn't understand or, even when we told them, were eager to proclaim public victory for image purposes. As reality set in, their reactions would charge Japanese "run-arounds" and duplicity. After I left Japanese affairs, the USG tried to adopt quantitative benchmarks to measure progress, with occasional success, but also much rancor as the Japanese charged that we were waging "managed trade" rather than "free trade".

Q: I would have thought that there would be a certain almost career or professional danger to bringing in American interest groups working on some of these things. In a way, by explaining how the Japanese operate, it could sound like you've either gone native or you're giving too many concessions. It must be difficult to bring your fellow conferees up to speed about how to deal with the Japanese.

FRITTS: Well, negotiations with Japan are hardball. Their officials are well-educated and experienced. Their professionals understand us as well or better as we profess to understand them. There is gamesmanship involved, but we are prisoners of our culture as they are prisoners of theirs.

Given the period we're talking about, the '60s and '70s - what we then thought as rather arcane but accurate knowledge of the Japanese system is now common knowledge by even the most junior business people going out to Japan, many of whom speak fluent Japanese. Meanwhile, Japan has evolved - has become much more like us.

An anecdote about their system. We had a series of U.S.-Japan Joint Economic Conferences, which were Cabinet-level meetings held annually between the U.S. and Japan. Part of the concept was to expose more insular Japanese ministers and officials, other than just the Foreign Office, to us and our concerns - and to induce them to be more interactive and open in discussing issues and problems. On one occasion, I was part of an advance team with Phil Trezise and others who arrived a few days early. As the working-level coordinator, I had thrashed through the issues within the USG, including the briefing book policy papers, and set up the arrangements. As per usual, I had drafted, negotiated USG clearances, and provided a draft joint communiqué to the Japanese Embassy in Washington.

I arrived in Japan overnight, along with Phil and others, and was looking forward to spending half a day or so getting around and talking with people whom I knew in Japan before getting down to the work of the conference. Early in the morning, I had a call from my Foreign Office

fellow counterpart asking me to come over "...for awhile". I demurred, saying I had some other things to do. "No, we really want to see you. You really have to be here." "Okay," I said, "I'll stop by the Ministry." "Oh, no," he said, "Come to the Okura Hotel."

When I got there, I entered a suite they had turned into an interagency cockpit, with a Foreign Ministry guy in charge. I was put at a small table in a corner of a rear room. I couldn't get out without having to walk over about a dozen officials who filled the room. I became captive to negotiating the joint communiqué and I was there for the next twelve hours. We went through the issues and phrases piece by piece. We'd reach an impasse, they'd form a whispering group, a junior officer would leave, and some time later, he and new people would come back and huddle in the other rooms I could see from my corner. What they were doing was running over to MITI or the Ministry of Finance and elsewhere, negotiating with those ministries, and then back to the Okura with revised wording to negotiate. I was there, as I say, for 12 hours or so. I don't remember either food or a john break. We worked out the communiqué which constituted the outcome in advance of the Joint Cabinet meeting to be held. That shows their intensity and the complexity of consultation required to achieve a Japanese consensus. All of them versus me. Quite eye-opening.

Q: Did your negotiated communiqué stand?

FRITTS: Only one word got changed. I was quite proud of that.

Q: So, in retrospect, do you believe our economic negotiations with Japan have been successful?

FRITTS: Oh, yes, very. Japan has opened tremendously. So much so, its culture is changing rapidly. Each advance was too small by our standards, but given the context of where the Japanese were coming from, quite long by theirs. I think the U.S.-Japan relationship can be considered as one of the best and most successfully managed bilateral relationships in history. A true testament to long-term American diplomacy. All of Asia would be in a much different strategic environment today without the firm U.S.-Japan relationship forged over a half-century. And economics are an important part of that success and environment.

Q: Did you feel that way then? Or just, "Oh, God, dealing with the Japanese?"

FRITTS: I always knew, concurred in, and fiddled with our overall long-term policy. But few of us then would have predicted Japan's rise to a top three world economy. However, when I left the Japan Desk, I had been totally immersed in U.S.-Japan issues for about seven years. I was tired of the problems. Some years later in the Carter Administration, a new East Asia Assistant Secretary, Dick Holbrooke, asked me to become reimmersed as Japan Country Director. Much to his surprise, I turned him down to direct another of his offices. I just didn't want to take on what to me were old problems in new guises, political and economic. I wonder how our Middle East colleagues bear it.

Q: Yes, some issues just don't go away. Did the political climate change at all in Japan while you were handling it there? I guess it was the Liberal Democratic Party (LDP) throughout..

FRITTS: Yes, the LDP reigned and the political climate was static. But there was a major change in how the Japanese did their diplomatic business. The quality of Japanese representation in Washington and abroad jumped markedly. They always had good people, but a real sea change occurred with their international skills. Always well trained technically, they became much more global, more confident in their ability to interact internationally, and adopted a higher profile in expressing positions. Non-foreign ministry types became fluent in English. Even spouses, who previously could rarely speak English, began to initiate conversations rather than huddle together. Rather than just working the usual places like the State Department, they expanded into the media and onto the Hill. They became Americanized in the conduct of diplomacy. It happened in the space of a few years.

Q: Were they picking this up on their own, or was there a sort of tutorial with us saying, "If you really want to get something done in the United States, you've got to work the media, you've got to work Congress?"

FRITTS: We had always sought to engender greater Japanese openness, less insularity and a more global view of their responsibilities. But the change was also generational, engendered by growing confidence in a world class economy, increased experience, the dimming memory and inhibitions of WWII, the lifting of foreign exchange controls which sent floods of Japanese abroad to clog world tourist sights. Japanese society was changing, and the Foreign Office anticipated and was even ahead of the curve. Would that our Foreign Service could be so farsighted and financially supported.

Q: How did you find the Japanese media? From what I gather, it's a pretty hungry beast - lots of newspapers, lots of TV, and they're all over the place?

FRITTS: The Japanese media are hyper-competitive and very influential. Anything happening in the U.S. and the USG, particularly with any relevance to the U.S. and Japan, is automatically big news. The U.S. is covered extensively and intensively. The media national circulation plus proportion of readership and viewers are much higher than in the U.S. The media were quite insular then. They viewed the first Nixon Administration as "weak" because Nixon's competitors in the primaries were included in his cabinet. Now they have bureaus around the world with very qualified, sophisticated journalists.

Q: Did you get involved when Kissinger went to China? It was the first of the Nixon shokkus.

FRITTS: I had minor roles in damage control - drafting instructions on how to mollify the Japanese. My only role in the opening to China was that John Holdridge, who was on the National Security Council staff, realized he had to have white tie and tails for the Nixon trip to China. He knew I had a set (left-over from being a member of the University of Michigan Men's Glee Club. He asked if I still had them. I did, he wore them, they went.

Q: Did you feel that our involvement in Vietnam tended to downplay the importance of Japan. That all of our effort was focused on Vietnam?

FRITTS: No, not at all. Vietnam actually provoked a good deal of policy attention toward Japan,

albeit often in a Vietnam context. We were up to our ears in trying to assuage Japanese fears that Vietnam was going to disrupt all of Southeast Asia, cut down on their lucrative trade and investments, and create regional instabilities. Their nightmare was that Vietnam could lead to U.S. military conflicts with China and/or Russia or a renewal of war in Korea. Japan wanted an end to the Vietnam War. From Japan, we wanted all the political and, particularly, economic support or "contributions" we could garner. I guess our diplomacy could be termed as focused on assuagement, inducement and reassurance. We tried to get them increasingly involved in Vietnam and SE Asia, not militarily, but economically and financially.

Q: I realize you were dealing with Japan, but was Korea beginning to... It was still early days in Korea, I guess, so Korea wasn't much of an economic power, was it?

FRITTS: No, but Japan was still negotiating reparations and trade agreements with South Korea. Whatever our difficulties in negotiating with Japan, we took relief from the fact that it was much worse between the Japanese and Koreans. Their bilateral "discussions" were marked by Korean vituperation and harassment.

I remember discussing Korea with a Japanese diplomat, who had come back from meetings in Seoul. After we had discussed the substance for my report, he added. "You know, in negotiating with Americans, we're very careful to write down everything precisely and clearly, because we know you'll raise it with us and we'll need to be prepared. But we don't take notes of talks with the Koreans. Whatever is agreed won't last anyhow, so why bother?"

Q: Now this was the Nixon White House and Kissinger is national security advisor. Did relations with Japan reflect their "command and control" styles?

FRITTS: Well, I've spoken of Maurice Stans, the Secretary of Commerce, who cut an independent swath, that U.S. economic policy with Japan was often schizophrenic, and of Trezise' efforts to provide cohesion from his level. Okinawa reversion occurred in 1972 with Secretary Rogers. Whatever the truth, we felt Kissinger was Europe and China focused and didn't care much about what we viewed as the tremendously important relationship with Japan. We thought he took it for granted.

Q: Did the East Asia Bureau feel during this time that Japan was getting enough attention?

FRITTS: Well, we were, of course, incredulous at the non-notification to Japan before the U.S. opening to China, the negation of dollar convertibility, and the soybean embargo. They were insults to a major ally.

Q: Was the feeling that this was lack of attention or deliberate?

FRITTS: I don't know what Kissinger now says, but they were omissions we couldn't understand. Frankly, we thought it would never have happened to a Western European country. Our memos said how bad it was, but, of course, it was water over the dam. Our professional focus had to be on damage control, such as citing exceptional circumstance, no lessening of our strong relationship, sending out VIP's with kind words - that kind of thing.

Q: Well, I think one of the ideas that was floated around, why this happened was that if you told a Japanese anything, even at the highest level, it would be leaked within a very short time.

FRITTS: That probably was a concern and, unfortunately, it was probably true. We generally operated on the premise that most of what we did with Japan would become public, particularly on the economic side. Defense issues had a better record, although they were not immune, as per my Rostow-Emmerson story.

U. ALEXIS JOHNSON
Ambassador
Japan (1966-1968)

U. Alexis Johnson was born in 1908 in Falun Kansas. He Graduated from Occidental College in 1931 and entered the Foreign Service in 1935. He served as Deputy Ambassador to Vietnam from 1964-1965 and Ambassador to Japan from 1966-1968. He also served as Deputy Undersecretary of Political Affairs and Undersecretary of Political Affairs. Ambassador Johnson was initially interviewed by Paige E. Mulhollan in 1969.

Q: How much, as Ambassador in Japan, did you get to stay in the Vietnam considerations? At all? Was your view solicited?

JOHNSON: No. My views were never solicited. However, people going to and from Vietnam at all levels, of course, frequently were passing through Tokyo; and naturally, I saw them. I kept in close contact with the situation through high level people passing through. In fact, in some ways, I felt I was able to keep track of things better in Japan than I was back here. I saw people that normally you wouldn't see.

Q: You saw people going both ways.

JOHNSON: Both ways, yes. And then in Japan, also, junior officers, both foreign service and military people, were coming through, that I'd known, who would stop and see me. So I spent a considerable amount of time simply trying to keep track of what was going on, not that I had any responsibility for it. Naturally, I had a deep interest in it. And of course, it deeply affected my position in Japan.

Q: I was going to say, Mr. Reischauer indicated, in his book at least, that at least one time in Japan there was considerable irritation with American policy in Vietnam. Was that true by the time that you got there?

JOHNSON: I've always thought--Ed and I have differed on this--I've always thought that this was not as much an issue in Japan as he felt that it was. I've always said . . . Let me say, I shouldn't say I was never consulted. On the bombing halt, I was consulted in general on that, and on some

other moves, also, my views were invited. But insofar as Japan was concerned, the position I always took was that we should ignore Japan.

Q: As far as Vietnam was concerned?

JOHNSON: As far as Vietnam was concerned, that we should go ahead and do what we felt was necessary. If it came out all right, fine and good. If, because we listened to or were influenced by the views of Japan, it didn't come out all right, it would quickly be forgotten that we were being influenced by their views. It would simply be recognized that we'd failed. So the thing to do was to go ahead and do what we felt needed to be done without regard for the views of Japan. That was the position I always took on this.

As far as Japanese attitudes are concerned, the best indication of this, that I had, was at the time of the March 31 speech of President Johnson--March 31 a year ago--on the cessation of the bombing of the northern part of North Vietnam. With a liberal assist from the American press, this was universally interpreted by the Japanese press as being a prelude to a complete withdrawal and a reversal of policy on Vietnam. I spent some five hours alone with the Prime Minister two nights following that speech, trying to convince him this wasn't the case. He was terribly concerned that it was in fact the case.

Q: He was opposed to it being the case, I take it, you're saying?

JOHNSON: Oh, yes. Oh, he was very deeply so. And I had nothing to go on except that speech and my own instinct on the situation. And I tried to reassure him that this wasn't the case. And then all kinds of politicians from the--I wouldn't say the extreme left--but from the center and the right came directly or indirectly to me on this subject. They were terribly concerned. Those who had been opposing our policy, and were speaking against our policy, often, in effect said, "You know we've been saying these things because this is necessary, here in Japan, to our political situation. But, God, we never thought that you would listen to us."

Q: "Please don't take it seriously."

JOHNSON: "Please don't take it seriously." This was a real shock to them in Japan; the thought that we were really going to withdraw.

HERBERT LEVIN
Political Officer
Tokyo (1967-1970)

Herbert Levin was born in New York in 1930. He entered the Foreign Service in 1956. His career included posts in Hong Kong, Japan, Tanzania, Sri Lanka, and India. Mr. Levin was interviewed by Mike Springmann in 1994.

LEVIN: I went to Tokyo, to the Political Section. The Embassy in Tokyo in the Political Section

always had a Chinese Language Officer. Not exclusively to utilize the language skill but because Japan's relations with China, both the mainland and Taiwan, were of importance to the United States. You had to have someone with a strong background in Chinese affairs to have any kind of serious dialogue with the Japanese government and Japanese business people and scholars on China. There was always someone in Tokyo doing this job.

Q: What was your title at this point?

LEVIN: What was I? I guess I was a First Secretary.

In the Japanese Foreign Ministry, the China Section was headed by a very able, active person who later was the Japanese Ambassador to China, among other places. His name was Hiroshi Hashimoto. There was a great deal of interest in China in both the U.S. and Japan. We both were trying to understand what was going on there.

The Japanese were more forward with China than we were in terms of trade, travel and everything else. At the same time, they had no desire to play a prominent political role with the Chinese. The last thing they wanted was a brawl with the United States over China policy. So I worked on China and Taiwan, North and South Korea. It was really Japan's relations with Asia, including Siberia and Vietnam.

Q: What kind of insight did you get into the workings of the Japanese government on their China policy? Did you get that out of them by conversing with these guys, or did they kind of play it close to their chest?

LEVIN: I would say that they were quite open. After they accepted that we would be discreet, that they weren't going to hear themselves quoted back either by other Americans in my Embassy or, worse yet, by people in the State Department in Washington, they were quite helpful in trying to get you to understand what was their system of decision making and what the various forces were which affected the outcome.

Since the Liberal Democratic Party was in office and was likely to remain in office for the foreseeable future, they weren't going to have changes in policy due to elections. Factions within the LDP, and also bureaucratic and business groups, had distinct interests. The Japanese were quite helpful in describing these and what goals they were striving for. I found them quite frank in that respect.

Let me describe one incident which might help explain the atmosphere in Tokyo at the time. The United States had decided to recognize Mongolia. This had been an off-again on-again thing for many years, with the Russians repeatedly vetoing the Mongolians desire to have an international relationship with the U.S. The Japanese wished to normalize relations with Mongolia whenever the U.S. did.

The long-standing U.S. arrangement with the Japanese was that when the U.S. had reached the actual point of decision with the Mongolians, we would tell them in advance and permit them to announce their recognition of Mongolia first before the U.S., as a courtesy. This was done. We

informed them in advance when we were going to announce, perhaps it was to be a week later, that it was all decided. The Japanese promptly made their recognition announcement, as agreed with us.

The Americans had also notified Chiang Kai-shek in Taipei that they were going to do this. The Nationalist government in Taiwan claimed that Mongolia was part of China, and they energized their friends in the U.S. Congress -- in the Republican right wing -- to cancel our agreement with Mongolia to enter into diplomatic relations and actually got the President to turn around.

The U.S. then had to go to the Japanese and say, "Forget what we told you; we've changed our minds." The Japanese, not looking for public fights with the Americans, and being a country where forms of courtesy are observed, avoided any public reaction. At the same time, the Japanese were shocked and in a fury that the Americans, after literally years of working on this, could be reversed by Chiang Kai-shek and accept this kind of humiliation from him. The question was also privately raised, "Could Japan really count on anything the Americans could say when something like Mongolian recognition could be changed?" What was more important to Washington: the assurances that the American government had given the Japanese or Chiang Kai-shek's ire? Since I agreed with the Japanese that Washington was guilty of poor judgment, I had little difficulty in meticulously reporting Japanese anger to Washington.

I felt this was significant because it showed that the Japanese wanted to trust the United States. They wanted to be able to rely on us, and we had been unreliable without any really compelling reason.

Another interesting responsibility was in regard to a series of incidents along the northern border of China with Russia -- around Damansky Island in Russia, Chenpao in China -- and the question of who was provoking whom in minor skirmishes and shootings reported. It was obviously part of the world where there were not too many travelers. It was also a situation where satellite photographs couldn't really tell you much because these were small groups of people involved with small arms fire.

I asked the Japanese if they had any views on this. They made available the Japanese Imperial Army archives and retired Imperial Army officers who talked about their skirmishes with the Russians when they had been "defending Manchukuo" in exactly the same place. They explained that this island was really a mudbank, and it moved around depending on the spring floods. Sometimes it was attached to one side of the river; sometimes it was attached to the other side. Recent military academy graduates on first patrols could rush out there in the spring when the water was low and plant a flag and say, "It's ours." If the counterpart new Lieutenant on the other side wanted to show that he too was a hero, defending the soil of the Motherland, he would shoot at them. It was really a kind of a crummy little game over an insignificant wandering mudbank.

This didn't mean that Beijing or Moscow might not be choosing to push the other, and a small number of casualties was reportedly involved. But it really wasn't a situation wherein there was an agreed border, and one side was engaging in calculated belligerency, acts of war, by crossing it.

I think this information from the Japanese may have been helpful to Washington to understand that though one side or the other was letting their patrols be resolute, it was a muddy area in both senses of the term, where there could be people blundering into each other on patrols and other local confusion. The Japanese were cooperative and helpful in trying to figure out what was the real intent of Beijing and Moscow.

This was also the time when the Non-Proliferation Treaty was being negotiated.

Q: This is early '60, '61, '62, '63?

LEVIN: No, this was late '60s. The Soviet Union and the United States were the co-chairmen of the international committee that was negotiating the Non-Proliferation Treaty. The Japanese were obviously not about to build nuclear weapons. Indeed, they probably have the greatest anathema toward nuclear weapons of any country in the world because they're the only country that was bombed with nuclear weapons. At the same time, the Japanese were having difficulty in accepting the Non-Proliferation Treaty draft because the Washington and London naval disarmament conferences before World War II had put Japan in an inferior position in terms of numbers of battleships and cruisers to the Americans and the British.

It appeared as if an international treaty was coming into existence which would permanently label Japan as a second class country. While on one hand, they weren't going to develop nuclear weapons, and they were prepared to commit themselves to this, on the other hand, to sign a multilateral treaty which permanently put them in an inferior category was something they were having trouble with. It was necessary to have a long and difficult negotiation with them to put wording in the NonProliferation Treaty about the commitment of the nuclear countries to denuclearize and to eventually become equal to Japan, and a lot of other things to make it more palatable. (I think that Germany may have taken a similar stance.)

In the Soviet Embassy in Tokyo, there was an individual who had been assigned to Tokyo because, due to the deterioration of Sino-Soviet relations, the Soviet Embassy in Beijing had reduced its staff. The Soviet system had these people coming out of Chinese language training. They didn't have a Consulate in Hong Kong, they didn't have anything in Taipei and they couldn't go to Beijing. So somebody said, "Go to Japan and be a China watcher."

This was a period of detente between the United States and the Soviet Union. When this fellow arrived in Tokyo, he found out that there was somebody who spoke Chinese in the American Embassy. He did not speak any Japanese or much English, and he was kind of isolated, even in his own Embassy. He gave me a call and asked if he could come over and see me. I agreed. When we met, he told me the background for his unexpected assignment to Tokyo, and said he wanted to be a China watcher. I told him that was not too easy from Tokyo, but he could be a Taiwan watcher. He said, "Great." I got to know this Soviet officer, and he was a responsible and serious person in terms of trying to understand China. His name was Valentine Kovalenko.

At any rate, at one point in the NPT negotiations, an instruction came out that the Soviet and American Embassies in Tokyo should make a joint demarche on the Japanese in regard to one point in the negotiation. Both the American and Soviet Ambassadors, Alex Johnson and

Troyanovsky, had the same reaction which Kovalenko and I did. This was that if you wanted to increase Japanese resistance, the best way was to have a joint Soviet-American demarche. To have Japan's only ally and its long-standing enemy (there was still no Soviet-Japanese peace treaty to end WW II) going in together would drive the Japanese crazy.

We concluded we were not going to have the two Ambassadors go in and make the joint demarche. However, we could say to the Foreign Ministry that in order to save the Japanese time, the American and the Soviet representatives could drop in together because they had the same instructions. So Kovalenko and I did all the NPT negotiations. We later had American technical negotiating teams coming out. This took a great deal of my time and was very worthwhile.

All of my work on the NPT in Japan with Kovalenko was done in Chinese. In the Foreign Ministry, when we discussed things, it was in Chinese. The Japanese would have one of their Chinese language officers participate. But it was an unusual interlude. It was a period of detente with the Soviet Union, when people in the Soviet Embassy in Tokyo, who clearly wanted to have normal relations with the United States, were allowed by their system to have them. They came forward, and some of them were personally interesting and professionally useful to work with. They stood out clearly from the more usual Soviet types around them.

Q: Then you went on from the NSC, you said, to the Senate Intelligence Staff?

LEVIN: No. I went from the NSC to the Japan desk in State. I had come from Tokyo to the NSC staff, where I also did Japanese relations, which were very important. Then I went to the Japan desk.

Q: As Desk Officer?

LEVIN: I was the number two.

Q: There are Country Directors and then Desk Officers?

LEVIN: I think they had created the title of Deputy Country Director at that point. It was a large desk by State Department standards, including some seven Economic and Political Officers. Relations with Japan were always extremely active. Basically, there were no bilateral political problems between the U.S. and Japan. There were bilateral trade problems, though less than there are today. You always have American economic interests who are unhappy with the way the Japanese are handling them, so this takes a lot of work.

There are few major problems in the world that can be solved if the Japanese and the Americans are on opposite sides. There are few global problems that cannot be affected favorably if the Japanese and the Americans are working together. It was true then, and it is true now. While we have this endless squabble about Japanese protectionism and the trade imbalance and so forth, which has a life of its own, we also have a tremendous desire in both Tokyo and Washington to have us working together on nuclear nonproliferation or limiting the spread of conventional weapons, on international environmental matters, on what to do about Russia, on what to do

about North Korea, about foreign aid to Turkey, etc., etc., etc. All those things require a great deal of work by the Japan Desk.

These pieces of business are not very secretive or sensitive, but they don't attract the same kind of headlines as another fight over whether or not the Japanese are giving a license fast enough for some American company to sell cellular telephones in Tokyo. We were spending a great deal of time on what was really important to the U.S. national interest, I think with a lot of success. We did not allow the urgent to take precedence over the important.

Q: This was the early '70s?

LEVIN: Yes.

Q: Where did you go after that? Well let me ask you. . . I guess I should ask you about the ins and outs of the Washington bureaucracy. When you were at the Japan desk at State, what kind of interrelations did you have with Capitol committees, or individual Congressmen on Japan, or the Commerce Department, or the CIA or other parts of the bureaucracy?

LEVIN: On the Hill, there would be a rare Congressman or Senator who would take the time to pursue a sustained interest in a single country. Most Congressmen or Senators don't take any interest in international affairs. The small number who take an interest in international affairs have to spread themselves globally. To find someone who wants to maintain a particular interest in Japan -- there just isn't enough time for members to do this.

There were a handful of members who would designate someone on their staff to keep abreast of Japanese affairs or occasionally ask for a briefing for themselves. Of course, we were delighted to try to work with these people. But the international interests of the Members of Congress tend to be episodic. If something is in the headlines, if there is a public problem, then they will focus on it. It is very hard for the Hill to maintain a continuous interest over a long period of time in something like the totality of a single country relationship.

I think this is best illustrated by the fact that contrary to what many Americans believe, our number one trading relationship is not with Japan, it is with Canada. We have more people moving back and forth between Canada and the United States than with any other country -- and a whole range of other sorts of relations. But the number of American Congressmen or Senators who really take an interest in that relationship, who have some idea of what its dynamics are, are really few. You may have a member from a state that borders on Canada who is worried about too much fresh bread coming across the border because his bakeries don't like it or something like that, but sustained interest in the number one economic relationship the U.S. has -- with Canada -- is unknown.

Basically, Congress is not a place to which you look to set substantial long term international policies for the United States. There are individuals up there who have this kind of an interest. So I'd say the Japan Desk's relations with the Hill were a continuous search to try and find people who did have time to receive this information and to help them understand the problems with Japan.

We always were the targets for wild crazy attacks, "The State Department is selling out the national interest," the usual nonsense. You didn't respond directly, but you could hope to have enough people on the Hill who would say, "Well, what is the full story on this issue?" This kind of defanging effort.

The Hill relationships tend to be sporadic, episodic, very short term, and I think that's just in the nature of the way the Congress operates.

As far as the other departments of government are concerned, you always had Defense Department professionals who had long term commitments to understanding not only Japan's military situation, but the policies in Japan as they affected the military security interests of the United States. These DOD officials, though they were focused on maintaining the military security interest which was their job, generally had a good knowledge in depth of the way Japan operated. Where it was appropriate, they could be brought in to remind the people consumed with the economic problem of the moment that there were other things involved. The quality of the Defense professionals, civilian and military, was quite good.

The Commerce Department is not a policy making or policy oriented organization; it is a service organization. It does quite a good job in providing services, but when people get strange ideas that the Commerce Department is going to determine American economic policy toward Japan, you get in trouble because this is not the way the place is set up -- it is not constituted that way. It really cannot play that kind of a role.

Q: Okay, then you went on from the Japan desk to where?

LEVIN: After the Japan Desk, I was a Fellow at the Center for International Affairs at Harvard. I was offered the National War College. It is prestigious; you get to know more officers who are going to become Generals and Admirals. However, I thought if I was going to take a year out of Foreign Service work, it should be out of the government.

ULRICH STRAUS
Japan Desk Officer
Washington, DC (1967-1970)

Ulrich Straus was born in Germany in 1926. His career in the Foreign Service included assignments in Japan, Germany, the Philippines, and Washington, DC. He was interviewed by Charles Stuart Kennedy in late 1992 and early 1993.

STRAUS: So I was back on the Japan Desk.

Q: This was from 1967-70?

STRAUS: That is correct. I had two jobs. One was the political/military job and the other one

was keeping track of internal Japanese political affairs. The last year I was also the Deputy Director.

Q: How were you reading the Vietnam situation?

STRAUS: Our policy, of course, was to get the Japanese not to go off the reservation -- to maintain our bases in Japan and to retain our freedom to use them, which meant, of course, not launching any combat operations from them, but we didn't need to. We had Okinawa to do that if we needed to, as well as the Philippines.

There was, of course, a growing anti-war movement in Japan, and the Japanese were concerned that our engagement in Vietnam would involve them -- the Japanese -- in conflict with the Chinese. I think many thoughtful Japanese said, in effect, "You know your war in Vietnam is just like our war in China. We had all the military victories, but we lost the war." I thought that was not that far off the mark.

Q: Did you find being in the East Asian Bureau that it was difficult? Were there sort of true believers at the top, and you had to be concerned about the reporting that was coming out of Japan?

STRAUS: Not particularly. We had many issues and problems dealing with Japan that were strictly bilateral and did not affect the Vietnam thing one way or the other. There was very little interaction there. We had much more interaction with the Korean Desk, the China Desk, although I did have some good friends on the Vietnam Desk, some of whom were true believers and with whom I had some good discussions about Vietnam.

Q: What were the major issues that you were seeing that we had with Japan at that time?

STRAUS: One of the issues that arose that first fall was the issue of Okinawa. I think it was very clear to both of us that until there was some further progress on the Vietnam situation that it would be difficult for us to give up our unfettered use of Okinawa.

Another major issue was the seizing of the *Pueblo* off the coast of Korea. I happened to be in charge of the Japan Desk at the time because my boss, Dick Sneider, was at a conference. Of course, the Japanese Ambassador came in quite often on consultations on this issue. The Japanese were much concerned that we would launch combat operations from Japanese bases in retaliatory action. That increase of tension on the Korean peninsula, of course, did affect the Japanese government a great deal more than what was going on in Vietnam because Vietnam was further away.

Q: What was the feeling on the Pueblo business? This was when the North Koreans seized a radio intelligence ship. Did the Japanese just want to stay out of the problem?

STRAUS: Yes. They wanted a peaceful resolution of this issue. They did not, I think, want to be in the position of having to authorize the use of bases in Japan for combat strikes against North Korea.

Q: This brings up a question. You know we had our troops in Japanese, not major elements, but bases there with the rationale of protecting Japan. Looking at it, how did you feel? Were we reaching the point of wondering what we were doing there? Did it make sense to be there?

STRAUS: Certainly the Japanese public opinion was strongly against any involvement of Japan in the Korean conflict. Nevertheless, the Japanese government did recognize that in Korea, if nowhere else in the world, it was very much in Japan's national interest. While they certainly didn't think of sending combat forces or anything like that over to Korea -- that was the last thing the Koreans would want -- I think they were generally understanding that if there had been an invasion of South Korea by the North that, of course, there may well have arisen opportunities for us to use bases in Japan to protect our interests in South Korea. But I think something like the seizure of a naval vessel didn't qualify for that. We eventually backed off from retaliatory action. The Japanese were understandably nervous. There were a couple of meetings that I recall with the Secretary of State on this issue. The Japanese press was very much interested to know what was going to happen.

Another major interest was the increasing pressure at that time on the part of the Japanese to reduce our military presence in Japan, to withdraw our bases from downtown Tokyo and other cities. To move out into the countryside. The Japanese were prepared to a large extent to offer alternative facilities. To just consolidate our facilities. By that point, the Japanese economy was going great guns, and there was growing pressure in Japan for us to return some base land, which they saw as being under-utilized. We did in a somewhat desultory fashion turn back bases and facilities at that time. As a matter of fact, I recall one case where the military felt that it would be advisable to give up our big naval base at Yokosuka, which we on the Desk thought was the last place in Japan we should give up. We actually talked the military into keeping it.

Q: On the military side, was it thought that Subic Bay would take care of it?

STRAUS: It was during Lyndon Johnson's presidency and his desire to avoid spending a lot of dollars abroad. It may well be that there was the feeling that Subic would be adequate for our purposes.

Q: How did you find the American military? They don't give up facilities easily.

STRAUS: I think they will never volunteer to give up anything because they don't pay the price for it. On the other hand, fortunately, I think they are very disciplined, and if they get an order from above to get rid of something, they will salute smartly and get rid of it. There were times in our history when budgetary requirements have mandated such elimination of foreign bases.

A final issue, and one which kept me very involved for a long time, was the issue of nuclear powered warships into Japanese ports. There I dealt with Admiral Rickover and his staff.

Q: Admiral Rickover was famous as the father of the nuclear navy and a power unto himself.

STRAUS: Yes, and with direct access to the Congress where he had many friends. The Japanese

at that time, again responding, I think, to public pressure, exhibited extreme nervousness about the port entry of nuclear powered warships. The Japanese weren't the only ones at that time that were nervous, but perhaps as much as anybody, they were nervous with this rather new technology. It was part of the Japanese nuclear allergy. We assured them that there was nothing to fear, but they had very strong doubts and insisted on their own monitoring. We had very little confidence in their monitoring. There were discrepancies between their monitoring and our monitoring. There were always demonstrations by left wing forces in Japan whenever nuclear powered warships...

Q: These were usually submarines weren't they?

STRAUS: Submarines at first, but later on there were also surface vessels. It took a lot of patient work. Of course, Admiral Rickover really didn't want to make any concessions whatsoever. He was confident that his reactors didn't leak, had never leaked, were never going to leak, and whatever the Japanese saw on their instruments was of no interest to him. Our job was to keep both happy, a typical diplomat's task.

It took a long time, and beyond the time that I was involved with it, the Japanese eventually recognized that these nuclear reactors really were safe.

Q: Did you get involved with the mega problem of whether our vessels were carrying nuclear weapons or not?

STRAUS: That involved the highest levels, although I did do some writing about it. There were a couple of incidents when this issue came up. It came up periodically in Japan and was always resolved by a complicated terminology on both sides. We would not do anything without the knowledge of the Japanese government.

Q: Did you get involved in the recognition of China? We were adamant that nobody recognize China, and a few years later, we surprised everybody by doing it. I think the Japanese wanted to get going with this.

STRAUS: Very much so.

Q: Did this come up?

STRAUS: Well, it was one of the most important points of difference between us. I think the Japanese were good, if reluctant, soldiers on this thing and supported our position at the UN, even while we were losing worldwide support for our China policy. But again, this was a little before the time this China issue became very hot. As long as we were as heavily involved in Vietnam as we were in the late sixties, it didn't seem quite feasible that very much would happen there.

Q: Those were the major items you were covering at that time?

STRAUS: Yes, I would say so. Oh, one other issue was the reversion of the Bonin Islands to

Japan. While a minor matter, it was generally seen by both the Japanese and ourselves as the precursor of the reversion of Okinawa, which was a bigger issue. It went rather well.

Q: This was Iwo Jima and...

STRAUS: Yes. And the symbolic significance of Iwo Jima. We were very concerned about our veterans. Actually, our veterans were really ahead of the game, I think, and were supportive as long as the memorial on Iwo Jima was taken care of. They had already established sort of collegial ties with veterans associations in Japan, and, if anything, I think they were rather helpful on this matter. It was taken care of by an administrative agreement with the Japanese rather than a treaty, but we, of course, did take great care that the Congress wouldn't give us any problems. We recognized, of course, the political significance of Iwo Jima.

Q: Speaking of the reversion issue, which is a word we never use anymore and was almost strictly used in our political vocabulary to Japan, and mainly Okinawa, but also the Bonin Islands to begin with -- the northern islands and the Soviets who struck me as an interested but not involved observer that the Soviets lost a major -- they kept Japan permanently hostile practically, even to today, because of these little islands, where some compromise might have been reached. Were we thinking that with the Soviets doing their thing, we could show some flexibility, and they couldn't?

STRAUS: I think so. It certainly made the Japanese government's task somewhat easier in asking for increased appropriations for military expenditures.

I should also mention that in the time 1967-70, when I was on the Desk, we got real movement. With the onset of the Nixon administration in January, 1969, we got real movement on the reversion of Okinawa because we saw that a satisfactory resolution of the Okinawa issue was prerequisite for our ability to maintain the U.S.-Japan Security Treaty, which underlay the whole relationship.

My boss at that time, Dick Sneider, who moved over in 1969 to the National Security Council, was highly successful in convincing the powers that be that flexibility was essential. Elements of the military held out until the last moment, but agreement was reached in 1970 or so for reversion to take place in 1972. It was one occasion where the U.S. Government moved in the nick of time.

Q: What was your feeling sitting on the Desk about the Okinawa business, because if I recall, the Mayor of Naha kept being thrown in everyone's face because he was supposed to be a Communist?

STRAUS: Yes, he was a Communist.

Q: This was a slippery slope to ruin?

STRAUS: The Mayor of Naha, the capital city of Okinawa, was Mr. Sanaga. Sanaga had been elected Mayor of Naha, and then the military had purged him from office under their powers

there. This didn't necessarily endear him and other people to continued American rule. It was an expression not of their Communism, but Okinawans tend to be somewhat ornery against someone who is trying to run their affairs for them. I thought we had no good reason, frankly, to maintain rule over a million Okinawans. They needed to go back to Japan.

Q: What was the feeling? Was Okinawa considered part of Japan?

STRAUS: Yes.

Q: Was there any separatist movement?

STRAUS: Well, there was a very, very minor separatist movement, and I suppose the Okinawans, if they had their druthers in a perfect world, would prefer to be independent. But they realized that they can't go it alone. To be a part of a rapidly more wealthy Japan wasn't half bad, and that, of course, is what it proved to be. So it was a very good move.

In the reversion negotiations, I think we retained all the essential rights. One wonders now what all the fuss was about.

Q: Who were the key people in this whole reversion thing as you saw it, from our side?

STRAUS: I think Dick Sneider orchestrated the whole thing and later became the negotiator for the reversion in Tokyo. I think Alex Johnson played a major role. There was a fellow, a political appointee over in Defense, ISA. He later was involved with the Pentagon Papers and is head of the ACLU now. I can't remember his name. At the time, he was a rather young man, I think around thirty, although he was a Deputy Assistant Secretary. He helped swing part of the military around, although the military were never very enthusiastic about this. Until the very end, I think, the CINCPAC Commander, Admiral Sharp, opposed it. But the civilian authorities in Defense gradually swung over to the view that it wouldn't be the end of the world. We were also concerned, of course, of what Congress would say. In the end, the Congress was much more sympathetic than we had thought. We were concerned about some of the economic arrangements involved in the reversion, but Congress seemed to be rather disinterested about the American business community and their rights.

Then, in the negotiations, we got some good words from the GOJ on the use of Japanese bases in the future, particularly in the event of a Korean eventuality, and to a lesser extent, in the case of a Taiwan eventuality.

Q: This was the terminology, an eventuality?

STRAUS: Well, I think the word was contingency. It has been a long time.

WILLIAM H. LITTLEWOOD
Science Attaché

Tokyo (1967-1970)

William H. Littlewood was born in Detroit Michigan in 1924. After serving in the U.S. Army during World War II he completed his B.A. at the Univeristy of Florida and his M.A. at the Univeristy of Michigan. He joined the Foreign Service in 1960 and served as a Science Attaché or Counselor in Sweden, Japan, and Indonesia. He also worked in the NASA Foreign Relations Office and as the Associate Director of Science and Technology for USAID. Mr. Littlewood was interviewed in 2001 by Charles Stuart Kennedy.

Q: You went to Tokyo. You were in Tokyo from...?

LITTLEWOOD: That Science Officer position opened up in 1967. Late '67. They pulled me out of NASA back into State to be their oceanographic officer as I mentioned before. There was an interagency Committee on Oceanography, so I represented State at that. The White House had a "Marine Council chaired by the Vice President." So I backstopped that. The State representative had to be the Secretary or the Under Secretary of State. They couldn't go any lower than that. U. Alexis Johnson was Under Secretary at that time. Later he was Ambassador to Japan. It was a very good experience, so I sat in on some of those Council meetings. And did the background work and other interesting things within the oceanographic field, from an office chair, not a ship...

Q: Concerning oceanography, was this at the time we're talking about, the late '60s and all, was oceanography becoming more and more of a shared, open knowledge both with Europeans and also the Soviets and others?

LITTLEWOOD: Absolutely. In the Antarctic we had complete cooperation between the Soviet Union and the U.S. The Antarctic Treaty was the only treaty that we had in common with the Soviets. Our Congress was very happy to have that treaty going because it was something that they could point to.

Q: In Tokyo you were there from when to when?

LITTLEWOOD: '67 to '70.

Q: What were you up to?

LITTLEWOOD: There, the same job as Sweden. To meet oceanographers and other scientists there and work with whatever came up with a scientific content. The U.S. had a special cooperative arrangement with Japan, run on our side by the Department of the Interior. It had about twelve different panels. One would be on forestry, another one would be on oceanography, rain sciences, another would be on earthquake resistant building, another on water pollution, etc. In fact, the water pollution meeting occurred first ten to fifteen days after I arrived. So I was helping it to be arranged from the Japanese side and the American side. I was the intermediary. I would help the American side arriving, meet their planes, pass customs, etc. We could tell the late arrivals, "You forgot about the dateline." [laughter] Other problems were when we wanted to

substitute somebody, and I'd have to report that to the Japanese and see if they had any objections, or if they had any suggestions. Then I would sit in on the meetings and help the American delegation any way that they needed. Maybe we'd have eight people on the American delegation, all water pollution experts, representing both government and non-government, e.g. from a university. So my first real view of Tokyo was with the water pollution field trip going up the canals in Tokyo, and I would just think about, here I'm seeing downtown Tokyo, through their polluted canals. I hadn't really settled there in Tokyo. I was living pretty close to the Embassy and really hadn't traveled around the city. And our delegates would say, "Wow, look at the pollution coming out of that thing." All that hydrogen sulfide. That comes from so and so. It was kind of a different first view of the city.

Q: Japan was just really getting cranked up for the Japanese miracle about the time you arrived.

LITTLEWOOD: I guess one could say that. My focus was on the science side and we had lots of counterparts. The Japanese had a station down in the Antarctic and they were planning certain things like over the ice travel to the South Pole. They needed fuel depots and things like that. They had to depend on the U.S. for many things. When they get to the South Pole they'd be out of fuel but by pre-arrangement they could get enough fuel from us to get back to the coast and their ship. So I was really able to help. I was the perfect person for them, as I knew all of the U.S. senior people in the Antarctic. They were my friends after four years. So I could arrange all of that for them. I did that, and I met all of their oceanographic people, I gave a talk at a breakfast meeting at the Japanese DIET about research on manganese nodules on the deep sea floor, which could be dredged up. This is possibly a new source of manganese but what environmental harm does it do?

Q: Now, did you tell them what you were doing or did...?

LITTLEWOOD: I could give them new information that had not yet gotten into the literature. I could talk because this was a cooperative program; what's going on, what we were working on in our laboratories and in the field. My focus is to help anything that can promote joint cooperation in the scientific fields in both countries.

Q: We were all terribly impressed by the Japanese manufacturing and Japanese system which was beginning to develop: automobiles, electronics, and all that. And it was beginning to get started while you were there, wasn't it? Did you find that the Japanese were more into practical science or experimental science, I mean how did you find it?

LITTLEWOOD: Of course much of that technical activity comes over to the commercial side and that's not in my field, but I was quite aware they were becoming competitive in automobile production. They took away our business by making a better automobile, I presume. And they took away from the Germans their earlier optical leadership; think Zeiss. The Germans made nice lenses, they were the greatest in the world - and suddenly they come up against the Japanese. Cameras and microscopes and other lens-related instruments. And the Japanese did this just by their own ability, and probably Japanese government money, too.

Q: Were we working to find out, you know, sort of the reverse of that side, to find out what fields

the Japanese were working in to get information back to the United States?

LITTLEWOOD: I think that the industrial companies themselves would have their representatives over and could do a better job of that commercial intelligence. I don't remember anybody in the Embassy focusing on a large scale of that, obviously it's part of the commercial and economic side of the Embassy, not science. We were promoting cooperation to advance science.

Q: But it was more, we were relying on sort of the powerful American business side to take care of this. How about Japanese going to the United States to study, in the science field?

LITTLEWOOD: There was a certain amount of that but I don't remember it being a big factor. I think Japan did a lot of just-on-their-own. Of course they started from scratch. When you've got a big factory that's all tooled up for the latest model it's hard to change, I suppose. When you've got a *new* factory you can tool it up for a new model right away. Perhaps that's most of Japan's big advantage, in that they don't have to change Detroit around. Their government obviously has more input and power. I can't imagine the U.S. Government dictating the design and price of a car.

Q: It took about twenty years to get Detroit to get back into full competitive swing.

LITTLEWOOD: Even then, the Japanese still have an edge I think with some of the cars, in that they are more efficient, less likely to break down, I'm not into that field, but I have a Toyota Camry. Car and Driver says it's the best car.

Q: Well, I've got one. It's about eight years old.

LITTLEWOOD: Mine is five years old.

Q: When looking from your vantage point, were we looking at what was going on in China at all, from the Tokyo perspective?

LITTLEWOOD: No, I certainly was not involved at all in anything like that. We had enough science activity between the United States and Japan to keep us busy. The Antarctic cooperation was very profitable scientifically, to them and to us. One of the groups under our science cooperation agreement that came over was the Forestry group. This was great cooperation. And Ed Cliff, the U.S. Chief Forester through three administrations, was the head of the U.S. Forest Service and Chairman of the U.S. forestry team. He was a very nice guy. I went with this Japan-U.S. forestry group on their field trips in Japan and would sit in on their meetings. It was a very good education for me, too, plenty of different viewpoints. Then there was something that influenced me later in my work. I earlier mentioned a group on earthquake resistant construction. The Japanese had a "shake table" where they could build a module of a house or an apartment or something, and give it various earthquake shake forces to see where the cracks began, and how they spread. They then could figure out from an architectural viewpoint how you could strengthen the construction so that particular motion, the lateral motion of the earthquake, will *not* bring the building down. And they, the Japanese, were doing this because they were about to

build a lot of modular housing. There were to be a hundred apartments, a hundred of the *same* all along the street or elsewhere, all low-cost housing. So they would take various designs and test a model of each from an earthquake viewpoint, before they built a hundred or a thousand of them. That makes a lot of sense. So I gained expertise, I later visited our National Bureau of Standards, now called “NIST,” the National Institute of Standards and Technology, which was a leader in U.S. delegation to Japan on this subject. They were very good. They were also working on this earthquake-resistant construction on our side. I was made very aware of this and later in my story we’ll get to Indonesia. Indonesia has earthquakes and volcanoes and in some earlier work there I actually used that team from NIST. I was then with USAID.

Q: Were the scientists, Japanese scientists, well supported by their government?

LITTLEWOOD: Yes, yes they were. And I had no problems, in fact I have not had any problems in my career with cooperation with the other scientists. It’s been a great job.

WILLIAM J. CUNNINGHAM
Political Officer
Tokyo (1968-1971)

William J. Cunningham was born in California in 1926. After serving in the Navy from 1944-1947, he received his Bachelor’s degree from the University of New Mexico in 1948 and his Master’s in 1950. He joined the Foreign Service in 1949 and his career has include positions in Prague, Paris, Tokyo, Taipei, Phnom Penh Saigon. Mr. Cunningham was interviewed by Charles Stuart Kennedy on March 17, 1997.

CUNNINGHAM: We finally got to Tokyo, March 1968. Skip Purnell was acting political counselor at the time, I believe. I settled into my job as director of external affairs in the political section of the American embassy in Tokyo.

Q: You were in Tokyo from 1968 until when?

CUNNINGHAM: March 1968 until June 1971. This was a significant period in our relations with Japan because the main thing we were doing at that time was to prepare for the retrocession of Okinawa to Japanese administration. As a result of the settlement, the San Francisco Peace Treaty and the understanding reached at that time, the U.S. would continue to administer Okinawa which we acknowledged was sovereign Japanese territory, but the governor of Okinawa in effect was an American. I was not involved in the negotiations that ended this arrangement.

Q: That was Dick Sneider’s jewel wasn’t it?

CUNNINGHAM: Yes. When I got to Tokyo, David Osborn was the deputy chief of mission and U. Alexis Johnson was the ambassador. This was the third time that I had worked with David

Osborn. He had been my boss in Sapporo when I was vice consul. He had been my boss in Taipei when I was second secretary in the political section and he was political counselor, and now he was the DCM, and I was First Secretary of Embassy. That was a grand opportunity to work with an old friend and somebody who I respected very much.

The other interesting thing was to work for U. Alexis Johnson, who was a veteran ambassador and East Asian hand. There are two things that I remember about U. Alexis Johnson that I think are important to recall.

He had a reception every month at his residence for all the new arrivals to the embassy to welcome them. It was just for us with nobody from the diplomatic community at all. He and Mrs. Johnson would welcome us as friends and colleagues and members of the family. There would be a little socializing and after a while the ambassador would ask everyone to sit down and he would give us a little talk about how to get along in Japan. He said that he realized that most of us didn't know Japanese and that it was a difficult language to master and that there were many things about the formalisms of Japanese life that were somewhat off putting for foreigners. But, he said that there are a couple of things he had learned that always helped him get along in this country. "The first thing is when you are going out anywhere make sure you always have a notepad and a pencil in your pocket. Japanese know English, they study it from the third grade, but very few of them speak it well. If you speak to them in English they are going to get terribly flustered and embarrassed because they don't know how to answer and they will think they don't understand you at all. So, there is a mental block that develops. What I have learned is if you have a question you want to ask a Japanese write it down. They can all read very well. They will understand it and be much more at ease. Then they will either answer you in spoken English or they will write down the answer for you. In any case, they will accommodate you and take care of you because they are very kind to people who are guests in their country." He then said that a good way to break the ice with the Japanese is to ask them something about their country or their home town or where they come from, who they are, that kind of thing. Ask about something that is in their background. That is one image I have of U. Alexis Johnson, a very wise man, I think, with a lot of experience about how to get along in a foreign culture.

The second thing is a little episode early in 1968. We had already worked out the retro-cession of the Bonin Islands to Japan. Those are the islands where Iwo Jima is located. They too had remained under U.S. administration along with Okinawa after the San Francisco Treaty. Somebody, probably Dick Sneider, then still country director in the Department, engineered this retrocession, decided that it would be a good idea to use the Bonin Islands as a test case for the return of sovereign Japanese territory to Japanese administration. The Bonins were unique because the people who lived there are not Japanese, they are kind of the offspring of whoever was on the islands in the first place and co-mingled with people who got shipwrecked or somehow ended up there. We wanted to make sure that their interests were taken care of. That was part of the negotiations that we conducted with the Japanese. The Japanese understood very well that this script was a dry run for the retro-cession of Okinawa.

So, it came time to execute the press release for this and that had to be cleared by Washington, DC. One of my colleagues drafted a suggested press release, Rodney Armstrong, a Japan specialist, Japanese language officer. He was in the section of which I was in charge so it fell to

me to take this draft up to Ambassador Johnson to be approved. I read it over and there was something in the text that was a bit obtuse in the sense that you could infer from the press release that this was making a comparison to the eventual return of Okinawa, but it wasn't explicit. I was puzzled by this. I was newly back to Japan and not fully tuned in to the subtleties of life and diplomacy there. I thought to myself, why don't we just come out and say explicitly what our purpose is. Why leave people guessing? After all it is an American press release.

I took it into the ambassador's office, it was mid day and he was sitting behind his desk, which was absolutely clear, nothing on it. He was smoking a cigarette and reading a book. I was struck by that and thought, hmmm, here is Ambassador Johnson heading up this big embassy with 30 government agencies represented and he is just reading a book and taking it easy in the middle of the day while everyone else is slaving away, working hard. I gave him the telegram and he read it over and said, "What do you think of it?" I said, "Well, you know, Mr. Ambassador, I am kind of puzzled as to why we are not more explicit and direct here about the Bonins being a dry run for the Okinawa retro-cession." He looked at it and then at me with those twinkling blue eyes of his and said, "Oh, I think it is better to leave things of this kind to the imagination rather than to come out and be too direct about them," or something to that effect. He said, "I sort of side with the French style of diplomacy in matters of this kind." I said, "Okay."

Later on I mentioned this to somebody. I said, "You know, the ambassador was up there reading a book and as soon as he signed the telegram went back to reading the book." And somebody said to me, "That's his style. He doesn't get involved. He counts on us to know our jobs and to attend to them. His style is, if you need help, he will get involved. When his help is no longer necessary, if you let him know that, he will get uninvolved. He is depending on his staff to be professional enough to carry off its job on its own." I thought, "Well, that's a pretty good boss to have. He will backstop you if you need but he is not going to interfere in something if it is unnecessary. He saves his heavy ammunition for the big battles." So, I admired that very much in Johnson.

My work during those three years in the embassy involved three things. My work was liaison with the ministry of foreign affairs. There was not very much English spoken outside the ministry of foreign affairs in Japan in those days except in the very small international community and I did not know Japanese. I had the hope when I went there that I would be able to develop capability in Japanese since I also knew Chinese very well. That is to say, the written language should not have presented much difficulty for me. If I could learn the spoken language reasonably well then I hoped to be able to develop a capability in the written language also. So, I took the 100 hour intensive course in spoken Japanese that they used to offer in the embassy. After that it was up to me to take an occasional lesson. The short of it is, I never developed a spoken Japanese capability. There was so much work to do that I simply could not find the time or the energy to invest in the homework that I had to do in order to develop a capability in spoken Japanese. That was a disappointment for me that I wasn't able to do it. People told me that wasn't unusual because it is a very difficult language and I certainly believe them after that experience. But, as a result I was restricted pretty much to the diplomatic community and the ministry of foreign affairs as far as my work was concerned with Japan at that time.

Our policy at that point was to make the Japanese as fully our partners in diplomacy as the

British were. That was the slogan. In other words, we shared everything with the Japanese. This was just the beginning of that period. So, every day I would look over the incoming traffic and the telegrams to see what issues we had internationally in the world at large that we wanted to tell the Japanese about. We wanted them to know our position. It was not necessarily issues that related directly to Japanese interests or U.S. interests. It would extend to matters that involved our global interests and the whole broad scheme of international affairs.

For example. I cultivated the head of the Middle East desk and would go over and talk to them about what we were doing in the Middle East, what was going on, and what the Japanese assessment of developments in the Middle East might be. The Arab-Israeli war of 1967 had just taken place and how did the Japanese see this situation and how we saw the situation, etc. The same thing with Africa and to some extent with Latin America, and, of course, particularly with regard to China and Southeast Asia. Herbert Levin was also in that section and he was a China specialist and during my time there mainly handled China issues with the Japanese.

Another issue that was going on was the non-proliferation treaty (NPT) at the time. I spent a lot of time talking with the people in the arms control part of the foreign ministry about this treaty and what we were doing and trying to persuade them that Japan should become a signatory of the NPT. There was resistance on the part of Japan at that time to adhere to the NPT. The question being raised, particularly on the political right, in Japan was that by adhering to the treaty the Japanese were giving up a nuclear option. They were sacrificing something that would be important to their national interests. This was the argument that was being made in political circles in Japan against adherence to the non-proliferation treaty. But, I think the real reservation on the part of the Japanese was that they were sympathetic to the argument of the third world countries which was, "well all right, if we are going to forswear the position and development of nuclear weapons there has to be some progress on the part of the nuclear weapons powers towards nuclear disarmament." The Japanese as a result, became active in the subsequent modification of the draft non-proliferation treaty to impose that obligation in the convention upon the major nuclear powers –the U.S., France, Russia and the UK. So, that was really the point. I can't remember specifically any conversation where this was made explicit to us, there may have been. Herb and I were both doing this work with liaison with the foreign ministry. But, certainly, and I am sure I did some reporting at the time or Herb and I did together, that made it very clear that this should be inferred from what the Japanese were saying to us and that indeed that did represent their bottom line position in regard to the NPT....

Q: What was your impression of the Japanese Foreign Service and foreign ministry?

CUNNINGHAM: They were super. I never worked harder in my life then I worked in Tokyo. At the end of three years I was very tired. But in all of these comparisons of batting order that we used to make about international affairs every day when I go over to the Ministry of Foreign Affairs, I never told them anything new that they didn't already know. They knew everything just as quickly as we did. We had different understandings and interpretations and they and we were both interested in knowing what each other thought about any issue at hand. We were kind of confirming each other's analyses and confirming the details with one another. At the end of one of these conversations, I would go back and report to Washington what the Japanese had told me. In other words, it was another perspective on that particular issue. I never surprised them and

I'm happy to say they never surprised us either in any of these exchanges, but we always learned something from one another. I came to respect the Ministry of Foreign Affairs very, very highly.

The quality of the diplomatic corps in Tokyo was absolutely first class. We had world class people in all the embassies there. It was a real privilege to work with people in the German embassy, the British embassy, the French and all the rest and even the Soviet embassy, with whom we worked from time to time. They were knowledgeable, able people who were first rate diplomats. So, you get to be a good player by playing with the champions, and it was a great opportunity for me to work in that embassy.

**WILLIAM SHERMAN
Principal Officer
Kobe/Osaka (1968-1970)**

**Counselor for Political Affairs
Tokyo (1970-1972)**

William Sherman was born in 1923 and raised in Kentucky. His career in the Foreign Service included posts in Japan, Korea, Italy, and Washington, DC. He was interviewed by Thomas Stern on October 27, 1993.

Q: After the War College, you were assigned to Tokyo. Was that your choice?

SHERMAN: I had actually hoped to go to Seoul as the Political Counselor. I had just received a promotion to FSO-2 while at the War College which made me eligible for that assignment. I had been in Korea many years before, as I described earlier. Bill Porter became Ambassador in the Summer of 1967. He had been part of the U.S. delegation headed by Hubert Humphrey that went to the Park Chung Hee inauguration the year before. As I mentioned, I had worked on the preparation for that visit and had accompanied the delegation. So I met Porter on that trip and I took the opportunity to tell him I was interested in that job -- he had already been announced as our next Ambassador by that time -- even though I was not eligible for an assignment until the following year. Sending a newly appointed, but not announced, Ambassador as part of a delegation made matters a little tricky for the Chargé who at that time was George Newman. In any case, Porter eventually chose Dick Peters for the job of Political Counselor and then the Bureau offered me the job as Principal Officer at Kobe-Osaka. As it turned out, that was probably the better assignment for me in any case.

The Consulate General at Kobe-Osaka in 1968 was approximately 10-12 Americans. The Consular Section was in Kobe and the Administrative Section moved from Kobe to Osaka and back. The Economic Section was in Osaka. I worked in Osaka primarily because that was the location of the World Exposition which as my main focus for the years I was the C.G. All of the other normal activities of the post really took second place.

It is somewhat unique in the Foreign Service to have a Consulate General with two main offices,

separated by roughly thirty miles. I did not travel very much between the two offices. My predecessors and successors tended to use the office in Kobe to a large extent because it was more spacious and far more pleasant and the commute from the CG's house was far better. But since most of my time was taken up by the Exposition, I stayed in Osaka most of the time. Kobe didn't need any "hands-on" supervision, although, as I said, I would occasionally visit our offices in Kobe. I did travel to Tokyo and to prefectural capitals in my district.

The Consul General in Kobe-Osaka is a unique assignment under any circumstances and was even more so while I was there because of the Exposition. Osaka historically and traditionally was the business center of Japan. All of the large industrial combines -- Mitsubishi, Sumitomo, etc. -- had started in Osaka and had kept their roots there. By the end of the war, it became apparent that Tokyo would become the center of Japan. So the CEO's and business leaders, while maintaining their homes in the Osaka area, spent most of their time in Tokyo because that became the center of commercial activity. All of these business leaders maintained a sympathetic and sentimental attachment to the land of their forefathers. Therefore, when the U.S. first established its posts in Japan right after the War -- i.e. the diplomatic branches of the Military Government -- Osaka was a natural place for a presence. Osaka was one of the Japanese cities that have a special designation -- along with Kyoto and Tokyo (as illustrated by the fact that the Tokyo city administrator is a governor, not a mayor). The Osaka is a *Fu*, which is a higher rank than a *Shi*, which is the next level. Kobe, however, also merited attention. There always existed great rivalry between Osaka and Kobe. They are in two different prefectures. Traditionally, the U.S. had had a presence in Kobe because it was a major port. After the War, Osaka also became a major port. It became clear to one of my predecessors that having only a presence in Kobe was insufficient; so the Department rented space for him in Osaka and gradually the post became known as Kobe-Osaka. While I was there, we requested that the post designation be changed to Osaka-Kobe as an indicator of the changed importance of the two cities. Kobe, of course, was greatly distressed by the change, but I felt that the new designation was a far more accurate description of the situation on the ground. Nevertheless, I still had to deal with two sets of Japan-American societies, two sets of city government officials. I suppose that a foreign Consul General in Minneapolis-St. Paul might face the same problems, although those two cities are closer together than Osaka and Kobe were. I had to do a certain amount of representation with the city officials of both municipalities, but there was very little if any official business conducted. That just wasn't necessary and I kept it to the bare minimum. There were consular corps in both cities which had to be periodically called out for some civic function or other -- building dedication, ribbon cutting, Miss Kobe contests, etc.

We built a beautiful new Consulate building in Kobe. It was clear from the beginning, even before people moved in, that this was a summer palace. It never was fully utilized; it always had empty office space. Many of the rooms intended for offices became storage space. It was a great waste of money. During my tour as C.G., I continued the efforts started by Owen Zurhellen to consolidate staffs so that we could all be together in one city, which had to be Osaka. Long after my departure, that consolidation took place; we now are only in Osaka and the office building in Kobe has been sold -- to finance the new building in Osaka. Because of the Japanese tax system, which charges you by the ground square footage, we wound up building a very beautiful tall square edifice in Osaka. So in summary, U.S. representation started in Kobe, slowly over many years shifted to Osaka and is now entirely in Osaka. We still do some consular work in Kobe,

trying to help the shipping and travel industry, but our base is in Osaka.

My principal contacts were the business people in Osaka. I spent a lot of time supporting the American business community, which consisted of 60 or 70 people involved in joint ventures or building nuclear plants, representing 40 to 50 companies. There was a branch of the Japan-American Chamber of Commerce in Kobe-Osaka, I thought the Americans needed more support than they were getting from that source. So I worked hard at keeping them aware of what was going on in the foreign policy arena. The American companies had already penetrated the Japanese market by the late 60's. We had American banks -- e.g. the Bank of America -- American businesses -- e.g. Goodyear-Sumitomo, Dupont -- accounting firms, airlines, services - - e.g. Northwest and Pan American -- construction companies -- e.g. General Electric, which was building a nuclear power plant.

I did a lot of traveling, doing representational work. The consular district was very large, covering fourteen or fifteen prefectures, covering the island of Shikoku and on the main island, almost from Hiroshima to Nagoya and from the Pacific Ocean to the Sea of Japan. Hiroshima was of course a place of concern; it was politically sensitive and we tried very hard to keep good relationships with that city and the Atomic Bomb Casualty Commission, which consisted of 50 or 60 Americans who worked there. There were many missionaries in our consular district, most of whom lived in the rural areas. I started a program in which I and one of my staff would spend a day in one prefecture, trying to explain what the American Consulate General could do for the locals in terms of services. That included not only consular services, but also trade assistance for those Japanese that wanted to trade with the United States. That program was not always successful, but I think it provided the Japanese a better understanding of why an American diplomatic establishment was set-up. I have mixed feelings about the role of constituent posts. It is not always clear to me that they are always necessary; it depends largely on the country whether they are effective and how useful they are. In the case of Osaka-Kobe, it was a very productive operation. We used to issue three or four million visas each year; that was when we still required visas for all visitors to the United States. The staff that handled that work-load consisted of only three Americans and five or six locals. It is true that most of the visas were for visitors, there were only a few immigrant visa cases processed. What helped us, of course, was the assistance of the travel agencies which filled out, or had filled out, all the basic visa application papers. They used to bring these large batches of applications for the groups that they were taking to the United States. Without the travel agencies, I don't think we could have handled the work-load with such a small staff. Many of the Japanese used to go on group tours to Hawaii or Guam; some went to the United States, mainly to the West Coast. These tour packages were relatively cheap and the Japanese are great group tourists. The large number of visitors was an indication of the economic recovery that Japan enjoyed twenty-five years after the War. The tourist agencies would charter a JAL plane, loaded it with its customers and off they went to an inexpensive hotel. It was not very expensive, but there were enough Japanese by this time who could afford that small expenditure so that the visa issuance work-load was very high. The yen in the late '60s was still 360 to a dollar -- those were the great days for us.

The Osaka-Kobe consular district was also very busy on commercial matters. The two way trade between that district and the U.S. was almost as large as the U.S. trade with the Common Market. The two-way trade at the end of the '60s was very large. The trade deficits were not yet

the problem they were to become, although we could see glimmers of difficulties ahead. Much of the export from Osaka-Kobe were textiles; it also exported metals, minerals, pharmaceuticals and other manufactured goods.

Q: Tell me how it felt to be a United States representative when you visited Hiroshima -- the site of our first atomic bombing?

SHERMAN: It was a remarkable experience. In Hiroshima then and even today, one can clearly see some of the destruction caused by the bomb. You can always see the ruined dome which was the site of a pre-war Exposition. You can see the Noguchi mausoleum, a memorial for the hundreds of thousands who died. That is a site that everyone visits, and the Japanese burn incense or deposit paper cranes in front of it. There is an Atomic Bomb Museum that has horrifying exhibits of the many types of damage that was done; however, the exhibits are crowded and rather poorly presented -- I understand it is better today. Most of the exhibits were in large glass cases so that the horror was not as fully exploited as they might have been. Around these terrible reminders of a terrible catastrophe, the city has developed into a hustling, bustling community with a major automobile plant -- Mazda had its headquarters near Hiroshima. By the late '60s the city had been rebuilt and was functioning well. As was true for all cities that had been bombed, Hiroshima was rebuilt in a much more sensible fashion with a grid, much more able to handle modern traffic than it could have managed had it remained as it was pre-war. While I was Consul General, the prefecture had a young, active governor who compared himself to John Kennedy because he had also commanded a PT boat and was about the same age. Hiroshima had one of the most active America-Japan societies in my district.

There was an American Atomic Bomb Casualty Commission which consisted of scientists studying the genetic after-effects of the radiation created by the bomb. That Commission had records on everybody who was anywhere near the epicenter, how far away they had been at the time of the explosion, etc. The Commission gave an annual physical examination to each victim. Even though working in a country like Japan, where autopsies are rare and seen as irreverent, the Commission conducted autopsies as the victims died; the local population willingly supported this deviation from their social mores. All the information was on computers. The Commission increasingly became a joint operation until today it is almost entirely Japanese managed and staffed. In my days, the Americans were in charge of the Commission and as I mentioned before, we had about 50-60 doctors and public health experts living in Hiroshima.

The Hiroshima population was warm and friendly. It was extraordinarily cooperative, even more so than in other Japanese cities. I don't want to underplay in any way the devastation that the atomic bomb caused, but Hiroshima was not taken over by drum-beating, placard-waving peace activists that might be expected and that could be seen in other Japanese cities and sometimes at international disarmament conferences where they became self-appointed advocates for "Hiroshima victims." Of course, there were many Hiroshima citizens who had strong opinions on disarmament, but they were not the disruptive publicity seeking kinds that one found elsewhere. The United States was not criticized because it had dropped the atomic bomb. We were perceived as Japan's allies. The US presence in Hiroshima, which consisted of a small USIS library in addition to the bomb Commission, was very welcome. I used to go to Hiroshima frequently because I arrived in Osaka-Kobe two years before the 25th anniversary of the

bombing which was 1970. Alexis Johnson, then our Ambassador to Japan, had not paid an official visit to Hiroshima; soon after my arrival, I organized an Ambassadorial visit. So I was in Hiroshima within the first two weeks after my arrival in Osaka-Kobe. Reischauer had, of course, been there earlier; I think he visited almost every prefecture in Japan. But I am not aware on any special attention that the U.S. establishment in Tokyo paid to Hiroshima also Reischauer may have done something special because he was the kind of person who would have thought in terms of Hiroshima's history. But in general, our Ambassadors didn't have the time or resources to devote too much attention to Hiroshima or most cities outside of Tokyo. I found Hiroshima fascinating; I felt some inspiration when I saw how the people had risen from a devastating blow and had turned their tragedy into into a positive asset. The bombing was part the city's history, which they respected, but they would not let that dominate their lives. They built a vibrant economy and looked to the future and not the past. They were more interested in re-establishing a major industrial center than in wallowing in their past.

In general, the Japanese were remarkable for overcoming their major military defeat and the scars, both physical and psychological of war. It was not so much a matter of "forgiving and forgetting" as it was a matter of perception of life as a continuing and moving experience. Events both positive and negative happen; they can not be denied, but the present and the future are more important than the sanctification of the past. The Japanese are known for their ancestor worship which is an integral of the Confucian tradition. They do not have a central and dominant religious belief -- certainly not an institutional one. Shintoism revolves around propitiation of natural deities, many representing various natural forces like wind and fire. It is not an ethical system. Confucianism is the ethical system that dominates Japan and Korea. It does not have a Supreme Being at its center like Buddhism, but it is more oriented to giving some structure to daily life. Buddhism centers on the search for perfection and the "after life". The three philosophical strains co-exist in Japan and often reinforce each other as the same person may show allegiance to two or all three strains. You are born Buddhist and you die Buddhist -- there are ceremonies for each. You are married in a Shinto shrine, but you live as a Confucian. Christian penetration of Japan has been minimal; its adherents have remained at about the same number since the 17th Century -- about one million, mostly Catholic. Protestant missionaries have had relatively little success in Japan unlike Korea, where they did have an impact. Japanese do not worship every week; there are holidays that are important, but religion as we know it is not a central theme in Japanese life. Many have a family shrine which is used for offerings to ancestral gods, but Japanese life does not revolve around religion.

Q: You mentioned earlier that the International Exhibition became your predominant occupation soon after your arrival in Osaka-Kobe in July 1968. Were plans already underway for that major event when you arrived?

SHERMAN: The planning for the US participation were well underway in Washington. Howard Chernoff had been named as Commissioner-General and had assembled a staff, under the aegis of USIA which was the lead agency for the Exhibition. He spent some time in raising private American financial contributions which are always necessary if the US is to make any kind of showing. He also supervised the architectural work for the US Pavilion. There was also a small staff already in being when I arrived in Osaka detached from the C.G. devoted to this major enterprise. It was going to be a big deal. Every major company was going to have at least a

booth. The local Chamber of Commerce, the Rotary club and other organizations were entirely focused on the Exhibition, even though it would not open for another two years. There was a large clock in the center of Osaka which counted down the days until the opening.

Ground had not yet been broken for the US Pavilion; so I was there for the first shovel-load. Chernoff moved to Osaka in 1969. I had some experience with Expositions since I had been involved in the closing of the one that had been held in Brussels. I had noticed that Commissioner-Generals and Ambassadors seemed always to be at odds about who was the chief US representative. I was determined that such a situation would not occur in Osaka and that the State Department and Exposition staffs would collaborate fully. There would no competition for being "top dog". I saw the Exposition as a tremendous opportunity for the United States which I was not going to have messed up by "turf" warfare. There was enough work to go around for everyone. The CG was besieged by a steady stream of visitors, most of whom knew little about Japan and we anticipated having to help a lot of visitors with the usual traumas of unpleasant incidents like lost hotel reservations, lost belongings, thievery, etc. The Exhibition was scheduled to last 6-8 months, which meant that there would be an extended period of visitors, whose potential problems would be the responsibility of the Consulate General, while the Commissioner-General could concentrate on the problems of the Pavilion and the exhibitors. I called on Howard before I left Washington and then I hosted receptions for him once he had established his quarters in Osaka. So we developed a very close relationship. He was sensitive to my problems as I was to his. We tried to have our respective staffs mingle so that there was good cooperation at that level as well. In the end, I think our efforts paid off.

My days would start with a drive to our building in Osaka, which always took over an hour since I lived half-way between Osaka and Kobe. It was a long commute, even though most of it took place over a super-highway; even in those days, traffic was bumper to bumper -- "natural clogging" as the Japanese would describe it. Then I might have a luncheon engagement in Kyoto which was 30-40 miles away. That was another hour's drive. After lunch, I might go to Senri Hills where the Exposition was being built. Although there was good public transportation available, my schedule was such that I had to use the car and I spent much of my time just going from one engagement to another. I think I was in my official car on an average of 100-150 miles each day I was in the Osaka-Kobe area.

The Exposition kept me very busy. I had to represent the United States at every ground breaking ceremony, at every national day and at every reception for a Japanese or foreign VIP visitor -- e.g. when Prince Charles of Great Britain or the twin sister of the Shah of Iran appeared. These social occasions invariably took place at the Exposition grounds, not in town, which meant another long round-trip. Sometimes, the foreign visit coincided with a national day celebration. Then we would send special groups to the Exhibition like Ozawa and the San Francisco Symphony; they performed at the Osaka Festival Hall. At one time, there was a film festival in honor of the Exhibition. All of these events required me, as the Consul General and the senior U.S. representative in the area, to attend some social event, unless of course I was sick or out of town. It would not have been acceptable to send a substitute. That made for a huge representational work-load, most of it meaningless and unproductive, generated primarily by the Exposition. All Consul Generals have some representational work-load, but nothing compared to one who has a major international exhibition in this geographical area. These continual social

requirements started sometime before the opening of the Exposition and during the Exposition, which lasted for several months, as I have mentioned earlier. My representational responsibilities were not lightened at all by the presence of a U.S. Commissioner-General. Protocol required that we both attend this endless series of social occasions.

When I first arrived in Osaka-Kobe, I tried to establish a "management by objectives" system for the Consulate General. The consular program of course was already well established and ran smoothly and didn't need much of my supervisory time, despite the fact that we were the second largest visa issuing post in the world -- Tokyo was the largest. Political and economic reporting was not a major concern, but commercial work was important. That usually consumed the work of two American officers and several local employees. The Exposition certainly increased the Commercial Section's work-load just because more American businessmen came into our district and requested information about commercial opportunities. Franchising was becoming an important aspect of business opportunities at the time. It was about this time, for example, that Kentucky Fried Chicken started in Japan with a concession at the Exposition. That was the start; other American firms soon followed with their outlets. The Commercial officers were very much involved in helping the American franchisers establish their networks in Japan. We also worked closely with the American business community to help them expand their investments. The Exposition did not have a major impact on US-Japan trade which was already well developed.

The Exposition and related activities became a major factor in our work-loads. My deputy, Rod Armstrong, put together a loose-leaf notebook, in both English and Japanese, that was intended to assist American visitors. It included such information as doctors, attorneys, hotels, restaurants, etc. A copy was available at the front desk of all the hotels in town for the use of Americans with questions or problems.. If the guest needed any services and if he or she couldn't communicate, the hand-book was intended to overcome the language barrier. As it turned out, it was not needed nearly as much as we anticipated. We did a lot of contingency planning, but in the final analysis, we found out that the Japanese were well organized and we didn't encounter any serious problems. The most exciting event during the Exposition came when two of Czechoslovakian guides one night decided that they wanted to defect. They consulted with some of the other Exposition staff, including some American guides. The guides did not come to us and eventually changed their minds and went back to Prague.

The Exposition was a terrific boon to Osaka and to Japan as a whole, just as the Olympics had been for Tokyo and Japan in 1964. I was in Italy at the time, but I benefitted from the Tokyo Olympics because the Japanese rebuilt their city traffic paths; they built a super-highway system, which was the latest in urban planning although they have had to expand it several times since then. The Osaka Exposition did the same thing for the Kansai. A whole new network of highways and roads were constructed in and around Osaka. A whole new infrastructure arose on an amazing dimension, bringing with it thousands of jobs both in construction and other commercial enterprises. So the Exposition had an enormous impact on Osaka's economy as well as that of the region.

Q: I would like to ask about the CG's relationship with the Embassy and with the Department in Washington. Did you get much supervision from either?

SHERMAN: Not very much. In fact, I was surprised by the amount of autonomy I enjoyed. I had never been a principal officer before and it was the first time I was really on my own. I had expected closer supervision particularly by the Embassy. I was pleased that I was given as much flexibility as I did. I took pains to keep the Embassy informed of my activities and events in my district. Dave Osborn was the DCM to Ambassador Alexis Johnson and it was to him that I reported. The Embassy did not have a Supervisory Consul General -- a job that was often seen in the Foreign Service in earlier years. Dave decided that a monthly letter from each of the constituent posts was adequate for supervisory purposes. That enabled him to keep track of the major events around the country. If he had any special requirements, he would phone or write. We were in touch as necessary with all of the Embassy sections when we needed help or guidance. We had a close liaison with the consular and commercial sections especially. We had a branch USIA operation in Osaka, which was autonomous. We were quartered in the same building, but the Osaka USIA office was not part of the Consulate General. This was during a period when USIS was striving for maximum independence and didn't want to have any Department of State interference with its operations. I always included the USIS Director in my staff meetings so that he could keep abreast of political and economic events; we had a close social and personal relationship, but I never tried to give him any directions or guidance. There were USIS branches in both Kyoto and Osaka; the one in Kobe had been closed before I arrived. The one in Hiroshima was closed during my tour as Consul General. We cooperated and worked well together, but I was well aware of the Agency's concern about its independence.

Some of our reports went directly to Washington; others were submitted first to the Embassy. We received all material from the Department that was sent to all posts. We only had a limited telegraphic capacity.

I thought it was important for my staff to know what was going on outside of Osaka. So I instituted a system which permitted one officer to go to Tokyo each week as a courier. He would bring back copies of all the telegrams that the Embassy had received and sent in the previous week. We rotated that assignment throughout the staff so that everybody had an opportunity to go to Tokyo. Once the cables were in the C.G., they were held, under security protection, available for all Americans to read. We didn't have access to the very highly classified material, but the bulk of the telegraphic traffic was available to us. That enabled the staff to keep current on Japanese affairs, certainly, and other world wide events of note. It kept people from becoming too insular.

That courier run was also used to bring back some of the necessities of life. When I first arrived in Osaka, the Army had a small commissary which was available to State Department employees. It was small, but since the prices for certain basic goods were sky high on the Japanese market, the commissary played a very useful economic role for our staff. For example, meat and liquor, for example, were both very expensive and sometimes scarce on the Japanese market. For those of us with representational responsibilities, it would have been prohibitive to entertain very often if we had to rely entirely on the Japanese market. The commissary closed soon after my arrival, because the US military presence in Osaka or anywhere in our consular district was almost nil by 1968. So we started to order as a group large quantities of the necessities from the commissary in Tokyo. The courier would take that bulk order with him and deliver it to the commissary. We then contracted with a shipping firm to deliver the goods from Tokyo to us.

There was some rivalry between us and the Soviets at the Exposition. We used to issue bulletins about the number of visitors each of our Pavilions hosted during a period. There was no Soviet consular representation in Osaka. Their only presence was their Exposition staff. We had the better attraction because the moon rocks retrieved by our astronauts were on exhibition in our Pavilion. That was an exclusive; no one else had them. In general, our space exhibit was great. We showed the suits worn by the astronauts, the space modules they used as well as the space ships they actually had flown. The Soviets had huge portraits of Yuri Gagarin holding a dove and mock-ups of their space vehicles which seemed to lack credibility.

We had a constant stream of visitors to the Exhibition. They frequently were my responsibility rather than Chernoff's. There were some visitors who came just to see the Commissioner-General, but most were in Osaka under State Department auspices and that meant under my charge. I would take them around the Exposition. Then there were a number of Americans who had connections in Washington who, while being in Japan, thought they just had to see the Exposition. There were a lot of Congressional delegations. Even John Rooney with his usual entourage came. I was expected to shepherd the Congressional delegations. The Commissioner-General's office included two protocol officers who did nothing but take care of visitors.

I enjoyed my tour in Osaka. I think I left the staff more unified than I had found it when I first arrived. We started some recreational activities, like field event days with three legged races, tugs-of-war and other contests. We developed a Consul General softball team that played in local leagues. I worked hard to build morale which I think was successful. Even now when I return to Osaka now, the few local employees who are still there from 25 years ago, I am greeted warmly by them and that is very rewarding. We were fortunate to have a good local staff. Employment at the CG was prestigious even after the War and it was a long term arrangement. Our turnover as very small. That was true for the Embassy in Tokyo as well. When 30 and forty year service awards were handed out, the lines of recipients were long. I don't believe we had anyone on our staff who had worked for us before the War, but many of them stated with us right after the War. We did hire a few while I was there, but the turn-over of the Japanese staff was minimal. All of our staff were very good.

I was there for the whole Exposition run. On the last day of the Exposition, I transferred directly to Tokyo to take up my job as Political Counselor.

Q: That transfer took place in September, 1970, I believe. How did that transfer come about?

SHERMAN: Armin Meyer became Ambassador to Japan in mid-1969. He was not a very successful Ambassador in Tokyo. The Embassy's morale was very low primarily because of the demands that Mrs. Meyer put on the staff. He had not any experience in East Asian affairs. His forte had been the Middle East where he was Ambassador in Lebanon and Iran. He tried to transfer what he had learned in that part of the world to Japan and had very limited success. Although he tried hard and certainly did his best, Meyer didn't empathize with the Japanese; he didn't know them or their language. So Meyer was a "new man on the block". Both he and she had chips on their shoulders particularly with respect to the Japanese experts. So the Embassy was not a particularly happy place. I had an opportunity to meet him several times when he came

to visit Osaka and the Exposition. His visits were always major productions which place heavy demands on our limited staff. He came for opening day of the Exposition; he came when David and Julie Eisenhower were with us. Osaka was also the center of the Japanese textile industry and we were in the center of the US-Japan dispute about textile trade. So for all of these reasons, Meyer came to see us eight or nine times in the first year of his tour.

Meyer traveled a lot, but never visited other posts as often as he came to see us. We got along tolerably well during these visits. During one of the visits, he told me that Dick Ericson, his Political Counselor, was about to be transferred and he wanted me as the replacement. I told him that I would be pleased to take that assignment, but it almost came to nought when we had a major social misunderstanding with Mrs. Meyer. But that was overcome sufficiently that I did transfer to Tokyo. I accepted the job even though I knew the morale situation at the Embassy. I thought that problem was manageable, particularly for the Political Counselor.

My Japanese language skills were good since I had used Japanese often while in Osaka. No one is ever bilingual in Japanese because of the many different levels of speech which can exclude a foreigner from any particular conversation. But I could express myself in Japanese and be understood. I could get along in most conversations; my Japanese came back to me in Osaka even though I had not spoken it regularly for twelve years.

Dick Sneider was the DCM. He had come to Tokyo about the same time as Meyer had. Dick had been in the NSC working on Okinawa reversion. He was assigned to the Embassy to finish off that reversion issue. But the then DCM, Osborn, was due for transfer; so Meyer, who needed a DCM, decided he would take Dick even though I think they did not know each other. It was very unusual situation because in those days most Embassies had DCM's who were known personally to the Ambassador. But the Ambassadorial position had been left vacant for six months. I don't know for sure, but common wisdom was that the job had been offered to several people who turned the offer down. It was said that John Rockefeller had been offered the job as well as some other notables with Japanese experience or contact. The story was that Armin Meyer became available after his tour in Iran and Alexis Johnson, by now the Under Secretary for Political Affairs, suggested that Meyer be sent to Japan in the absence of any other acceptable candidate who was willing to go. Alex's view was that any Career Minister in the Foreign Service should be able to take any assignment in the Foreign Service. (Incidentally, I think that is a very defensible opinion.) And that is, according to the grapevine, how Armin Meyer ended up ended up in Japan. One night I got a call from Mr. Hotta, the head of the Sumitomo Bank, asking me whether I knew that a man by the name of Armin Meyer had been appointed to be US Ambassador to Japan. I told him that that sounded very strange in light of Meyer's unfamiliarity with the area. So I was surprised when the nomination was actually made.

Q: You had met Ambassador Meyer during his visits to Osaka. You knew the DCM, Dick Sneider. Who else was in the Embassy at the time?

SHERMAN: Herman Barger was the Economic Minister. He was followed by Les Edmond. Bill Wells was the Station Chief. Alan Carter had come to reorganize the USIA operation in Japan and therefore I knew him from his visits to Osaka. He changed USIA's presence in Japan dramatically, and in the process, of course, ran into some controversy. I knew almost all of the

staff in the Political Section.

The DCM and the Political Section staff were East Asian veterans. The Economic Section had a few East Asian experts, but little Japanese language fluency. In general, the Embassy was well staffed with Japanese experts, many of whom spoke Japanese. The Political Section was all fluent in Japanese.

Q: How were our relationships with the Japanese in the early '70s?

SHERMAN: They were good, even though the Vietnam war was still going on. There were a lot of anti-US student demonstrations -- it was almost a daily occurrence. All demonstrations were orderly and many quite large. There was absolutely no violence. There were also still some union demonstrations, but they also were primarily non-violent, especially since the police had become so expert in crowd control. By regulation, all the demonstrations had to follow prescribed routes and procedures. Any diversions were promptly and effectively suppressed without bloodshed. But there were a lot of demonstrations, which consisted primarily of sloganeering and chanting and yelling in front of the Embassy. The "Student League Against the War in Vietnam" -- the so called *Beheiren* -- was in the forefront of the demonstrations. As I said, labor was also involved as were the Socialist and Communist Parties.

The Embassy's principal task was the completion of the Okinawa reversion process. We were negotiating at all levels on all aspects of the process. We had no guidelines because the event was unprecedented in world history. Territory has rarely been returned by a victorious power, especially after it had been occupied for many years. Eventual reversion had been foreshadowed by Dulles when he expressed the view that Japan had "residual sovereignty" over Okinawa. Once that had been said, the Japanese began to center their attention on reversion. The Nixon Administration had managed to get Congressional approval for reversion, even over some opposition, particularly from the Navy. The Navy believed that its bases in Okinawa were essential for maintaining its strategic role in the Pacific, and in the final analysis, the US retained total control over those facilities. The U.S. military was the only part of the US Government that really opposed reversion. The Japanese continued to press us to give back the islands. Prime Minister Sato's statement made during this period that "the U.S. occupation of Japan will not really be over until Okinawa reversion had been accomplished" pretty well summarized the feelings of the country. Dick Sneider, who had spearheaded the reversion process in Washington just continued his role when he became DCM in Tokyo. He conducted the negotiations essentially as a personal matter; he had a small staff -- mostly legal people and a Vice-Admiral, who was the Navy's watch-dog to make sure that its interests were protected -- reporting to him which worked exclusively on Okinawa reversion. There were others working on Okinawa proper as the High Commissioner sought to work out an amicable procedures and negotiate with Okinawan civil officials. We in the Political Section had little to do with reversion. We were involved when Okinawa was part of larger political issues, but on a day-by-day basis, this issue was handled by Dick and his staff. Whatever economic work had to be done in connection with reversion was done by the Economic Section. We worried about making sure that the professionals in Okinawa retained their rights and privileges when the Japanese took over; we worried about traffic because on Okinawa people drove on the right hand side of the road -- US style -- which was not true in Japan. So a lot of changes had to occur for reversion to work. The

whole reversion process took three years, followed by a short transition period.

All these negotiations took place while Vietnam was still going on; the treaty permitted us to use the bases to rehabilitate ships and equipment damaged during the war, but did not allow planes to take off from Okinawa and fly directly to Vietnam. We had to go through the process of making a refueling stop elsewhere; the Japanese did not wish to be or to give the appearance of being directly involved in our operations in Vietnam. They supported us logistically and in many other ways. But the use of our bases in Japan to do anything other than protect or defend Japan created a Constitutional problem for the Japanese..

Later on, we had a serious problem when the Mayor of Yokohama, who was a Socialist, declared that the streets and bridges of his city were too fragile to carry the heavy tanks and equipment which were being driven to the docks for loading for shipment to Vietnam. We maintained that the US-Japan Security Treaty gave us complete rights to ship material across Japan and between US bases. The Mayor's position turned into a real confrontation and for a time we were in a complete stand-off. Finally, the Foreign Office drew a very circuitous route over mountains and other natural barriers which was certainly the long way around but didn't cross any of the Mayor's bridges. That broke the impasse and we were able to load our ships. This was just one example of the many political difficulties that the Vietnam war created for us in Japan. There were many Japanese opposed to our activities in Vietnam, that we were well aware of it on a daily basis. The Government, however, did everything it could to solve our problems and to support our position.

Q: We have talked a little about the Navy's role in the Okinawa reversion process. How in general was the US military-Embassy relationship in Japan?

SHERMAN: Alexis Johnson, when he became Ambassador, had established a position for a Political-Military Affairs Counselor, primarily to accommodate some conflicting personalities in the Embassy although I think that Johnson liked the idea anyway. He had done the same thing when he was Deputy Under Secretary for Political Affairs. He had set up a Pol-Mil staff in his own office. The position of Political-Military Counselor was first filled by Scott George. That cut the Political Section out of direct involvement in negotiations and liaison with the military. The military-civilian relationships were conducted primarily through a series of committees that included Embassy, US military and the Japanese government, both civilian and military. Scott was replaced by Howard Meyers. Sneider, who was a Political-Military specialist, kept a close eye on political-military matters. The Ambassador was also involved through his contacts with the US Commanders in Chief of the Air Force and USFJ and with the CINC in Okinawa. When I arrived in 1970, the Embassy still had a Political-Military Counselor. When in 1972, the Okinawa reversion process had been successfully concluded, I recommended that the Embassy return to a more normal organization with the political-military work being integrated within the Political Section. There wasn't a separate section in Germany or in Italy and I didn't understand why, after reversion, there needed to be one in Japan. Howard Meyers had left by this time; Chuck Schmitz, who had been the chief lawyer working for Dick Sneider on reversion, followed Howard as the man in charge of the Pol-Military Affairs office. On paper, that section was part of the Political Section. Sneider had left to be followed by Tom Shoemith. I insisted that the Political Counselor be responsible for political-military affairs and so it was done. It had worked

that way ever since and very smoothly at that.

Our contact with the US military was on a daily basis, by phone, if not personally. The military rarely met alone with Japanese civilians in the National Defense Agency. There were of course a lot of daily contacts on a military-to-military contacts, but normally, if there were any discussions with the defense Agency, the Embassy participated. As I said, much of the work was done in committees, particularly the Joint Committee, which consisted of representatives of the Foreign Ministry, the Defense Agency, the Embassy and the military of both countries. There we discussed issues arising under the Administrative Agreement, the Okinawa Reversion Agreement and other important matters. My main contact was usually the Deputy Chief of Staff of the U.S. Air Force; the CINC dealt with the Ambassador. Our relationships were generally productive and congenial. The only problem that I can recall was that encountered by Tom Shoesmith when he first arrived; he didn't see eye-to-eye with the general in charge of the military facility at Zama, who was also the same person responsible for the transportation of tanks and heavy equipment to the docks in Yokohama. The General wanted to take a strong stand and demand US "rights" to the freedom of transportation of equipment throughout Japan; Shoesmith was counseling restraint. Tom was sure that a peaceful resolution could be found given enough time; the General was not willing to brook any delay. He just wanted to bull his way through the streets of Yokohama.

So periodically, there were differences between the US military and civilian arms. The military were much more inclined to pound tables and demand, even knowing Japanese reluctance to raise politically sensitive issues. But on the whole, the cooperation was good and there was no competition. Most of the issues that we discussed were related to the status of US forces. There were always problems about some incident or another caused by a GI -- minor incidents of cab drivers being robbed by a drunken GI, or some incident related to prostitutes. They were relatively infrequent and were handled at lower command levels. The more serious problems involved the question of administrative cost sharing, such as would arise whenever new housing was constructed. Also there would be questions about utility cost-sharing and the wage scales for local employees. Periodically, the citizens living around a base would complain about the noise made by airplanes landing and taking off, particularly during night exercises or about airplane interference with their TV reception or destruction of property during some military exercise. Many of these problems arose in Okinawa because our presence was so much greater there than in other parts of Japan and because Okinawa was used often for military exercises. We had some exercises in Okaido, but most of them occurred in Okinawa.

Q: What were the major political issues that you had to confront during the three years you were in Tokyo as Political Counselor?

SHERMAN: There was a considerable amount of disarray in the Japanese government after Sato's resignation and his replacement by Tanaka. Tanaka was a controversial figure whose ascendancy to power was a stormy affair. That turn of events created considerable amount of reporting and analysis by the Embassy. The one-party system had been entrenched in Japan for many, many years, but it must be understood that the "one-party" label that Americans have applied to the Japanese political system is very misleading. The "one-party" label masked a number of competing factions, which made for vigorous competition in the political process. We

had to follow closely what was happening in each faction.

The Socialists were viewed as a much less of a menace than they had been in the '50s and '60s. They were not pro-American by any means, particularly when it came to the Vietnam war. Of course, they had a lot of support from non-Socialists on that issue and we had to devote a lot of public relations effort to explain the US position on the war. As I mentioned before, the students especially had a field day with that issue. They not only demonstrated frequently, but sometimes would barricade their campuses, effectively closing them down. One day, an American plane ran into a tower on the campus of Fukuoka University. The plane was held captive by the students as a symbol of American war making. The campus was closed for many weeks. There were some Americans -- e.g. a Buddhist priest named Brian Victoria -- in the anti-war movement; he used to go on hunger strikes in front of the Embassy.

Economic tensions between the United States and Japan were just beginning. We noticed a marked increase in exports to the US, particularly TV sets and automobiles. Textiles had always been a problem. Ambassador Meyer took great interest in this trade issue, in part because textiles were such an important part of Nixon's "Southern strategy". This southern coalition was instrumental in Nixon's election; many represented states with major textile production facilities and workers, who feared the large imports of Japanese textiles. Finally, marathon negotiations were started which ended in a multi-fiber agreement, which cut back on Japanese exports. The US side was headed by Secretary of the Treasury Kennedy. He set up his offices in the Okura Hotel, and he worked from there. The Japanese resented the U.S. pressure and the resulting agreement. That is not unusual; in general, most of the negotiations end up in resentment on both sides. We also worried about citrus -- particularly grapefruit -- imports into Japan, which continued to be a problem for many years, although the issue has disappeared by now. The Japanese were limiting imports of citrus fruits because it competed with its own domestic production; they feared that imports would wipe out their own industry. So the early '70s saw the beginning of the trade frictions and the burgeoning of the trade deficits. We were worrying then about a potential imbalance of \$10 billion. We have of course long surpassed that!

Q: Who were your main contacts in the Japanese bureaucracy?

SHERMAN: Our main point of contact was the Foreign Ministry, where we had access to any official. We didn't have to go through the North American Bureau to talk to officials in the Foreign Ministry, unless for example the Ambassador wanted an appointment with the Foreign Minister. We made our own appointments in other parts of the Japanese government, like MITI or the Ministry of Finance. Our contacts with the Japanese bureaucracy were daily. Then, as it is today, the Japanese bureaucracy was in control of Japanese policy. It had more power than the politicians, as it still has today. The bureaucracy's continuing strength is anchored in the Confucian social system. In ancient days, there were Mandarins; these were experts with long years of experience in the daily workings of an issue. The Japanese bureaucracy was viewed as the modern incarnation of the Mandarins. Very recently, this view has changed, and the bureaucracy is under a lot more critical attention but it is still very powerful. There was no question that in the '70s, the bureaucracy was the dominant policy making element of the government. Sometimes, it could be stymied by determined political opposition which could block necessary legislation or prevent it from being implemented, but that occurred only rarely.

The Liberal Democratic Party didn't always stand united on every issue and therefore couldn't always dictate passage of every bit of legislation. Also the Japanese political system almost requires that legislation have some support from an opposition party. The so-called "tyranny of the majority" was not acceptable in Japanese politics, except on very rare occasions. The LDP would never ram legislation through the Diet without some support from one of the minor opposition party. That was just not the Japanese way -- consensus was and is essential. That society lives by consensus and the imposition of one view, even if held by a majority, is just not acceptable; some representatives of the minority have to accede. That importance of consensus is still vital in Japanese politics as it is in their personal lives. No argument can be won by reference to "I have all the chips"; concessions have to be made to minority views. It is a culture that Americans have a difficult time understanding and dealing with. Unless you have lived with it for sometime, it is very hard to understand it and deal with it. It was our job in the Embassy to try to explain this culture to Washington; it was our job to explain to the newcomers in the Embassy who might not have been familiar with it. It is important to understand the Japanese culture if we are to be successful in achieving our objectives; direct confrontation was and is just not likely to elicit the right response. We had to explain this culture difference to visiting Congressmen or any other American policy makers who were inclined to use the direct American approach. Of course, this role placed us in awkward positions at times; some Americans just viewed us as "apologists". That is true still today. There is the so-called "Chrysanthemum Club", as the old "Japanese hands" are known. We are the ones who are opposing the thunder of the American righteous wrath about Japanese trade policies, for example, when all red-blooded Americans are anxious to mount the ramparts and blast the Japanese for their "sins" in the hopes of bludgeoning the Japanese into taking actions which they are not prepared for. This cultural clash has been true throughout the history of U.S.-Japanese relations. If you look at those relations even before the war when Joseph Grew was our Ambassador in Tokyo you can see some indications of this tension. To some degree, all Embassies have to wrestle with this problem of interpreting their host society to the American policy makers, but I think that our representatives in Tokyo bear a special burden in this area.

The perception that the Embassy had "clientitis" existed in the early '70s. Meyer did not want that perception to be perpetuated and he was tough on the Japanese when it came to economic/trade issues. He was right; some of those transactions should have been brought to the attention of Washington and were. The mercantilism exhibited by the Japanese in those days was just unacceptable. All of the Embassy agreed on that point. There were occasional efforts made to explain to Washington that change in Japanese practices could only be made through other means than direct confrontation. The debate was not about objectives; it was about means.

We also differed with Japan to a certain extent about China. They thought we were much too confrontational with the Mainland. They felt that we would be more influential if we were spoke a little more softly, thereby softening the atmosphere which might permit the Chinese to be somewhat more accommodating. That of course is exactly what took place in the Nixon/Kissinger regime starting with the "China shock". When the Kissinger visit became known in Tokyo, the Japanese were astonished. The professionals were outraged that there had not been any advance consultation, much less warning. They felt betrayed. Here was the United States actively engaged in trying to keep the Chinese Communists from taking a seat in the UN Security Council. We were conferring daily with the Japanese on this issue both in New York

and in Tokyo, stirring up support for Taiwan. We had repeatedly promised that we would take no action with respect to China without prior consultation. In the final analysis, we broke our word. The Embassy knew absolutely nothing about Kissinger's trip to China; I think the Japanese came to believe that fact, but at the time it happened, they probably thought that someone in the Embassy must have known. It would have been impossible in the Japanese system for anything like that to happen. Privately, the Japanese felt that Kissinger had betrayed them, although they really had not had much contact with him. He had never visited Japan and had never shown much interest in the Far East. There was a general curiosity about the articulate National Security Advisor, but he was not a target of Japanese attention in Washington. The China trip changed all that; Kissinger got their attention!

The "China shock" was quickly followed by the "dollar shock" and the "soybean shock". No one in the Embassy was very happy about those and I doubt that anyone in the Bureau for Far Eastern Affairs in State was very happy. Marshall Green was the Assistant Secretary at the time and he was totally surprised. The Japanese found it very hard to accommodate themselves to these major lunges in US policies. They all came as surprises to one degree or another and had no history of consultation behind them. The American decision-making process is so culturally different from that of the Japanese that the effects of policy changes were greatly magnified just by the cultural differences. Everybody in the Embassy was dismayed by the shift in our China policy. Many supported closer relationships with Peking; indeed "ping-pong" diplomacy started in Tokyo. By sheer accident, Bill Cunningham, who worked for me and who happened to be a China expert, was walking out of the Embassy and overheard the Marine Guard at the front desk talking on the phone telling a caller that he couldn't do something or other. He heard enough of the conversation to raise his curiosity; so he asked the Marine Guard what the conversation was all about. It turned out that an American ping-pong team coach was calling because he and his players had been invited to go to China and wanted to know whether it would be all right. Bill immediately cabled Washington about this invitation. We of course did not know that Kissinger had been in contact with the Chinese and that this invitation was part of a diplomatic dance that was on-going and that in fact was a response to Kissinger's "feelers". It was pure chance that the "ping-pong" trip could have been scotched by a Marine Guard; also Armin Meyer was very reluctant to have the Embassy recommend that the players be permitted to go to China. Nevertheless, a reporting cable was sent which became one more step in the "opening to China" process.

Q: Who was the Japanese Country Director when you were in Tokyo and how were Embassy-Washington relationships in the early '70s?

SHERMAN: The Country Director was Dick Ericson, who took that job after I had succeeded him in Tokyo. We had generally good and productive relationships with Washington. The key was the DCM's relationship with the Country Director. there were nightly telephone calls between the two as well as other phone conversations between Tokyo and Washington on specific issues. We were well served by Washington. Our relationships with other agencies were also very good. I certainly had no problems and I don't remember anyone else in the Embassy having any serious issues with other agencies. A number of them of course worked quite independently, such as Treasury. The Embassy, as a whole, was quite effective in these days. After Ambassador Meyer left and after Bob Ingersoll replaced him in the Spring, 1972, the

Embassy worked on much more of an "even keel".

Ingersoll had just retired from Borg-Warner. He had no knowledge of Japan. He had to go through an education process to which he took extremely well. He listened carefully and absorbed ell. He was energetic. He saw his role as an American businessman talking to Japanese businessmen. He did that often and extremely well. He permitted us to continue our daily contacts with the Japanese government without micro-managing them. We kept him informed, but he didn't intervene on day-to-day matters. He was a good economist and knew and understood trade both in theory and in practice since he had worked for Borg-Warner. I thought he performed very well.

RICHARD B. FINN
Country Director, Japan Desk
Washington DC (1969-1970)

Richard B. Finn was born in 1917 and raised in New York. In addition to Japan, his career in the Foreign Service included posts in Washington, DC, France, and the Philippines. He was interviewed by Charles Stuart Kennedy on April 8, 1991.

Q: Then they brought you back to your early specialty, Japan from 1969-70. You were what?

FINN: I was Country Director for Japan.

Q: Were there any particular issues during this time?

FINN: The two big things were that we did an NSC policy review paper and the return of Okinawa to Japanese control. The new administration under President Nixon had come in and we did an NSC paper the main purpose of which was to see whether we could agree to the return of Okinawa to Japan. It had to win the support of the Defense Department. We did the paper and Nixon and Kissinger decided to go ahead with the return of Okinawa. Those were the main jobs I had in my year and a half or so as Country Director.

Q: That, of course, was a major step. How did you deal with the Pentagon? Did they feel you were a bunch of stripe pants guys giving away the store, or did they understand that this was an issue beyond just plain military?

FINN: Certainly no opposition and no resentment and no effort to drag their feet or anything of that sort. I think they accepted the decision by the President. And, after all they did not have to pack up and leave. They retained all the rights they had before except that they had to remove the nuclear weapons on Okinawa.

Q: We were still there, more or less.

FINN: Right. That was the same thing in Tokyo, of course, in 1952. We didn't give up an inch of land or send back one GI because of the peace treaty and we did the same thing in Okinawa after the so-called reversion, except for nuclear weapons.

Q: As you dealt with this, did the mayor of Naha play a major role?

FINN: The so-called governor of Okinawa was a man called Yara. He was a socialist and a school teacher and very eager to get the American presence reduced. He was against rearmament, defense and all that. But he was a very engaging person and you couldn't really get mad at him. Although he would make quite strong speeches on the stump, when you talked to him he was quite rational and very understanding. It was not a problem.

But there was a lot of bureaucracy involved in the negotiations before the Japanese could take over the administration of the island. We had to give up certain privileges and activities like the USIA broadcast station there that the Japanese didn't like. They did let us keep it but they wanted to have an agreement on what it could do and could not do. Things like that. But the whole operation really went quite smoothly. It was very well handled, I think. Alex Johnson, who had come back from Tokyo to be the Deputy Under Secretary of State, was really the mastermind. Kissinger and Nixon were quite helpful and cooperative all the way. It was a good operation, I think.

Q: Did you have the feeling that the Nixon and Kissinger foreign policy apparatus knew what it was doing?

FINN: Yes, I think Nixon was very well grounded, very interested and very astute about foreign policy. He used to travel regularly when he was out of office in the 1960s and he would always go around and call on heads of government. He was helpful with the local ambassador whom he would clue in on everything and take along on calls. You couldn't help but feel that Nixon liked to do this and had a real empathy for the problems of American foreign policy.

Kissinger, Nixon's National Security Adviser, didn't do much with Japan, as I recall. I think Kissinger, as he said himself, didn't find the Japanese easy to talk to or easy to discuss problems with. He found Zhou En-lai when he went to China in 1972 a very sympathetic person whom he could spend hours talking with. He never found that kind of counterpart in Japan. The Japanese are different, as we were saying earlier, they are not prone to lengthy discussion and analysis.

Q: Dealing with Japan over a period of time, did you have the impression that there is a problem because the Japanese don't seem to be able to develop a close personal relationship which helps discussion and negotiations--not just language, but cultural problems?

FINN: I think you are right. The Japanese Foreign Office produces some remarkable people who know English extremely well as well as America and our outlook on the world. But they don't make the policy of the Japanese government. Other bureaucracies are more influential in most cases. The businessmen are not that well versed in international affairs. Even if a man has had a couple of years in New York as a representative of a Japanese business, he is not likely to be a powerful man in the hierarchy back home. So the thing is structured in a way that the people who

are familiar with the West and easy for us to do business with are not really the basic policy makers or actors in the Japanese government.

This man who is now (April 1991) Prime Minister, Kaifu, is a remarkable exception. He is really quite personable. But the Prime Ministers tend to be people who don't speak any English, have not spent much time abroad and are rather wooden when it comes to any kind of meetings like a Seven Nation Summit. That is a problem with Japan. Japan is not yet in the international world to the degree that it ought to be. I have on occasion thought that one of our greatest weapons is the English language and the day will come when a lot of Japanese will speak good English. Japanese kids start at age 12 studying English and study it all the way through college, but they are not good at speaking it. A curious phenomenon. We are far worse in speaking Japanese so we cannot blame it culturally on them in any way. But there is a fair distance to go for us and to get the Japanese together.

WILLIAM CLARK, JR.
Chief, Liaison Office
Okinawa (1969-1972)

Ambassador William Clark, Jr. was born in California in 1930. His career included posts in Sierra Leone, Japan, South Korea, Egypt, and India. Ambassador Clark was interviewed by Thomas Stern in 1994.

Q: How did your assignment to Okinawa come about?

CLARK: As I said, I was in the regional Office of the Bureau for Far Eastern Affairs. I was a Japanese language officer. The Country Director for Japan at the time was Richard Sneider, later Ambassador to Korea. One day, he asked me to come to his office. All who now him have recognized what a great manipulator of policies and people he really was. He said that he wanted me to go to Okinawa to head up a liaison office -- the political advisor's office for the Civil Administration. He said that he had send my name to Bob Fearey, who had agreed on my assignment. Sneider said that Fearey knew me "well and favorable". I mentioned him in connection with the SEATO meeting that was held in 1969. He had moved from POLAD in Honolulu to Civil Administrator in Okinawa. I told Sneider that that assignment seemed alright. Once the word had gotten around, I received unsolicited advice from a number of people who thought I was making a mistake, primarily for going to work for Fearey. In fact, Bob and I became great friends and he is one of my son's godfathers. But he had a reputation of being very tough on people, particularly those who had not established the right relationships right away.

I knew something about the Okinawa problems from my tours in Japan. I also knew that, for the record, an assignment to Okinawa would show as "detail to the US Army". That was not the most propitious entry a Foreign Service officer could have on his record; I had no illusions that the Okinawa assignment would be "career-enhancing". But the opportunity to participate in a process which would return occupied territory to its former country seemed to me to be too important to miss. The decision to revert the island back to Japan had already been reached in the

previous year; it was progressing towards an unset date, but I was confident that it would happen during my tour in Okinawa. I was looking forward to assisting the reversion and preventing any obstacles from being erected. What I didn't know was that Sneider was going to go to Tokyo, first as the officer in charge of the reversion process and later as the DCM. Sneider knew that when he asked me to go to Okinawa, but I didn't.

The whole administration of Okinawa was under the US Army. We did have a consulate there which was sub-office of the consular section in the Embassy in Tokyo. That was the ingenious solution to the question of how the US Government could have a Consulate in territory which it already administered. The head of Okinawa consular section was very unhappy with that solution because he was not treated as a Principal Officer which impacted on his eligibility for a number of allowances like Official Residence expenses. All of the Americans in the Consular Section remained part of the State Department establishment; they were not seconded to the US Army. That office was there primarily to service the American military who needed documentation if they were to leave Okinawa for visits to other places. The US military was not entirely happy with the State Department presence for quite a while, but it finally adjusted to it.

I, on the other hand, was detailed to the US Army as were all of the Foreign Service officer who worked for the Civil Administration. I replaced John Manjo who had been the first Foreign Service Officer to head the liaison office. Before that, that position had been filled by a US Army civilian. The office liaised with lots of units, but principally it was there to maintain contact with the government of the Ryukyu Islands, which was run by Okinawans. That was the organization that really governed the Islands.

The US presence in Okinawa was headed by a High Commissioner. He was also the commander of the 8th Army -- a lieutenant general. He was assisted by the 8th Army Chief of Staff, a CINCPAC Chief of Staff because the General also was part of the CINCPAC staff, and a civilian Chief of Staff. Below that level, there was a large Civil Administration staff, which had legal, economic and administrative sections as well as the Liaison Office. The Civil Administrator was a civilian; his deputy was a Colonel. Over time, the Department assigned Foreign Service Officers to the Civil administrator. When it became clear that the Islands would be reverted to Japan, the Army became less and less interested in the function and the State Department increased its representation because, wisely, it thought it was important to have officers in Okinawa who knew the language and the culture as we approached the actual reversion date. So my deputy was a Foreign Service Officer; there were two other FSOs in the Liaison Office as well as four military officers, three secretaries, two Japanese-Americans for translation purposes and two Okinawans.

Our major political objective was to keep stability on the Islands until Japan could take control. We were concerned with anti-base agitations which was on-going; much of it was generated, strangely enough, by the base workers' union. We used to have demonstrators demanding the abolition of the bases and the same time they insisted on no more reductions in staffing. Logic was not of great importance! So we had to wrestle with some unrest. The US had used Okinawa for a storage area for poison gas -- mustard and CSH nerve gas. The demonstrations forced us to remove that material from the Islands. That was very touchy issue.

Then we had to worry about the future of the facilities we had on Okinawa. Over the years, the US had maintained that many of these facilities were being built for the benefit of the islanders, but which, as part of the final settlement, were in fact sold to Japan for \$360 million, which in the late 1960s was a fairly sizeable amount. Ten percent of that went, at the demand of Senator Javits, to a Japan-US Friendship Commission -- an educational program which is devoted to funding research and studies. It is still alive even though it had been expected to go out of business years ago.

We had to deal with the disposition of the Senkaku Islands which are located between Okinawa and Taiwan. They are on the Chinese Continental Shelf. Nevertheless, Japan claimed them -- the only territory claimed by Japan which is on the other side of the Japanese chain. These islands had been part of the Japanese Empire, but had been administered from Taiwan. When we occupied Okinawa, we administered the islands from there. The US government, in one of its usual firm, unswerving positions, said that it was turning the administration of the islands over to Japan, but would not take a position on which country they belonged to. The Taiwanese stimulated some demonstrations against this solution on the Senkakus which we had to deal with.

One other issue that we worked on diligently was the question of which facilities might be retained on the Islands and which would have to be relocated. In fact, this was not a major problem. Unlike our bases in Japan, the bases in Okinawa were leased from the Okinawans. That made for a large "landlord community". As we approached reversion, the Japanese government picked up the leases and became the tenants. The lease terms were quite generous; in most cases, the leases were more profitable for the Okinawan owners than alternative uses. That factor dampened down the enthusiasm for closing the bases.

The reversion negotiations were a three way discussion: the Japanese government, the Okinawans and us. There wasn't much interest in the issues in other countries. In some way, the most difficult part of the process was to get the various US bureaucracies to agree and to speak with one voice. Let me take you back into history briefly. The first US administrator of the Islands was the US Navy. Then the responsibility was shifted to the US Army. The High Commissioner, as I mentioned, was a US General -- the last one being Jim Lambert. We were all fortunate that he was in charge during the end game; in fact, he extended his tour in Okinawa for another year to finish the job. He had been an engineer and thought that seeing reversion to fruition would be a high note of his career. Issues referred to the Pentagon were handled by a special group in the Office of International Security Affairs which was responsible for Okinawa and Panama issues. This group had been in being for many years; it had a relatively narrow view of Okinawa. It resisted change. The Army finally reluctantly agreed to support reversion, in part pushed by Lambert who was committed to the process and who was instrumental in making progress. The Army, until 1968, viewed Okinawa as a vital defense territory for the defense of our Far East position. The Navy was much more relaxed. They had a much smaller operation on the Islands. The Air Force had a large installation as did the Marines, but the Army was in charge and therefore viewed itself the greater "defender of the faith". The Air Force and the Marines knew that their facilities would remain even after reversion; so they stayed out of involvement in the politics of reversion. Three years before reversion, the Okinawan government changed from a conservative one to a reform in an election. The new Chief Executive was less favorably disposed to us than his predecessors, but he was absolutely committed to getting us out of the

civil administration of the Islands. That helped in getting good cooperation out of him. We were able to do some things with that Executive that we might not have been able to do with a conservative. For example, he was very helpful in the removal of chemical weapons, which was quite an operation.

I think in general we had done a pretty good job in getting the Okinawans prepared to administer their own territory. We certainly did a far better job there than we did in Micronesia. The Okinawans, at reversion time, were in pretty good economic shape by Southeast Asian standards. They were not at the level of their countrymen in Japan, but then they had not been there even before the war. It became the poorest prefecture in Japan as it had been before the war. Our investment was relatively modest to that made by Japan after reversion. We had done a fair amount, but our investment was essentially in the development of the bases, which did become the mainstay of the economy. The Islands were essentially an agricultural area; employment provided by the bases was a major economic boost. Of course, a whole base support industry developed -- bars, restaurants, etc. We had a good many Americans stationed on Okinawa who spent some of their income on the local economy. So our presence certainly was important to the economy, but still not sufficient to bring it up to Japanese standards. We did relatively little on infrastructure investment. We were building a rather large dam to help improve a fair water system. The roads were acceptable and we were building some at the time of reversion. There was a working telephone system. So the economy was finally moving in the right direction; the Japanese accelerated the process.

I arrived in Okinawa after the initial negotiations had been completed. The amounts of compensations had been settled. But there here were still some ambiguities that had to be worked out. One was that, in the reversion agreement, we had promised the Okinawans a complete after system. That seemed to have been forgotten in days after. When we finally got around to looking at it, we found that the main pumping station was in the middle of Kadena Air Base. The Air Force was reluctant to turn the base over to the Okinawans, but eventually it gave in and we did return the base to Okinawa. That was just one example of a lot of loose ends that had to be tied down before the final ceremony. These fine points were not left intentionally vague; the initial agreement was relatively detailed and voluminous, but still too broad to nail down every last aspect. We spent a lot of time with Japanese on how the various projects -- the dam, the roads, etc. -- that we had started would be completed. In retrospect, that was primarily an exercise in negotiations because once the Japanese took control of the Islands, they proceeded as they wished. We undertook those negotiations because we had an engineering division in the Civil Administration which was dedicated to doing a good job and it wanted to be sure that the Japanese would not let all their good work go down the drain. Actually, we just should have told the Japanese what we were working on, given them the plans and then let them do what they pleased.

The initial negotiations were between the Japanese and the US Government. Subsequently, as the details had to be worked out, the Ryukyu Islands administration was brought in making the those discussions tri-partite. The US was represented by a Foreign Service officer assigned especially to Okinawa for these last negotiations; he had a small staff working with him. The Japanese had an Ambassador assigned to Okinawa; he was the head of their delegation. The Chief Executive of the Ryukyu Islands was the chief Okinawan representative and he also has a small staff

devoted entirely to the negotiations. At the end of the day, it was primarily a hand-holding operation which was useful in that regard. The Americans doing the negotiations never really appreciated how useful their role really had been. They thought they should be far more operational, but that is not what that staff was intended to be. They were there to act as an information transmission belt and to make sure that all none of the Okinawans were surprised by any developments. This process permitted the local inhabitants to have considerable input before they were officially at the negotiating table.

From the time the US Government had agreed to deal with reversion, the State Department began to infiltrate the US military establishment on the Islands. We, who worked in a US Army organization, got along quite well with the US military. By the time I arrived, the Civil Administrator and his staff had the confidence of the High Commissioner and the US military-civilian interface went quite well. We, of course, had differences of opinions with the US military on substantive issues, but we were fully accepted by them as part of their operations. The Consular office, which as I mentioned was a sub-office of the Embassy in Tokyo, had a more difficult time. The head of the office was never quite pleased with his status because, as I also mentioned earlier, he never had all the perks that went with being a Principal Officer. Until just shortly before reversion actually took place, the US military was very suspicious of the independent State Department personnel on the Islands. They used to monitor the consular operation closely, even though that function was in Okinawa essentially for the benefit of the military. Of course, as time went on, that consular operation was most helpful to the Okinawans who wanted to travel to US or its territories. At one point, Dick Flint, who was the head of that consular office, used to go to Tokyo once each quarter to report what was going on in Okinawa because all of his communications went through military channels, which he felt restricted his reporting. He did write letters and traveled to Tokyo, but I think he felt that he was being censored. The consular section actually worked on one of the military bases; that meant that Okinawans who had consular business to transact had to go through a military check-point.

My assignment to Okinawa was rather serendipitous in the first place having accidentally met Bob Fearey while I was working on SEATO Affairs in Washington. I arrived in Okinawa right after the completion of a major conference on the reversion process. Representatives of State and DOD from Washington attended as well as representatives of the High Commissioner. I was told that it had been a very good conference, except for one occasion when a State Department officer -- trying to be amusing, I think -- commented that General Lambert was using "back channel" communications to Washington. The General didn't appreciate the gratuitous remark and tore the State Department officer into shreds. In fact, Lambert did not use "back channels" and tried his best to be very cooperative with all elements of the US government. The conference finally got over that inauspicious beginning and was successful. My job, right from the beginning, was to liaison with the government of the Ryukyu Islands. At an earlier period, the Civil Administrator and the Government of the Ryukyu Islands had been in the same building. But then a new headquarters was built which separated us from the local government -- three miles away which most often took thirty minutes to navigate. So the Liaison Office was not spending as much time as it should have with the Okinawans. It was my job to see the Chief Executive, although his official counterparts were really the High Commissioner and the Civil Administrator. My main task was the liaison one. I was also responsible for a public affairs function, which included the management of a small fund to build small village places and other facilities of that kind and

were intended primarily to engender good will. We spent some time on "putting out fires". If problems arose, we would try to find solutions. We intervened to a considerable extent in local politics. The last time we tried it -- election of Chief Administrator -- it was an abject failure. We did support the LDP candidate for Chief Administrator. He was followed by a conservative who in turn was succeeded by a socialist, Mr. Yara, who also became the first governor after reversion. About the time I got to Okinawa, the LDP opened an office in Okinawa, headed by a Mr. Nishimi. He later became the Governor of the Islands. Before I arrived, I believe that we provided financial support to LDP candidates; by the time I arrived, the election had taken place and no further US government financial support was disbursed. There was an election of Mayor of Naha. But the reform Mayor was so solidly entrenched that his election was assured. But we had a policy before reversion had been agreed on to support candidates that backed the status quo.

One of the things that I found interesting was the chemical weapons removal because it gave me considerable insight into the workings of several organization. One of those was the US military. The existence of weapons had been published in the *Wall Street Journal* about six months before my arrival in Okinawa. The military was rehabilitating some of the mustard gas canisters which were deteriorating. A small leak had developed on one of the canisters; no harm had one to anyone, but the story became known to the *Wall Street Journal*. That began the drive to remove them from Okinawa. The preparation for evacuation was very elaborate. at the last minute, Washington decided that a test run would be necessary -- six months in advance of the total evacuation. Some of us argued against this decision on the grounds that a test run would only exacerbate the local concerns; if we were to get the gas out of Okinawa, we should do it as rapidly as possible. But we didn't prevail. We briefed all of the islanders. We had a Colonel who went all over Okinawa briefing all the local inhabitants, explaining the procedures and what the convoy would look like -- a police car in front, then an MP car, then a contamination truck, an ambulance, then the five gas carrying trucks and then the same configuration in back -- the ambulance, contamination truck, etc. When the demonstration process began, I was on the press bus watching the convoy leave the base. This convoy had only four trucks in it, raising the question of what happened to the other truck. Later, the Colonel explained that his briefings were based on a "normal" convoy; there wasn't enough mustard gas to require five trucks. A story of unintended consequences. The convoy had a long way to go to Tengan Pier, where the gas would be loaded onto to ships -- it was too heavy to fly out. The Okinawans objected to that route. So in the six months between the demonstration and the real thing, we had to build a special road that went straight to the pier, mostly across military occupied territory. The Okinawans had a point; the transport of gas is a dangerous process; their population would have been at greater risk over the original route. But had we not had the practice run, but actually evacuated the gas right away, we would have been successful too. The gas was transported to Johnson Island where, as far as I know, it still rests. We built a disposal facility there, which hopefully has been used.

During the actual evacuation of the gas, Okinawa was going through a severe drought. So we tried to help out by bringing some "cloud seeders" to Okinawa. We tried to make it rain when the convoys were not moving. Trying to make it rain, but not at specific times, was a complicated task in itself. It didn't work very well. There was rain, for which the "cloud seeders" took credit. Unfortunately, most of time, the rain fell in the seas away from the Islands.

I mentioned that Dick Sneider had gone to Tokyo as Minister for Okinawa Reversion. Dave Osborn was the DCM. When Dave left, the two jobs were combined and Dick became the DCM. By the time I arrived, the direct communications problem had been solved and we had no difficulties. As I mentioned before, earlier in the history of the Okinawa occupation, the US military always wanted to put its spin on the analysis of local events. By the time I arrived that was no longer true and we sent our messages without censorship. The Embassy received copies of almost all the messages we sent, which were sent to the Pentagon with the Department receiving copies. We traveled back and forth often; that was true for Embassy personnel as well as Japanese Foreign Office officials. So we had a close working relationships with Tokyo. Washington was still concerned about reversion. The military of course was interested in maintaining as much of their base structure as possible. The Vietnam war was still on, which made Okinawa a very important logistic base for that effort. Trucks and tanks were repaired on the island, by the hundreds. Reversion was also important as an aspect of US-Japan relations, so that the State Department was interested in what was happening on the Islands. But by the time I arrived, the decision to return and the broad outlines of an agreement had been reached. Our job in 1970 and for the following two years was just to get it done and leaving.

As I mentioned, we did have a mounting number of demonstrations as we got closer to reversion. They culminated one evening in a march on our headquarters in late 1971 or early 1972. I was in a helicopter at the time overseeing the demonstration and radioing back what was happening. That was the last march. It was a union-sponsored march, but it had been infiltrated by some radical students. They managed to pull one policeman from his group; they knocked him down and threw Molotov cocktails on him, killing him. That ended demonstrations for good; the Okinawans had had enough. The students came from the local University. Some of the demonstrated came from Japan. There was a well known incident involving our Marines who had been in Vietnam. The Marine commander, Lew Wilson, later Commandant of the Corps and a Congressional Medal of Honor holder, had decided that despite all their Vietnam experience, his troops still needed more experience, particularly in building "fire bases". He decided that he would hold some maneuvers in the northern training area. The Marines built a gun emplacement and put a 105 into it. In the meantime, local criticism, which spread throughout the world, grew because the Marines were invading the territory of the red throated woodpecker. People were concerned that the gun fire would scare the animals and that might prevent their reproduction. Some Japanese demonstrators showed up and Wilson figured he could handle them by himself. He didn't ask for any assistance from any one who knew something about Japanese or demonstrations. He sent one of his Okinawan employees to monitor the demonstrators. They got half way up the hill where the gun stood. One of them climbed a tree and nailed the Japanese flag on it and refused to come down. I talked to the Civil Administrator about the situation and urged him to call Wilson to cancel the exercise. The Civil Administrator did that and I monitored the conversation on an other phone nearby. Wilson got on and the Civil Administrator said: "Lou, I have Bill Clark on the extension. He would like to talk to you!". So I gave Wilson my arguments; they didn't get very far. The Marines' political advisor told Wilson that the kid on the tree was obviously a leftist and that his fellow demonstrators would congregate around the tree. Of course, anyone who knew anything about Japan would have known that the leftists hated the flag and would never have used it, much less rallied around it. The Marines took a chain saw and threatened to cut the tree down unless the kid climbed down. He of course wouldn't; so the tree was cut down, kid and flag and all. The kid broke a couple of ribs and was treated in the US

military hospital. All this happened while I was in a meeting with General Wilson, three other generals and some of the Okinawans who were protesting the proposed exercise. Wilson got a note during the meeting. He passed the note to other generals and me with many inappropriate expletives. Finally, CINCPAC called from Hawaii and told Wilson to knock off the exercise. Despite this rough beginning, Wilson and I got along very well. As it turned out, the kid was a conservative and the son of a Japanese policeman. He didn't object to our forces being in Okinawa or in Japan; he just didn't want the red throated woodpecker disturbed. That is just an illustration of some of the problems we encountered with the military. It was also an example of a Japanese who wanted the US military to stay in Okinawa but he was definitely in the minority.

The reversion decision had been big news in Japan. The details and some of the troublesome implementations were not headline material. Sato, who served seven years as Prime Minister, was the big Japanese "mover" on reversion. He had said that his principal goal was to end the war in the Far East by the Okinawa reversion. He stayed as Prime Minister until it was completed. He is one of the few politicians who supported a positive policy that he was able to see to fruition.

In closing this chapter of my career, I should describe the actual reversion ceremony which took place on May 15, 1972. It was done on that day because the Japanese fiscal year ended on March 31. The Japanese wanted reversion take place on April 1. Our fiscal year, in those days, ended on June 30 and therefore we were holding out for July 1. The obvious compromise: May 15, which made everybody unhappy. I remember one staff meeting when the generals got into a debate over the need to put up another flag post on all of the bases after reversion in order to fly both the American and the Japanese flags. The debate was about the modalities of pulling down our flag and then putting it up with the Japanese one. I suggested that the ceremony take place at midnight, after sun down when our flag is lowered in any case. And so it was done. We pulled down our flag at sunset and raised both the next day.

MARSHALL GREEN
Assistant Secretary, East Asian/Pacific Affairs
Washington, DC (1969-1973)

Ambassador Marshall Green was born in 1916 in Holyoke, Massachusetts. He received an undergraduate degree from Yale University in 1939. In addition to his service as Assistant Secretary for East Asian/Pacific Affairs, Ambassador Green served in Australia, China, Indonesia, Hong Kong, and South Korea. He was interviewed on March 2, 1995 by Charles Stuart Kennedy.

Q: We're moving to the period of the Japanese connection when you were Assistant Secretary for East Asia and the Pacific in Washington. This was 1969-1973. Let's talk about Japan. When you took over this position in 1969, how did you view Japan as a factor in our foreign relations at that time?

GREEN: I had already had several assignments related to Japan. Japan had been a thread

throughout my career. During the period from 1969 to 1973 I saw Japan as increasingly important on the world scene, and especially in East Asia. I saw the primacy of the US-Japan security relationship in the broadest sense of the word. We had a common goal. Many objectives on the world scene were shared objectives. Japan had the technological and economic strength. We had a lot of that but we also had the military strength. Therefore, by working in unison, with each country participating to the maximum extent in accordance with its special strengths, we could make quite a mark on the world in terms of peace and progress. Not for any expansionist reasons but simply for improving conditions of life for the people of the world.

Q: We're talking about 1969, when you became Assistant Secretary. This was...

GREEN: The first experience I had with Japan in 1969 right after I was appointed Assistant Secretary by President Nixon, was in the course of a trip through the whole of East Asia, meeting with the various national leaders, all of which I've covered in the book I co-authored entitled War and Peace with China.

As Assistant Secretary-designate, I visited Japan in April 1969 at the end of a long trip through East Asia. My purpose was principally to convey to Japanese leaders impressions of my trip and to answer questions about President Nixon's views. This segment of my trip was very much like the others. In Japan my pitch was that we would stand by our commitments and that we considered our security treaty with Japan to be the keystone of our whole security position in that part of the world, and so forth.

I also mentioned a number of things about the countries of the area being in a better position to "fend for themselves." I also explained the Vietnamization program, which was already under way, involving turning over more responsibilities to the Vietnamese. So that was my first connection with Japan during the Nixon administration, when I met the leaders.

The second contact with Japan during my time as Assistant Secretary was very closely related to the first one. That concerned "The Nixon Doctrine" itself. You remember that "The Nixon Doctrine" originated on July 25 [1969], when the President was making a trip around the world. He stopped off in Guam and had a background press conference at the Top-of-the-Mar Hotel.

In this press conference President Nixon expressed what became known as "The Nixon Doctrine." Well, along with Bob Barnett, I had written the "scope paper" for his trip through Asia in July [1969]. In this paper I suggested that the President say many of the things that I had mentioned earlier on in March and April [1969] about the countries of the area being in a better position to fend for themselves.

In his backgrounder, the President put his emphasis more on military affairs, on our defense commitments, and on our progress to help strengthen the defense capabilities of our friends and allies. However, it was the primary responsibility of each country to provide for its own defense, to the maximum extent possible. We could only provide assistance in a supplementary sense.

Quite frankly, this had a lot to do with Japan, because in the scope paper that Bob Barnett and I had written for the President's trip around the world we emphasized the fact that these countries

were "more on their feet" these days, with Japan beginning to provide economic assistance, as indeed it had in Indonesia, where they were giving just as much assistance as we were. Later on, they gave more. My idea of "The Nixon Doctrine" tracked back, in many ways, to Japan.

The Japanese reaction to the Nixon Doctrine was generally favorable. They formally expressed their complete support several months later, in November [1969], when Prime Minister Sato gave what he called "The New Pacific Age" speech, which was a distinct reflection of the Nixon Doctrine. The whole concept of this speech concerned the United States working together with Japan and in support of the economic development and progress of all of East Asia.

The United States and Japan were further drawn together, I would say, by the Nixon Doctrine and what it expressed. The reactions of some of the other countries of East Asia were generally good, but they were nervous, fearing that the United States was preparing a rationale for minimizing its assistance to them. So I had a great deal of difficulty in reassuring the countries concerned that we were not "getting out." Once again, I talked about other countries (like Japan) being in a position to do more. As economic development progressed, the countries that were doing the best were in a position to help other friendly nations.

Incidentally, after the President gave his backgrounder to the press in Guam, he said that I would be prepared to answer further questions. Well, I didn't know what he had said not having been invited up to the press conference. It was a little embarrassing for me because I then had to brief the press both at the next stop, which was Manila, and then in Jakarta.

The press kept asking questions about what had gone on at the summit meetings between Nixon and Marcos in the Philippines and Nixon and Suharto in Indonesia. Since nobody in the State Department, including the Secretary of State, was present at those meetings, only President Nixon, Kissinger, and the head of government concerned knew what the President had said. The press people were not interested in general background. They wanted to know precisely what was said. All I had was a slip of paper from someone on one or two points that I could make. Probably, Ron Ziegler [President Nixon's press spokesman] got this slip of paper from Henry Kissinger. That was about it. It was very embarrassing for me. I recall that "Newsweek" magazine came out with an article, saying that my briefing in Manila was very much like a travel lecture. That was about all I could do.

Q: You were the principal person dealing with Asian affairs at that time and you had largely spent your career dealing with Asian matters. How did you feel about Kissinger's views on Asia at the beginning of the Nixon administration?

GREEN: I saw a good deal of Kissinger during 1969. I could sense increasingly that he wanted to have nothing to do with the State Department and that he was going to "run" foreign policy. I realized that I was going to be his principal victim as the Assistant Secretary for East Asia and the Pacific, the area which was primarily "on the block" at that time. I could see that I was going to spend a lot of time dealing with an evasive White House. Another thing that bothered me, since we are talking about Japan, is that the only person Kissinger had on his staff who knew anything about Japan was Dick Sneider [a Foreign Service Officer and later Ambassador to Korea]. Shortly after that Dick Sneider found that he couldn't get along with Kissinger and was

assigned to Japan. After that, they had nobody on the White House staff who had real Japanese experience. The Japan factor wasn't adequately considered in a series of situations that were to arise.

Q: As I do these interviews, there is one thing that comes through. That is, first, Henry Kissinger was very "bright." However, and secondly, there were areas that he didn't know very much about and relied on his "brightness." Often, it didn't work out very well. Africa was one such area. Latin America was another...

GREEN: I think that Kissinger had lots of gaps in his knowledge of the world. He was a splendid tactician. In a given situation he knew how to maneuver very well indeed. He also is very good at briefing and is highly articulate. These were his strengths. However, depth of knowledge about East Asia, no. He had none. I think that his failure to draw upon the expertise of people who had spent their lives working on East Asia was a great mistake on his part. That is not the way we should run a government. To pay these people for all of those years of work and then not use them is pointless -- worse than pointless.

Another problem is one that nobody ever speaks about. Let me mention it right now. When you are "cut out" of things, the way other people and I were "cut out" of them, and you know that you are being "cut out," you begin to lose confidence in yourself, because you know that you don't have all the threads in your hand. You don't have the complete picture. Meanwhile, Kissinger knew that you didn't have the complete picture, and therefore he tended to discredit your views accordingly. It ended up by nobody really knowing what the other person knew or didn't know. It's a very bad way of running a government.

Q: Because the information flow must be "up and down."

GREEN: Right. He was playing his proper role of maneuvering and conducting certain kinds of delicate negotiations. However, with the assistance of key people in the State Department, we would not have made some of the mistakes that we made. Furthermore, we would have had a strong, effective foreign policy because it was headed by a man [President Nixon] who came into office, probably knowing more about foreign affairs than any president in history. We had a wonderful opportunity but, of course, a lot of that was not properly used. We could have done much better.

Q: As we keep our focus on Japan from 1969 through 1973, what do you think were some of the major developments?

GREEN: I would say that the two major developments were the opening to China and the "reversion" of the Ryukyu Islands to Japan. I would also mention the Nixon Doctrine and the related Vietnamization program as being a fundamental development. So those were the principal developments during the Nixon administration that related to Japan.

Q: Let's talk about China. One of the great moments in the Nixon administration was the opening to China after many years of isolation between the United States and China, although there had been contacts. You've already talked about the US and China. How about the Japan factor?

What were some of the points that you were concerned with?

GREEN: The July 15, 1971 announcement by President Nixon in California of his intended trip to China (following Kissinger's successful earlier trip to China) produced a deep shock in Japan. This was known in Japan as the first of several Nixon "shocks." This reaction is very understandable if you bear in mind that the United States and Japan had a partnership. No third country was more important to the United States and Japan than China. That the President should suddenly announce this surprise visit, reversing policies which we had been pursuing for a long time, was deeply embarrassing to the government of Prime Minister Sato. One of the things we must remember was the fact that, year after year, the United States had been trying to keep communist China out of the United Nations. Sentiment in Japan had been rather favorable toward the People's Republic of China as being a member of the United Nations. We had kept Japan "in line" on this issue. When we suddenly announced that President Nixon was going to go to China, it also looked as though we were "abandoning" Taiwan, which had been a Japanese territory at one time and where the Japanese had enormous interests. Taiwan is very close to Japan. All of this boded ill to Japan.

However, above all, this subject was what was known as "Asakai's nightmare." Asakai was the Japanese Ambassador to Washington [at the time of the Nixon announcement]. His nightmare was that he would wake up one morning and find that the United States was represented in Peking. All of this put Japan in a terribly difficult position. It left the Japanese Government -- and Prime Minister Sato in particular -- with a feeling that they had been worsted, that Sato himself had been overshadowed by Nixon, that we were not reliable partners, and that we didn't consult, when consultations are fundamental to any viable relationship. The Japanese felt that we were committed to consult on all issues and hadn't done so. As a result, the reaction in Japan [to the Nixon announcement] was quite severe, at first. I don't think that the White House had really thought about this.

When Secretary of State Rogers called up on July 15, shortly after the President had made his announcement on television, to ask me and Jack Irwin, the Deputy Secretary of State, how we felt about the news, I said that it was "great but what about Japan?" Rogers said, "Well, what about Japan?" I said, "The Japanese are going to take this terribly hard." Rogers said, "But we gave them advance notice." I said, "You gave them an hour or two advance notice, but that's not much advance notice, and that's not consultations." I said that we were going to have a severe problem with Japan.

At that point I said that Dick Ericson and I would draft a message of explanation from the President to Prime Minister Sato and get it to the President by telex immediately. So Nixon sent that message to Sato. It was an effort to try to placate the Japanese. When we were in Peking, as I said in my book on the subject, as well as, I think, in my oral history of the time, there were indications that Peking was very concerned about the US-Japanese relationship.

Q: Leaving China to face Japan and Russia.

GREEN: They [the Chinese] didn't like that. On the other hand they suspected that all this US-Japan partnership talk might have a contrary design. Maybe the United States was building up

Japan as a military force before it left the area, so that Japan could take over China.

When I was in Peking [with President Nixon], I had a number of talks with a man who was very close to the Chinese Prime Minister Zhou En-lai. His name was Hsiung Hsiung-hui, a special assistant to the prime minister. On three occasions during the visit he took me aside -- during automobile rides and once when we were rowing on the lake at Hangzhou -- to talk about Japan. It was clear that he and the prime minister were deeply concerned about Japan. They feared that we were playing our hand in such a way that Japan was going to be a new military power on the world scene. China's memories of Japanese occupation were very deep and rather fresh. I said, and it turned out that Henry Kissinger had said the same thing when he was in Peking in the summer of 1971, that, on the contrary, our whole purpose in our relationship with Japan was to ensure that Japan did not have to be rearmed, except for self defense. We would provide the "Sunday punch," and Japan would not "go nuclear." Japan would not have any expansionist capabilities, because of our treaty alliance. The Chinese had never thought of it that way. I added that the more lasting our security relationship with Japan is, the greater the chances were that Japan would never be, or pose anything like, a military threat to China. Anyway, I think that that went over well.

We must remember here that Japan and China have a long, long stormy relationship, particularly during the years preceding and during World War II. Therefore, there are very deep-seated Chinese fears of Japan. I don't think that the White House ever took them adequately into consideration. This Chinese fear of Japan was more in the calculations of the State Department.

The person on the State Department side who was the most knowledgeable on Japan was U. Alexis Johnson, the Deputy Under Secretary for Political Affairs. Johnson's book, "The Right Hand of Power," devotes a good deal of attention to this particular issue at this particular moment. He graphically described the concerns which our China policy had created in Japan. He reproved the President rather strongly about our failure to consult with the Japanese properly, such as by sending Alex to Japan, maybe a day or so in advance of the announcement. This would have had the effect of giving Prime Minister Sato time to prepare his position publicly and how he was going to express it. Secondly, for us to have taken the unusual step of sending a special emissary to Japan, would be evidence of the primacy we accorded Japan and the importance we attached to Japan's constructive relationship with China. However, for reasons which have never been explained, the administration called off plans to have Johnson make that trip which left a permanent scar on US-Japan relations, according to Alex.

In my meetings with Japanese Prime Minister Sato and Foreign Minister Fukuda following Nixon's China trip, they acted like the old friends that they are. Even though the press, including especially the press in the United States, was talking about what a disaster this had been for US-Japanese relations, that was not my impression at all. I read Selig Harrison's and other people's accounts of the mood in Japan at the time I arrived. By the time I left I had the impression that this view was far too pessimistic. The fact of the matter is that I got along fine with both the prime minister and the foreign minister. The Embassy in Tokyo later reported that what a success our visit had been in terms of allaying Japanese concerns over our China policy. So I think that we got over that hump. That doesn't mean that there are no residual fears.

I might add one other thing here, and I'll come back to this later. I mentioned the Nixon "shocks." We had other problems with the Japanese, largely over trade.

At the time of the agreement with Japan on the reversion of the Ryukyu Islands in November, 1969, there was an understanding that one of the things that Japan would do, in response to our rather generous offer on the return of the Ryukyus, was that they would respect certain "restraints" on textile [exports to the United States]. President Nixon was under very heavy pressure from a number of members of Congress from the South, where our textile industry had moved, to "deliver" on these restraints, so that the Japanese would not export such large quantities of textiles.

Well, to make a long story short, from his end Prime Minister Sato was unable to bring "his" textile industry along. Therefore, that understanding fell apart. President Nixon was furious. This was another area where I don't think that the President ever understood the Japanese leadership, as he did the Chinese leadership. I'm sure that he compared Sato, Fukuda, and others rather unfavorably with men like Zhou En-lai, who had a great, broad political and strategic vision of the world. The Japanese leadership seemed to be narrowly focused on economic issues, and the President and Henry Kissinger were not very strong in that area. That was another reason why they were rather prejudiced against Japan.

There has always been a tendency in our Foreign Service, as, in fact, in the US Government, which goes way back, for at least 100 years, for officials to be either pro-Chinese or pro-Japanese. It seemed that we had fallen again into that syndrome, with the President favoring China over Japan. He would never say so, but that would seem to have been the case. It came largely down to personalities and the fact that, as interpreters, the Chinese used attractive young ladies, who would laugh uproariously when the President made a joke, before they even brought themselves to interpret it, which was a clear signal to the audience that they had damned well better laugh. The Japanese interpreters did their work in a solemn, matter of fact voice. Interpreting Chinese is much easier than interpreting Japanese -- that is simultaneous interpreting. The word order in Chinese sentences is similar to the word order in English, whereas Japanese word order is more like German -- very difficult. These are the kinds of things that have added to problems in US-Japanese relations.

Q: How did you rate our Embassy in Japan during the 1969-1973 period? This was a major period.

GREEN: We had very good people in Japan, although Ambassador Armin Meyer was not a Japanese expert. He had come from being Ambassador to Iran. As a matter of fact, I had been offered the job and given the choice. To make a long story short, I decided to be Assistant Secretary instead. Armin had some very good Japanese specialists on his staff, including Dick Sneider. So I would say that it was a strong Embassy.

Q: So you felt that the reporting...

GREEN: The reporting was excellent.

Q: We were speaking of Henry Kissinger and Japan. This reminds me of his book, "The White House Years." He talked about going to Rome. When I read the book, I had the feeling that, in Kissinger's view, the Italian Government was really just a coalition -- sort of the same coalition, with people "trading" government portfolios. So you couldn't get anything done. Kissinger -- and, I guess, President Nixon, too -- were people who wanted to sit down with somebody and make a deal. You can't make a deal with a coalition government because there are too many people involved, who tend to "water down" things. It sounds as if there was a similar process going on with the Japanese. It's well known that in Japan you don't talk to somebody in the Japanese Government and really reach an agreement. It takes extended negotiations with both the government and within the bureaucracy to reach a consensus.

GREEN: Absolutely. The bureaucracy in Japan is all-important. Where we have political figures at the top, they have experts and bureaucrats -- and these include bureaucrats who specialize in foreign affairs and are very knowledgeable.

To be a leader, people have to know where you're going. When a US leader suddenly and independently changes his course and direction -- or seems to do so -- it causes a great deal of concern. It was our task to allay that concern. My wife's remark about how wise it was for the President to send two Foreign Service Officers to explain the Nixon visit to China to Far East leaders was entirely valid, since John and I, were known to leaders in Asia. They knew we didn't just come in with one administration and then left. We didn't have any political axes to grind. We were not trying to make a career out of this matter. We were trying to do what was best for the United States and for friendly countries concerned.

Q: When William Rogers was Secretary of State during this period, did he have much "feel" for Japan?

GREEN: I think that Bill Rogers had a good feeling for public opinion. He would have been a first rate Minister of Information, which many countries have. Of course, his activities were so sharply curtailed and circumscribed by Nixon and Kissinger that it's not fair to judge the man. I knew Bill Rogers very well. We were very good friends and played a lot of bridge and golf together, quite apart from our office contacts. I trusted him. I think that he liked the Foreign Service. I felt that he could have done more in the way of taking up with the President the fact that the Foreign Service strongly supported his policies. I remember that I had an impassioned discussion with Rogers about this at the President's poolside in San Clemente, CA. I couldn't get Bill Rogers to say more than that he would take this up at the right time. I don't think that he ever did.

In particular, as I pointed out in War and Peace with China, the President made a serious mistake not only in his unwarranted distrust of the Foreign Service but also in his refusal to take Alex Johnson and me into his total confidence. As a result he ran some serious risks which are mentioned in my book and one of those included his unnecessarily sharp affront of the Japanese Government. Subsequently Nixon was able to allay Japanese resentment when the President and Mrs. Nixon, at my suggestion, journeyed all the way up to Alaska to greet their Imperial Majesties en route to Europe by polar flight. This was the first trip outside Japan by any reigning monarch of Japan; and the first foreign soil he was to step on was US soil.

Q: One of the rationales given out, and I tend to be very dubious about rationales, which are usually developed on an "ex post facto" basis, is that the White House was concerned that, if it consulted Japan on any subject, the country "leaked" like mad. So the White House felt that it had to be very careful. Half the reason for Nixon's problems was always...

GREEN: Nixon always put it in the sense that it would be a great blow to China if the news of his trip to China should leak out. He acted as though secrecy was something enjoined by China. That's not the case at all. It was his own desire for secrecy that was the controlling consideration here. However, he carried this penchant for secrecy to ridiculous lengths. The arrangements for the President's trip to China by Kissinger had to be secret. I fully agree with that. That they didn't inform the Japanese, say, a week or two weeks in advance, was understandable and justifiable. It is true that the Japanese Government party, the Liberal-Democratic Party, is a coalition of factions whose leaders usually have to be consulted before the Prime Minister takes any action. So the Prime Minister would probably have been under some obligation to "check in" with the LDP factional leaders if there had been, say, more than a day or two advance notice. Had we done that, probably the whole matter of the President's visit to China would have leaked to the press. So, as I say, it's a question of degree. I think that sending Alex Johnson to talk with Prime Minister Sato 24 hours in advance would have been very helpful on that issue.

Q: Shall we talk about the reversion of Okinawa [the Ryukyu Islands]? I always felt that this was one of the most difficult things to handle, internally within the US Government. The US Department of Defense was almost adamant about not giving Okinawa up, at least from some points of view.

GREEN: The Department of Defense was a bit "sticky" on this issue -- more than it was on the US-Japan Security Treaty of 1960. Incidentally, the Security Treaty of 1960 came up for renewal in 1970. So the questions that came up in 1969 regarding the reversion of the Ryukyus also had to take into consideration the fact that, if the reversion negotiations fell through, the Security Treaty with Japan might not be renewed by the Japanese. Meanwhile, there was a great deal of Japanese pressure on us to "do something" about the Ryukyus.

Now the issue of the reversion of the Ryukyus was very complex. First of all, their strategic importance has to be underlined strongly. These are a chain of islands, Okinawa being the most important one. It is located off the East China Sea, right in the middle of this whole series of islands looping down from southern Japan. It couldn't be more critically located. More than that, Okinawa is a large island, large enough to accommodate Japanese farmers and city residents, as well as a lot of American installations. We had a problem with the administration there. It wasn't just like a big US military base. There was a large Okinawan population to deal with. Increasingly, there was a great deal of sentiment, mostly among the Okinawans, regarding their future reversion status. Going back to the Peace Treaty with Japan of 1951, the Ryukyus had been placed temporarily under American administration. However, their ultimate sovereignty was vested in Japan. So it was simply a question of when the Ryukyus were going to revert to Japanese control.

In the State Department we thought -- and certainly the Embassy in Tokyo did too -- that it was

critically important to move rapidly on the Ryukyus. Things were beginning to go "sour" in both the Ryukyus and Japan. We needed to move in a timely fashion, bearing in mind that we had a deadline of 1970 [for the renewal of the Security Treaty of 1960]. So we entered into talks about the reversion of the Ryukyus with the Japanese in Tokyo and Washington.

The big question was this. We had major bases in the Ryukyus that were of critical importance in the support of any operation that we might have to conduct in Southeast Asia -- or China or Korea, for that matter in support of our commitment. If the Ryukyus reverted to Japan, we would have to have bases in the Ryukyus on a continuing basis. We would also have to have ready access to those bases and the ability to use them when critically necessary. Our allies and friends in embattled Southeast Asia, Korea and Taiwan were concerned over their dependence on our basis in Japan, for Japan always had a tendency of being rather pacifistic, and might deny us the use of those bases at a critical moment. So we had to meet that concern in any communique with Japan on reversion.

We finally got Japan to agree on language in the Joint Communique (on the reversion of the Ryukyus to Japan) which stated that Korea was vital to the security of Japan and the United States; and that the security of Taiwan was more important. Once we got agreement on that language, then things began to fall pretty much into place. So we and the Japanese were able to declare in November [1969], that the Ryukyus would revert to Japan in 1972. We needed the time between 1969 and 1972 to complete an enormous amount of housekeeping and bookkeeping duties so as to turn the administration over to Japan.

As you know, the drafting of most communiqués always precedes agreements and visits. They are not done afterwards. The communique had been agreed to long before Prime Minister Sato came to Washington. When Sato came to Washington, there was a press conference, at which he made a statement which, in essence, said that Japan recognized the critical importance of the Ryukyus to the United States in discharging its security missions. Of course, it is a basic principle of our Navy and of our military never to confirm or deny the presence of any particular weapons systems such as nuclear. So we couldn't confirm or deny this. Instead, there was an acceptable Japanese-US "understanding," that the issue had been worked out in satisfactory fashion for the Japanese.

The Ryukyu issue has been discussed at some length in "The Right Hand of Power," by U. Alexis Johnson. I really don't have much to add to that. You will recall that he pointed out [in the book] that there was a long, sad story of Japanese inattention to the Ryukyus. There were a lot of bitter feelings in the Ryukyus about the Japanese at that time -- bitter feelings that Japan has subsequently been at pains to allay.

Q: Protesting about things that happened before World War II.

GREEN: Yes. The people of the Ryukyus felt like "second class citizens" and all of that. So that was another issue which had to be straightened out. In other words, there had to be assurances by the Japanese that they were going to treat the Ryukyus "the right way." Of course, the Japanese had a reason for giving such assurances, because the international spotlight was right on them. I never had any doubt that the Japanese would treat the Ryukyus properly.

We had to have extended talks and discussions in Tokyo and Washington over the actual reversion of the Ryukyus. The financial arrangements were "sticky," because the United States felt that we were giving up an awful lot of property and we already had constructed many buildings, roads, utilities, etc. The Japanese finally did come through fairly handsomely on payments to the United States for materiel, buildings, and so forth which we had left to the people of the Ryukyus.

It was a complex negotiation, involving just about every department of our government. I was the chairman of the task force in our government, dealing with all of these financial and other issues.

Q: Could you discuss your experience in dealing with the US Department of Defense, at your level, on the issue of reversion of the Ryukyus?

GREEN: Yes, I can. I think that I may have mentioned to you, on previous occasions, Stu, that I consider that the Department of Defense has come a long way over the past 10 years or so, in terms of understanding diplomatic and strategic issues. There isn't the kind of "gulf" separating military from State Department thinking which may have existed at one time. When you were dealing with Generals like Curtis Lemay, of course it was difficult. His solutions started with 15 kiloton nuclear bombs and went up from there. State Department solutions involve no kilotons, if we can help it. Furthermore, we have tried to think in long range, political terms. I think that once we got that point through to the military, they understood it very well and were strong supporters of this approach. As I said, I thought that Admiral Arleigh Burke and various CINCPACs were superb as "sailor statesmen." They talked the same language that we did. Setting up all these political advisers throughout the world also helped. Then there are the war colleges, which have helped. The United States, I think, has done more than any other country -- possibly Britain has done as much, I don't know, but certainly the US has done more than the countries that I have dealt with -- to try to instill a common understanding by civil and military leaders of national goals and purposes and how to achieve them.

We have had problems. When it comes down to dollars and cents and particular issues, yes, there have been lots and lots of problems which we have had to iron out. However, regarding major issues, as you "kick them upstairs," you begin to find more and more opportunities to resolve them.

Q: Is there any other area that we should cover on Japan before we move to Australia?

GREEN: Yes, there is one other area that I would like to mention. I think that I began to mention it during the last session that we had, Stu. That is, relations between the ROK and Japan.

Q: The ROK means the Republic of Korea.

GREEN: The Republic of Korea and Japan. Of course, this now looms rather significantly in terms of North Korea developing nuclear weapons and what concerns this can create in Japan. Clearly, one of the advantages that Japan saw in our security relationship was the fact that we

had a military presence in South Korea. In other words, we had American troops standing between Japan and its potential enemies -- North Korea, communist China, the Soviet Union. Throughout my years as Assistant Secretary and as Deputy Assistant Secretary and Regional Planning Adviser before that, I and others in State and Defense had worked very hard for the retention of American forces in Korea. We still have them there today. The reason we have them there today has as much to do with Japan as with South Korea. If we didn't have those forces there, the Japanese would be far more concerned and worried about whether they were putting their necks out too far by being allied with the United States.

There has also been the long-standing problem of feuding in Japan among the 750,000 Koreans residing there, with sharp lines drawn between those supporting North Korea and those supporting South Korea. Obviously the pro-North Korean crowd gave Japan the most concern because of their links with the communists in Asia as well as with disappointed youth in Japan. And of course, all Koreans whether in Japan or Korea harbored long memories of harsh Japanese rule in Korea earlier in the century.

US policy in this situation has been to urge the fair treatment of all Koreans in Japan and the development of much closer relations between Japan and South Korea.

In 1972 we heard the news that the North Koreans had made an overture to the South Koreans, suggesting talks leading to the reunification of Korea. Obviously, this idea was one which we welcomed, although we greatly distrusted North Korea's motives. Sure enough, the North Koreans were making a "grandstand play." They wanted to go for some kind of political union [between the two Korea's], or something like that. They were asking for those things which they knew the South couldn't give. They also knew that the South had a lot of students who, for a long time, have been very anxious to have relations with North Korea. There were a lot of people in South Korea who wanted to visit their friends and relatives in North Korea.

The positions of South Korea, the United States, and Japan had always been, "Let's work toward eventual reunification. Let's have more exchanges. Let's develop a degree of mutual trust that will then enable us to move into the political realm." The very fact that the North Koreans wanted to move immediately into the political realm indicated quite clearly that they were trying to upset South Korea. What we knew -- although we didn't say this -- was that the North Koreans were basically trying to get the South Koreans to agree to reunification under terms which provided that the United States would withdraw its forces from South Korea. We knew that this would be anathema to the Japanese, as well as to ourselves and to the South Koreans. And maybe even to the Chinese, by the way.

So we had to play this game very delicately. In 1972 I made a trip to South Korea. I had talks with President Park Chung Hee, as well as with Kim Chong Pil, the Prime Minister, Kim Yong Shik, the Foreign Minister, and Lee Hu Rak, the head of their CIA who was in contact with North Korea about these matters. We went into some detail about them. I found that the South Koreans' thinking was about the same as ours. When I went to Japan I reassured the Japanese about the talks I had had in South Korea. So I was able to help calm down what could have been a rather dangerous situation -- at least, politically dangerous.

I mention that because, as it turned out, Japan and South Korea did develop good trading relationships. In essence, what happened was that Japan's success in moving away from labor intensive industries into the high tech field meant that Japan's labor intensive industrial field was left for other Asians to occupy. The South Koreans then moved into shipbuilding and textiles. Eventually, they moved out of that, and those activities shifted on to other countries, such as Indonesia, for example. This was the beginning of a train of events where the Japanese were able to help the South Koreans, and the South Koreans, in turn, were able to help other countries. This was all part of the regional interdependence that we were hoping to encourage.

There is one other major development in 1972 relating to Japan. That is, that Japan normalized its relations with China in September, 1972. Preceding that in June we had a meeting with the Japanese in Hawaii. President Nixon, Kissinger, Secretary of State Rogers, Alex Johnson, and I flew out in the President's plane to the Kuilima Hotel, which is on the other side of Oahu from Waikiki Beach. There we had a two-day conference with the Japanese, led by the new Japanese Prime Minister Tanaka.

I remember that on the plane going out to Honolulu, Alex Johnson, Rogers, Kissinger, and I were quite concerned that, since it was known that Japanese Prime Minister Tanaka was going to go to Peking to normalize relations, the Japanese were in a rather weak bargaining position. Tanaka had to deliver on his promise to the Japanese people that he would normalize relations with China during his trip to Peking in September, 1972. This was a situation the Chinese could exploit. We knew little about Tanaka. He hadn't had any advanced education and was a newcomer in the international field. We were rather concerned that China would come up with terms and demands which were going to make it very difficult for Taiwan and the United States. It could be rather shattering for our relationship with Japan if Japan were to accede to such demands.

These matters were discussed on the plane going out to Hawaii. It was really quite interesting, because I remember that President Nixon seemed less concerned about Tanaka's trip to China than did the rest of us. He was right. Those were not problems, as it turned out.

When Prime Minister Tanaka went to Peking a couple of months later to normalize relations, the Chinese were very considerate and reasonable. No demands were made of the Japanese to terminate any of their commercial and cultural ties with Taiwan, for example, with respect to airlines, sea routes, telecommunications of any kind, or cultural contacts. All that China demanded was that there should be a Japanese Embassy in Peking and not in Taipei. So the Japanese actually did get to normalize relations with the People's Republic of China before we did. During the normalization process Peking made it very clear that it welcomed good relations with Japan, good relations with the United States, and good relations between the United States and Japan. Here we had three countries, all of whom had been at war with each other at some point during the previous half century now at peace, representing the world's most powerful country (the US), the world's most populous country (China) and the world's most economically dynamic nation (Japan).

Q: You mentioned that you were the "regional man" in the State Department. You were looking for good relations between the various countries. Now I'm looking at this matter almost from the

Foreign Service point of view. At Chiefs of Mission meetings, did you find the usual parochialism, localitis, or what have you from the various ambassadors or their deputies? Did you have to urge them to play a more cooperative role?

GREEN: No. The only flare up I recall between two of our members where parochialism was involved, occurred at our Chiefs of Mission meeting near Manila in 1971. I have already given you an account of this memorable exchange between our Ambassadors to Korea (Bill Porter) and to Japan (Armin Meyer).

Our Ambassadors are our officials generally, whether in Washington or the field, reflected an awareness of US overall interests and were not given to parochialism, for it was and is basic to US policy that our friends and allies harmonize their relationships as far as possible. Much of our efforts have been directed towards furthering that goal.

Here I should add that our Chiefs of Mission conferences, usually annual affairs in pleasant places like Baguio (the Philippines), Hong Kong or Tokyo, were also attended by representatives of the Defense Department (CINCPAC), AID (Agency for International Development), USIS and a few other agencies.

Q: Before we leave the subject of Japan, I wonder if you could comment on how you felt that Japan operated in the rest of the world. It has become a very important country economically. The Japanese don't seem to have the "clout" or influence that the United States has. In a way, it doesn't seem that Japan will move in that direction outside of the field of economics. Do you have any views on that?

GREEN: As far as military affairs are concerned, Japan is bound by its constitution. More than that, it is bound by its own fears of involvement in a war. The effects of World War II were traumatic, as far as the Japanese were concerned. In my opinion, the chances of their going "militaristic" are very low, indeed. They are all the more reliant on the United States, because their whole position in the world is based upon commerce -- access to raw materials and markets. The United States is the best guarantor of that -- far better than the United Nations itself. And the Japanese know that. It is a fundamental "plus" in our relationship as long as we are a reliable ally, standing firm against threats to Japan and the US, such as are now implicit in the potential development of nuclear war capabilities by North Korea.

Now I will not get into US-Japan trade issues, but it must be emphasized that in the realms of trade, economics, technology and science, the Japanese are fully as powerful as the US. Its role in third world development assistance is highly laudable.

Where Japan is weak and, in terms of its size and power, too ineffectual on the world scene relative to its failure to be adequately involved in global strategies, political and social issues.

Finally, let me emphasize the supervening importance of the US-Japanese relationship in the years ahead -- and the consequent need for greater American understanding of the Japanese people and their culture.

In our relations with Japan, we have discovered that it is very hard for the Japanese to make up their minds, very hard for them to reach a consensus. They are consensus builders. We're not. We can have Republicans come to town and, overnight, we have new US programs and policies. It's all too fast. But in Japan such things take a long, long time. So that if we're looking for quick answers and quick results, as we often do as a world leader -- we try to "sign people up" -- we find the Japanese lagging behind. Because of their political processes, they operate that way. Almost all democratic countries do that -- much more than we do. So it takes some time for Japan to make up its mind. And sometimes we get impatient. That's one difficulty.

Another difficulty, of course, is in the whole field of trade and the way their system works. The Japanese are far better organized than we are. They save a great deal more than we do. A lot of the things that we do badly, they do well, and vice versa. I've often thought that the best solution for Japan and the United States is for each to be more like the other. Americans could save more and plan further ahead, the way the Japanese do, to place greater emphasis on education and family unity, more circumspect, more cautious, and certainly to think more in terms of the interests of society, rather than just those of the individual. We would do better if we did that.

For their part the Japanese would do better if they thought more in terms of other races, the need to harmonize with other peoples of different backgrounds, to relax and enjoy life more, spending more on housing, infrastructure and the good things in life. Also if they strove to play a more constructive role across a wider range of the world agenda. These are the things that the Japanese should do.

I believe the Japanese have always rather envied the United States for its wide open spaces and its free spirit. We have to remember that Japan has always lived on a few, rocky islands off the shores of Asia -- far away from the rest of the world with which it has commercial links. Its whole history, its topography, its geography, its outlook are different. So we are "the odd couple" which simply has to get along.

The most important long-term investment we can make toward improving US-Japanese understanding is for Americans to know a lot more about the Japanese, their language and culture than we do today.

I accordingly inaugurated in 1988, with the help of my wife, the Marshall Green Fund, managed by the Japan-American Society of Washington, DC of which I was President at that time. This Fund supports programs encouraging the study of Japanese language and of Japanese area studies deeply at the high school level. Originally the program operated only in the Washington area; now it is nationwide, providing incentive awards to students and teachers as well as video tapes, Japanese encyclopedias and dictionaries. The Fund also finances with the help of Mobil Corp. an annual "Japan Bowl" competition among high schools in terms of language proficiency and general knowledge about Japanese policies, history and culture. Nineteen teams competed in the Japan Bowl" in 1995 held at the George Mason University.

ROBIN BERRINGTON

**Assistant Cultural Affairs Officer, USIS
Tokyo (1969)**

**Japanese Language Training
Yokohama (1969)**

**Branch Public Affairs Officer, USIS
Fukuoka (1969-1973)**

Mr. Berrington was born and raised in Ohio and educated at Wesleyan University Harvard Universities. After service with the Peace Corps in Thailand, he joined the Foreign Service (USIA) in 1969. During his Foreign Service career Mr. Berrington served at posts abroad in Thailand, Japan, Ireland and England, variously as Public and Cultural Affairs Officer. He also served several tours at USIA Headquarters in Washington, DC. Mr. Berrington was interviewed by Charles Stuart Kennedy in 2000.

Q: Today is the first of May, May Day, 2000. Robin, you were assigned to Japan, 1969- 1973, where did you go and what were your initial duties?

BERRINGTON: Well I arrived in Tokyo in January in the winter of 1969. They wanted me to become what they called the student affairs officer. It was an ACAO position (Assistant Cultural Affairs Officer).

I was first assigned as the student officer for the embassy. That was fine with me, but shortly after I arrived one of those curious combination of events which probably are not that infrequent in the foreign service, one person's wife said something that upset somebody. Everybody got very emotional about it. The officer decided that he didn't want to stay in Japan. He left; his position came open, and in a domino effect, other people were transferred to fill his position and the other position before him, and as a result, the branch PAO slot which was the branch Public Affairs Officer slot in Fukuoka which is the southernmost and westernmost major city of Japan came open. That appealed to me much more mainly because it took me outside the capital city. It put me in charge of my own operation, and as a student of Japanese history and Japanese affairs, Kyushu which is the island where Fukuoka is located has always been sort of the cradle of Japanese heritage and politics. It is far and away the center that has produced the most political leaders and cultural leaders of the country. Kind of not unlike the south is to the United States. So when the chance came to go there, I grabbed it, and was assigned.

However there was going to be an interim period before that actually came open, so they put me in language school from January to September even though I already had the language and had scored a 3/3 or 3+/3+, I can't remember [Editor's Note: In FSI language competency testing the first score is reading, the second is speaking. The score of three suggests competency at the college level]. So I bided my time in language school in Yokohama before I went to Fukuoka. Which was not a bad development because being in the language school for a few months; it enabled me to meet some of my colleagues who would eventually be assigned to the embassy in Tokyo. If I had gone straight to Fukuoka these would have been just names, but now they were

faces and voices and real living bodies. It was helpful to have had that kind of bonding experience even if it was for a very short period.

Q: Who was our ambassador in Japan at that time?

BERRINGTON: At that point the Ambassador was U. Alexis Johnson who arrived in 1966 and departed post in January 1969, shortly after I arrived. He was one of the grand old men of the Japan-hands crowd.

Q: Well then what was the state of affairs in Kyushu-Fukuoka when you got there?

BERRINGTON: Well, in fact in a way I was walking into something of a hornet's nest although I didn't know it at the time. Kyushu, being the way it is geographically, it is the closest part to Korea. It is also the closest island to the China mainland, so it has always been an important military and strategic base. not just for the Japanese but for the American occupation forces and for those American military based in Japan once the occupation was over. So, we had several bases still in Kyushu when I got there.

There was a U.S. Air Force base called Itazuke. Itazuke had a large air force contingent there. Just a few months before I arrived a jet plane, it was either taking off or landing, I can't quite remember, lost power and crashed into Kyushu University [Editor's Note: this reference may be to the crash of an RF-4C the night on June 2, 1968] setting off all the radicals on campus into a frenzy of anti Americanism, and you know just provided the further excuse that they wanted to demonstrate and just cause general chaos. That was the kind of stage at which young Mr. Berrington walked onto the scene. So you had a very kind of delicate tense relationship with the base which was located very close to the city, and with the city leaders, the political leaders as well as the economic business leaders. [Editor's Note: In 1971 it was announced that Itazuke would be returned to Japanese control, and the USAF facilities were closed on 31 March 1972.]

At the same time we had a naval base in Sasebo. That was a constant source of tension as well because nuclear-powered or aircraft carriers often came in to Sasebo. Of course, the American policy being that they would never confirm or deny the existence of nuclear weapons. But anything that came into the port was usually the focus and object of various demonstrators and political malcontents that just wanted to stir up trouble with the Americans. So between this crash of a fighter plane into the computer building at the University in Fukuoka and the constant in and out of American warships in Sasebo, in terms of political relationships there was a lot of tension and a lot of activity to keep you on your toes.

Q: Who was consul in Fukuoka at that time?

BERRINGTON: In those days, before job inflation, a lot of the posts in Japan were just consulates. A new consul arrived about the same time I did. His name was Jerry Sutton. The American Center was located in a nice old building right downtown in the very center of the city. In fact it was a building which had been the old bankers club before the war, and during the war

it became a military officers club. After the war when the occupation took it up it became a kind of headquarters for all occupation activities in the Kyushu area. After the occupation ended, the embassy of course, took it over and it then became the American...well at that time it was called the American Cultural Center, but within a few years of that time it became the American Center.

There is one little anecdote which I always found amusing, in light of the extremist students and the crashed plane in the university. The American Center was located, as I mentioned, right downtown in the very core area. On our right side was the top newspaper of Kyushu called Nishi-Nippon Shimbun. On our left side was the LDP headquarters building. Across the street was city hall. Down the street just a half a block was the prefectural government headquarters building. We couldn't have had more establishment neighbors. We used to call our neighbor, because of all the student demonstrators and often labor unions demonstrations as well; it was sort of like the "A" court. Because you would catch all of these people together. It was not unusual for me to...our building was a three story building and there was a balcony off on the third floor...stand out there and look down this broad avenue, which had all of these establishment offices on either side. You could look down and you could see literally the whole street just full of people, often waving placards, shouting slogans, raising their fists, all very organized, scripted of course. Then they did the famous snake dancing which you will recall from the Eisenhower period; the Zengakuren.

Q: That died about...

BERRINGTON: Oh no. Zengakuren [All-Japan Federation of Student Self-Government Associations (全日本学生自治会総連合, Zen-Nihon Gakusei Jichikai Sōrengō)] was still very much...

Q: I was thinking of guys with ties around, bandannas around their head.

BERRINGTON: Bandannas. I had a, I ripped out a page from the newspapers which had a listing of the helmets and the headbands that the kids wore because factionalism in Japan was rampant. Zengakuren had lots of factions in it. If it was a green helmet with a red band around the mouth, then I knew that's faction A, and if it was a black helmet with a white band it would be somebody else. We could always tell who was who. In Japan the uniform is extremely important. You wear a uniform whether you are a businessman, whether you are a student, whether you are a tennis player or whatever. So I would often be up in the top of the building there just watching the snake dancing demonstrations. I can remember one time I was down on the main floor by the entrance of the building, and the groups were chanting and snake dancing past us when at one point one of the kids darted out, ran up the driveway to us. I thought Uh-oh, what's this. He said, Koncho-San, that was my title in Japanese for director. He said, "Koncho-San, here is a book I borrowed from the library. Please take it." And ran back into that demonstration and disappeared into that sea of people. In a way that was a kind of a metaphor for the whole business of the Japanese and the United States. You know, they could demonstrate against us. They could yell things at us. They could carry on like that, but they were always interested in what we were. They were always willing to borrow books. They were always eager to find out more about the United States. In the long run, and there were other examples too where a kid would run out of

the line or they would come up to us and say kind of quietly, "Can I use the bathroom?" They felt very comfortable with us. They liked the Americans, and that sort of made the stay of people like Jerry Sutton and myself very pleasant in a place like Kyushu.

The consulate, on the other hand, was located in a new building about two to three miles west of it, west of the downtown where we were in a large park called Ohori Park, a wonderful beautiful building. Jerry and his staff were in the consulate, and I and my staff were in the American Center. We were geographically separated although we would see each other three to four times a week, whether at meetings at the consulate or at the Center or socially and professionally around town.

Q: During this '69-'73 period, what essentially were your tasks?

BERRINGTON: The task of USIS Japan was really not that different from anyplace, of a USIS post anywhere, which is basically to improve...to deepen broaden and generally improve the understanding between the United States and the host country. In order to do that, of course, we employed an array of program tools among which were speakers, who we would bring in to Fukuoka to give talks at the Center itself or at outside institutions around town. We had a large library located in the Center which was open to the public. Anybody could come in, go out and borrow books or look at magazines or check out the reference materials and other documentary materials that we had. We would work at press placement to get important statements or articles in the local press which was both electronic and print media. We would set up exhibits or arrange for cultural presentations, usually quite modest because we didn't have a large budget for that. We had the exchanges program in which we could nominate local leaders for the IV program which is better known as the international visitor program. Representation, of course, at which both Jerry and I would run around and attend various activities. Goodness I am sure I am forgetting something else. But those are sort of the real basic weapons or tools that we had to work at deepening this dialogue between Japanese Americans on current issues.

Q: Well let's focus on a couple of things. In the first place, could you talk about, maybe they are quite different, but your dealings with both the Navy and the Air Force and the impact they are having on the community and what they were proposing?

BERRINGTON: OK let's take the American military. They had what they called public information officers of their own, who held the rank of lieutenant or kind of junior captain in the air force, or just lieutenant in the navy. Usually these people had no Japanese experience or Japanese language, but they were seen as people who would be fairly good on their feet and capable of dealing with the community and good at PR (public relations). But like most military, their lives tended to be very much focused on the base. They didn't get out that much. They didn't know that many people in the community, and they tended to have a fairly narrow focus on all these issues.

We in the embassy tended to look at a broader perspective at whatever was happening. Some of that - let's say - if a submarine was coming into town, it would be my job to go down there, work with the local PIO, Public Information Officer, and try to arrange for press activity or maybe appearances on local television show in advance or try to get some materials out and about and

introduce him to people that he might not have otherwise known. Because, well first of all as I say, they didn't have the language, and secondly he was so busy on base with the things that he had to do there that he just didn't have the time to get out and meet people. Particularly in a country like Japan you just don't walk in to an editor's office and say bang on the table, "here is a press release. I want you to put this in." There is a lot of stroking and cultivating of friendships and relationships that are required. I think those of us that were civilians that were not wearing a uniform probably found it easier to do that than the military, partly because of our language ability, partly because we tended to be around longer, and let's face it, for many Japanese, anything in uniform was still suspect. Remember this is only, gosh the occupation was over in '52, so we are talking about only 15 plus years since the end of the occupation. You know, memories of the war and the American occupation were still very fresh.

Q: How did you find the level of cooperation from the military, because sometimes you know, there is almost a built in suspicion, who are these people and what are they doing?

BERRINGTON: The PIOs were wonderful. I had nothing but the greatest respect for them given their limitations linguistically and experience and time. Particularly the one at the airbase in Fukuoka was great because he had a Japanese wife, and he knew...well let's put it this way, he knew what he didn't know, so he wasn't quite as full of himself. So the PIOs tended to be pretty decent guys who were cooperative and were happy to get our help. The problem, of course, was very often with their superior officers, some of whom had less than what I would call enlightened views about community relations or the position of the Japanese in world affairs or how to deal with the Japanese in terms of achieving other interests besides just the local base concerns. They didn't often see how base issues fit into a larger fabric of U.S. Japan relationship. They tended to see only in terms of what's happening at this base yesterday, today, and tomorrow, and that was about it. There were particularly in the air force. I have to say the navy was generally easier to deal with, even the senior officers. I had quite good personal relations with base commanders. This was I think, quite amazing for me because let's face it, I was a young 29 year old still wet behind the ears, junior officer of the embassy, and the base commander of Sasebo was a Captain, a very experienced Captain who probably would be promoted to flag rank within a few years. So the navy was generally easier to deal with. The air force had I'm afraid a number of what I would call the Curtis LeMay types that saw the Japanese in very racist and prejudicial terms and frankly would have been happy just to go in with guns or bombs and sort of get rid of the opposition whatever their attitudes might have been. It was a bigger challenge with the air force than with the navy.

Q: Well when you were there, did you work on any programs or initiatives to get our military to better know the Japanese and get the Japanese to better know the military?

BERRINGTON: I have to say, now here I am going to reveal my own limitations. At the beginning I thought that would be a great idea. In fact, whenever I hosted an event, let's say there was a cocktail party at the American Center, or I was having a reception at my home, or Jerry Sutton the consul did much the same thing. We would try to include select senior officers or important representatives of the base community in order to give them an opportunity to meet the local Japanese because the largest number of our invitees to events like that were the local Japanese community. I mean first of all we are not over there to invite Americans to these things,

and second of all in a town like Fukuoka there weren't many Americans anyway, outside the base of course. Yes, we tried to include as many of the base people as would have been appropriate. I mean we didn't want an overwhelming number. Say it was a part for maybe 40-50 people; I would usually include three or four uniformed people from one of the bases.

As time went by, I think I began to realize that in many cases this was a lost cause. Many of those who were the most hard-nosed and kind of difficult to deal with probably weren't going to change on the basis of my efforts to get them to change. For many of the GI's, you know, the enlisted, many of them were just as happy to stay on the base, and go to the bowling alley and go to the movie and eat their hamburgers and frequent the bars that tended to spring up around the perimeter of the base. I wasn't sure that was an entirely bad thing because for a lot of these folks to try and put them downtown in a large group of Japanese invited a little friction or problems. There were enough problems already without kind of bringing more by pushing this too hard. I think more importantly rather than the social or political or the understanding side, just by getting a more open attitude among the base officers to meeting with the local press or agreeing to go on local television or getting that press release out there - in Japanese if possible, for example, we tended to mark our achievement in things just like that rather than in getting total understanding between the base people and the local Japanese.

Q: Well at this time what was sort of the political orientation of Kyushu Province and Fukuoka?

BERRINGTON: Interesting area. As I said it was sort of the cradle of Japanese heritage. It has always been one of the more conservative centers of Japan. Again the comparison with the American south is not that bad. Strongly aware of Japanese heritage, very nationalistic, but at the same time, and this is common to many Japanese cities, there was also this broad streak of internationalism which Kyushu tended to have because it was kind of the doorway to Korea, and East Asia, and China from Japan. You have to remember that when Japan was a closed country for hundreds of years, the one opening, the one back door in which the Japanese could peek out at the west and the west could peek in was Nagasaki which was, of course, one of the major cities of Kyushu. So while it was extremely conservative, there was this sort of slightly contradictory element of internationalism in the Kyushu makeup. At that time, Japan was pretty much a two party system. The controlling party was called the Liberal Democratic Party, the LDP, and the opposition was called the Japan Socialist Party, the JSP. The JSP was a permanent opposition. They had never held power until a very brief period a few years after the occupation, and since then they have never done it again. The LDP, although it seemed like an eternal ruling party because in effect their party president became prime minister no matter who it was, so it was just continuous periods of LDP prime ministers who had run Japan, except for that very brief period under the JSP. Many of the LDP leaders came from Kyushu, so the fact that there was that kind of geographical base for many of these people meant that Kyushu got a lot of attention from Tokyo. It also meant that because at that time and still today, the Japanese looked to the U.S. as their most important, their senior, their number one ally in everything, places like an American consulate or an American Center tended to be seen as an extension of the embassy. For those of us who were assigned there, it was a very nice place to be. We tended to get cooperation in almost everything, from the officials. We tended to be included in almost everything. There was a certain prestige and status associated with anything the embassy, and perhaps even more so out there in the provinces. It was in many ways a very comfortable

arrangement. We were, Jerry Sutton and I as the two senior Americans in town, the two senior non military Americans in town, we tended to be the beneficiaries of all of this.

Q: How did you find your relations were with the press and the media in general?

BERRINGTON: Electronic media was a different thing. The electronic media tended to be very friendly. If I said I wanted to go on TV to talk about something or make a statement or whatever, usually it could be done. The print media were something else, and that is largely because of...well in Japan, the print media were seen as a more viable opposition to the government than the Japan Socialist Party was. They kind of looked upon themselves as being the one voice that could say things and chide the government or raise objections or criticize in a kind of grand tradition of providing that kind of voice. So on one hand personally they were always extremely friendly, but on the other hand, they were required a lot more massaging and a lot more persuading to get them to say take materials that we might offer them explaining the American side. There was almost a more instinctive or knee jerk, I won't say anti Americanism. The military would have called it that. But I would say an instinctive or knee jerk tendency to criticize America, even over the slightest things. If let's say an American ship sailed in to Sasebo, whether it had nuclear weapons or nuclear power or not, the press always tended to see a boogie man under the bed and tended to exacerbate the problem by insinuating that there might be nuclear weapons or some problem and that one of our main responsibilities was to kind of keep the press from going out too far on some of these sometimes sensationalistic stands to stir things up.

Q: How would you try to keep them from going too far? Was the press sort of sensationalist in the form that so much of the British press is, sex and scandal and that sort of thing?

BERRINGTON: No, it was more sensationalist in just accepting hearsay and gossip. The mainline Japanese press are very much like the British press in that there is no naked girls or sex to speak of, a little bit but not that much. That type of material tended to be in the magazine sector of the Japanese print media or in there were a number of tabloid papers as well some of which tended to come out in the evening, good for the commuters when they were riding home on the train. But as far as the mainstream press of which there were two papers in Fukuoka, no you wouldn't have called them any kind of a sleaze and sex, not at all. But they did often pick up a story and just run with it even though they may not have checked it out completely. The idea of verifying two or three sources before running a story is not exactly a popular custom in Japan. You know, if the headline said "nuclear weapons on aircraft carrier in Sasebo harbor," and if in fact that wasn't true at all, they didn't care that much. The rumor was the story of the day and they would run it; they could always run a denial the next day with further investigation we feel that was not true, but for them moment it was just as easy to run it.

Q: You had aircraft carriers in there. I am not a navy man but I have to assume that any aircraft carrier would probably be very likely to have nuclear arms on board. How would you if you can't confirm or deny, you have to be very careful if a cargo ship comes in you can't say it is a cargo ship, it can't have it. Then you are pretty much pointing your finger at a warship that probably does have those.

BERRINGTON: You just of course put your finger on one of the basic dilemmas that all of us face. We had to fall back upon at that time the Japanese had what they called the three pillars of a non nuclear policy, one of which was never to allow nuclear weapons in their country. They said the American government respected that. What we would say is we follow the three basic pillars of the non nuclear policy and we do not deny or confirm the presence or absence of nuclear weapons and we can't say any more. So it's I am putting our statements in very simple terms.

Q: It sounds like you couldn't go after somebody and refute a claim that we have nuclear weapons on board outside of making a formal statement to the press.

BERRINGTON: Well, in effect, we would have to say the ship is there because of strategic interests in Asia. Japan and the U.S. are co-signees to a security treaty. Ship visits are a part of the Japanese obligation being a co-signee, and again we will not confirm or deny. You had to couch it in other terms, which it was there for reasons that were more important than whether or not there were nuclear weapons on it. Of course what we have since found out is that there were of course, as many had suspected all along. The Japanese government said they didn't even want to know whether or not there were nuclear weapons on any of these, of course did know. We just in fact denied things; they were party to a broad policy to I guess you would call it deceit.

Q: But at the same time it was, I mean anybody who followed military affairs even as an amateur could almost point a finger to which ship would have and which wouldn't have.

BERRINGTON: Of course. It was one of those fictions that we all you know, paid attention to. All of us played this game; everybody knew what was happening, and the media in a way was just as much a party to it as anybody else. They didn't really go out and investigate that much. They never turned up any evidence of there being anything. It was sort of like a, I hate to use the word, but kind of like a Kabuki drama. They knew what the roles and the parts were but nobody ever did anything other than that.

Q: Now your tour was during the height of Vietnam. How was that playing down in your area? What were you doing?

BERRINGTON: Well that of course, was one of the reasons for all of this activity in these bases because particularly Okinawa which was further on down from Kyushu. A large marine contingency was in Okinawa. Most of the visits had some kind of connection to a larger East Asian strategy. The Japanese were very unhappy with what was going on in Vietnam. They saw the war largely in racist terms, you know the white Americans beating up on the yellow Vietnamese. Probably without too much effort they could be reminded of what they had gone through in World War II. The Japanese suffer from something called the victimization attitude. They like to see themselves as a kind of victim status a victim situation. WWII was for them a great national tragedy largely because they saw themselves as victimized by the West, not just the Americans but the British, the Dutch and others. The two atom bombs, Nagasaki and Hiroshima, were very much seen as the most egregious final result of their victimization. Now of course, lost in all of this woe-is-me attitude is how the war started and Pearl Harbor and all of that. But never mind, we all have our forgetful moments. So it was easy for them to kind of by

extension of this innate victimization they had of their own to look towards the Vietnamese as being exploited or victimized by the west as well, so there was a sort of big brother/little brother attitude there about gosh that is awful. In a way they wished we could end it, get it over with and get out so they wouldn't have to have this problem weighing on their conscious as much as it was. But of course it wasn't that easy. Needless to say at the same time, and this is something the Japanese didn't exactly play up very much, was the large commercial profit taking by the Japanese corporations with what was going on not only within Japan but southeast Asia as well. So that probably for those that really wanted to dig deeply would cause some feelings of guilt.

Q: All I know is that during part of this period I was consul general in Saigon and the most dangerous part of the war for me was these damn little Honda scooters which I think are still in the streets of Saigon today. This is obviously not without profit to the Japanese.

BERRINGTON: Oh not at all. It wasn't just that. It was all the materials passing through Japan on the way to Southeast Asia. And of course, there was a huge Japanese presence in Thailand of corporate representatives and business activities. Of course, we had all the military bases in Thailand as well, so the Japanese were doing quite well thank you.

Q: Was there a Japanese business community that carried clout that you were dealing with in Fukuoka?

BERRINGTON: Yes. Well the Japanese businessman is a very important part of the establishment in Japan. They have very influential business organizations. In Fukuoka it was called the Kyukeiren which was the Kyushu version of the nationwide Keidanren which is well known as one of the leading Japanese business lobbying organizations. I would regularly get together with businessmen to talk about the issues, to encourage them to maybe fund activities we were interested in. The business community, of course, was more the province of the consul than it was of the American Center, but Fukuoka being a smaller town, it was about a million population, and the establishment of Fukuoka being a kind of rather small well definable group, and because Jerry and I were the only two people there, I mean it was kind of easy for us to move back and forth. He would get involved with a media group with my great support as much as I would get involved with the business community and he didn't mind that. So yes, I would frequently see business leaders. Although my natural constituency tended to be more the media and the educational communities.

Q: What about the educational community because one always thinks about the brighter Japanese university student is on the barricades while a student, and is immediately thereafter moves into corporate or government headquarters where he is sitting on the other side. Was this pattern there too?

BERRINGTON: Oh you summed it up very well, and particularly at Kyushu University which if you will recall, that burned out hulk of that plane is still sitting there on that campus. Because of the political sensitivities, Vietnam, all of the bases at that time, the extremist students would not consent to allowing the authorities to come in and take the plane out. In a way this perpetuated this symbol of American imperialism and American military oppression or name your cliché of the time. So it was very difficult for me to go on to the campus of Kyushu University because of

this lingering hostility by these extremist students. Now, probably most of the people at the university couldn't have cared less about whether I was on campus or not, but the student leaders from these extremist organizations had so cowed and intimidated the university officials that in order to keep them from being more demonstrations and more destruction and damage and riots and tear gas and all that, it was just easier for the academic authorities just to say let's not stir things up. Let's keep it the way it is and eventually time will pass; these kids will leave; things will moderate; and we can get rid of the plane, and go back to rebuilding the structure where it crashed.

There was a second campus of Kyushu University which was about two or three miles away from the main campus where the crash had occurred. I could go over there without any problem. In fact, that was the campus where there was more American studies, literature, political science, the sorts of things we were interested in anyway. The other universities, and there were two other main universities. One was called Fukuoka University and the other was Seinan Gakuin University, were much more moderate in this respect and there were no problems. Again in the same vein that some of the media representatives would be officially very critical of America but personally very cordial. Some of these professors might appear on TV or do an interview in the paper and say some very nasty things about the U.S. and the next day come to my cocktail party or have lunch at my place and be very friendly. So, in spite of all these strains in the official relationship, we maintained a very good relationship with most of the academics there.

Q: In many European and American universities, we use the stereotype that there remains a strong sort of cadre of people who subscribe to, in one extent or another, a Marxist viewpoint which supports easy criticism of the West.

BERRINGTON: No, you literally took the words out of my mouth. The economic faculty at Kyushu University I think was 100% Marxist, and many of the history professors as well had that kind of an orientation. That is part of a kind of a long academic tradition in Japan. Without getting into a long history lesson, right before the war in the 30's, many of the non Marxist academics really kind of did themselves in by, in effect, cooperating with the military officials, with the government that Japan had in WWII. It was only the Marxists and the communists that resisted much of this and were arrested, often imprisoned, and after the war, came out kind of the academic heroes of that period. So, that tradition that the whole kind of Marxist left wing tradition in Japanese academics had some thing of an honorable badge that they could all wear because they had not embarrassed themselves or postured themselves to keep in pace with military governments before the war. So you have that tradition to deal with in the academic community, but again age caught up with a lot of these people, and as time went by, more and more of these professors tended to retire or moderated their positions.

Q: Were you able to sort of turn the spotlight on to the Soviet Union and to Communist China and point out what was happening there?

BERRINGTON: Not really. I mean not because we were unable, but it was because we didn't need to. I mean the Japanese were very much aware of what was happening in China. The Russians, I mean to this day most Japanese don't like the Russians. In any poll of public opinion in Japan, whenever they talk about who are the most beloved foreigners and who are the most

hated foreigners, when it comes to the hated foreigners, the Koreans and the Russians always come out on top. They sort of vie with each other for the top position. So we didn't really have to say or do anything about the Russians to convince the Japanese that they were the bad guys. The Japanese have always had a mixed attitude toward the Chinese. I mean they see the Chinese as the sort of mother civilization of that part of the world, so there is some feeling that they should be closer and more understanding with the Chinese, but then we all know about what happened in WWII in China, so there is some lingering ill will there with the Chinese too. You know the excesses of the Mao's cultural revolution and all that were frequently reported so we didn't have to play that up. Besides I think that would have been less useful anyway. Our program in Japan was more of a positive program pointing out the benefits to the Japanese of maintaining the security relationship, of close political and economic ties with the U.S. and stressing those positive things rather than working on the negatives of China or Russia or anyplace else.

Q: Was it pretty well accepted there that you could have fun twisting the lion's tail while accepting the security protection the U.S. relationship offered? That basically saved their own kids from going into the military and saved budgetary resources. Was this pretty much an accepted good thing?

BERRINGTON: Oh most Japanese are very happy with that. First of all again a little bit of Kabuki, everything about Japan is. There were what they called the self defense forces. There was a naval self defense force, a land self defense force, the air self defense forces, and they were in effect the Japanese army, navy, and air force. But the self defense forces were quite limited in what they could do. This has been one of the ongoing debates internally in Japan, just how far could the self defense forces go in pushing their mandate, in pushing their function. In those earlier years when I was in Japan, the self defense forces were really almost used primarily for disaster relief, that sort of thing. You know, a flood comes along and they were sent down to take care of it. Most of the kids that would go into the self defense forces were not your high fliers. They were the ones that didn't do very well academically or maybe didn't complete school, or farming kids that were very conservative in their outlook, and maybe still thought of the military as being a worthy profession. But for most people it is off to a good school, while for most of the country the self defense forces are really a kind of second rate operation. As a result they were very happy to have the umbrella of protection from the United States rather than having to rely on their own forces which not too many years before had caused the grief and tragedy of WWII. Everything when it comes to Japan still today, you know the two absolutely crucial events were the closing of the country during its Tokugawa period and WWII. Those two events really inform so much of Japanese attitude, behavior and still have formed much of what they say and do.

Q: Speaking of a closed society, how difficult was it to operate in Japan? You might know the language, but was it either hard to make contact or understand how the society operated?

BERRINGTON: I was lucky in that I had studied in Japan, and had more than an FSI language ability. So, it was easier for me to move around. I have to add one other...and probably the sociologists will think I am nuts, but one other factor which I think often accounted for my success in the country, and that is I am only 5 feet 5 inches tall. I could literally look at the Japanese in the eye and I would not intimidate. I mean many of the officers at the embassy

would be six foot or more and would be literally overwhelming physically. The Japanese are very conscious of their shortened stature and their small physique. The idea of getting a foreigner who was the same size, I think, was probably much easier for them. A third element was the fact that I was a bachelor. Incidentally Jerry Sutton was also a bachelor. Japan is a great society for, well I think even today, but even more so back then, it was basically a male society. This meant going out drinking, yukking it up with the guys at night, and since I didn't have a wife or family that felt obligated to spend my evenings or weekends with, it was easy for me to join the gang on any kind of events that were happening. So, obviously my knowledge of Japanese history and my Japanese studies in school, and my previous time there as a student, all of this had sensitized me to a lot of other things as well.

The Japanese society was very dependent on codes, you know gestures, body language, all of that. Much of that I had instinctively picked up over the years, so it was easy for me operate within the society. Now having said that, one of the things for many people to spend a lot of time there, it is very frustrating, is that you are always regarded as a gaijin. Gaijin is the Japanese word for foreigner. It literally means outside person. If you meet a Japanese for the first time, and you were to say something like "Hello, my name is..., how do you do." It doesn't matter whether you said it with the klutziest accent or whether you said it with an accent that made you sound like a native speaker; they would still think "Oh my God, this man speaks Japanese." They would be astonished; nothing short of the open mouth and the look of surprise on the face, if you knew how to eat Japanese food with chopsticks. Every time I went out to dinner invariably someone would say "Oh you are very good at chopsticks." There were other little comments like that, that would constantly remind you that you were in fact an outsider. Now very few of us wanted to be Japanese. It is not that, but it is the kind of condescending attitude that many of us felt that we were kind of regarded as not much different from talking dogs. There was a constant curiosity about how we lived, what our homes were like, our attitudes about this and that because we were curiosities.

Q: How much of their understanding was formed by TV and the movies?

BERRINGTON: Unfortunately, and I don't think that has changed much over the years, very much. I mean a lot of it was formed by TV and the movies. You know, all foreigners were blond, beautiful, tall, rich, prone to violence. All those stereotypes were closely held. That was one of the things we had to keep chipping away at, those stereotypes. Well, maybe there was a kernel of truth to some of them, by and large they were not very accurate. It was a constant effort. We are talking about 1969-'73 period. Even 1993 when I left Japan 20 years later much of that was still the same. A story that I used to tell was when I was a student in Japan in 1960-'61, I had a Japanese, what they call a guarantor, somebody who signed the papers and make sure if I got in financial trouble or whatever, he would take care of it. He probably knew me as well as anybody. He had studied at Antioch College in Ohio, was fluent in English, was a very intellectual and sophisticated guy. Every time I would see him even if it was, well not every time. Say if I had gone away for a few years and come back to Japan and we would get together for dinner or something, invariably he would start out, "Oh your Japanese is so good," and "Oh you can use chopsticks." You know I would often sit there and think even somebody like this? We have to go through kind of these initial steps of proving who you are. It could be very frustrating.

Q: Perhaps not when you were first there, but one of the most revolutionary things that America has been pushing by example and otherwise is a progressive view of the role of women. Were we doing anything either consciously or unconsciously on that?

BERRINGTON: Yes. When Reischauer was ambassador [April 1961 to August 1966], he brought out a young woman to be a women's affairs officer at the embassy, much in the same way I was supposed to be a student affairs officer. That was a position that was kept in the embassy for a number of years. Of course, if we were bringing out speakers or experts in any field, we always thought we were kind of getting a twofer if we were able to recruit not just an expert but also an expert who maybe happened to be female, or a black or something else that showed in America there was a greater equality of opportunity. So we tried to send messages in more ways than...

Q: I would think that sometimes if we are trying to send a message, we only satisfying ourselves. In other words let's say you put a woman or a black into the Japanese society to lecture on environmental affairs or Melville or something like that. Would the Japanese make the connection that these are really experts and all or would they think they were being...

BERRINGTON: Yes, I think they did, and the reason they did was, it took me awhile to figure this out, but the Japanese had long since come to the conclusion that we, the Americans, were different. By being different, we could do things like appoint blacks or women to important positions or they could rise up in the system to become experts in their various fields, and they could still be listened to and regarded just as authoritatively as if the person were a white man. They didn't necessarily make the next logical conclusion that gee we should do that here too. I think many of my colleagues were hoping that they were making that step. I doubt if they were. Of course, the women's movement or civil rights movement, which for Japan was basically for Chinese or Koreans rather than blacks, those kinds of movements did move along farther as time went by. At this time in late 1960s early 1970s there was not much evidence of any kind of movement in Japan on those fronts.

Q: What about were you getting any reflections from Japanese women about "Gee I wish I had more opportunity" and that sort of thing, or was this not something they had expressed to you?

BERRINGTON: Yes. Many of the Japanese would tell us things that they would not tell each other. Again because we were outsiders, because they probably knew we would not be passing this on, and simply because we were not part of the system. It's like they let their hair down or speak up in front of us without fear of any kind of embarrassment from their colleagues or their family or friends or whatever. So, yes, I would hear a lot of this from others, particularly from women about how they wished they had as many opportunities or as much power as American women. But then of course, there were other Japanese women who would kind of engage in the usual kind of mythology that we-Japanese-women-have-more-power-than-American-women so we don't need to be taking the kinds of steps that American women are. Frankly I regarded that as excuses for those women who didn't want to see the change or had problems dealing with reality.

Q: What about Koreans there?

BERRINGTON: Well Koreans are of course, the ethnic minority group that is most discriminated against and at the bottom of the rung of the ladder. There is a large Korean community especially in places like Kyushu, and in the other major cities. Many of them were basically in professions that were kind of left for the economic low classes. Those Koreans that did achieve and were able to kind of make the leap into the Japanese mainstream usually did so with some risk because they had to either hide the fact they were Korean by taking on a Japanese name or kind of concealing their past, or just by kidding themselves that they had become Japanese when in fact they still were Korean. It was a sad story for many of them. Even more unfortunate of course, was what they called the untouchable class, the “eta” or burakumin of Japan who basically were the sort of like the untouchable caste of India. These were a much smaller minority, but they were still there. They were different from the Koreans in that they were ethnic Japanese which is very astonishing. How they came to be regarded as kind of a non class untouchable class is one of the great mysteries of Japanese history. It is assumed that many of them were butchers or did those professions that involved unclean activities hundreds of years ago, tanning of hides, burying the dead. Over the generations the families that did those sorts of things just became tagged with that untouchable social stigmatization, and just over the years were unable to escape beyond that.

I had one absolutely astonishing experience in Fukuoka once. As a bachelor and wanting to get out and around, I had a few bars in Fukuoka that I used to frequent. I can remember one night I was at one of these bars and as was often the case, when they see a single foreigner sitting there talking Japanese to the bartender whatever, curiosity is aroused. Another guy sitting at the bar came up to me and started asking me questions, who was I and so forth and so on. He said, "Well let me take you to my bar." We went to his place which turned out to be kind of a night club with lots of hostesses, women sitting around. I could tell that he was a kind of an uneducated lower class type of person, but you know, it was fun meeting people of all types. The night club was a bit of a cheesy place but, frankly when you are a foreigner, those kinds of experiences are interesting and amusing. I didn't mind going to things like that. At one point he got up and left to go to the bathroom. The hostess who was sitting closest to me turned to me and said in Japanese, "Did you know that your friend is an untouchable?" I was absolutely astonished. I didn't know that. I couldn't tell just by looking at them so I said, "No, I had no idea." She said, "Oh, yes, he is a regular here and we all like him very much but I wasn't sure if you knew this." I said, "Okay, that's very interesting. If he is an untouchable, why are you so clearly friendly with him?" The young woman said, "Oh, Japanese women like untouchable men because," and she took her fingers and put them way up, "they have big ones." I was absolutely astonished. I thought Margaret Mead where are you tonight. The idea of a discriminated ethnic minority class having this kind of sexual prowess. I have always remembered that experience. That was so indicative of the whole issue of a kind of lower class or forbidden fruit, that sort of thing.

Q: Well did we get involved at all in saying “gee you should be nicer to the Koreans or the untouchables or whomever?”

BERRINGTON: Let's face it, USIS Japan, USIS any country is in the business of forming, shaping public opinion. We have limited resources and limited ability to do this. How do you do this? You do it through the gatekeepers of the opinion formation process of a country. You try to

reach those people who will be in a position to make the decisions or be in a position to influence those who make the decisions. So what we are talking about are the media of course, the academics, the teachers, the professors, the politicians who make the pronouncements, the intellectuals, the artists who write or do things that are regarded as important voices in the community, those kinds of community leaders. The ethnic minorities or the untouchables certainly didn't fall in that category, and they weren't even a large enough ethnic minority to be a factor in any of the various equations of the U.S.-Japan political, economic, or security relationship. If they had been, then I am sure we might have wanted to do something with them, but no they were just a very small blip on any radar screen if even a blip at all.

Q: This is a time of considerable activity on the part of President Nixon and Henry Kissinger and all. How was this playing down where you were, or did it? I was wondering about the opening of China while you were there. Did you have that Nixon shock too?

BERRINGTON: Well, yes, there were two major body blows to the U.S.-Japan relationship. One was the oil shock which was basically a problem of oil prices and oil supply from the Middle East. The other was the so called Nixon shock which was the opening of China. In both of these cases, the U.S. did not give the Japanese the kind of advance notice or any kinds of consultative briefing that they expected to receive and that they thought they deserved as our so called leading ally in the whole east Asian area. So particularly the China visit was a very humiliating experience for the Japanese leadership because we had not given them the kind of advance word that they expected they would get. We were constantly trying to explain that and deal with that, and that unfortunately for the Japanese was a bad thing. You can hardly make a good thing out of a bad thing.

Q: I heard, and this may be self justification, that there was a certain amount of premeditation in doing this because it was hard to find somebody in the Japanese government that you could talk to who wouldn't immediately share it with everybody else who would share it with everybody. In other words it is this consentative type of government which means that you can't really tip somebody off early. Is that valid or not?

BERRINGTON: I have heard that one before obviously. That was often used as a justification at the time. I mean not an official justification. It was batted about informally. That was very hard for me to deal with too because basically I was in Kyushu. I wasn't dealing with central government officials. I had no idea whether the central government was as much of a fizz of information as people said it was. I mean there was clearly some truth in that notion, but it seems to me that this was a major policy shift, and we certainly paid a price of trust and closeness in the government for a long time after because of that. It is hard for me to second guess.

Q: What about, and I have heard you keep talking about the central government, but also how Japan works, nothing is decided here and now. It is usually in committee, by consensus. Did you run across that when you wanted to put on a program, nobody would look you in the eye and say "OK, we'll do that?"

BERRINGTON: Japan is not a society marked by decisive leaders in any field. University presidents are very much members of a board rather than executives in their own right.

Newspaper editors-in-chief again tend to operate within the group rather than in determining editorial policy as probably an American paper would. Certainly within the political arena, Japanese governors lacked the power that American executives would have in the states. The whole Japanese system of government was very much to use a western model was very much like what I understand France was like with all the power being in Paris and everything flows out, kind of all roads lead to Rome kind of approach. Japan is very much like that. Tokyo was where all the action was taken, and once a course of action was decided on, then there was very much a building of consensus nationwide through the networks that the LDP or other organizations have. Nothing ever changed quickly in Japan. We often used to describe it as being like a large battleship or the Titanic or some giant ocean liner. You know, you can't really turn things on a dime. It slowly moves, but the whole business of consensus building was so important there, you don't get an overnight change. The problem with that, of course, is it takes a long time. It can be very frustrating, and there is difficulty dealing with a crisis or really urgent issues. The good news is, of course, that once consensus had been formed, the whole nation is literally mobilized, or the whole organization. Let's not even say nationwide, just say a corporation or university or whatever, that whole organization is mobilized to do whatever needs to be done. Then you are less likely to have the kind of backbiting or sniping or fractious disagreement, but consensus building does take time.

Q: As the USIA representative, I imagine you would be dealing with artists, the artistic community. What is in it for the United States to deal with the artistic community in Japan?

BERRINGTON: Well the same in any country. Artists are frequently seen as non-political, non-ideological, as sort of neutral observers of events. They are seen as intellectuals. They are seen as people who call it like it is. Because of their artistic achievement, they occupy a special niche within the society. So if, as was often the case on Japanese TV or in a Japanese newspaper, if so and so is being interviewed, or is in a discussion about what ever the topic might be, it might be an artistic issue or a local issue, it was not unusual for something involving U.S.-Japanese affairs to come up and he would be outspoken. Very often they have thoughts about these things. Very few of them would say Oh I am just an artist and I don't think about that. It doesn't work that way. They usually do have an opinion, and it is probably better to have a lot of those guys on your side or if not on your side, at least have them understand better the issues or the relationships that are so important for both countries. So they would certainly be part of what we would call our target audience. This could be anything from musicians to dancers to painters to writers to pop stars. You name it. We did not go in for celebrities cultivating just for the good of saying a celebrity. It was really more to make them better understand what the whole kind of fabric of U.S.-Japan relations was about. You know to be sure, if we had not done it, or if we had not talked to them that much, they would kind of feel like they were left out. Particularly in a town like Fukuoka which was our regional center, and with the consulate and the American Center being major players on the local scene, if we had totally ignored them, they would probably wonder why? Why didn't we include them in things we were doing?

Another element in all this of course is that to talk to these people, very often you had to do things that would interest them. I mean I didn't just walk up to a sculptor and say let's talk about nuclear ship visits and start talking. You had to probably have an American sculptor in town to talk about maybe issues of common interest, and then at the time if it were appropriate or

something came up, then you might edge into some of these areas. So it was very important for us to be seen as the kind of society that had the values that put culture and the arts and intellectualism and all of that high on our list as well. It's an area that I don't think Americans quite understand, but many non-Americans regard a country's culture, its arts, its literature, its intellectual community as something of an indicator of the worth of the civilization of that country. If we as the U.S. government are not doing more to promote our own cultural activities, our writers, our composers, whatever, we would be seen as maybe not quite as worthy an ally or we are not the substantive society or nation that is worth spending so much of their own political or economic capital on. It made up a better, a society of better nations to them, and so, you know, it was very much a two way street.

Q: I would assume there wouldn't be quite the same hang up that we get sometimes in Europe where some Europeans, this is dying but, would take the stand, Americans have no culture. I suppose the Japanese look upon what we do as exotic or something, or did they?

BERRINGTON: That was one of the nicer things about being in Japan. The Japanese were absolutely obsessed with anything that went on in the United States. They were deeply interested in everything we did whether it was in social issues or cultural issues in the United States, largely because they saw us as kind of the laboratory in which things happened, and if these events or trends were successful, invariably they would come to Japan as well.

So if it was like women's rights happening in the U.S. they figured five or eight years down the road it would be happening in Japan as well and the same with any cultural activities or artistic activities. So anything that we would bring to Japan in our exhibit or musical performance or dance or whatever was flocked to by the local community. They really wanted to see what's up in America. If we had not done anything at all, they would have wondered why in the hell we were not doing it, but when we did it, they were always there to take a look and find out for themselves what was happening in America. So, yes, working with the cultural community was extremely important. Let's face it, you can deal with the bureaucrats, the politicians, and the businessmen for a lot of things, but after awhile some of the cultural types were more fun, more interesting, and it was like adding the spice or the salt and pepper to your stew. If you had a party or an event going on, throwing in some of those types, it was more fun for the Japanese to see: "Oh look, there is so and so the well known writer or the famous potter," "Oh he is here tonight too." It added to that sort of class or status of your position in the community to have those people there.

Q: What about leader grants, sending people to the United States? Did we have much of a program and did you get any feel?

BERRINGTON: We had an International Visitor program which is what I assume you are talking about. In Fukuoka alone we used to nominate about, oh gosh I think we used to have at least six or eight a year and maybe even more. The Japan program was one of the largest in the world. The embassy in Tokyo was very good at making sure that all of the regional centers got their fair share of nominations. That was very important because the way the Japan system worked, particularly with a lot of these nationwide institutions, whether it was Asahi Shimbun the big newspaper or whether it was a corporation like Mitsubishi or one of the political parties

like the LDP or the JSP. Many of these people got their start in one of these regional centers. As they would rise within the system, first in the regional center and then maybe in Osaka and then finally when they hit the big time in Tokyo, it was much easier to contact and meet these people out in the Fukuoka or Sapporo or Kyoto rather than once they had gotten to Tokyo, where they would be just too damn busy to do a lot of the things we wanted to do with them. So it was very important for us out in places like Fukuoka too, to have these contacts and nominate these people. Many of the people, whether it was members of the diet, politicians or the young journalists that I knew have now risen to extremely senior important positions in their organization.

Q: Were you pleased with the way the program is run and experiences of the people coming back?

BERRINGTON: Oh of course. The IV program was over the years when USIS would go through one of those spasms of budget cutting where you had to rank what are the best things we do and the worst things we do. The IV program would consistently come out on top as one of the best things we ever did. So no that was always very well run, very fruitful, very positive. In leaping forward, one time when I was in Tokyo for example, I sent the deputy governor of the prefecture in which Yokohama is located. Yokohama is now I think the third largest city in the country. The deputy governor was one of those left wing politicians that had kind of grown up within the very Marxist kind of anti American tradition. When we sent him to the United States, he came back he was a changed man. I mean he was one of the most dramatic examples I have seen come through that IV program, and literally had his attitude do an about face about market economies and security relationship and all that, just go 180 degrees as a result of the IV experience. So yes it was an extremely successful program.

Q: Is there anything we should cover here, any events or issues that maybe we haven't talked about?

BERRINGTON: Well I have been talking mainly about Fukuoka because that was where we were based, it is the largest city, but to a degree the same thing was happening in the other cities of Kyushu. Jerry Sutton and I would try to get to places like Kumamoto or Nagasaki or Kagoshima. I mean big cities but they just didn't have an American Center library or they didn't have a consulate. So we were doing much the same kind of outreach to the political leaders, the media leaders, the academics, just not on as frequent or regular basis.

Often, even though we might be in a place like Nagasaki only say four times a year, the results of those visits could be extremely important because our visit would be like VIP's coming down from the regional center. Another important development during my period in Fukuoka was when we changed the name from the USIS office there from the American Cultural Center to the American Center. That was a major kind of I guess you would say policy decision by the top people at USIS in Tokyo. This was based on the decision that the USIS program in Japan had literally not changed since the occupation period. At the same time, Japan itself was changing by leaps and bounds, and it was time to make our programs far more modern and more welded to contemporary society than it had been. It had gotten pretty cobwebby and dusty and all of that. So we changed it. The one way to show this change was the name change from American

Cultural Center to American Center. One of the reasons we did that was to show that there was more to the American Center than just culture. I mean we were heavily involved in the policy issues of trade and military relations and all of that. But also because we were instituting what were in those days, now this was I think 1971-1972, some pretty radical modern electronic equipment like the old fax machine which is kind of dated nowadays, but in those days we were using fax machines to transmit back and forth between the Embassy and our Center which enabled us to get policy statements from the ambassador or from people literally into the hands of people instantaneously.

We were also, and this was important, we were being much more attentive to the audiences we were dealing with. In the old days, we were sort of happy to have almost anybody come into the Center. We were happy to be giving out our policy paper to almost anybody. You know, you work for the newspaper, fine let's give it to him. Now if he was in the distribution office of the newspaper, so what? He didn't have much to do with policy issues, but because he was with the newspaper, we would give it to him. Well we were much more focused in our efforts, so as to get things into the hands of the real political, economic, cultural, military movers; those kinds of hands rather than just what I called the "Friends of America." We were more purposefully going out and looking for target audience members, particularly those people who were not true believers necessarily.

In a way, we were making our own lives more difficult because we were trying to do more than we were doing when we were the old American Cultural Center and just sort of dealing with whatever came in off the sidewalk. So it was a much more aggressive, strident, focused, targeted kind of program. For example, (Herman) Melville, you mentioned that earlier. We didn't do anything about Melville. We stopped doing nice comfortable things like Melville. Instead we started doing things like Saul Bellow. The idea was to make the program as contemporary as possible. We figured everybody already knew about the Civil War or knew about Nathaniel Hawthorne and that sort of thing, but how many people knew about the current developments in American dance or how many people knew about those American writers who were getting the book awards and all of that, probably not so much. So we were making it a much more contemporary and focused operation in our program, as well as our audiences. That was a major change because for many USIS people, this meant change.

It meant getting off your can, getting out with new material and doing something; and we were instituting some accountability as well. I mean if you didn't deal with some of these people, you weren't doing what you should be doing. We were actually recording the idea of putting this in quantifiable terms. It went a bit overboard at times, but we were trying to record how much we actually did see the professors of international relations or how many people from the local legislature did we send off on an IV program, as opposed to how many people were friends of ours. It was a major institutional change for USIS Japan. This was a change incidentally which then kind of set the mark for many other USIS programs around the world.

Q: You were sort of in the lead then?

BERRINGTON: Yes, very much. We changed the name of the library from the American Cultural Center Library to what we called Infomat – "info" came from information and "mat"

came from automatic. You could automatically get the latest, most relevant kind of information. So it was a bit of a trendy thing. We put in super graphics in the buildings to kind of liven and make them with more verve and style. In many respects it was very successful.

Q: Where was the drive coming from?

BERRINGTON: This was coming from the PAO in Tokyo, Alan Carter, who was one of the great thinkers and kind of conceptualizers of USIS. A man who created a lot of enemies because he did upset apple carts.

He was somebody who had never had any Japan experience before he got that job, the senior USIS job in Tokyo. Many of the kind of old Japan hands were immediately against him because they didn't like what he was doing. So in their criticism they tried to use the idea that he was inexperienced in Japan.

Many of us were unsure about what was happening. I think many of the younger officers were quickly won over. Carter did a fantastic job of turning that post around and making us the kind of vanguard of what USIS should be doing worldwide.

Q: Did the trade issue come up? I mean were you playing that because we were beginning to be worried about the deficit and also be worried about the fact that the Japanese market was hard to penetrate.

BERRINGTON: Oh yes. The trade issue is one of those things that never goes away. When baseball bats two years ago or grapefruits this year or automobile parts two years later or lawyer- age in the next decade, we were always trying to open the Japanese market to whatever the American product was that we felt was being advanced. You know, that sounds like a silly group of things in terms of baseball bats to lawyers but these were the things we were talking about.

Q: This is very much the essence of what our diplomatic missions were about. For example, President Nixon came into office at the time you were in Japan and he owed his election to winning in places in the South which in those days were dependent on textiles. Did your work cover trying to explain our textile policy?

BERRINGTON: Oh yes, textile policy was a major trade issue throughout the late 1960s early 1970s period. I could have referred to that along with baseball bats and grapefruits, but textiles were constantly coming up. For me in Fukuoka, probably security issues were paramount and then I would say trade. In other places where there weren't so many bases close by, probably security issues were paramount and then maybe trade. Trade issues were an ongoing continuous thread all through my Japan experience.

JOHN B. RATLIFF, III
Director, FSI Language School
Tokyo (1969-1974)

John B. Ratliff III was born in Louisiana in 1935. He graduated from Southeastern Louisiana College and Georgetown University. He served in the U.S. Army from 1954 to 1957 in Japan and Korean Language Training. After postings at language programs in Bangkok and Tokyo, Ratliff became Dean of the Foreign Service Institute in Arlington, Virginia. Dean Ratliff was interviewed by Charles Stuart Kennedy in 1997.

Q: You left Bangkok in '69. Whither?

RATLIFF: Back to Japan. I was very much motivated and reassured throughout my Bangkok, Southeast Asia Tour by the promise from FSI that upon the completion of the Southeast Asia tour, I was going back to Japan as the director of that school. I was able to keep my eye on that objective. Even when things got frustrating or I felt a little low, I knew I had that to look forward to.

Q: So you went back there in '69. You were there from '69 to when?

RATLIFF: Until '74.

Q: As director and a different time period, did you find there was a difference?

RATLIFF: Two differences; the two were inter-related. I found that I was no longer the same age as the students. When I arrived in 1964 as Assistant Director, I was one of the guys. First of all, I was not in the position of ultimate authority, and I was the same age, in some cases younger, as many of the students, so I made very good friends. When I came back, I was a few years older; I was the director, and as they say, the buck stops here. I found it a very different existence. It had its own rewards, but it was very different.

Q: Were there any changes in the procedures, problems in this period?

RATLIFF: I thought I'd have a little bit of a honeymoon period once I arrived. I'd had my time in Vietnam and the like. But we had a Foreign Service inspection as soon as I arrived, within I'd say three or four months. The complaints that had been festering over the years about the materials kind of came to a head during the inspector's visit. The complaint was focused on the relative lack of advanced materials. We had tried to write a text when I was there the first time but we had rushed it into production very quickly. It wasn't very suitable and became quickly outdated. It was based on real events at a point in time in Japanese politics and economics and the like. I was pretty much instructed as a result of the inspection to embark on the development of an advanced spoken text that would focus on the needs of the Foreign Service. I spent a good part of the first two years in Japan working on that text while directing the school.

CHARLES A. SCHMITZ

**Counselor for Political/Military Affairs
Tokyo (1969-1974)**

Charles A. Schmitz was born in Kansas City in 1938. He attended Yale for both undergraduate and law school. In addition to serving in Japan, Mr. Schmitz served in Morocco, and Japan. He was interviewed by Samuel F. Hart on July 29, 1993.

Q: So when you left Morocco...?

SCHMITZ: I came back to the Office of the Legal Advisor and wanted to be where the action was. Action at that time was in East Asia where we were fighting a war in Vietnam. So I asked for an assignment with the East Asia area in the Legal Advisor's Office.

While there we divided our clients into various categories. I wound up working on elements of the war in Vietnam, primarily what we called the status of the contractors in the country and to what extent they were controlled by military law. I dealt with some of the hostages held by the Cambodians and issues of defoliation of Cambodia, trying to defend the value of the Laotian kip and things of that kind in Indochina.

But as that period developed I found myself being drawn more and more into the work of what I then considered a minor part of my area and that was Japan. I was drawn into it because the preliminary discussions leading to the Okinawa Reversion Treaty were going on. As these discussions proceeded, the issues changed from ones of large policy to ones of technical implementation. How would we square the resulting US presence on Okinawa with their existing treaties in Japan, particularly the Status of Forces Treaty. In the middle of that continuum, between those two extremes, there were policy questions which could take legal form having to do with issues such as how do we take care of the dollars which were being used as legal currency in Okinawa that would be picked up by the Japanese when reversion occurred in such a way that they would not become additional claims on the balance of payments problems of the United States. This was a matter of great concern at the time to the Nixon Administration.

Q: What did you see as the most important foreign policy issues you were dealing with on the Okinawa problem?

SCHMITZ: The principal issue was whether or not we could get the support of the American people to do it at all. We, who were concerned with it, were absolutely certain that it was the best thing to do. I and my colleagues had seemingly endless debates with Americans who thought that giving back Okinawa was a terrible mistake. We had, after all, fought and bleed and even died for it. It was important to national security and we couldn't trust the Japanese. In fact, we shouldn't give the Japanese a thing and we ought to just hang on to it and provide for ourselves.

Q: Did this cause you to have certain deja vu feelings later on when you worked on the Panama Treaty?

SCHMITZ: Yes. In fact, I think that experience had a lot to do with why I was working on the

Panama Treaty later on.

There were some subsidiary issues in the Okinawa exercise having to do with what do we do with nuclear weapons, what about the American businessmen who were already on the island. What about American activities which were nonconforming under the Japanese Status of Forces such as our VOA station, Foreign Broadcasting Information Service, some of the special military operations we were running out of there, religious language broadcasting, etc. I think probably there were about a thousand issues that had to be resolved government to government in that negotiation.

Q: You mentioned special operations being run out of there, could you elaborate on that?

SCHMITZ: It is probably still too early to elaborate on that, but the category of things, of course, was having to do with how we used Okinawa in the Cold War context to advance our purposes. We had there a major CIA installation and a black operations run, I think, by all the services, including the famous black bird itself, the SR-71, which operated out of Okinawa. Most of these things gave great concern to Japanese politicians and therefore to the Japanese bureaucrats with whom we were dealing primarily. And we had to make provisions for each one. And those provisions had to be basically whether they could continue or not, which was a heavy part of the negotiation initially.

And then secondly, if they were allowed to continue how would it be done, how would it be explained? Most of this happened after I had actually gotten to Japan which was a little bit after the time we are talking about.

Q: Was it a good treaty or not?

SCHMITZ: It took us the better part of two years to negotiate the treaty and its related arrangements and to make sure it came into effect in good form. It was for the United States one of the best deals we had made since, I think, the Louisiana Purchase, because we wound up yielding practically nothing. We made some adjustments, but those adjustments did not make it more difficult or more expensive for us to carry out our functions. We continue to this day to use Okinawa as a military staging base, something which in 1969 we weren't sure would last for even five years after Okinawa was returned to Japan. From that standpoint, any usefulness now of Okinawa for us is a big plus.

But in addition to being able to use it for almost everything we wanted to, we were relieved of the burden, financial and other, of occupying and running the island, which most Americans didn't realize was costing us millions and millions of dollars every year for doing something which we weren't good at and didn't need to do. Our continued government there made us look like imperialists, and that was causing us a lot of trouble throughout the rest of Asia. What we did in the negotiations was sell the effort that we had already put in to running Okinawa. Maybe was a contribution that I made, because I argued that once we had committed ourselves to giving Okinawa to the Japanese, we would in effect, in legal terms, be yielding our "future interests" to the facilities which we had constructed there. We would then be criticized by the US people or the Senate as it considered the treaty, for having disposed of American assets without making

proper accounting of them.

I did a considerable amount of research on this and discovered that when NATO was thrown out of France there was a similar kind of negotiation when the French took over military facilities. The formula used then was to find the value of the facilities which the French accepted. And that value turned out to be something we came to call the “depreciated replacement value”. That is, what it would cost today to build that same facility with the same amount of years on it as it had had. Obviously it is a purely mathematical construct, but it managed to take into account both the depreciation of the thing and the inflation, which had to be a major consideration. On that basis we calculated a value for these facilities and were able in various ways in the Okinawa Reversion Agreement to have that accounted for by the Japanese and paid back to the United States, not so much in cash, but in very usable forms.

Q: What happened when the treaty went to the Senate?

SCHMITZ: The Senate committee asked for our explanation of what we had done. I prepared the materials for that, including a briefing book for our people with the horrible questions and the best answers that we could make. We were able, by signaling what those questions and answers were going to be, to avoid any difficulty whatsoever in the Senate consideration of the treaty. In fact, when the General Accounting Office, as a part of its responsibility to help the Senate decide what to do about this, asked us to prepare for an audit of the treaty dispositions, I supplied them almost everything we had in the book. They looked at our briefing book and wrote a letter saying that they had been prepared to spend two man years on the audit, but because they saw that we had been completely open with them and had foreseen and taken account of these issues, they gave the treaty a clean bill of health. They suspended the audit and told us we had saved the taxpayers a lot of money by not having forced them to audit the books.

Q: So the treaty had a very smooth passage once negotiated. Other than yourself, who were the major players in negotiating this treaty?

SCHMITZ: The principal player for the US was Richard Sneider, who had been on the Japan Desk when these negotiations first started and then he went to the NSC. When it became time to negotiate the treaty in Tokyo, he was our designated negotiator. It was he who hired me to go with him to Tokyo to do that.

Shortly after we had arrived and assembled the team, he was then elevated to be DCM of the Embassy. So while he could continue to watch over these negotiations, the day-to-day job of finding solutions to the issues in the negotiations fell then to me. I wound up be, in effect, the chief of staff for that work. He did the heavy lifting on the interagency concurrences and the initial work on Congressional approval of the treaty. He was a very aggressive man, especially relative to other Foreign Service officers.

Q: Type A?

SCHMITZ: Yes, type A plus. Type A with sharp teeth and sharp elbows. He was a man who was very effective in getting his way and obviously often bruised people in the process. The reason

that I was able to exist under that was that early on we had a disagreement and I was lucky enough that that disagreement was on an issue in which I didn't have any choice. That issue was whether or not this agreement to return Okinawa would be done as an Executive Agreement, as we did in the earlier return of the Bonin Islands, which included Iwo Jima, or whether it had to be done by treaty. His assumption was that we could do it by Executive Agreement and he wanted it to be that way so you did not have to fool with Congress.

As I looked at the issue I easily came to the conclusion that Okinawa was a different kettle of fish qualitatively than Iwo Jima and the little bunch of islands about which nobody cared: that this agreement to return Okinawa was a matter of policy for the country. I argued that we could not win the legal argument that the precedent of Iwo Jima would apply, and therefore we had to go to the Senate with it.

Q: This was a legal judgment or a political judgment?

SCHMITZ: Well, it is one of those beautiful ones in which the policy is lying there but the way you decide the policy is that you ask lawyers for views. The Constitution says something about treaties and the implied Executive Powers of the President says something about Executive Agreements, but you then look to see what the precedents are. That is generally a lawyer's job. You look at the precedents, which was my job. I could see that if we were going to assert this was an Executive Agreement, we would have to make an argument about something more important than anything that had ever carried that attribution before; and that then becomes a policy question of whether we want to do it. But, as I told the policy makers, if we try to make that argument, when you turn around to ask your lawyers to help you out, you will see a whole bunch of people diving for cover. The Senate has lawyers too, and so do interest groups, so this is not the kind of issue that you can pass up. This is one of those cases we were talking about before where State Department FSOs, let's say, frequently say, "I could have done it quick and easy if it hadn't been for the lawyers mucking around with me."

Q: You feel in the end that Sneider accepted your views as being the valid ones?

SCHMITZ: Oh, more than that. He admitted that he was wrong. The reason he did that was because had he won, we would have lost in the negotiations because we had on our side in the negotiations a very powerful argument for nearly every one of these delicate issues and that was, "You might be able to persuade us, but how the hell are we going to persuade the Senate of the United States." So that in the theory of negotiations is the value of having an irrational partner. The person with an irrational partner almost always wins. In fact, that not only gave us that set of negotiating arguments, it gave the whole negotiation a visibility in the United States that clearly had an impact in the way he (Sneider) was regarded in the State Department through the United States Government.

So the effect was to benefit Sneider, benefit the Embassy, and benefit the State Department because this was a very important negotiation.

Q: Didn't he later on become Assistant Secretary for EA?

SCHMITZ: No, he became Ambassador to Korea.

In any case, as we had the discussion about this, he said, "You can not maintain that position. It is time for you lawyers to think politically." I said, "I'm sorry that I can't change this position because as far as I am concerned as a lawyer I can not make the argument that you are telling me I can make, and therefore it is really a question of shall we take this together to our superiors and have it out." Sneider then threatened to throw me off the negotiating team if I didn't change my mind.

Well, if the issue had been tougher for me, I might well have yielded on that and I would have lost his respect, I think. I might have stayed on the team, but I would have been rolled over. But because the issue took the form it did, I didn't yield, and ultimately my view prevailed. The episode developed a sense of reliability that allowed him to turn over to me a lot of this negotiation while he could attend to the rest of the issues of the Embassy.

Q: Okay, we have the Okinawa negotiations completed and ratified and you moved on to...?

SCHMITZ: In the summer of 1972, when everything about Okinawa was pretty much concluded, I was asked to stay on at the Embassy to be Counselor for Political/Military affairs in order to provide some continuity with the negotiations. In part, this was because the Embassy felt that there might be a lot of loose ends to the negotiations and that maybe not everything would work well. Sneider was leaving, there was a turnover of ambassadors, and so I could provide the continuity. Moreover, since I had mastered the Status of Forces Agreement and all the military paraphernalia, it made a certain amount of sense that I do that.

So, for two more years I carried out that function, which had to do in part with making sure that our forces on Okinawa performed well and could do their job, and in part that the whole US-Japan security relationship, which at that time was changing radically because of the reversion, continued to function.

At the same time I could do things like assist in making sense out of adjustments in our military force structure in Japan, and when I had some spare time I could do some legal work such as what was required to clear the title of Embassy grounds so that we could rebuild the Embassy, which we did at the tag end of that period.

Q: Anything else that is particularly memorable from that period?

SCHMITZ: The most fascinating part of that whole thing was an issue which we called the Murasami Bashi problem. That was a problem involving our continuing to fight in Vietnam, very unpopular in Japan, and using Japan to support that fight. We did that in a noteworthy case by repairing tanks and armored personnel carriers at the Sagami depot in Japan. After these things were repaired they were put on big Army convoys and driven down to the piers in Yokohama to be put on ships to go to Vietnam. They moved visibly through the streets. Yokohama was then run by a Socialist mayor. There were lots of young communists. To see these things moving around in Japan they considered were going down to kill Vietnamese was anathema. There were demonstrations about these movements, and ultimately one day a convoy was totally surrounded

by demonstrators and stopped. The police told us they couldn't interfere because the load limit of one of the bridges turned out to be less than the weight of trucks in the convoy and therefore if they allowed the convoy to proceed, the police would be a party to a violation of the law, which they would not abide. The short of this was that 104 days went by before we were able to resolve the issue. I don't want to give the impression that the convoy sat on the street for a 104 days, it sat there for 25 hours surrounded by a howling mob with highly disciplined soldier drivers in the cabs of those trucks doing an excellent job. We finally decided to send them back to Sagami so that we would have some breathing room to solve the problem.

The solution of the problem involved excellent work from some of the finest career public service officials I have ever seen in my life. These were Japanese and they were what allowed the solution to materialize. This is a hot issue in the Diet and with the opposition parties including the Socialist mayor. The Foreign Ministry officials worked out a mechanism with the rest of the government and the political parties that would allow certain kinds of payments to flow into Yokohama, certain kinds of political statements to be made, and undoubtedly lots of other political payoffs.

The essential capability that would allow this to take place was the US Army's capacity every morning, around 2 am, to throw a Bailey bridge across the top of the existing bridge and rush the convoy across and down to the docks; unload the tanks and equipment onto the ships; turn around and get back across that Bailey bridge so that it could be taken down to accommodate the morning rush hour traffic that began at six-thirty every morning. It was an extraordinarily disciplined act by the Army engineers of throwing this bridge every morning across the weak bridge, allowing the convoy to rush in, unload and rush out, and deconstruct that bridge in time for the Japanese rush hour. They did an astonishing job of it.

The reason that all of this was important was that these vehicles had been promised to the South Vietnamese military as a part of their Vietnamizing the war and allowing us to get out of the war. This was an agreement negotiated by Kissinger. It had a special code word. It was critical to the political processes of a whole lot of countries, including our own.

Q: What year was this?

SCHMITZ: That was 1972, in the summer and fall.

So the US was under heavy pressure to solve this problem. Of course that translated right to the Embassy. I had the job. We managed to transmit that pressure effectively to the Japanese. They felt it and worked literally night and day, by themselves and with us, to get the thing done.

Q: During your period in Japan, both when you were negotiating on the Okinawa treaty and while you were Pol/Mil Counselor, what Japanese leaders did you have a good close view of and which ones did you consider were either particularly able or particularly unhelpful?

SCHMITZ: I think probably the Japanese Prime Minister, Nakasone was one...I am not sure that I had a closer view of him than you could mostly get in the paper and by talking to people who worked with him, which was what I did. A very strong personality, hawkish, a great supporter, of

course, of the US and security relationship. He was a powerful and effective man who like most Japanese politicians of that ilk gave rise to suggestions that he was not entirely honest. It is very hard to be entirely honest and be Prime Minister of Japan, I think, under those circumstances. I certainly feel that he was among the most able of all the prominent Japanese politicians.

But the admiration that I have for the Japanese is not so much for the politicians, they are really less of a leader than our politicians are in the US, but for the Japanese career service and many of those wound up in the Foreign Ministry which is one of the two or three premium ministries in Japan. The best of their people they put on the front line to deal with the United States, because we were their biggest problem. Therefore, I had the wonderful job, both in the Okinawa experience and the political/ military experience, of working with what surely was the cream of the crop of an entire generation of Japanese with any kind of public spirit.

Of them I would say that there were several that were among the very best public servants that I have ever seen. Particularly one named Matsuda who himself put together and pushed through, including in the Japanese Diet, the deal that made possible the resolution of this tank shipping problem.

Q: What about on the Okinawa side? Who sold it on the Japanese side?

SCHMITZ: Again the selling inside the Diet was done by these professional diplomats. They worked in a team. A lot of the work fell to their lawyers. They had three principal lawyers working on this while I was there. The two most active with whom I worked were Nakajima, who went on to become Japanese Ambassador to Malaysia and then China and is now on the Japanese Supreme Court, and a fellow who was then a youngish officer called Kuriyama, who now is Japanese Ambassador to the United States.

Q: You mentioned in the context of your time in Japan, the Vietnam war. Would you share with us your views on that whole time? What were your feelings and thoughts then and in retrospect?

SCHMITZ: I had not been in the military, and that was one of the reasons I felt I had a few years to come and give my time to the State Department, so I was looking at it as a civilian and a political analyst. I felt initially that what we were doing there was justified and congruent with US interests. As it became an obviously unwinnable war and we were beginning to use so much of our political integrity in doing it as well as our money, I thought it was imperative that we get out of there as quickly as we could with a shred of dignity. I therefore was supportive of most of what I could see being done when I was in the State Department and was a little more privy to our policies than I am now. I thought that most of our people were working quite hard, first of all to try to win the war and secondly, when we couldn't, to Vietnamize the war part of which we had in Japan and thirdly to terminate our involvement in it just as quickly as we possibly could. Of course, not everybody seemed to be participating in all of that and I thought it was a brutalizing thing for us. It was causing a lot of our people to show their worst sides in public and in private.

HOWARD MEYERS
Counselor for Political/Military Affairs
Tokyo (1970-1972)

Howard Meyers was born and raised in New York City. He attended the University of Michigan and then Harvard Law School, before joining the U.S. Army in 1942. He entered the Foreign Service in 1955, working mainly in the Arms Control area. He served in several posts in England, Japan, and Belgium, as well as in the U.S. Mr. Meyers was interviewed by Peter Moffat in 2000.

Q: ...destined back for Japan many, many years after your previous time there?

MEYERS: Yes, a long time. It was a fascinating job, absolutely fascinating. It was a very difficult job because it was the mid-stage of Okinawa-reversion negotiations. We had, I would say, one of the most competent career officers managing the negotiations, this was Dick Snyder, in Tokyo. He had come directly from his assignment on the National Security Council dealing with the same issues, so there was certainly nobody who knew the issues better and who knew so many of the career Japanese officials. I never encountered an occasion on which we disagreed on substance, but we certainly disagreed on procedures, and how to get there. I put that to one side; I really think he was superbly competent for the job. We had innumerable difficult issues, ranging from the entry and the departure of nuclear powered submarines to naval visits to noise at Yakota, for example, the principal base, to what to do with the complaints raised about the Marines' use of the artillery base further down in Honshu. There was hardly a day that we didn't have some sort of minor crisis and it was just fascinating.

It was particularly fascinating to me and for my amazingly linguistically competent spouse, who I swear learned foreign languages by osmosis and who had the charm and graciousness that the Japanese have always found, even in our coming here in our very different tenure there more than 20 years previous, to be so attractive. She was, for example, the only foreign woman on the Board of the International Ladies Benevolent Association, a fascinating organization. The Board was composed, with the single exclusion of Hope, of the ancient Japanese Christian nobility - they were all Christian and mostly Catholic. I think my long Presbyterian background wife was just right to fit in. There was one result of this, we were always turning up at social occasions where nobody else but Ambassadors were invited and I assure you it had nothing to do with me. I was the third ranking career officer in the Embassy, but I had nothing to do with this kind of invitation, it was all due to Hope. It gave a very interesting view, which I got second hand, of the difficulties for the Japanese in establishing close feelings of responsibility or concern about lesser favored people, because though the Buddhists do a reasonable job locally, they do not have the same sense - and I am not saying this in a critical way, but a factual way - of ethical and moral responsibility that we Christians do. I shouldn't say we Christians, Jews do, others do, who have a different tradition, but this group was exceptional because of this fact. I don't know that all the ladies were Christians, but most were. I don't know the percentages anymore, but certainly not more than 2-3% of Japanese are Christians.

I wish that I could relate some of the stories of my interactional role with the U.S. nuclear navy, but I can't. I'm afraid I would get some of my navy friends in trouble, although Hyman Rickover

is no longer there. It was very difficult to cope with this extraordinarily single-minded man who would not accept in any way, the complexities of foreign relations when it involved his blessed nuclear navy. I got involved in a number of these issues typically because of allegations of nuclear radiation that weren't true but that caused a lot of trouble. I found my U.S. navy friends to be extraordinarily helpful, to the extent they were able to do it, and if I may be very blunt about it to some extent going around Admiral Rickover. It was a very interesting exposure to what life was like in the nuclear navy. We got through all of these issues successfully except for one dreadful period, when for its own lack of examination naval headquarters in Washington, that is the CNO's office, decided they wanted to save money on ship repair and decided that they would opt for essentially a commercial operation at Sasebo, instead of being able to use the only Japanese government facility that had always been a government facility in Yokosuka. All of the services: Air Force, Army, Navy, State, kept on saying this is crazy. I won't go into all the details, but this was the issue because Sasebo was a commercial operation and even with special prerogatives, you had to force your way into line. Finally at the last moment, based in part, I guess, on this absolutely unified representation position, the Navy changed its mind.

At this time they had succeeded in doing something I never encountered in my two tours in Japan. They had united the Liberal Democratic Party, the Socialists, the Communists, the Chamber of Commerce, that is the Japanese version, the labor unions - every single business and political interest was united because they were ready to grapple and grab this gem that had only been an imperial navy base. I suddenly got a notice that a navy team would come out and hopefully reverse the Japanese position. So they came out and we met in my office, on a Sunday as usual, and I told them in the most direct terms - there was a commander who was their leader, an obviously first class technical person, and they have the technical personnel - "I'm going to introduce you and I am going to sit down. You got us into this mess and you're going to get us out of this mess. I have a promise from the Foreign Office that they will help to the best they can."

So we went through this procedure on Monday, the next day, and sitting across the table were the very senior representatives of the largest and most important Japanese industrial corporations, the ones that were involved in Sasebo. After I had introduced the navy commander and sat down, saying he would explain what U.S. views were, I listened to him and his view was that these organizations did not have adequate quality control to take care of U.S. navy ships in Sasebo and that it should be done, therefore, in Yokosuka. I managed to keep a straight face, but I want to tell you that one of my two Japanese opposite numbers actually dropped his jaw, but they were manful and they carried out their promise to me, and somehow, God knows what the Japanese government promised, but somehow or other we managed to get out of that particular trap. I have never forgotten that. I was ready to hoot with laughter when I heard what the Navy's reason was. That was almost the highlight of my experience in Japan except for one.

I was there at the time of the actual formal transfer of administrative responsibility for Okinawa. Our representative was the great man, our then Vice President, and he did quite a good job. But the moment for me which was so transcendent, having landed there as a CIC agent five days after the surrender on the battleship "Missouri," then to come back and be among the fortunate invited guests when the Prime Minister of Japan announced with tears running down his cheeks, this final recovery of Okinawa.

That was Esaku Sato. But I did not describe an interesting aspect of this ceremony, which was that our information agency had arranged with Washington so that the signing of the changes in the Treaty of Peace would be done simultaneously in Washington by President Nixon and in Tokyo by Prime Minister Sato and shown on a split screen side by side. That was very fascinating, perhaps more so to our friends in USIA than to ourselves. But it was also very interesting to me because of what had happened the preceding night.

A major aspect of political military relations between Japan and the United States is governed by a committee established under our Mutual Defense Treaty. I was a member of that committee. It was necessary to change various technical aspects of that agreement resulting from changes administratively and otherwise in Okinawa and, as I recall, in Japan proper. The Japanese government was very nervous about this, much more so than we. They wanted nothing to go wrong and also they were inclined to be very formal and correct on matters of this high state level. So it was arranged that the two sides of the committee would get together about half an hour or so before midnight, at the Foreign Minister's guesthouse in Tokyo, and the signing ceremony would take place and we would raise a glass toasting each other and then depart gracefully and go home and go to bed. We Americans (there were only a few of us, and would fit in two cars), we gathered at the Embassy Chancery at about 11 PM. About 11:30 or so, we departed and as our cars departed from the Chancery, as the gates opened into what you could call the square that was immediately in front of it, this was in the heart of administrative downtown Tokyo, the streets leading into this area were suddenly blocked by squadrons of burly riot police, so that nobody could get in. As we turned and went up the major avenue, called Ripongi, as these two cars drove along, ahead of us on either side, platoons of these same riot police would appear blocking all entrance or exit and as we got up the block, they would then disappear, and this happened all the way up Ripongi, until we had to turn left in the direction of the Foreign Office Guest House, which by the way is on the same street, only a short distance from, the Soviet Embassy, but in this case, they blocked entrance from any egress or access to anybody for the entire time we were there for the signing ceremony and the formal toast of greeting to each other. I have never forgotten the efficiency which this was done. And that was a fitting approach to the next day's ceremony. That was all I have to say.

DAVID G. BROWN
Political Officer
Tokyo (1970-1973)

David G. Brown was born in Boston, Massachusetts in 1940. He graduated from Princeton University in 1964 entered the Foreign Service. His assignments include Taipei, Saigon, Yokohama, Tokyo, Vienna, Beijing, Oslo, and Hong Kong. Before retirement in 1996, he served as Director of the Office of Korean Affairs. Mr. Brown was interviewed by Charles Stuart Kennedy on January 28, 2003.

BROWN: I spent three more years in Japan from the summer of '70 to the summer of '73 in Tokyo. All the time in what was called the external unit of the Political Section and my principal

beat was to follow Japanese policy in Asia. The biggest part of that was Japan's relationship with China.

Q: Yes, of course an interesting time, too. Before we get to that, how would you describe Japanese American relations in 1970?

BROWN: They were reasonably good. We had been through the period of demonstrations against the U.S. Japan security treaty. That was in the past. We were in the process of, I wasn't involved in this, but we were in the process of negotiating what we called the reversion of Okinawa to Japanese sovereignty and of course when that was accomplished in 1972 that was a hugely symbolic event representing America's respect for Japan and the fact that we were, you know, returning the territory to them. Relations were reasonably good. One bad aspect, that again I was not personally involved in, was the controversy over textile exports from Japan to the United States. Later, there were more serious problems caused by the so-called Nixon shocks. The first of those being over Kissinger's secret trip to China and the second one being the U.S. decision to go off the gold standard. Both of these steps were taken without prior consultation with a country that was deeply affected by the decision and a close ally to the United States.

Q: Was it you know, somebody trying to deal with the Japanese government. Was there kind of a I don't want to sound fictitious, a Japanese person you could talk to or if you wanted to deal with the Japanese government you found yourself sharing with a whole bunch of people. In other words you couldn't go up to the prime minister and say, look we're going to be recognizing China, but don't tell anyone?

BROWN: Well, first dealing with the Japanese government was quite favorable. Although I was a junior officer, my counterparts were officials with considerable influence on policy. The Foreign Ministry did control Japanese foreign policy. Within the Foreign Ministry, responsibility was delegated downward on most issues rather remarkably. An office director was tasked to come up with policy ideas and to lead a process of consultation within the Japanese government. His boss, the assistant secretary level person was then responsible for selling these policy ideas to the upper levels of the bureaucracy. The ministry's leadership worked hand in glove with the governing Liberal Democratic Party and would get the LDP's blessing, which was normally pro forma. The LDP controlled the Diet, so there wasn't any problem at that level. If we were able to work things out with the ministry at the level at which I was dealing, things went very smoothly. Now, needless to say when you run into a crisis in the relationship as we did when Kissinger's secret trip was revealed things got escalated way up the line and it was the ambassador who was dealing directly with the minister and political leadership....

Q: Now, you dealt with external relations. Before we move to the China one, what about, to me one of the great puzzlements remains with the Soviets and now the Russians, the hanging on to those little islands up to the north or not making some concession seem and the fact that we were just at the time of the reversion of Okinawa. I mean the contrast couldn't have been greater and where it seemed like the Soviets were in a continual case of shooting themselves in the foot with Japanese relations. It was extremely important for the Soviets.

BROWN: Well, one would have thought so. The Northern Territories were a thorn in the side of

the Japanese-Soviet relationship. In recent years, they have tried to deal with it off and on in a more compromising way, but even now nationalist sentiments block progress. But nothing was really happening on that issue in the '70s when I was there. It had been discussed in the mid-'50s trying to deal with this and trying to work out a compromise that involved two of the islands coming to the Japanese and the status of the other two being unresolved. However, that didn't work out then and issue was frozen the whole time I was there.

Q: It must have given a certain amount of pleasure in a way or at least made things easier for us wasn't it to watch this? I mean if it meant that flank you didn't have to worry about.

BROWN: Yes.

Q: Well, then, how about again to the south, what about, did you get involved in the relationship over say Indonesia or the Philippines?

BROWN: Quite frankly, I can't remember any big issues there. We didn't really have much in terms of serious problems with the Japanese in terms of policy in Vietnam. We were in the process of trying to wind things down and the Japanese had no problem with that. That was not a big issue.

Q: What about with China? You know, prior to the Kissinger thing because Kissinger visit was when?

BROWN: It was in August of 1971.

Q: Yes. So, what was the state that we were observing of Japanese Chinese relations?

BROWN: Our policies were quite consistent with each other in the sense that neither of us had relations with Beijing and both governments were in the process of thinking about how to change that and modifying their policies in modest ways. Both governments were in sync in terms of supporting the Republic of China in the UN. The big difference was that the Japanese had a substantial economic relationship with China and the U.S. did not. We still had an embargo on trade with China, though U.S. had already been going through a process of small steps with China to signal that we were open to improving relations. Then the big break came when China invited the U.S. ping pong team.

Q: That was the famous ping pong diplomacy.

BROWN: Right. I didn't get involved in it personally because my boss here was also a China hand, Bill Cunningham and he jumped on that as soon as he heard that the news of the invitation. The ping pong team actually transited through Tokyo on the way to China. Bill helped facilitate that and went out to the airport and saw them.

Q: What was the Japanese economic relationship with China?

BROWN: It was not an aid relationship, but a purely commercial one, and it was done under the

rubric of a trade agreement between a Japanese trading association rather than the government and the China Council for the Promotion of International Trade, a government front group handling Beijing's trade with the West. It was a pretty substantial relationship. For Japan, which was promoting itself as a trading nation, being able to sell everywhere was important. The U.S. didn't really have a problem with this Japanese trade because we too were moving away from a strict embargo on trade with China.

Q: Was there any disquiet in this period by say the Japanese hands of watching Japan, it was about this time Japan was really turning into an economic powerhouse, wasn't it?

BROWN: Yes. This was their period of fast growth and also a period in which the economists in Japan were making predictions to show when the Japanese per capita income was going to surpass the United States, when the Japanese economy was going to end up being bigger than the American economy. So, yes, the Japanese were on a roll.

Q: Was there any concern on our part, I mean, you know, people looking out from the embassy that you were hearing about?

BROWN: When I was there, no, subsequently we can talk when I got on the Japan desk.

Q: Textiles of course were, Nixon owed a lot of his election to factory states in the South, part of the southern strategy. Textiles in those days were a big deal there in the Carolinas and that sort of thing. I guess that, did that intrude on what you were doing?

BROWN: It didn't intrude on what I was doing, but it was being handled by other people in the embassy and I was knowledgeable about what was going on and about the extent to which it was creating friction in the relationship. Nixon had met Tanaka who was I think at that time the Minister of International Trade Industry and that they had had a discussion on limiting textile exports. Tanaka had said something that for Japanese meant that they would study it, but not do anything. Nixon interpreted he remark to mean that Tanaka had agreed to solve the problem for the United States. That was a misunderstanding that created real strains in the relationship.

Q: Were you in a way being a China hand?

BROWN: Yes, we followed Japanese ties with China closely. I was not an intelligence officer but I read all open source information about China in Japan and reported it. I was supposed to maintain contact with the Japanese China watchers who met Chinese coming through Japan. There were academics whose knowledge and opinions about China we reported. But the main work was maintaining very close coordination with the Japanese Foreign Ministry. We exchanged information on what they were doing on what our policy was, the steps we were taking. There were annual consultations between the Office of Asian Communist Affairs, the China desk at the State Department and the Ministry and between their policy planning staff and our policy planning staff. We were in bed with each other. That's what made the absence of prior consultation about Kissinger's visit to China in 1971 such a shock.

The Japanese government was under a certain amount of pressure to build upon the economic

relationship and to begin to improve relations with China. Some European countries were moving ahead to recognize China in the early 1970s. Out of deference to the U.S., the Japanese government was resisting the domestic pressures on it in order to stay in sync with the U.S. The State Department too was trying to keep our two countries on the same wave length. Then suddenly without a word of forewarning the U.S. takes a huge step to open up its relationship with Beijing. The government and the foreign ministry in particular felt that their confidence and support for the U.S. had been betrayed. There was a lot of bitterness in certain parts of the Japanese Foreign Ministry.

Q: How did you personally at this time, how did you hear about the news and what instructions were you giving and how did you deal with the damn thing?

BROWN: Well, you read about it in the news. I can't remember whether we saw Nixon's announcement on TV or not. We saw it replayed. Now, as it turned out this had been very closely held and even Secretary of State Rogers hadn't been told that Kissinger was making this trip to China. We in the embassy were taken by surprise, but when we learned the extent to which other people were equally in the dark, we didn't feel quite so bad ourselves. However, we still had to deal with the Japanese. I can remember going over there and having an extremely prickly conversation with Hiroshi Hashimoto who was then the head of the Office of Chinese Affairs. He was an older man and had spent a good part of his post war life involved in China. As a young man had been a soldier in the Japanese army at the very end of the Second World War if my recollection is right, he was in the air force. His reaction was very nationalistic. Over drinks he said this was the end of Japan's trusting the U.S. The relationship with the United States was going to change and Japan would have to start making its own policy thinking about its national interest. That was not the typical reaction. The typical reaction was not nearly so nationalistic and pained as he was. Yet it had been his job to make sure that his government knew exactly what the United States was doing on the China policy and he felt he had been betrayed.

Q: How did you respond?

BROWN: There is no response. There isn't a good response, but we said that we've got to move on from this. The next order of business between us was the annual fight over Chinese representation in the United Nations. This was something on which the Japanese and American governments had collaborated to an extraordinary degree on a daily basis exchanging intelligence about what was going on every capital in the world, about the demarches that were being made, divvying up responsibility on who could do a better job in persuading various capitals to support our common cause.

Q: I know the Americans had sort of assumed the Japanese had expended tremendous what you might call political capital in these fights over who was going to represent China in the United Nations because this was, every little capital, like you say, Togo or something like that and all of a sudden I can't remember what we did, what did we do, fudge it or something for the next time around?

BROWN: Well, there was a general presumption that this traumatic change in U.S. dealings with

China was going to radically undermine the efforts to sustain Taiwan's place in the U.N. Nevertheless, the instructions that came out were to fight the good fight. The U.S. went to Taiwan and said the only way that there's going to be a hope of winning would be to go for dual representation, that is an approach which would create the possibility for both Taipei and Beijing to have a seat, even if Beijing. Washington tried to persuade Taipei that if we could sell this it was certain that the Chinese would reject it and that Taipei in the end would remain in the U.N. However, Chiang Kai-shek but was very deeply committed to the idea that the Republic of China was the sole legal government of all China and he was not going to give on that. So, what resulted was that Taipei said it opposed dual recognition but would not object to the U.S, pursuing the idea at the U.N. So on that understanding, the Japanese and American governments again together tried to sell this. However, after Nixon's announcement, many governments were rethinking their China policies because of what the United States had done. In the end we lost the vote in the United Nations and the Republic of China walked out. Our representative to the UN at the time was George Bush and he got up and he said that it is a reasonable thing for China to be in the United Nations, but it's unfair the way this came about because the principal of universality is important. A founding member has now been thrown out which sets a horrible precedent. I'm sure Kissinger probably didn't care at all that that had happened.

Q: Prior to this in talking around with both your colleagues in the embassy, but also, and then it carried over to talking to the Japanese in informal conversations. You know, when I came into the Foreign Service it seemed to me to be perfectly reasonable that eventually we're going to have to recognize China. I mean this was not, to say the least.

BROWN: You've got to live with the reality.

Q: Yes and I think most of my colleagues did and in talking around this was not one of these things that it wasn't staying gee, communism is a good idea or anything like that, it was just you know, we've got other big countries and they're just going to have to come around. Were the Japanese talking this way, too or did you avoid the conversation?

BROWN: No, before Nixon's announcement, I often talked with Japanese colleagues informally about how both our countries should be moving together to open relations with China. After Kissinger trip had been announced and knowing that Nixon himself was going to China in the following year, a process of political change was unleashed in Japan and within a year and a half Tokyo had worked out its deals and recognized China and devised a formula for maintaining an unofficial relationship with Taiwan which has worked for the Japanese pretty well and which in fact the United States more or less copied when we took the step in 1978....

Q: How did you find sort of let's say before because that would have been when things were normal, before the opening to China, dealing with the foreign ministry?

BROWN: It was a very good relationship; personally we got a lot of information. We shared a lot of information. It was a close relationship and it still is.

Q: Did the Japanese have good information on China? I would imagine they would.

BROWN: They had all sorts of sources because of the economic relationship and people traveling back and forth and conversations that would take place with Chinese leaders when one or another delegation went to Beijing. Did anyone have real access to the countryside and what was going on in China? No, but we were all trying to share the information that we had. They did their intelligence reports and gave copies to us. We got material from INR, not so much from the CIA because the station had its own relationship with the Cabinet Research Office. So, many analytical reports were being sent back and forth.

Q: Did you all have a feel for the tragedy of the Cultural Revolution at that time?

BROWN: I don't know. You certainly were aware of how it had disrupted China, but you didn't really understand then its full impact, as I recall.

Q: Did you know, one of the things I'm struck about people who got involved in that first opening to China. I was just talking yesterday with Winston Lord. I did a very long interview with him and the sort of the thrill of seeing Mao Zedong and all that, but I mean in a way it's almost although, nobody was really making note that this guy at least in my estimation was a real monster. The things he did to his country are just beyond belief. Was this at all coming out at this particular time you were dealing with it?

BROWN: We had the impression of him as a megalomaniac who was very far long in his years and was just losing it a little bit.

Q: A senior moment. How about Zhou? Was he considered the voice of rationality or something?

BROWN: That was certainly the impression we had. I can't recall any particular episodes from the period when I was there, 1970 to 1973, that involved Zhou in a big way. My memory's not as good as I'd like it to be....

Q: After the Nixon visit, well, I mean the Kissinger visit first, as far as dealing I mean your job was it mainly assuaging hurt feelings. I mean were there developments or were the Japanese in a way turned loose as far as China was concerned?

BROWN: Yes. They felt they freed to do what was in their best interests. They would keep us informed. My recollection is that I had to work harder to find things out and double check sources. It wasn't quite as open as it had been in the past. It was more a job of piecing information together to understand what was going on in the political process in Tokyo.

Q: Well, I imagine the Japanese press must have gone wild, not just against us, but the whole idea of okay, now we can really report on China and you know, I mean, in that particular relationship. Things must have been sort of fast and loose.

BROWN: My memory is failing me. I can't remember whether there was a big rush of Japanese reporters to go into China at the time. I can't remember which papers had those kinds of relationships whether that was changing or not. My recollection is that the Chinese were quite skillful at cultivating favorites amongst the Japanese press and freezing out those whose opinions

they didn't like.

Q: Did you, for you did you feel that you had finally entered the world of real diplomacy and all?

BROWN: I certainly did. Except for the China issue, not a great deal was happening, but Japan was slowly moving towards what was a very important decision which was to ratify the Nuclear Non-proliferation Treaty. Another major issue that I had to follow was attitudes within Japan on nuclear weapons issues. What was the Japanese government doing in terms of eventually ratifying the NPT? What were political and public views on ratification?

Q: I would have felt that it would have been an absolute surety that they were going to say hell, we don't like nuclear weapons for obvious reasons and whatever you want to do to stop it, we'll sign it.

BROWN: Well, in the end, that is what they did, but the issue was debated at length. There were elements on the conservative side of the spectrum that complicated the process. Consultation had to take place; everyone had to be brought onboard. Japan had to watch what other countries were doing and who was ratifying. They didn't want to be way out ahead of the pack. They didn't want to be way behind the pack.

Q: But it's interesting, you know, observing close hand Japanese diplomacy. One doesn't see the Japanese hand in a lot of those things. I mean when you think about you know, as we have today, you think about France for example, its fingerprints were all over everything, but what about Japan? Was there a style of diplomacy that you saw?

BROWN: At that point in time, Japan had not begun to think about having an independent diplomacy. They were still very much in the mode of being with the U.S. I think the shock on China was one of the things that began to prod them in the direction of saying well, you know, the war has been over for almost 30 years now. It's time for Japan to start having its own policies. The amazing thing is that we're now into the 21st Century and this sort of debate about whether Japan is going to have an independent policy from the United States still goes on. It's advanced and things have affected it over time, but it's been a very slow process in coming.

Q: Did you find the LDP had any particular cast as far as foreign affairs as opposed to I guess it would be the left wing?

BROWN: Yes. There was the Japanese Socialist Party, which was still opposed to the U.S.-Japan Security Treaty. They were in favor of moving rapidly ahead to recognize China, dumping Taiwan. They wanted to normalize relations with North Korea rapidly. That was part of the political scene, but the JSP was always a minority, and the real action was what was going on in the bureaucracy and within the LDP. Where's opinion within the LDP shifted at any given time? That's what you had to take into account.

Q: Well, say in the foreign ministry was the foreign ministry responsive to the mood of the LDP or did the foreign ministry kind of do its thing?

BROWN: The Foreign Ministry had a very strong sense, the ethic of the Japanese bureaucracy, that they were the guardians of the national interest. The ministry knew what was happening internationally. It understood the sophistication and the complexities of international relations. Therefore, it was their job to make sure that Japan stays on the right course. That meant that the Foreign Ministry had to guide the LDP to do what's right for Japan. As I said, they didn't have to worry about the other parties because the LDP commanded a majority in the Diet. It was just a matter of infiltrating sensible ideas into the LDP. That was done a lot at these evening entertainment parties that went on endlessly and at various levels. The office directors, who were the people I was dealing with, would go off in the evening for dinners and drinking with junior LDP politicians and people in the business community who had interests in China policy. Policy was worked out behind the scene. If a Japanese bureaucrat was doing his job well he was able to come up with the ideas, to percolate them up through his own system. Then the system at the senior levels would do this quiet liaison with people in the LDP and the LDP itself was a very hierarchical and structured organization. It was a bottom up type of decision-making. It wasn't the LDP driving policy; it was the mid levels of the bureaucracy driving it.

Q: But you're saying an interesting thing that much of the Japanese bureaucratic system was giving power below at least, things could ferment up to the top. I mean it wasn't these were at the lower level, these weren't just faceless people putting stamps on things.

BROWN: Absolutely not. From the office director on up, they were trying to structure and manage policy internationally.

Q: What about the, was there a good corps of America hands?

BROWN: Oh, yes, very much so, and there still is.

Q: Do they know it? I mean were they where they coming from?

BROWN: Well, it was a career service. If you happened to be the cream of the crop, you got to go to the country that was most important to Japan, which was the United States. You would go as a junior officer and then you return to American Affairs two or three times during your career, working in Washington and in the Bureau of American Affairs in Tokyo. Very typically people in this track would end up as ambassadors to the U.S. and as vice ministers at home...

Q: Did you with the opening to China; were you conflicted about being a China hand, Japanese hand and all? I mean all of a sudden this is a new ball game.

BROWN: I thought it was a great advantage to know something about Japan. I was able to go back and work in Chinese affairs, but I wasn't a person who was only a China hand as some others were. I would say the quintessential archetype of the China hand was Dick Williams who was my last CG in Hong Kong. He had had five overseas assignments during his 30 plus years in the Foreign Service. Four of them to Hong Kong and one to Guangzhou. Those are the only places that he had served overseas. I mean he worked on other things back in Washington, but that wasn't the career track I was on. I was very happy being able to go from China to something else and then back to China and then do something else and so forth.

DAVID I. HITCHCOCK, JR.
Deputy Public Affairs Officer, USIS
Tokyo (1970-1973)

David I. Hitchcock, Jr. was born in 1928 in Massachusetts and raised in New Haven, Connecticut. His career with USIS included posts in Vietnam, Japan, and Israel. He was interviewed by G. Lewis Schmidt on November 17, 1992.

HITCHCOCK: In 1970, I went back to Japan from the IAF office as Deputy PAO under Alan Carter. Alan had all kinds of interesting ideas he wanted to try out. I was the Japan hand. It was a pretty good combination since I had the language and the background on Japan, and he had some revolutionary ideas on how to organize USIS and how to focus its programs on the right audience with a combination of all the tools focused on one issue and one theme.

It doesn't sound very revolutionary now, that is what the Agency still attempts to do, but it was quite unusual to see it done as severely with so much discipline as it was in Japan at that time. He also organized the libraries into what were called "Infomat," with some super graphics done by Ray Komai, a Japanese-American USIS officer who had been involved in inventing the eye logo for CBS in his early days. Certainly in the early seventies, Japan was with it...was very much in the groove of U.S. popular culture. The super graphics, etc., that USIA put on all of its buildings in Japan were popular. It was eye catching, and many Japanese imitated it. The "Infomat" concept was essentially to get ourselves into the electronic age, to get information by electronic means, to focus the library schematically, color coded by area of interest -- to get all the books we had airshipped, to reduce the quantity -- to get the quantity down to about, I think it was to be, about 4,000 hot, fresh books, not in depth any longer. We gave away a lot of books and thus were able to pay for bringing Japan the information as fast as possible.

I know that some people will not agree with me, but I think if I had to name one individual in all of USIA who really made a difference in the way USIA operated, not only in one post but around the world, I would name Alan Carter. There was nobody who had as much influence among the career people in the Agency over the way we operated. He wasn't always an easy guy to work for, and our personalities were not particularly compatible, but that doesn't matter. The fact is that he really made a difference, and I think that his influence later on under Reinhardt continued to be, on the whole, a good influence.

Q: Of course I was looking at it from afar and hadn't much opportunity to observe it. But I know it was highly controversial. You, however, from what you say, felt it was very effective and worthwhile.

HITCHCOCK: It was. It needed moderation a little bit, and I tried to provide that to soften the corners -- to take into account Japanese culture more than Alan would have. On the whole, I think he respected that.

Q: At one point, he expressed the idea that he didn't want anybody with any experience in Japan in the operation. He tried to weed out those who did.

HITCHCOCK: He certainly backed down on that. I think he respected the ability of those who had the language to communicate with the Japanese. I know he wished he had that ability himself.

After that, I came back to Washington and was assigned to the Senior Seminar first and then to the State Department in the CU job.

Q: You were in Japan for how long?

HITCHCOCK: Three years. So all together by that time I had had nine years in Japan.

I succeeded Frank Tenny in the CU job as area director for East Asia. At that point in CU, just for those who don't recall exactly what that meant, we had charge of all of the educational and cultural exchange programs, which later on, in 1978-79 were transferred to USIA. That included the Fulbright program, the IV program, and the AMPART program, which is now returned to being called U.S. Specialists. We also had the private sector programs, with some of the money for private sector programs with each of the area offices. One of the things that made that particularly fun was that I had some money to play with. I could contract with the Asian Society for a study of how Asia is treated in American high school textbooks, for instance. I had to have it approved and cleared here and there, but basically, I could do that kind of thing.

One of the accomplishments that I look back on in those days under John Richardson -- and Bill Hitchcock, who was the Senior Deputy Assistant Secretary, was the establishment of what we call the "Asian Studies Scholar in Residence" program. This simply brought Asian professors whose English was up to it to American university campuses to lecture on Asia. That program is still going. I don't think there is anything like it in any of the other areas.

Q: How long do the professors stay?

HITCHCOCK: A full academic year.

Q: This was somewhat akin to the Fulbright program.

HITCHCOCK: It, of course, used Fulbright money, but it was somewhat specialized. They had to be people who realized that they were coming here primarily to lecture. They obviously had some research of their own that they wanted to pursue, but they were here primarily as lecturers, not as researchers.

I think that program ought to be expanded around the world. I think area studies in the United States is still not where it should be. It could use more focus of that nature in Latin America and Eastern Europe in particular, where our campuses just don't have enough.

Q: Was the selection of these people from Japan made through the Fulbright Commission?

HITCHCOCK: Yes, usually they were. They were made with the Fulbright Commission's involvement, but the CAO played a major role.

I should have said that when I went back to Japan as Deputy PAO, I became chairman of the Fulbright Commission as well.

Q: That usually went to the PAO didn't it?

HITCHCOCK: Well, Alan did it for a while, and then shifted it to me. When I came back as PAO in 1981, I chaired it again. So I may be the only PAO who served in the same country as Fulbright chairman twice.

One of the areas that I spent a great deal of time on in CU...now I had started this as Deputy PAO in Tokyo...is in the area of American studies. I would like to talk about this for a minute because in your outline, you also sort of speak of areas where one actually may have accomplished something of a more permanent nature. What I had discovered in Japan, later on, was that the Fulbright program had for years simply been going on its merry way of strengthening the quality of young faculty, usually, to teach better in their own field -- literature, science, etc. But most of these faculty, junior faculty and doctoral candidates who came under the Fulbright program from various countries, including Japan, went back home benefitting themselves from the program immensely. Probably improving their teaching but did not to any degree start any new curriculum to deal with the United States.

So what you had was better trained foreign teachers, but teaching a small handful of undergraduates who were majoring in American literature and a few who were taking on the very few doctoral candidates; the vast sea of undergraduates in these Japanese universities and universities elsewhere never are exposed to the United States in any kind of general introductory fashion. What are our basic principles? What are the tenants of society in the United States? What is the role of religion? What is the role of individualism, where does this concept come from, and how is it carried out in the United States? In other words, not dealing so much with the chronology of American history as with the concepts, ideas, traditions, in a multi-disciplinary, introductory, two-semester course. This is what is still lacking all over the world.

Both as Deputy PAO and Fulbright chairman in the early seventies and as PAO in Israel in the late seventies and in Japan in the early eighties and then as area director in the late eighties and early nineties, I made this my number one priority -- to try to persuade university presidents, deans, faculty members to introduce such courses. And they should be taught in the local language, which meant that you had to have proper level text material. Most of the students would not take courses that already existed on American literature, or whatever, because they were too deep for them. These were kids who were majoring in economics or business management or marketing or whatever. If they were going to take a course outside of their field on the United States, it was going to have to be in their language and at their level. One had to understand that these kids had never had anything to do with the United States academically, except, perhaps, a scattering in world history or social studies in high school and whatever they picked up in other subjects.

We are making progress with this. I made this such a high priority that every PAO has it in his OER goals. Henry Catto endorsed this as a worldwide priority for USIA, giving responsibility to the E Bureau to launch pilot projects with universities in each part of the world. I think that if this works, it will be a legacy that probably overshadows everything else that I have done in these thirty-five years.

Q: In the selection of the Japanese professors to come over here, was there any particular major area of study that you looked for? Did their exposure here give them any concept of the American political process?

HITCHCOCK: Well, it gave them that. As far as selection was concerned for regular Fulbrighters, there were the usual panels. It was a very objective, a carefully and professionally done thing in which I played no direct role. What I did play a role in was to try to see that more resources were devoted to scholarships in the area of American studies. In most of the universities in Japan and elsewhere, I found some teachers teaching American literature, so what I was trying to do was to get them to focus on the areas that were being left out -- political science in particular, economics also. But I couldn't turn my back on American literature people because they were going to be the hard core. If this was going to work, it was going to be those teachers who made it work. What they ended up doing in a place like Kyushu University and Hokkaido University was to "team- teach" this course. The literature, political science and history teachers would get together and figure out what they ought to be covering in a year in such a course and then figure out who would teach what. Of course, there are many obstacles to this, it is not an easy idea.

Q: Universities are pretty rigid.

HITCHCOCK: The European system of education predominates still around the world, where the university is a very specialized place and you almost enter into your major field the day you enter the door, hardly ever to see any other field until you leave. So you are battling tradition here. The conception of inter-disciplinary study at the introductory level is not wide spread, but there is a growing recognition that this kind of approach to studying other cultures is essential in an interdependent world. That was the argument that I would make. I would make this argument on a worldwide basis. I would say that this was not just American Studies that we were talking about. We were talking about Japanese Studies, Chinese Studies, German Studies. The major cultures that every young, bright kid in Japan, or the Philippines, or Singapore is going to run in to, willy nilly, once he gets into his/her career. He/She ought to have some proper exposure to -- some sort of planned introduction to the ideas and societies of those countries that he/she is going to be working with before it is too late. So the argument was being made not that students should be doing it because we are the United States and we are important, but because the world is going in a direction that requires undergraduates to know at least something about some major cultures besides their own. Put that way, deans and presidents began to nod their heads and say, "You know, you are right. There is something to this, and we are looking at the whole question of core curriculum."

So I think this is taking hold. I think it is beginning to catch fire. Where it has been introduced, it

has been immensely popular. It has been oversubscribed.

In Israel, I got into it. Believe it or not, Israel wasn't any better than Japan. The Federalist Papers had never been translated into Hebrew. No major solid American historical text, like Morrison and Commager, was in Hebrew. I took my own GOE money -- I was in Israel for four years -- and had Morrison, Commager, and Leutenberg translated in two volumes. It is still the core of several survey courses that have started now at Tel Aviv University, Ben Gurion University of the Negev and Hebrew University in Jerusalem. Also, I had Pritchett's little book on the American political system translated and finally did one on literary criticism of the United States. These became the mainstays of new survey courses taught in Hebrew for Israeli students. They were not taught in English by American Jews who had immigrated to Israel, which was what I found when I got there -- which were only for students whose English was good enough to take that course. So I think this is taking hold, and if I do any consulting for the Agency at all, and I don't know if I really have any desire to do that, it will be in this area.

Q: Just as a matter of curiosity, Doshisha University (in Japan) has quite a reputation for its American Studies program. Was this integrated in any way with what you were doing, or did they go off pretty much on their own?

HITCHCOCK: The famous Kyoto Seminar that was started with Ford Foundation money, and later on, had money from the Japan-U.S. Friendship Commission and elsewhere, brought professors of American studies to Kyoto in July for two weeks -- and young assistant professors and instructors as well -- from all over East Asia. From Korea, Taiwan and some from the Philippines, but mostly from Japan. It took place at Doshisha University in Kyoto, which is a large, private university started by Christians. Many of the people with whom I worked most closely in getting this thing to go outside of Kyoto were Doshisha professors, and, in fact, I would say Doshisha, along with Sophia and the International Christian University in Tokyo, were the three that have made the most progress in moving in the direction of generalized survey courses for students who are not majoring in anything to do with the United States but in something else and need this kind of course to round out their education.

Q: In my days in Japan, the International Christian University was in its infancy and had very little standing among Japanese universities. I gather from what I see now, particularly through the Japan-America Student Conference people coming here, that it has apparently attained quite a standing within the Japanese academic areas because every year there are three or four students from the International Christian University. Is it your opinion that they have advanced in stature substantially?

HITCHCOCK: I think so. I think what has happened is that the private universities like ICU, Sophia and Doshisha have shown more flexibility in updating their curriculum and modernizing their requirements than the national universities have. So students going into business, knowing that so much of Japan's business is overseas -- students who really have the familiarity, the grasp of language and foreign cultures, are the ones who are going to go places. So you can find ICU placing students in big companies like Sony every year. It has even gotten to the point now where the really good Japanese students are competing for jobs with American banks and firms in Tokyo as well. I think Tokyo University and the other former Imperial universities are still

trying to catch up and are plagued by tradition and inflexibility. The Ministry of Education is finally getting a little looser now.

Q: But they remain the prestige universities in the country.

HITCHCOCK: They do. They are certainly for government service -- Ministry of Finance and Foreign Ministry. Indeed, Tokyo University's first two-year campus has one of the strongest American studies program going. In fact, it now has the authority to have four year programs in American Studies, British, French, Chinese and Russian Studies at that campus, which is separate from the fuddy-duddy senior campus of the university. You can go there for four years now and get your BA right on that junior campus. Hiroshima University has gotten permission to do the same thing. So there is a change underway there. And, as I say, as Area Director, I have preached this cause from Australia to Korea. It is going to need vigorous leadership from Area Directors and PAOs to make it stick. But we have goodies for them. We can offer them Fulbright lecturers they might not otherwise get. We can offer them faculty development grants to retool a young instructor so that he can teach not only literature but the history of literature. We can make good presentations to those particular libraries. We can bring them here as International Visitors to see how we organize area studies -- not American studies, but Asian studies or Latin America Studies.

So this isn't such a revolutionary idea, what I have been advocating and Henry Catto has now endorsed. It is not so much providing new resources for America Studies, but marshaling the existing resources more effectively to see that these are all parts of the same thing. If you want to strengthen the teaching of the United States at the undergraduate level, the existing tools are there in USIA. We simply have to marshall them for that purpose. It is going to take, as I say, central direction. Catto assigned that to the Educational and Cultural Bureau, and its acting director, Barry Fulton, who is sold on the idea. We shall see what happens. Now, of course, we have a transfer of power, and I hope this doesn't get lost.

Q: I hope it doesn't. Catto has been particularly good at working on these kind of things and has brought the Agency back to the area where it ought to be operating. He has been very knowledgeable, largely because of his background. I am scared to death about a possible time when they get somebody coming in like Gelb again. If that happens, I don't know what will become of it.

HITCHCOCK: We will have to wait and see and keep our fingers crossed. I certainly plan to push this concept with the Agency if I see it is falling on hard times again because of lack of focus.

One other aspect of the work that I did in the State Department in the years of 1974-77, when I was directing the East Asian Office, deserves some focus because it is kind of an historical nugget in itself. I will try not to make it too detailed.

You, with your background in Japan, recall that after the war, the United States spent a great deal of money in Japan for food and all kinds of humanitarian assistance in the first five years. This was called "Government Assistance and Relief in Occupied Areas," with the acronym of

GARIOA. The Japanese made it very clear that they would eventually repay this. They paid it all back, I think it was \$900 million over a number of years for this kind of assistance when they were on their backs. Reischauer, as Ambassador, decided that \$25 million of this payment should be set aside to increase educational and cultural exchanges. He got permission to do that. There was an exchange of diplomatic notes indicating formal agreement.

Q: How was that handled?

HITCHCOCK: Well, this was what happened. It was U.S. money, so it was handled by the U.S. exclusively. But, unfortunately, John Rooney, who was then Chairman of the House subcommittee dealing with USIA and State, insisted that this Yen account, established in Japanese banks, would simply be drawn down to pay the existing Yen expenses of the Fulbright program! So there was no incremental increase whatsoever in the number of exchanges taking place. The Japanese were very bitter about this. They thought this was a betrayal of the agreement, and indeed it was. Ambassador Reischauer and those who followed him resented this, but there wasn't anything they could do about it.

By the time people began to focus on this in the early seventies, \$12 million of the \$25 million had already been spent in this fashion. There was a little over \$12 million left. The State Department had thought long and hard how it could set up some kind of special fund with this \$12 million now that Rooney was gone. Burton Fahs, who had come from the Rockefeller Foundation, had been Special Advisor to Reischauer in Tokyo and then PAO, had also come up with this idea. There was a fair amount of correspondence among a number of people concerning what to do with this money. Couldn't a special trust fund be set up?

Independent of this, Senator Jacob Javits of New York got interested in taking a similar kind of repayment by the Japanese to the United States and setting up a special trust fund for U.S.-Japan exchanges. The money he was looking at was the repayment by Japan to the United States for the consolidation of U.S. bases in Okinawa. This was at the time of the reversion of Okinawa to Japan, 1972. Javits thought that the reversion of Okinawa was the symbolic end of the war and the beginning of a new era. We had moved barracks, offices and consolidated a lot of expensive business in order to give up land in Okinawa which we occupied. We occupied almost half of the island at some point, and it was now down to about a third. We paid for that initially, and the Japanese were paying us back for those expenses. The idea was to take a certain percentage of that and devote it to exchanges.

The State Department wanted nothing to do with that. They wanted to get the GARIOA funds set aside in some intelligent fashion. Javits didn't want to have anything to do with GARIOA. That was old stuff, war time relief. He wanted this to be a symbol with the Okinawa reversion. We were running into difficulties with the GARIOA project because the Bureau of the Budget, OMB, was opposed to trust funds. Congress, generally speaking, did not like trust funds either because they don't control the money as closely as they would like. So we were running into those problems.

The Administration had no position on the matter. It was the State Department on its own playing with the idea of doing something with the GARIOA funds.

Q: This was during the Reagan administration?

HITCHCOCK: This was during the Nixon and Ford administrations. We were cooking on this from 1974-76. The people who were pushing hardest, of course, were the academic community in the U.S. It desperately wanted to get its hands on some of this money. I found I had allies in John Whitney Hall, professor of Japanese History at Yale, and in Robert Ward, professor of Asian Studies at Stanford. Both of them, Hall and Ward, had been consecutively the Chairman of the U.S.-Japan Cultural Conference, (CULCON) a bilateral meeting held every other year. I was the area director in CU, which was a sort of secretariat for the CULCON sessions. Of course, I came from New Haven and knew the Halls well, which helped.

Since I didn't have any authority, other than John Richardson's general blessing to try to move this forward, I used, and they were happy to be so employed, Bob Ward and Jack Hall, to make the calls on the Hill to try to persuade and come up with some kind of compromise with Javits.

The idea that we had was to combine the two, to take the \$12 million GARIOA funds that were left and some of the Okinawa reversion money, which came to about the same amount, it was about \$13-14 million, and combine them. Then we would have something that was substantial. We would set up a trust fund and a commission to oversee this.

Senator Javits, in the mean time, had introduced legislation to setup the Japan-U.S. Friendship Commission, with Okinawa reversion repayments only. It had been in the hopper for several sessions of Congress and had just sat there. There were no hearings. He had never discussed it with anybody in the House, which we thought was strange.

So we went to see Ohio Congressman Wayne Hayes, who, by that time, was the key power on the Hill for the State Department. Hayes made this clear. He said, "Over my dead body will there be any new commission. There are too many commissions now. We ought to get rid of half of them." So we, Jack Hall, Bob Ward and I, cogitated about this and came up with the idea: we didn't need a new commission, we already had one! We have a panel of twelve Americans, including four officials, ex officio, appointed by the Secretary of State to the U.S. panel of the CULCON (Conference on Cultural and Educational Interchange) -- the Japanese have twelve, too. We would simply give these twelve Americans, who include two Assistant Secretaries of State (East Asia/Pacific and Educational and Cultural Affairs), the Director of USIA, the Assistant Secretary of Education, a second hat. They would all become "commissioners" for the Japan-U.S. Friendship Commission!

Javits wouldn't buy it. It was not prestigious enough. Those people were not well enough known. So as a compromise, we would add two members of the House, one from each party, and two members of the Senate, one from each party, and the heads of the National Endowment of the Arts and Humanities -- all of them ex officio, and the Members of Congress ex officio and non-voting.

Both Javits and Hayes bought off on that. But we still had another problem. It was clear that OMB was going to fight this all the way down the line if it required a new trust fund. We wanted

this money to be the principal, earning interest, Government securities if necessary, but definitely earning interest. The Javits-Hayes bill was passed by both Houses and went to the White House. I was trying to get support for this, to keep this moving, and tried to use the visit of the Emperor of Japan in 1976 as a vehicle, so that this could be announced while he was here. I got memoranda up through Kissinger, from Kissinger to the White House, to the President, thanks to Under Secretary of State Phil Habib, a good friend.

So the question was: "What was the White House going to do with this legislation?" We had made all the deals, all the compromises. We still had no Administration position. We had never been asked officially to give a position, fortunately, because we couldn't have said that we favored it, even though John Richardson had given me all kinds of authority to work with Ward and Hall to get it going.

It went to the White House, and as happened in those days, OMB sent it around to relevant agencies for comment within forty-eight hours. I got wind that Justice was going to recommend a veto. Fortunately, I had contacts at NSC who were trying to help us. What was the problem? Well, the problem was that Congress had adopted the House version and not the Senate version. The House version did not make it clear that the Members of Congress serving ex officio would not be serving in a voting capacity. According to the Constitution, members of Congress should not serve in any other capacity, and Justice was going to veto it! Of course, I was convinced that OMB had put Justice up to this because they wanted to bomb this thing anyway. We had forty-eight hours to get an explanation to the Attorney General from Congress that it was the intent of Congress that the Members of Congress serving on the Japan-U.S. Friendship Commission would serve in ex officio, non-voting capacity.

Here is where I made a small contribution to history. I guess I was sort of a Paul Revere that weekend because I had served on the Hill for three years and knew both Senate and House Foreign Affairs staffers. At this point, Pat Holt was Chief of Staff of the Senate Foreign Relations Committee. He had been the number three guy when I was there working for Senator H. Alexander Smith. It was a weekend, and Wayne Hayes had an old timer, whose name escapes me now, but I knew him, who was still working part time for him, and I got ahold of him. I drafted the letter I wanted from Senator Sparkman, who was then Chairman of the Foreign Relations Committee on the Senate side, and Congressman Clement Zablocki, who was Chairman on the House side. Both the Congressman and Senator were out of town. Holt and the other fellow on the House side had to, in effect, sign the letters for them. I took these drafts around town in my car all weekend long. First I had to go to Pat Holt in Bethesda. He is a tall, lanky Texan. I explained what the problem was, and he said, "I can't believe that." He hauled down the Constitution from a shelf and found that it was right. So he agreed, he would help. So we got the letters in time. Then we just waited to see what was going to happen. Would OMB or Justice have any reason to oppose it?

We began to put some pressure on. We got people like Bob Ingersoll, who had been Deputy Secretary of State and Ambassador to Japan, and others to call the White House and put in a good word for this legislation. In the end, President Ford signed it. But, if we hadn't managed to get the Congressional intent letters that weekend, it would have died, at least for that time in history.

Just to finish this story, it is kind of nice, poetic justice that just before I retired from USIA, Henry Catto appointed me to the CULCON and the U.S.-Japan Friendship Commission, so now I am a member. So that is a nice story, I think.

ROBERT W. DUEMLING
Political Officer
Tokyo (1970-1974)

Ambassador Robert W. Duemling was born in Michigan in 1929 and grew up in Fort Wayne, Indiana. As a Foreign Service officer, Ambassador Duemling served in Italy, Malaysia, Japan, Canada, Nicaragua, the Sinai Peninsula, and was ambassador to Suriname. He was interviewed by Charles Stuart Kennedy on September 11, 1989.

Q: In 1970, you went back to Japan.

DUEMLING: Right. I decided that I could go back to Japan and still maintain my objectivity. By this time, of course, I was too old to become a Japanese Language Officer, but I insisted on learning some Japanese. I was assigned to a position that was not "language-designated" -- that is, it did not require a Japanese speaker. I was supposed to go to Tokyo in the Summer of 1970, but the incumbent of the job decided he wanted to extend for one more year. So the job did not open up in the summer, but it was the period of the Exposition in Osaka. I was given the liaison job between the American Consul General in Osaka and the American Pavilion. That was, again, a staff job. That occupied me from April to November, 1970. That was a lot of fun and very interesting. It got me back to Japan, and I started learning Japanese with a wonderful Japanese who was on the staff of Consulate General in Osaka. Because the job in Tokyo would not open until summer of 1971, I went to Japanese language school when my assignment in Osaka was ended. I had to persuade the system to let me go to the language school in Yokohama. I found myself a tiny little Japanese-style house in Kamakura, where the Daibutsu is. I spent seven months in intensive Japanese language training, which got me at least a certain amount of speaking ability. I didn't learn to read and write, but I did learn conversational Japanese, so I could get around, at least.

Then, in the summer of 1971, I went to Tokyo, where I headed the political-external section. The Political section in Tokyo was divided in two parts: one part focuses on domestic politics and the other on foreign affairs -- Japanese foreign policy all around the world. We have a very close relationship with the Japanese so that my job was essentially one of liaison with their Foreign Ministry. I had an assistant, and we covered all of the foreign policy areas in which Japan and the United States each took a strong interest, which was most of the world. It certainly included Asia, Europe, the Soviet Union and China; less so Latin America and Africa. We were constantly consulting the people in the Foreign Ministry to find out what the Japanese were thinking about in terms of their own foreign policy positions vis-a-vis these countries and then reporting back to Washington. One of most active things I did when I first took the job was to become involved in

preparations for the fall session of the U.N. General Assembly, which, in 1971, was addressing the issue of which government would represent China. There was a huge battle in the U.N. on this issue-Taiwan vs. Peking. The U.S. policy was to retain the Nationalist Government in the Security Council seat. We worked extremely hard to line up our allies and muster support to hold the line in support of the Nationalist Government. In the meanwhile, as we subsequently found out, Henry Kissinger was dealing privately with the government in Peking, and in fact, a couple of days before the final show-down at the U.N., it was revealed that Kissinger was in Peking. He was there on the day the vote took place at the U.N. The vote went against us by at least ten or more votes.

I had been deeply involved, meeting daily with the Japanese Foreign Office, because we coordinated very closely, and they were lobbying around the world, particularly in Asia, in support of the Nationalist Government as were we. Of course, Henry Kissinger just pulled the rug out from under this effort. That was the Nixon "Shokku."

Q: How did this go over with your contacts in the Japanese Foreign Ministry?

DUEMLING: The Japanese are very polite. I was embarrassed. I was flabbergasted. I was chagrined. The Japanese, very politely and very directly, said to me that Henry Kissinger had a double game going on. They didn't blame me because they recognized that I had been totally uninformed about the U.S. Government's two track approach. They said that my government had used me and had expected me to be as effective as possible to carry out one track of this policy. They kind of shrugged, but I did lose some credibility. But as Henry Kissinger has been quoted on more than one occasion: "Who cares if some civil servant is embarrassed?" He could care less. It is, of course, some kind of experience -- deeply unpleasant for a career diplomat because one's reliability and credibility is the major stock in trade. The manual on this subject by Harold Nicholson, the great British diplomatist, made it clear that above all else, ambassadors and diplomats at all levels have to be reliable and have to be recognized for their integrity and credibility. When you have an experience like the one I just described, it is detrimental to say the least to one's image of integrity and credibility. Fortunately, the Japanese realized that I was as much the victim of the situation as they were.

Q: There was some of the same impact on the Foreign Service as a whole. After that event, it did not have quite the same faith in the President and the Secretary of State as before. Would their future directives be real, or once again, intentionally misdirected?

DUEMLING: You may be right in pin-pointing that event as a changing force in attitudes. There have been some very significant attitudinal changes within the Foreign Service, certainly in the course of the thirty years I served in it. The trust in the leadership is one of them. Can one be sure that the policy being given to you by the leadership is really the one that they will follow? One must ask oneself: "Is this sensible? Should I lend myself to it?" Perhaps in some cases, there should be some holding back. That's unfortunate.

Of course, there are other things that effected that. For one, the politicalization of the Foreign Service. Increasingly, the Foreign Service Officer's view is that if he is to get promoted, he has to play politics -- both within and outside the Foreign Service. He has to find a mentor, a protector,

a rabbi in the White House or in the NSC or somewhere who is going to advance his cause. Increasingly, people see that assignments to highly desirable positions are administered not within the Department, but dictated from outside. That means you have to have your friends outside the Department.

Q: Were there any other periods during your career, besides the China events you have just described, during which there was a conflict between Japanese and American policy directions?

DUEMLING: During my time in Japan, there were some tensions over Japanese policy toward Iran. They were heavily dependant on Iranian oil at that time. They had to be very careful about how they treated the government of Iran. They were much less enamored with the Shah than we were. They were much more cautious about what might happen in Iran. The Japanese may have seen the coming demise of the Shah before we did. They positioned themselves to be a little less involved with the Shah. They may have been able to build some bridges to other Arab states.

That was equally true with respect to Israel. The Japanese have never been strong supporters of Israel. In part, that was because we are talking "real-politik" here. They are interested in the energy resources of the Middle East, and therefore, they have always been very anxious to maintain very good relations with Arab countries. They don't want to compromise those good relations by getting too cozy with the Israelis.

Q: You left Tokyo in 1974.

LESTER E. EDMOND
Minister Counselor for Economic and Commercial Affairs
Tokyo (1970-1974)

Lester E. Edmond attended the City College of New York and Harvard University. Edmond was in the US Army during WWII and worked in the State Department before entering the Foreign Service as a Rotation Officer and International Economist. His posts in the Foreign Service include Japan, Finland, Washington, DC, National War College, France, and the Philippines. Edmond was interviewed by Raymond Ewing in 2001.

EDMOND: In mid 1970 I returned to Japan for four years, serving as Minister Counselor for Economic and Commercial Affairs.

Q: Which meant that you were in charge of all of the parts of the mission concerned with economic commercial affairs, and you were the number-three ranking official in the embassy.

EDMOND: That's correct. The Minister for Economic and Commercial Affairs had overall responsibility for economic, commercial, agricultural, transportation and even science and technology. He had the support of an Economic Counselor directly supervising the Economic Section, a Commercial Counselor undertaking the same task for the Commercial Section, an

Agricultural Attaché and staff from the Department of Agriculture as well as a Financial Attaché's Office, the representatives of which came from Treasury and a Science Attaché and deputy supplied by the Atomic Energy Commission. The Agricultural and Financial Attaches reported back directly to their departments as did the Science attaché but all coordinated their activities closely with the Minister who had overall supervisory responsibility.

Q: Let me ask you first, did you have Japanese language capability, and how did that affect you in terms of doing your job?

EDMOND: I did not have language capability, which, of course, would have been very helpful. Although several positions within the Economic Section were classified as language essential, the Minister's position was not. I assume the view was held that to limit the candidates who would be eligible to fill that position to the relatively few Japanese qualified language officers would have been too restrictive. Becoming a qualified Japanese language officer required several years of full time training and the pool of language officers was quite small. Thus there were very few language officers who also had the necessary substantive background to fill the position of Economic Minister effectively. I took daily language lessons for about an hour a day before the start of the work day in order to achieve sufficient language fluency to permit me to cope with day to day affairs but certainly could not hold a serious conversation in Japanese,

Q: When you had those serious conversations or were negotiating or presenting US views, you would use an interpreter, or did you find that many of the senior officials that you dealt with in the Ministry of International Trade and Industry and wherever else in the Japanese government were pretty good in English or combination?

EDMOND: The senior officials in the Ministry of Foreign Affairs who were concerned with American economic or political affairs were almost all virtually bilingual. They frequently had been sent to American or English universities by the Foreign Office to improve their language ability. The language facility of Ministry of International Trade and Industry (MITI) was not at all comparable to that of the Foreign Office, but the lack of Japanese speaking officers did not prove to be too great a handicap for effective communication. I hosted and attended many luncheons and dinners with academics and newspapermen and the widespread knowledge of English in those circles continued to impress me. I must hasten to say that this was not true among the general population, even among the well educated, English was widely studied but not so as to promote conversational ability.

There was a need to use interpreters when discussing issues with senior members of the Japanese business community. On those occasions I was fortunate to have as an interpreter, the senior Japanese national employee in the Economic and Commercial Section named Takemori. He had worked for the Embassy for many years and was highly respected in Japanese business circles. Takemori was a trusted advisor and directly supervised the Japanese staff members who were assigned to the economic and commercial sections. I had known him when he worked in a similar capacity for Phil Trezise during the latter's tenure as Economic Minister, and I was fortunate to have been able to persuade him to postpone his retirement until I had concluded my tour.

Q: Who was the ambassador during this period from '70 to '74?

EDMOND: There were two. Armin Meyer who had arrived in 1969 had been appointed by President Nixon. He was a Middle East expert, and this was his first assignment in East Asia. It was a surprising appointment. Previous ambassadors to Japan had been experienced in Far Eastern relations and had been well known personalities. Joseph Grew, a very senior American diplomat had been appointed to Tokyo in 1931 and had remained until the beginning of World War II. Ambassador Meyer's immediate predecessors had been Douglas MacArthur II the nephew of the General, who had been the Ambassador during my first tour in Japan. He had been succeeded by Edwin Reischauer, perhaps the leading academic expert on Japan and East Asia in general, who in turn had been followed by U. Alexis Johnson, perhaps our most senior diplomat, and highly thought of East Asia hand, who at the time of the Meyer appointment was Under Secretary of State for Political Affairs. As an aside, Phil Trezise was also a prominent candidate for the position of ambassador. I was told that U. Alexis Johnson argued that Phil be named Assistant Secretary of State for Economic Affairs on the grounds that he was uniquely qualified for that position, whereas the Tokyo slot could be more easily filled.

Armin Meyer was succeeded as Ambassador in April 1972 by Robert Ingersoll. Bob Ingersoll at the time of his appointment was Chairman and Chief Executive Officer of Borg Warner. He was close to the Nixon Administration and was also being considered as a replacement for David Packard as Deputy Secretary of Defense.

It is interesting to note that both the Meyer and Ingersoll appointments were greeted with disappointment in Tokyo and with some doubt as to their wisdom in the United States. The Japanese apparently felt that the appointments indicated that the United States government was considering Japan's relations with the United States to be of secondary importance. Japanese officials were accustomed to holding policy discussions with Ambassadors who were knowledgeable about Japanese affairs and who therefore might display an understanding of Japanese concerns. Criticism in the United State generally took the view that the Japan-US relationship was too critical to leave to inexperienced hands who would learn on the job. For example, Carl Rowan wrote in his syndicated column under the headline "New Envoy Leaves Japan Cool," that knowledgeable Asian hands "know that Japan is today a critically sensitive post, and they argue fervently that if there is one post in the world that needs a well-trained Japanese expert or Asia expert or someone with a special claim to rapport with the people, it is Japan." George Ball in an article entitled "We Are Playing a Dangerous Game with Japan" in the New York Times magazine stated that "In less obvious ways, the Nixon Administration has also signaled to the Japanese that their friendship is low on our list of priorities. Disregarding their expressed desire that we send as Ambassador to Tokyo an experienced diplomat with whom they could carry on a dialogue in depth, the President instead appointed Robert S. Ingersoll, a businessman with no prior diplomatic experience. Suffice it to say that by the time he left that post, the Japanese had come to have had a high regard for Bob Ingersoll, and regretted his departure. Ingersoll's performance was regarded so highly that he was named Assistant Secretary for East Asian and Pacific Affairs and within a few months Deputy Secretary.

Q: Well, Japan had probably changed a lot in the 10 years or so that you were away. Why don't you say a bit about impact that had on the work of the embassy and what were some of the main

issues, the problems, that you dealt with as Minister for Economic and Commercial Affairs.

EDMOND: It might be argued that my second tour in Japan encompassed the most challenging post war period in US/Japan political and economic relations. Japan, itself, of course, had changed radically.

During my first tour, Japan was still recovering physically and economically from the devastation caused by the World War. We were acting as an elder brother assisting a younger sibling get back on its feet and prosper. I recall making speeches to Japanese industrial leaders in which I stressed the need for Japanese firms to promote quality control in their manufacture as they needed to overcome the perception that Japan only exported cheap and poorly made imitative products. Japan's living standards had only recovered to the level of the 1930s and per capita income approximated \$300 per annum. Japan's Gross National Product approximated \$30 billion. Japan was in a payments crisis and foreign exchange reserves had dwindled to a vanishing point. There was a half-billion dollar trade deficit with the world and a \$700 million trade deficit with the United States. The U.S. Export-Import Bank was lending Japan \$175 million to finance agricultural imports; the International Monetary Fund had approved a drawing of \$125 million or 50% of Japan's quota, and Japan had applied to the IBRD for assistance. The United States continued to maintain a very protective attitude. Japan was generally considered to be resource-poor and to have a vulnerable economy, highly dependent on the United States, and it suffered from widespread discrimination in other export markets.

In contrast by the time of my 1970-74 tour, Japan was regarded as a respected and feared competitor that was in the process of replacing the United States as the leading world model for achieving economic growth. Japan's GNP had grown to almost \$200 billion, the third highest in the world. It's per capita GNP exceeded \$2000, while exports attained a level of more than \$13 billion, growing at a rate nearly twice as fast as total world trade. Japan had become a world leader in key industries such as electronics, shipbuilding, steel and automobiles, while the yen was regarded as one of the world's strongest currencies.

Finally, there was the unprecedented fact that by 1969, the year prior to my arrival, Japan had achieved the largest payments surplus of any country in the world and the second highest trade surplus. Books were being written with titles such as "Japan as Number One" Terms such as "Japan Incorporated" were being bandied about, inferring that some sort of unholy alliance existed between the Japanese government and Japanese industry. Japanese industrial leaders were being credited with having long range policy orientation in contrast to American executives who were only mesmerized by short term profit considerations. Futurologists, such as Herman Kahn were making estimations as to when the Japanese gross domestic product would surpass those of the United States. All of these perceptions were colored by a feeling that somehow the Japanese were not playing fair and that they were taking advantage of an open US society.

The strains in US-Japanese relations were compounded by the existing protectionist measures that Japan continued to enforce and which we had tolerated and perhaps even encouraged when the Japanese economy was still fragile. The Japanese, on their part, regarded our new tough line as being unfair and demonstrated a lack of appreciation of what they still believed to be a weak economy. They seemed to be taken aback by their economic advances and strenuously argued

that their economy required protection from outside forces due to Japan's almost complete dependence on imported raw materials.

Thus I returned to Japan during a period when both countries were displaying growing resentment toward one another. We were, as I have indicated, psychologically shocked by the rapid development of Japanese industry and our fears that Japan's growing industrial might would overtake that of America. One could count nearly forty major Japanese corporations which ranked among the largest and most productive in the world. This new apprehension was perhaps most evident in our reaction to Japanese automotive exports to the United States and our growing concern that Japanese automobiles increasingly were being considered as technologically superior to those of the United States. This development was taking place in an industry that most Americans regarded as quintessentially American.

But of even greater popular and political concern was the growing trade imbalance between Japan and the United States. I think the trade deficit with Japan was somewhere in the neighborhood of \$3,000,000,000 annually. There was little point in making the argument that a negative bilateral trade imbalance had little or no economic significance. Despite all the efforts of the leading world economists beginning with Adam Smith, mercantilist theory still dominated popular thinking and the almost unanimous view was that a negative trade imbalance was a sign of economic weakness and that drastic action was necessary in order to see it eradicated or at least sharply reduced. Resentment on both sides grew as our manufacturers increasingly complained about the difficulties they were facing in exporting to Japan, which they blamed, primarily if not exclusively, on Japanese policies and practices designed to thwart imports.

Developments in certain industries were particularly politically sensitive. I have already mentioned automobiles. Textiles were another which led to bitter disagreement between Japan and the United States. The textile industry is a politically powerful industry in the United States, particularly in the South. It employs large number of relatively unskilled workers, who would find it difficult to obtain alternative employment. A substantial block of Senators and Congressmen made up the so-called textile lobby and all administrations are appreciative of the political clout of the textile industry.

As we began pressing the Japanese on these issues they grew increasingly resentful over what they thought was an overbearing attitude on the part of the United States; of their belief that we were continuing to press them unwarrantedly to open up their economy, which they felt still was weak. They began to question the dependability of the United States as a steadfast friend and ally. This was the atmosphere that existed during the period of my assignment.

I have little doubt that the position of Minister for Economic and Commercial Affairs in Embassy Tokyo probably was the most challenging, the most interesting, and I suspect the most demanding of the economic positions available at that time at any of our embassies. And I was excited to be there. Relations with Japan were soon to undergo even greater strain. This was caused by what has become known in Japan as the Nixon shocks.

The first Nixon shock was a surprise announcement issued by the White House on July 15, 1971. It was brief and simply stated that Henry Kissinger had held talks in Peking and that knowing of

the President's "expressed desire" to visit the People's Republic, Premier Chou En-lai had extended an invitation which the President had accepted. The purpose of the Peking meeting would be to "seek the normalization of relations between the two countries" and "to exchange views on questions of concern to the two sides." Although the question of Japan's relations with China was a continuing burning political issue in Japan, the Japanese Government had largely followed the United States lead and had continued to recognize the Government in Taipei as representing the Government of China. The sensitivity of this issue in Japanese eyes might be appreciated by a comment that Ambassador Koichiro Asakai made during his stay in Washington in the 1960s where he served as Ambassador. It was widely reported that he stated that he had a recurring nightmare that one day he would awaken and read in the Washington Post that the United States had recognized Peking and was negotiating diplomatic relations. The Japanese Government and public felt, in view of the importance of the question to Japan and our close relationship, that the United States had treated Japan disrespectfully and shabbily. They believed we demonstrated little concern at what would be their obvious embarrassment at not receiving advance notification of our reversal of policy. We had broken our repeated pledges to consult and to coordinate our actions.

One month after that, almost to the day, on August 16, President Nixon announced "a new economic policy," which suspended the dollar's convertibility into gold and called for the imposition of a ten per cent surcharge on all imports into the United States. The statement stated that continuing restrictions would be needed to correct the massive imbalance in trade between the United States and the rest of the world. Since the United States trade imbalance primarily resulted from our trade with Japan and since we had been discussing this issue with Japan almost continuously in an effort to find means to rectify it, the Japanese, not unreasonably, believed that the restrictive measures were largely directed at them. In an effort to minimize the anti US feeling that the new measures aroused, I engaged in a public relations campaign, which involved giving speeches before business and economic organizations throughout Japan, and holding dinners with reporters from Japan's leading newspapers. I pointed out that the President's action was not without precedent and that it was a procedure that had been followed by European countries I also noted that the Japanese Government had been told that the trade imbalance was continuing to grow dangerously, and that the Japanese continued to maintain unwarranted import barriers that hampered our efforts to rectify the situation My efforts were designed to secure an appreciation that the President's action was needed, not merely to assist the United States, but was essential to protect the world's trading and monetary structure which strongly benefitted Japan and where problems were reaching crisis proportions. I must say that the Japanese press reported these remarks fully and fairly.

The third shock was the completion of negotiations on a textile agreement between the United States and Japan in which the Japanese agreed to restrict the level of their synthetic textile exports to the United States. I can't think of another issue that was as contentious as the question of Japanese textile exports to the United States. The issue was heavily overlaid with political considerations in both countries. In Japan, the textile industry leaders were strongly influential in Japan's ruling Liberal Democratic Party. In the United States, the textile industry's political influence in both parties is legendary. In the early 1960s President Kennedy's administration, consistent with campaign promises, was successful in attaining an International Cotton Long term Agreement (LTA) which limited the importation of cotton textiles into the United States (as

well as in other developed countries). By the mid-1960s manufacturing in the United States had shifted heavily to synthetic textiles and pressure was rising for an LTA type arrangements for man-made fabrics and apparel.

It was commonly believed that the unusual attention that the Nixon Administration paid to the question of textile imports resulted from a campaign promise that the President made when he was a candidate. Although President Nixon was known to be a public advocate of liberal trading policies, during the campaign in an effort to enhance his southern support, he promised to restrain the importation of synthetic textiles. With another Presidential election on the horizon, Southern Republican Senators were raising the fear that in the next campaign the Democrats would charge that only they could be counted on to support the textile industry's demands. Although the actual negotiations took place in Washington and occasionally through special emissaries sent by the Department of Commerce to Tokyo, I believe, that these negotiations absorbed more of the Embassy's attention than did any other single issue with the possible exception of the Okinawa reversion negotiations.

The textile negotiation is an example of a negotiation that went badly. There were misunderstandings on both sides. It is difficult to believe now that an issue of such relatively unimportant substantive significance could arouse such resentment. Headline after headline were generated in Japanese papers where it was stated that the United States was exerting overweening economic pressure to demand unwarranted concessions from a small loyal ally. On the US side, the view was held that Japan did not understand the importance of this issue to the United States which already was suffering from discriminatory treatment of its exports to Japan and that Japan in at least one instance had reneged on promises that it had made. I believe that the entire trade in textiles between our two countries probably amounted to no more than \$60,000,000 annually. I may be in error on that, but it certainly was a modest amount in context to our entire trading relationship.

We did not wish to impose import quotas, which would have been highly questionable legally and probably would have forced the United States to offer Japan other trade concessions so we asked the Japanese to use "self restraint," and to develop "voluntary" restraints. The Japanese dug in their heels believing that it was unfair to require them to restrain their exports when, in their view, there was no economic justification for the demand and that the entire question arose only because of an internal political problem that Mr. Nixon himself had created or aggravated.

On one occasion Commerce Secretary Maurice Stans, visited Japan and demanded publicly that Japan deal with the issue promptly. The Japanese, always sensitive, believed that he treated them disrespectfully and not as an equal partner. This did nothing to move the negotiations forward as the Japanese dug in their heels, always sensitive to the view that they might not be being treated with the respect that they deserved. Another untoward development came when Prime Minister Sato visited the United States on a state visit and President Nixon raised the question of voluntary restraints with the Prime Minister. It is not clear what occurred. The Prime Minister may have promised more than he found he could deliver on his return to Tokyo. On the other hand there are those who believe, that the misunderstanding resulted from faulty translation; that the Prime Minister used the phrase "I will do my best," and President Nixon took this as a commitment. In any event, we took it as a promise and concluded that Prime Minister Sato failed

to keep his word.

This incident soured relations between the leaders of the two nations and fostered the belief that Japan could not be trusted.

I too, personally, had a diplomatic misadventure as a result of the textile negotiations. During my first year in this assignment, I had cultivated MITI Minister Miyazawa and had developed a good working relationship with him. During a conversation on other issues, he informed me of what appeared to be a significant offer that he was prepared to make in the textile negotiations. I promptly informed Washington. I was therefore shocked to receive a phone call from Minister Miyazawa within twenty four hours, in which he quite agitatedly informed me that I had misinformed Washington of his views and that I had placed him in a very embarrassing position. Upon investigation, I discovered what I believe had happened. The Commerce Department negotiators, excited about this apparent breakthrough, had informed their negotiating partner in the Japanese Embassy, that Miyazawa had informed Edmond of this new position. The Japanese negotiators, not being aware of this development, cabled Tokyo to determine the accuracy of the report. I believe Miyazawa, was just a little ahead of himself, and had not yet received Cabinet approval for his new offer. As I have already indicated, the textile question was an exceedingly sensitive issue in Japan. My relationship with Minister Miyazawa never fully recovered from that incident. He, however, left that position in a few months as a result of a Cabinet reshuffle.

Much of my time was spent attempting to promote United States exports to Japan which directly would benefit the affected American firms and farmers as well as alleviate the tensions that existed between our two countries as a result of the trade imbalance. These efforts were largely devoted to attempting to persuade the Japanese to remove import restrictions that appeared important to us as much for domestic as well as for economic considerations. At times, for example, Washington ordered us to press for the liberalization of commodities where the likelihood of success was infinitesimal. Undoubtedly there were political pressures being placed on the Administration. One good example was the time and effort that the agricultural attaché and I spent in trying to persuade the Japanese to permit increased rice imports.

It was an oversimplification to believe that Japan's restrictive rice import policy solely was due to the Liberal Democratic Party not wishing to antagonize its rural base of supporters, although that certainly was a highly significant consideration. But in addition, a deep rooted belief continued to exist within Japan that it remained a very vulnerable nation that could be blockaded or starved into submission due to its almost complete dependence on imported raw materials. Thus, Japan's incredibly expensive rice support policy was supported by almost all spectrums of Japanese society, by urban as well as rural dwellers, because of the wide spread view that Japan should not depend on imports for this basic food source. I frequently was informed that Japan's need to import almost all its raw material requirements was a source of weakness and that Japan therefore could not afford to import finished items that it could itself manufacture. It had to conserve its resources to import essential raw materials. I was told, for example, that Japan's burgeoning steel industry which was almost entirely dependent on imported coal, iron ore and scrap was therefore inherently weaker than the United States industry. I could argue to no real avail that, in actuality, Japan's steel industry benefited financially from its ability to import the required raw materials since it cost the American iron and steel firms more to transport coal by

rail from Appalachia to the US mills than it cost the Japanese to ship the coal from Hampton Roads Virginia by bulk carrier to Japan where it would be offloaded at the mill site.

With this background it becomes easier to appreciate the shock that occurred in Japan when the United States announced on June 28, 1973 that it was placing an export embargo on soybeans, which is an essential part of the Japanese diet. To us, soybeans are primarily an animal feed. At that time, the United States was the world's largest grower of soybeans. In the previous year, the US placed price controls on beef in the expectation that these would reassure the US consumer and yet would not distort the market for the world market price for soybeans was falling and US agricultural experts anticipated that the lower cost of feeding the cattle would increase the available supply and lower the price of beef. Unfortunately, we misjudged the world's demand for soybeans and soybean prices rose to three times the level of the previous year, and we introduced an export embargo. The US action fed exactly into the fear that I have described. The Japanese were astounded and shocked to see their strongest ally, the one country which we stated they could depend on, suddenly enforcing an embargo on a basic foodstuff. It actually developed that the Japanese did not suffer from the embargo as Japanese trading firms had anticipated and in fact may have partially caused the shortage and had contracted for a sufficient quantity of soybeans to carry Japan until the next harvest.

It was apparent to us at the Embassy that if the trade imbalance was going to be rectified emphasis should be placed on persuading Japan to liberalize the importation of products where the potential demand was substantial and not items such as rice, where even if we were successful, the beneficiaries would be low cost and nearby rice producers, such as Thailand and Burma. This meant focusing on high tech products, such as computers and integrated circuits. I have already mentioned the mystique that computers seemed to exert on the Europeans associated with the OECD. I saw this again when I discussed the issue of computer liberalization with MITI Minister Miyazawa. I had been attempting to persuade Minister Miyazawa to look sympathetically on my request to liberalize a number of commodities, when I mentioned the desirability of loosening import controls on computers. It was as if I had hit a sore tooth, This normally mild speaking man was leaning back in his chair when he suddenly sat upright, and as I recall, said "Mr. Edmond, let me tell you one thing. We will liberalize many things because I believe it is in Japan's interest as well as that of the United States for us to do so. But don't expect any liberalization in computers. Computers will be the brains of the world's future leading economic powers. If Japan is not a leader in computer manufacture we will fall behind and never be more than a second rate power. If there is one item we will not liberalize it is computers."

Q: Is it fair then to say that much of your activities there were basically trying to put out fires and control conflict and find a way forward?

EDMOND: Ray, it was that in large measure. In reviewing press clippings for this conversation, I was amazed at the number of speeches that I gave throughout Japan before economic groups, business organizations, and opinion makers at universities designed to assure Japan that we were a dependable friend; that our proposals would not harm their economy but actually would be beneficial to them as well as to us. I guess the phrase used today for that aspect of my duties would be the exercise of public diplomacy. I took advantage of the very impressive residence

that went with the Economic Minister's position to give dinners for small groups of opinion makers such as the editors of Japan's leading economic newspapers, the Nihon Keizai and the Sankei Shimbun.

A considerable portion of my time was spent attempting to persuade Japanese decision makers both privately and publicly to deal with issues such as capital and trade liberalization. These initiatives were individually not of earthshaking importance, but progress would largely take place only through a series of relatively minor actions that individually would not arouse serious domestic opposition within Japan. This at least would be true until the two governments were prepared to enter into major bilateral or multilateral trade negotiations. For example one of my initiatives was to persuade the Director General of the Ministry of Trade and Industry (MITI), the highest ranking civil servant in the Ministry, to agree to permit foreign firms establish wholly owned wholesale companies to enable them to distribute imported products and bypass the powerful Japanese trading companies. Now, this was deemed to be an accomplishment since one of the hurdles for foreign firms was to get their products accepted and distributed by the incredibly complex Japanese distribution system, which deliberately or inadvertently favored Japanese products. In actuality, not very much was accomplished by this development. Although it enabled American firms to overcome one obstacle there were many other hurdles that thwarted American exporters.

R. BARRY FULTON
Special Projects Officer, USIS
Tokyo (1971-1973)

R. Barry Fulton was born and raised in Pennsylvania. He earned his B.A. and M.A. from Penn State and after graduating in 1962 served in the U.S. Air Force. In 1968 he entered the Foreign Service and during his career served in Pakistan, Japan, Italy and Belgium. Mr. Fulton was interviewed by Charles Stuart Kennedy in 1999.

FULTON: When I returned from my first posting in Pakistan, I returned to the States with an onward assignment as Assistant Information Officer in Rome. The tantalizing proposition from the PAO, Public Affairs Officer in Tokyo to go to Tokyo as the Special Projects officer in what was thought to be a new look for USIA. That I already had the new assignment in Rome was obviously an attractive proposition to hold onto. Who wouldn't want to go to Rome? But the chance to try something somewhat different was appealing to me and after a few rounds of discussions with people in Personnel and people in the area office, those discussions concluded with the Area Director saying to me, "Well, you know, anyone who has any doubts about going to Rome I think won't fit in there, you'd better go off to Tokyo." And so I did.

Q: So you were in Tokyo from '71 to...

FULTON: '71 to '73.

Q: '73. And what was your job?

FULTON: Well I carried this title that was made up as far as I could tell for the occasion, Special Projects Officer. The special projects that were underway were to revamp a program that still had some of the cobwebs on it from the reading rooms that had been set up all across Japan just after the end of World War II. These were, important at the time, institutions and communities around Japan. But they were feeling by 1971 a little bit threadbare, they weren't sufficiently supported to keep them modern, and whereas at the time Japan was full of modernity in a lot of ways, consumer electronics and the flash and dash, these were well worn institutions that no longer attracted young people. Our idea, or the PAO's idea, Allen Carter, his idea was that these should be so attractive that young people would come to them and could find in them the latest literature and the latest films and the latest everything about the United States. I had the good fortune of being able to help articulate and put into practice that vision, along with a very very talented group of people who had largely been recruited by Allen Carter to do just that.

Q: Well now let's talk a bit. In the first place, how did you see the situation vi- a-vis the United States in Japan in this 1971 to '73 period?

FULTON: A couple things happened during that period that remind you of what we were winding down and what we continue to deal with vis-a-vis the Japanese. At the time I was there, there was a special negotiator assigned to the Embassy to negotiate the return of Okinawa to Japan. That happened during that period and put a mark of conclusion of U.S. occupation of Japanese territory. A second thing happened during that period, and that was a continuing friction between Japan and the United States on, of all things, trade issues. I recall one day when USIS had a call from one of the major newspapers, and the caller said, "We understand that the President has dispatched a special trade negotiator to Japan and that he is arriving here today. Is there any truth to this?" The person in question was to have been one Ambassador Kennedy, the then predecessor to the Special Trade Representatives office. We checked with our sources in the Embassy because we hadn't heard of it, and we called and reported back and we said, "No, there's nothing to that." And several hours later the reporter called us back and said, "If you check at the New Otani Hotel I think you will find him in room so and so." And in fact he had been dispatched and in fact the mission did not know about it, and in fact soon thereafter the Ambassador was recalled, the State Department lost confidence in the Ambassador.

Q: Who was he?

FULTON: Ambassador was Armin Meyer. The Department had lost confidence in him to deal with trade issues, because as today it is often that story that jumps out of the press at you for one reason or another.

Q: Well, let's talk about what you were doing. In the first place, how did we see, what were the target groups that USIA was interested in reaching particularly in this '71-'73 period?

FULTON: We knew both from the polling data, and in a way it was obvious even without the data, that there was a generation who had lived through the war, who had lived through American occupation, who had seen, had come to understand that American occupation was both

positive and largely benign, and who in one way or another knew Americans. There was a younger generation coming along as there always is who did not experience that, who did not know America nearly as well, for good or for bad. We understood, we believed that it was in our interests to develop relations with that generation. We had good relations with the other generation, we had good relations with the press, we had good relations with the academic community, and those were people at the time who were beginning to retire and whose successors were less well-known to people at the Embassy. The Embassy being what it was in some ways reflected Japanese society. It was staffed with a lot of senior people, and therefore older people. One of the things USIA tried to do was bring in some younger people who could in fact relate better to this younger generation of Japanese. So that was the primary push that we'd set out to effect, hoping along the way that we would not also stop attending to the people who continued to be influential in the press and academic circles.

Q: In the '71 to '73 period, and we're talking about youth in Japan, the young people in Japan, this was a time when, although one refers to it as the '60s, the '60s really moved way into the '70s in the United States in youth movement and all that. Was there a comparable youth movement in Japan and alienated and all that?

FULTON: Well, far less so. I think the Japanese in style then and still frequently follow the West, the United States in particular. After a few days you begin to see and fear the echo of American culture in all ways, including its discontent. I used to say, a few months after I got to Japan, I thought I had it all figured out. By the time I left two years later I understood that I didn't know very much. Because Japan on the surface and Japan underneath are very, very different. That country was not at the point where there was anything approaching the real discontent that American youth showed, although it had that appearance.

Q: Okay here you are. You've got the sort of dowdy reading centers or cultural centers around Japan which are pretty threadbare by this time. Here you are, the new boy on the block, and they say, "Okay Barry, this is yours." What did you do? What would you do?

FULTON: I had that role of pulling together a lot of thoughtful people who knew a lot more about Japan than I did. We had a good number of people on the staff who had experience with Japan, and some people who had little Japanese experience but who had some visions for change. What we decided to do, and in this particular case, although I don't think I'm known for my modesty, I would underscore the we, this was not a Barry Fulton enterprise. I was an organizer of a lot of thinking and a lot of talent. What we decided to do was to try to make our former reading rooms look like a contemporary bookstore. We wanted to have on the shelves, the week after they were reviewed, books that had just been published. We wanted the people in Japan who after all had sufficient resources to conduct their own deep research on anything, we wanted to say we are contemporary, we are your source of helping you interpret what's going on in America, we have a view of what's going on and we would like to influence your view by what we present to you in an attractive manner. We understood at the time that that meant we should, as the Japanese were doing, use the latest technology. Everybody would agree with that today. Not everybody agreed with that at the time, technology was not the buzzword as it is today. At that time Sony corporation was just developing home video recorders, Betamax recorders. We had the first consumer recorders in our libraries anywhere in the world, including

anywhere in Japan. We talked to Sony and we got the first issued. We got the congressional record and congressional committee prints on microfiche, and we had a complete collection of these. Now this isn't something that appeals to young people but it does appeal to young researchers. We were using fax transmission to communicate between our branches at the time. Now it was another ten years before that was commonly used, although I have to say it had been used in Japan by others prior to that. We were, at the time, in Japan out on the leading edge of the use of technology, and we began in Japan to use computer-supported addressing and record keeping so that we could better target the people we were after, and then that was probably the first large-scale use of computers to do what is now routine.

Q: Everything we did really depended on our clientele to speak English. Pretty much.

FULTON: We did all of our programs with simultaneous interpretation. Japanese students universally read English, and they read English at a high level of proficiency. At the time very few of them spoke English, that's changed somehow. If you go to Japan you find a lot of people who speak English. But at the time there were very few. We made a decision that one of our investments in technology had to be high quality interpreting equipment. That was a change, simply because funds weren't available, the equipment wasn't available. Many programs had been done prior to this change in English, because it's easier and it's cheaper. It's very expensive to do good interpretation. We happened to have on our staff one of the better known interpreters in Japan, and he was born Japanese, raised in the Midwest United States, came back to Japan. He was the person who the Japanese, the TV network would have, would hire on contract to do the simultaneous interpretation for the space shots, for example. So he was really a nationally known figure. He was on our staff, and he set up a training school for young translators, so we could expand our translation ability and we got this good equipment, and everything was done simultaneously.

Q: Did you all try to tackle the American military nuclear question, which you know is a very touchy one?

FULTON: Oh, the biggest, probably after trade at the time the biggest issue between Japan and the United States. We've since all learned a good bit about that, or at least allegations of the press. Speaking for USIS at the time we had a company line that we used and that was always that we, on any ship's visit, we fully observed and respected the agreement between Japan and the United States. The direct questions then were often, "Well, are there any nuclear weapons aboard this ship?" And the answer was, "We fully respect the accord between Japan and the United States." We never discussed the presence of nuclear weapons. Now, the accord between Japan and the United States was such that one would therefore conclude that there were no nuclear weapons aboard that ship. Now, subsequent to that we understood there were side agreements, and I don't know to this day any more than I knew at the time.

Q: Yes, it always was touchy, and I think sometimes the question rested on, were they in Japan if the ship was docked, I mean, you know, in a way it was fully understood by the people and authority on both sides what was going on. It just was not one thing, and probably rightly so. I mean otherwise it could spin out of control and you had peculiar manifestations that you had to offload on a ship outside the three-mile limit or something like that. Was USIA, your

organization, tackling trade with Japan?

FULTON: Yes.

Q: How would you do that?

FULTON: Mainly with the press. Like any good USIS operation the time, resources were roughly divided between information and education/cultural work. The Japanese press is terribly important not only in Japan but outside of Japan. It's frequently quoted. The Japanese are vociferous readers, there are six or eight major dailies in Japan and regional dailies from all the prefectures many times over. We had branch posts in six places outside of Tokyo. The branch PAOs were all tasked with keeping in regular contact with the regional papers and Tokyo itself, where all the national dailies, practically all the national dailies were headquartered, we had very active relations with them. Trade was right at the top of the agenda, but when we could bring through a specialist on trade issues, if we had anything to say about it that person did not get out of town without dealing with the press. As I said earlier that was almost always done with interpretation, when we had the chance then to explain our views. We had easy access to the press, I should say. It was not, this wasn't shooting our way into the front door, the press were eager to hear from us. So it was a matter of a phone call and an easy meeting and was something that was easy to do if we had a position to represent it frequently got good attention. We initiated a magazine at the Embassy called Trends. Long since it was first started, Trends in fact has been privatized and sold to a private entrepreneur. I don't know if it's current, but when it started, trade was one of the major issues covered in this magazine, It was a glossy heavyweight magazine and targeted to influential people in Japan, and there was not an issue of it published, came out every other month, that did not have some trade-related story.

Q: For the embassy, dealing with political and economic affairs, how important was it to make good contacts away from Tokyo?

FULTON: I think you'd find a dispute on this question. Japanese political life and cultural life is highly centralized. Tokyo is to Japan as Paris is to France, it's not decentralized. On the other hand, the population is dispersed widely across the islands, and we believed a lot of future leadership would come from outside of Tokyo and we believed it was important to have a reach outside of Tokyo. Hence we operated centers that had long been in existence in Osaka and Kyoto. We opened a center in Nagoya because it was a regional population center of some significant, and we continued centers in Fukuoka and Sapporo. At the same time we closed some smaller reading rooms where population size didn't warrant the continuing expense.

Q: How about our troop presence there, was it becoming a problem more than it had been, say the generational change?

FULTON: No it wasn't, with the exception of Okinawa, where the question of sovereignty was a major question and was resolved through the negotiations, there was not any major discontent about U.S. troops on Japanese soil. All things considered it was seen as positive. There was the occasional incident, but they were very infrequent.

Q: Did you use these posts, these reading rooms as sort of listening posts? Were things coming from them, different regions back to the Embassy?

FULTON: Well, yes and no. Yes in theory, one of the things that we frequently argued is that the better contact we had with people and the regional centers the better we could be advising on policy. In practice that didn't happen often. Busy people who run programs don't frequently do reporting. I don't know if that's your experience in branch posts, but that's usually the case. In practice State Department colleagues of ours who do reporting infrequently come to programs. Happened occasionally, not routinely. Should have.

Q: Armin Meyer left shortly after you arrived?

FULTON: Yes, it had been six months, he left, that was because of discontent within the White House or the Department with his role as concerns trade negotiations.

Q: He was replaced by Robert Stephen Ingersoll.

FULTON: Replaced by Robert Ingersoll who in particular had Kissinger's confidence, and Ingersoll stayed in Japan for the best part of two years and then returned to Washington where he became Kissinger's deputy in the State Department.

Q: How did you find relations between USIS and the State Department?

FULTON: In the time I was in Japan they were exceptionally good. It seems to me that that element which always contributes to good relations between the two has been whether there was this professional respect across the two. State Department had, as I think it frequently does in Japan a very, very strong contingent of officers and it happened the time that I was in Japan that USIS did as well. That appreciation that crossed that line was very, very strong. It couldn't have been any better. Ingersoll came to town, he had not served in a mission before, although in his business life he had a bit of foreign experience. He had a very, very broad strategic view of what U.S.-Japan relations should become. He used all the resources of the mission and orchestrated that mission in a way that could be a model anytime.

Q: Well I assume the feeling on the part of you and your colleagues was that Japan was a major player in the situation, in our policy in that part of the world.

FULTON: Well, it was so perceived certainly at the mission, and I think it was perceived that way in the Department as well.

Q: Were you all trying to paint the Soviet Union, I mean make sure the Soviet Union was getting the bad press or not?

FULTON: No. The Japanese had their own view of the Soviet Union and it was in most regards complementary to ours. We didn't spend any time on that.

Q: How about Vietnam?

FULTON: Ah. The irritation with the U.S. involvement in Vietnam escalated during that period in some ways reflecting what was going on domestically in the United States. I don't think it ever reached the fever pitch that it did actually in the United States, but we saw the same discontent reflected, the question of whether we were there as an imperial power, the question of how long we would stay, the question of whether commitments would be honored in terms of withdrawals. All of the issues that the United States confronted at home and around the world were present in Japan. We dealt with those as best we could. During that period we had a policy that was very much in transition and that was a difficult policy to explain, and we did our best.

Q: Was there a problem in Japan that you often have in a country that is dependant on the United States, we were their military power? You had China to the west and the Soviet Union to the east, it was not a friendly neighborhood. And yet as we see in other situations that you can get this sort of Ying and Yang, this mighty United States and we don't have any control over their military or some of their policies and all, at the same time for God's sakes don't leave us alone here, I mean was this a problem? Were you seeing this deflate out in the Japanese body politic?

FULTON: Well, you have well-described the dilemma that the Japanese faced, and dilemmas don't have solutions. On the one hand we were disruptive in the neighborhood by our presence in Vietnam, on the other hand we were essential to keeping peace in the neighborhood. The Japanese appreciated that, they appreciated the role we were in. One can imagine a Japan split between those two views, groups in the street opposed to U.S. policy. In fact there were some. It wasn't as though half the population felt we should be there with our military presence and our economic might and half thought we should not be. Probably half of every Japanese felt on the one hand and on the other hand, this is, we were both destabilizing and stabilizing in certain ways. All things considered, our relation with the Japanese was highly positive.

Q: What about the Korean-Japanese relationship? I was wondering whether we were trying to say, "Why can't you all learn to love each other again?"

FULTON: It wasn't an issue for us and it's clear that since that time the Korean-Japanese relationship has matured somewhat. But that came about through the efforts of the two sides, we were not party to that.

Q: Was Okinawa within your province?

FULTON: Well, we had a center on Okinawa when I arrived there, we had a USIS officer, and as I mentioned earlier we negotiated the return of Okinawa during that time. Had that not successfully happened that would have become a major irritant. It hadn't reached that stage but it could have. As I said it was a question of sovereignty. There were very complex issues on Okinawa that the Japanese themselves then and still face: economic disparities, and the U.S. troop presence that continues. We negotiated at the time a settlement that all parties thought was just for the return of Okinawa to Japan.

Q: Did you find on mainland Japan, referring to the three major islands, much interest in the

Okinawa thing, you know, with your reading rooms and all that?

FULTON: There was enormous interest in the national press. I didn't sense that there was much interest outside of Tokyo in that question, apart from that generated by the National Press. But there was great interest in the press because it was a question of Japanese sovereignty.

Q: What about the national press? What you were getting? Although this was not your major area of responsibility, I mean you were still in the apparatus that was dealing with this, among other opinion makers. What was your impression of the Japanese press? Because it's so big and seems to be a little hard to put a handle on.

FULTON: Well, the Japanese press was not then, I can't speak for it today as I've not followed it closely, but I would suspect we have some of the same situation today; it was not a totally free press in the sense that we understand it here. One has to be careful with these definitions across cultures, because a Japanese journalist would take offense at what I've just said. But certainly there was a very close relation between reporters who covered various aspects of the Japanese government and those government ministries. If you were covering a certain ministry, you had privileged access to that ministry. I don't want to suggest that doesn't happen here on occasions, too. But we are talking about an access that is unusually close in Japan, and if you are a reporter covering that ministry and you do not cover it in a way that is thought to be fair, at the time you could be cut out of the news in a way that could not happen here. So one sees across the spectrum of the Japanese press a similar line and a line that certainly at that time was well orchestrated by the ministries.

Q: Who was running Japan at this time? Where did we feel Japan was being run?

FULTON: Help me out with that question, let's go a little further.

Q: Well, I mean, in the sort of Foreign Affairs apparatus we always look for power centers. If you're looking at the United States, you'd say who runs it, I mean it's obviously the White House and the Foreign Affairs National Security Council with the President. The Department of State, Congress, Defense Department, conflicting things, so where did you feel, as far as, particularly American relations were concerned, who was calling the shots?

FULTON: You know, I'm tempted to give you some answers but I'm going to resist because I was not, when I arrived there and when I departed two years later, I was not a Japanese specialist. I was not a Japanese language officer. I had a particular role in trying to help restructure and recreate a new USIS operation. Probably two-thirds of the people I served with there were experts on the politics of power within Japan and could answer that question with much more validity than I can, so I'm not going to try that.

Q: I'll accept that. By '73 how did you feel, by the time you left how'd you feel the program of updating, modernizing, reattracting clientele was going?

FULTON: I was satisfied that we had accomplished what we set out to do. What we set out to do was to make the centers, and that is not only the books and periodicals that were there, but also

the programs that took place in those centers with visiting American experts, to make those attractive places that young Japanese would feel attracted to. Our attendance shot up, our book usage increased even though we had fewer volumes on the shelves. We weeded out a lot of things that never circulated and brought in newer things. Then attention of the national press increased to the centers. One of our designers who helped design the centers, an American who served in Japan for a couple of years, of American and Japanese ancestry, he was awarded by a Japanese design professional association their highest award for one of the years he was there for design of the centers. A Japanese encyclopedia, that is the equivalent in Japan of the Encyclopedia Britannica, used our centers to illustrate modern design. We got attention, which is what we were trying to do. We called, instead of calling them libraries we called them "infomats." That would work in 1990 easily, in 1971, 1972, 1973, some of our critics said, "Well, that's sort of a gimmicky title." Well, it was kind of a gimmicky title. But we were looking for that gimmick to say this isn't your traditional library, this is something new and you can come in here and look at videos and you can come in and listen to audios and you get the latest books and get the latest magazines. We're not your father's library. We're your library. And that part of it worked.

Q: How about the school system? I'm thinking more about the grammar and high school gymnasium system. How was that, was that a prime target of you all?

FULTON: No it was not. Our target was at the college level, and I think you could make a good case that you should target people much younger. I think you could make that case intellectually. One finally is constrained by the budget, and so we did our targeting at the university.

Q: And also, it's a different clientele. It's noisier and the more high school kids, the less college kids you get.

FULTON: You'd have to do it very differently. Target worthy, we were targeting college kids and their professors.

Q: Did you get involved in exchange programs?

FULTON: Yes. Japan and the United States have one of the largest exchange programs. That program is a genuine bi-national program, in fact the Japanese contribute more to that program than the Americans do, and the Japanese have traditionally had a large number of exchange students come here. I don't recall the number at the time, there are around 50,000 here now. The exact numbers would have been on the same scale at that time. Far fewer Americans going to Japan, and one of our interests over the years was getting more Americans to Japan. But the exchange program was a core part of the whole thing. It probably underwent less change than any part of the program, because it was working very well and still does.

ROBERT B. PETERSEN
Branch Public Affairs Officer, USIS
Sapporo (1971-1973)

Mr. Petersen was born and raised in Ohio and educated at Oberlin College. He entered the USIA Foreign Service in 1965 and served as Public and Cultural Affairs Office in Embassies or Consulates in Vietnam, Malaysia, Japan, Mauritius, Israel, Morocco and Cote d'Ivoire. He also served in several senior USIA positions in Washington, DC. Mr. Peterson was interviewed by Charles Stuart Kennedy in 2001.

PETERSEN: I loved Sapporo.

Q: You were there from when to when?

PETERSEN: From early '71 until mid-'73. I left in July of '73. I was there during the Winter Olympics of '72.

Q: Sapporo was the major city of Hokkaido.

PETERSEN: Yes. It was over a million population. It was a huge city. It was that part of Japan that had been an area of competition between imperial Russia and imperial Japan for centuries. It was not until the 19th century that Hokkaido became an integral part of Japan. It was absorbed into Japan under the Meiji era when they had all the samurai who had to be resettled during a great transformation in Japan. A number of people were induced to go up to the snowy, cold north in Hokkaido and settle that area. Before I was assigned to Sapporo, I had spent part of a week as a tourist in Kyoto and found it fascinating, but once I had lived in Sapporo for a brief time, I went down to Kyoto and I remember thinking, "Gosh, I am so lucky to be in Sapporo" because I found it fresh and open and exciting. Everything was in the future in Sapporo and in Kyoto, there was this tremendous cultural, historical legacy among the people of Kyoto and elsewhere in Japan as well. I just found Sapporo to be open and forward leaning, looking to the future. I liked it immensely. I had never in my life seen a ski slope before I went there, but once I found out I was going to Sapporo, I told myself, "I'm going to love being a skier." I went out and bought ski boots before I went to Japan. As soon as I got there, I bought a set of skis and started learning to ski the week I was there. Skiing was an important part of my time there, one of my enjoyable recreational activities.

Q: You were in Japan during an interesting time. You had the Nixon shokus and all that. How different was the work you were doing and the reception to the work you were doing in Hokkaido?

PETERSEN: Night and day. In a certain sense, going into the branch post in Sapporo was going into the traditional work of the U.S. Information Agency, if you would consider USIA's efforts in Vietnam as somewhat of an aberration for the Agency. The emphasis on PSYOP, working with the police and the military and with the department of prisons and so forth that I did in Malaysia and the kind of work I had been doing in Vietnam, yes, it used the concepts and the tools, the resources, of USIA, but in Sapporo, the structure was different. When I arrived in Sapporo, I was already nearly six years into my USIA career. I have to acknowledge that I had a very poor understanding of USIA at that time, how it functioned, the bureaucracy, the roles of

different positions and so forth. JUSPAO in Vietnam was a one-off structure. My work in East Malaysia, I kind of designed the organization and had a great deal of latitude to do so. In Sapporo, I was running a branch post that mirrored the other five branch posts in Japan. The same personnel structure, except the one in Tokyo was first among equals. It was bigger and more important. But the other five were all basically the same branch PAO, same number of staff, identical collections. The themes we programmed were identical. The PAO, Allen Carter, made a major point of saying, "There is only one foreign policy and the days of the branch PAOs programming according to what they felt were the appropriate themes for their area are gone. We're all speaking from the same textbook, all singing from the same sheet of music." I had some bureaucratic structure added to my life that had been lacking up until then.

But once again, I was further from the USIS headquarters than any of the other branch posts. I enjoyed that immensely. I worked with two different consuls in Sapporo. The first one, Martin Heflin, was there just a brief time. He left and Sunao Sakamoto took over, became the consul.

Q: Sunao has a fascinating history. He was a Marine. He was my deputy in Seoul.

PETERSEN: He went from Sapporo to London.

Q: He came to Seoul later.

PETERSEN: He was delightful to work with. While I was there, the major concern was Japan. You asked about the Nixon shocks and trying to add useful background to those issues was quite a challenge. Melvin Laird became the new Secretary of Defense. I remember using a lot of things he said to try to urge Japan to assume a greater role, share more of the burden for defense in East Asia. One of the challenges was trying to help the Japanese understand more clearly how it was that some of their exports could indeed harm the United States. The Japanese would talk about being the younger brother and the American being the older brother and America being very powerful and Japan being very weak. There was that popular image, but things such as textile exports were indeed creating havoc in part of our economy. I remember efforts through USIS in meeting with journalists, educators, others, to publicize the fact that, well, you've got to understand where textiles are located in the U.S., where that industry is located, and the fact that through a seniority system in our parliament in the U.S., the people from that area exert a lot of control on our government. You've got to be more sensitive to your export policies and more aware. One of the popular examples was just talking to a member of the executive branch of the United States isn't sufficient for the Japanese government. It should be also communicating with our Congress to understand us. So, through our IV (International Visitors') programs and our speakers programs and so forth, we were trying to increase this understanding of how we worked and how our two economies and two political systems could interact.

We also had the issue in Sapporo of the effort where we were trying to open up a little bit toward the Soviet Union in the period of detente. Our place there involved very carefully orchestrated meetings between the Soviet consulate and ours. We would go to their place. They would come to ours. I remember the first meeting in our consulate. I think there were three of us Americans there, the three Americans in the consulate. The Soviets were sitting there rather stiffly. And we went to their place and sat rather stiffly. It seemed like we did this once a month; maybe it was

less often. We exchanged views. Our two governments were trying to understand each other better. So, we would talk about Japan, about our interests and so forth. One of the things that impressed me immensely in dealing with the Soviets was the wealth of resources they poured into training for their diplomats. They would tell us about the preparation they had for their assignments to Japan and it made us envious of how much they got. We talked. A big high point was, they expressed interest in the cultural center that we operated. I discussed this ahead of time with our consul. We were ready for this, but they were absolutely shocked and delighted when I invited them over and said, "Come on in and we'll show you around." I specifically invited the one man who said he had cultural interests, but the whole team came over. In any event, I was very pleased to show them our center and let them see what we did and all the holdings we had. That was one aspect of the work, dealing with them.

But I was there to work in support of our country plan on Japan. We had a very active program in Sapporo. When I was assigned to Japan, we had nine branch posts, nine cultural centers. Allen Carter, the new PAO, reduced the nine to six and make the six of them identical, gave them all up-to-date resources, revamped them so that much of my first year was involved in the reconstruction of our center and retraining the staff. The center itself was active. Lots of speakers. A lot of outreach. I worked a great deal with Hokkaido University. One of my big projects – and it was supported by Dave Hitchcock, the deputy PAO in Tokyo – Dave took a particular interest in that and really pushed hard – was to have an interdisciplinary American studies program take root at Hokkaido University. The mantra for us was, we don't care if someone's studying law or medicine or history or literature or chemistry, but in the course of that student's stay at the university, that student should have the opportunity for at least one course about the United States --American history, literature, foreign policy. We worked very hard at that, bringing in people who could substitute and teach for Japanese professors who would take a sabbatical to go to the U.S. We provided other support to the university as well in terms of resources. But that was taking root when I left. That was something I took a real interest in. I felt that was a major long-term accomplishment for the program.

Q: Did you have to go into high gear in Sapporo when the first Nixon shock, the opening to China, came? How did that hit your area? How did you all respond?

PETERSEN: Definitely. I don't remember the details of where I was when I learned about it. But yes, there was a flurry of activity. We were out meeting with people, getting our talking points, and then rushing off to meet with journalists primarily. That was the immediate concern, the media portrayal of this. There wasn't a crushing need to speak to government officials in Hokkaido, since that was being done at the ministerial level in Tokyo. But the media, the Hokkaido Times, the Hokkaido Shimbun and so forth. I went rushing over there as quickly as my legs could carry me to give them the latest material explaining the background of this. There was a sense on the part of the Japanese that we had preemptorily done something when we should have to properly reflect our relationship with them, we should have been consulting them about the impact this would have on Japan. There was great concern. Alleviating that, we were in high gear.

Q: Going back to the Soviet thing, the fact that the Soviets were hanging on to those northern islands was probably the greatest boon to our policy with Japan for 50 years.

PETERSEN: It was interesting. In Sapporo, when I'd be in a movie theater, before every film would begin, there would be on the screen an outline of the northern territories. There would be a banner statement "The northern territories must be returned." Some – enough that it made quite an impression on me – Japanese I would meet in Hokkaido, if I turned over their business card, on the back would be the statement "The northern territories must be returned" and an outline of the islands. Go down to Tokyo, and people would shrug. It wasn't an issue that moved them. I even had a Japanese tell me down in Tokyo, "You know, it's kind of embarrassing the way the people in Hokkaido carry on about the northern territories because it interferes with some of our foreign policy initiatives." One of the messages I would carry down to Tokyo to the country team was, it may be artificial in the way it's engineered, before a film is shown in the cinema, having that appear on the screen, or putting it on a business card, but artificial or not, it was a first-line issue up in Hokkaido.

Q: Was this something that you could kind of drop, a card you could always play, say, "We support you fully on that?"

PETERSEN: We also held Okinawa. While I was in Sapporo, Okinawa reverted to Japan. I don't want to say we were crass. We were subtle. We didn't have to be out shouting about it. People could draw their conclusion. We were astute enough to let the issue speak for itself. That doesn't mean we didn't put out a lot of information about the reversion, because we did.

Q: This had been in the cards for a long time. It was taking a long time and we weren't negotiating with the Japanese on this. We were negotiating with the United States Marines.

PETERSEN: And still are.

Q: And still are.

How did the Olympics go?

PETERSEN: The Winter Olympics of '72 went off like clockwork, beautifully planned. I had an interesting involvement there. I arrived and began working in Sapporo a little less than a year before the Olympics. In that year, 1971, I remember participating in some public panel discussions. I think one time it was in the big meeting hall of either the Hokkaido Shimbun or the Hokkaido Times. It was a panel discussion about how could Sapporo best prepare for the influx of all the foreigners. There I was, talking along with a few other people about what the city should do, reminding them that taxi drivers are vital, that that often is the only contact somebody has. The Japanese preparation was very well done, very sophisticated. I wouldn't begin to suggest that I actually contributed anything to that. They left no stone unturned and that was indicative of the efforts.

Q: Did we have any problem with star American athletes acting a little bit prima donna-ish or anything like that?

PETERSEN: I don't remember that.

Q: I'm not thinking of any incidents, but it's always a problem. This is true of any country.

PETERSEN: I don't remember that. I remember Avery Brundage, an American, head of the International Olympic Committee. There was the opening ceremony in an outdoor stadium. But then there was some other kind of opening at an indoor venue a couple days prior to that at which Avery Brundage spoke. It was relatively small, maybe 1,000 people or so. Maybe it was the opening of the meeting of the International Olympic Committee. I remember Brundage getting up and I could only describe him as irascible. He talked about how the person who founded the modern Olympics at the turn of the century would be turning over in his grave at what had become of the Olympic movement and especially the Winter Olympic movement, which has all these pseudo sports and all this advertising effort put into it. Brundage was a purist and was very critical of the idea of having a Winter Olympics and certainly of the effort to advertise in connection with it. As far as American participation, I remember the American hockey team because I met the guys on the team, but I don't remember how they did. I don't recall any great exploits by American athletes. There may have been some. But I do remember a Frenchman, Jean-Claude Killy, who was the hero, the great downhill skier. He cut a swath. Then for Japan, a fellow named Kasaya, who won a gold medal in the ski jump, the 70 meter. I was there and watched that. I later had the honor of presenting him the Helms trophy that is given to the outstanding amateur athlete of the year. I remember we arranged a presentation at USIS. It was covered on TV. I remember a cousin of mine in the U.S. told me he saw me on TV making that presentation later. I guess it had widespread coverage. But a lot of Japanese were just delighted with that. It was thrilling. The Emperor saw it. It was exciting.

Q: What was your impression of the Japanese media, their provincial media?

PETERSEN: Energetic. I was illiterate. I could piece out what an article in the newspaper might be about and get it right occasionally, but I couldn't actually read the article. I could recognize perhaps enough of the characters in an article to kind of figure out what it was about, not much beyond that. So, in terms of what was in the newspaper, I relied on secondary sources. My impression is mainly of the journalists that I got to know. They were very energetic, very... I want to say opinionated, but that's unfair. It's just that they did have decided views on things. Very critical of the government. I don't want to use the word "cynical," even though it's the word that comes to mind. In a sense, they remind me a lot of journalists I've met in a lot of countries, particularly wire service people and others, American journalists abroad. Very skeptical about what they heard and learned. Always looking for the real story behind the story. They would keep me on my toes.

One of the things we did, because we were still immersed deeply in Vietnam, was set up a monthly off-the-record meeting at the center and invite journalists in to talk only Vietnam. I'd bring people up from the embassy in Tokyo to talk. I would speak, drawing on my own experience and following events there closely. I remember, I would always say at the beginning of these sessions, "This is off the record and our purpose is to share information so that you will draw your own conclusions. Your conclusions are your conclusions. We're not trying to tell you what to conclude, but we want you to form your opinions on as accurate information as possible." We would answer questions that we could answer and present information that they

might not otherwise be aware of. Most other sessions were on the record. The Japanese wanted to know about our opinion of their going in to try to exploit Siberian resources. Would we be supportive? Would we interfere.? That was an issue. What would the U.S. view be of Japan really making an effort to develop mineral resources in eastern Russia?

Q: I can think of nothing that would cause a more difficult response than getting something from the government. This is usually going to be an ad hoc thing when it happens anyway. To come up with a considered, quick response from USIS would be very difficult.

PETERSEN: I remember being very impressed by the econ officer who was head of the economic section from the embassy. His answer was, "We've got this very close and special relationship between us, but Japan has to make certain decisions that are in Japan's interest and we understand what Japan has to do." That was a summary of maybe a 15-minute long answer he gave. I was very impressed by that. The man did a very good job.

THOMAS P. SHOESMITH
Deputy Chief of Mission
Tokyo (1971-1976)

Thomas P. Shosmith was born in 1922 and raised in Pennsylvania. His career in the State Department included service in Japan, Hong Kong, South Korea, and an ambassadorship to Malaysia. He was interviewed by Charles Stuart Kennedy in 1991.

Q: And then you went as Deputy Chief of Mission to Tokyo, where you served for almost five years. That's a long time. How did you get the job?

SHOESMITH: Marshall Green asked me to take it. There was a new Ambassador, Robert Ingersoll. Although he had had a certain amount of experience in Japan through his business connections, senior Department officers obviously felt that they needed somebody in the DCM slot, a professional who knew the Department and knew how an Embassy ought to run and had some experience in Japan. I don't know why Marshall Green asked me to do the job, except that we had worked together in Korea when he was DCM in Korea and I was in the Political Section. We were friends. I was succeeding Dick Sneider. Dick was a very effective operator in the bureaucratic structure and very knowledgeable about the Northeast Asian area. He was very effective in his dealings with the Japanese Government, particularly on the question of Okinawan reversion and the prospective home porting of an aircraft carrier, which was one of the issues that was up at that time.

So I accepted. I mean, you don't turn down positions like that. I accepted the assignment with some trepidation because I'd never had a management job as large as that. I remember Ambassador Brown, who was the senior Deputy Assistant Secretary at that time, said to me, "This is being the Chief Executive Officer of a large corporation, and that's what your job is going to be out there." And most Foreign Service Officers -- I suspect even today -- when they

get into positions like that, have very little management experience.

Q: Could you provide some idea of what this management job involved? I mean, the Embassy in Tokyo is obviously a major Embassy. What were some of the management areas and problems you had to deal with?

SHOESMITH: Well, I think that the largest problem is simply one of defining the priorities of the Embassy, what we ought to be trying to do within the broad framework of the policies that are outlined in Washington -- our relations with the host government. When you have as large an Embassy as that, with so many different parts, and including the attached agencies, you need to make sure, as best you can, that they are all at least aware of what each other is doing and that they're all more or less working on the same track. Then there's the problem with all of these people that you've got -- I think that the American contingent, including the attached agencies, was something over 250, maybe 300 people. You need to try to create within the Embassy the best climate for them to do their job, to give them a sense that you regard what they're doing as important and that you are concerned to see that they get what they need to do their job, insofar as possible. More generally, you need to keep up a congenial, collegiate atmosphere within the Embassy through one device or another, whether through staff meetings, meeting individually with these people, and so on. I think that those are the general parameters within which I worked as...

Q: Did you have any problems with any of the other governmental agencies, in the sense of "free wheeling" or striking out on their own?

SHOESMITH: Not particularly. There would occasionally be times when you had that, but no particular incident comes to mind right now. Of course, there must have been such times. However, I found that most people, and particularly most of the heads of the attached agencies, were anxious for me to know what they were doing. They wanted to be part of the Country Team. I took the concept of the Country Team very seriously. I think that most people -- if they were persuaded that you took them seriously -- were quite ready to work as part of a team, rather than as independent operators. It worked that way, as far as I could see. There was also the problem in Tokyo that when you have Consulates, as we have in Hokkaido, Osaka and Fukuoka, you need to keep them truly a part of the operation. However, that took less time.

Q: Well, your first Ambassador was Robert Ingersoll. What was his background, and how did he work?

SHOESMITH: He's a businessman from Chicago. He had a family business which, among other things, used to manufacture automobile transmissions. They had good business contacts in Japan to buy transmissions for automobiles and maybe for a lot of other things. He had a businessman's background and relationship with Japan. He was a first class person and very quickly was able to attract the admiration and respect of everybody in the Embassy. He made very, very good use of his staff, across the board. His contacts, where it was most natural and easiest for him, were in the Japanese business community. He did a lot of work in that community. He was always available if we felt that he ought to meet with a political leader, or journalist, or whatever. He was always very effective in such meetings.

Q: How were relations with the Japanese Government? They were just going through the aftermath of the trauma of the opening to China and all that. The Japanese had not been informed and felt very unhappy about this.

SHOESMITH: Well, they certainly did feel unhappy about it. While you would encounter constant reminders of the "Nixon shock," I don't think that really posed a serious problem in the relationship, although it probably underscored the view of many Japanese then, and perhaps even now, that we did not give them full, what would you call it, partnership status. They believed that we were prepared to do things affecting their interests without consulting them properly, and particularly not consulting them in advance. That was true then, and it's true now. The economic relationship in the early 1970s was beginning to become quite troublesome, particularly with the surge in Japanese exports, including television sets, textiles and other items. And we were beginning to run a deficit in our trade at that time. It was negligible, compared to now. Maybe \$4 or \$5 billion annually. However, we were very much concerned about that. There was the continuing problem of the base presence and Vietnam, even though we were standing down in Vietnam in the early 1970's. There was still considerable, public opposition to our continued presence in Vietnam and to our base structure in Japan. One of the principal efforts of the Embassy was to try to accommodate to some of those pressures by consolidating bases. For that purpose, we needed support from the Japanese Government. We spent a lot of time on those subjects.

Q: How did you find the American military? I mean, did they try to dig in their heels as much as possible?

SHOESMITH: Well, yes. I suppose that is to be expected. However, there was very good leadership from the top. General Persley, a very sophisticated man, was the commander of U.S. Forces-Japan for most of the time I was there. General Snowden, a marvelous Marine Corps officer, was his deputy. They were people of very, very broad scope. While we did encounter problems with individual base commanders, we had lots of support in trying, for example, in the context of developing a consolidation plan -- to close down some of the bases and consolidate them in various places, thereby reducing our exposure, to some extent. I had very good support from them. As we moved in the mid 1970s to try to -- what would be the word -- to try to put more of the base structure under the Japan-U.S. security arrangement that would give the Japanese a better sense of cooperation with the Headquarters of U.S. Forces-Japan. Together with us, the two commanders were able to work very closely and very effectively with civilians, particularly Japanese civilians in the Ministry of Foreign Affairs, which had the lead much of the time.

Q: How did you find the Ministry of Foreign Affairs?

SHOESMITH: Well, increasingly sophisticated. We were able to work very effectively with them. They were well informed, they were very effective, working within their own ministry. As you know, perhaps to a greater degree than is true within the Department of State, much of the actual policy formulation comes from below in Japan. It moves up the chain to the Minister and the Vice Minister. So these were important people to deal with. And we worked very well with

them on all the base problems. I can't speak so much for the economic side of things because I was not as directly involved in those matters as I was with base issues.

Q: Well, what about the issue that kept -- and keeps -- coming up: nuclear weapons on board American ships?

SHOESMITH: Oh, that was a very sensitive issue.

Q: Never to confirm or deny.

SHOESMITH: Never to confirm or deny.

Q: But anybody knows that if you have a large aircraft carrier coming in...

SHOESMITH: Again, the Japanese Government relied on a statement that was worked out, I think, in the 1960s some time, I think it was when U. Alexis Johnson was Ambassador. The statement said, in effect, that under the terms of the security treaty arrangement, if the United States wished to undertake -- I've forgotten the exact wording -- any major change in the disposition of its forces, this would have to be in consultation with and in agreement with the Japanese Government. And the Japanese Government explained that that would cover such things as the positioning of nuclear weapons in Japan or even the transit of nuclear weapons in Japan. And since they had never had any such approach from the U.S. Government, they assumed that this was not taking place. And that was it.

Q: In other words, that didn't quiet the critics. Obviously, we're not talking about anything classified. To anybody knowledgeable, it was pretty obvious that we couldn't denuke an aircraft carrier...

SHOESMITH: Couldn't off-load the nuclear weapons, no.

Q: But if you didn't say things specifically, then there was an agreed upon ambiguity.

SHOESMITH: I think that puts it very well. There was an agreed upon ambiguity, which proved to be sustainable. That is to say, the Japanese Government never felt so pressed by critics of its policy that it felt it had to clarify the ambiguity, as, for example, was the case in the Philippines. Under their new Philippine constitution, I think that this matter is explicitly dealt with. There shall not be positioning of nuclear weapons in the Philippines. Or as, for example, happened in New Zealand, where, under -- I've forgotten his name -- the Prime Minister (David Lange) insisted that we either confirm or deny the presence of nuclear weapons on our ships before they came in. The Japanese Government never felt under pressure to that extent. So this agreed upon ambiguity, as you put it -- I think quite rightly -- proved sustainable. It did not answer all the criticism, but it was there.

Now, there have been times when some people have felt, on the American side, that this is a dodge that allows the Japanese Government -- if, for example, something should ever come to the surface that was irrefutable -- to place all of the responsibility on us for having violated the

so-called agreements. At one point, Ambassador Reischauer got quite upset about this. He wanted to make it clear what had happened. He wasn't very keen about leaving it ambiguous. However, it has worked. So far as I know, it is not now an issue.

Q: Well, James Hodgson came up with a labor background.

SHOESMITH: I think he had been Secretary of Labor. I've forgotten under which administration. At the time he was nominated as Ambassador to Japan, he was, I believe, a Vice President, a senior executive in Lockheed for labor relations. This must have been some time, like, 1973 or early 1974 -- somewhere in there. His confirmation was held up for nine months by Senator Symington, I believe it was. There was competition in Japan for aircraft sales -- military aircraft sales -- between Lockheed and McDonnell-Douglas. I think McDonnell-Douglas is in Missouri. And Senator Symington felt that having an ex-Lockheed man there -- I guess this is what he felt, this is what I heard -- would give Lockheed an advantage. So he sat on this as a matter of personal privilege for nine months. But finally, Ambassador Hodgson was cleared.

Q: Well, what were his strengths and weaknesses?

SHOESMITH: Again, his most natural area of contact was in the business world. He was a good administrator. He probably took a more active role in the management of the Embassy than Ambassador Ingersoll had done. However, like Ingersoll, he relied very much on the staff.

Q: What about the evolving relationship with the People's Republic of China? Did you spend much time trying to explain where we were going?

SHOESMITH: No, I did not. If it came up, it must have been a peripheral issue, but I can't remember talking about it at any time at all. You know, in Japan, the focus on the relationship with the U.S. is overwhelming. And almost nothing else comes up. I can't recall the correct chronology. I believe, yes, the Japanese did move ahead of us in reestablishing relations with China. I believe that's the case. Prime Minister Tanaka visited China. This must have been in the mid-1970s, whereas we didn't normalize relations until 1979. The Japanese kept us very well informed on what they were doing.

We have a series of annual policy planning discussions with the Japanese, with the participation of people from the Bureau (of East Asian Affairs) and from the Policy Planning Staff in the Department. Also participating are people from the Department of Defense and maybe some of the other agencies and their counterparts at the assistant secretary level or below. In that context, questions of where we were going on China policy and where Japan was going on China policy were discussed. For example, draft papers on the recognition issue were prepared for these meetings during the late 1960s and early 1970s. At a typical meeting of this kind -- which covered two and a half days -- there was a general review of matters concerning the Soviet Union, Southeast Asia, and so on. At that level, a good exchange took place, even though only once a year. However, they had established contacts that could be drawn upon subsequently in the intervals between the meetings by people coming to Washington and meeting with the people that they had met on the Policy Planning Staff. Also, under the Security Treaty, there were two levels: an assistant secretary level for security consultations and then the annual meetings at the

top, participated in by ambassadors, CINCPAC, and so on. And there you would have similar discussions going on. These meetings were not limited solely to the security treaty relationship but would deal with the context of the relationship, the strategic context of the relationship. As a result, you would again have discussions about our policy in such areas as China and the Soviet Union. As a result, on an ongoing basis, there was a good deal of exchange on policy matters between Japan and the United States. What did happen, of course, was that sometimes when we would reach a decision, we did not always inform the Japanese.

Q: Was that a real problem, since it was almost impossible to inform the top level of the Japanese Government without all of this getting out?

SHOESMITH: Yes, there was. There certainly was. That was true. That was a concern frequently expressed on the American side. However, I always felt that it was somewhat a case of the pot calling the kettle black because Washington is a great place for leaks. I don't think that Tokyo was any worse than Washington, if as bad.

Q: How did you feel that Henry Kissinger, who was the dominant person during almost all of the time that you were there, related to the Japanese? You always think of him as focusing on China and on the Soviet Union and lots of things involving the Middle East. But I never get a feel for him on Japan.

SHOESMITH: Well, he himself, after he left office as Secretary of State, has acknowledged on a number of occasions that he really never quite understood Japan and never felt very comfortable in dealing with it. At least, not in the early stages.

I mean, in the latter part of his time as Secretary of State, he may have understood them better, but he did not. He simply did not understand Japan, and he, I think, had a suspicion that Japan was holding something back because how could you be, by the 1970s, a burgeoning economic power and not be willing to assume responsibilities as he would like to have them do? As, for example, in the Mid East crisis of -- I've forgotten which 7-day war this was, maybe...

Q: 1973 was the October War, the Yom Kippur War.

SHOESMITH: As I recall it, Mr. Kissinger went to the Middle East and got some sort of agreement between the Arabs and Israelis at least to enter into some sort of discussions. He didn't want to prejudice these discussions, he didn't want countries lining up on one side or the other. The Arabs, of course, had instituted a boycott...

Q: Of oil.

SHOESMITH: And the Japanese were terribly concerned about their position, their access to Middle East oil. After he had been in the Middle East, he went to China, and then he came to Japan. And he met with the Prime Minister and the Foreign Minister. In those meetings, he was very anxious that Japan not take any step which would seem to place them on the side of the Arabs in the conflict. The Japanese concern was that they couldn't go out too far because, look, they are dependent on Middle Eastern oil, and if they are denied that access, the consequences at

home will be quite serious. I remember one remark that Kissinger made, I think to the Foreign Minister, that, well, it wouldn't be the first time in history when a country made a decision on the basis of short-term advantage at the sacrifice of longer term interest. I think that he was just very impatient with the Japanese. Of course, they were not nearly as successful as, I presume, Zhou En-lai was in explaining their views. Also, I think that Kissinger's own words speak eloquently of the problem he had. He says, "I did not understand them." I think that that was very apparent. And he used to get terribly upset when the Japanese press would criticize him, as they did very frequently. All sorts of bells would ring in the Department whenever that happened. Then bells would ring in Tokyo. Of course, we couldn't do anything about it. We didn't take it all that seriously.

Q: Well, what about the problem of Vietnam? You were there at that time. Was this a difficult period for us because so much of our policy was based on the idea that in time of trouble, the United States will be there. And here we were, pulling out of it.

SHOESMITH: Well, the one thing I do recall very clearly was that in academic and intellectual circles in Japan, there was a good deal of speculation as to what our defeat, as they saw it, our withdrawal from Vietnam meant for U.S. policy in East Asia. Was the U.S. going to continue to maintain an active, an important presence, in East Asia? Or were we going to be sort of withdrawing from the Western Pacific? There was a lot of speculation like that. What would the strategic implications of this be if the United States actually did that? I mean that, apparently, there must have been a sufficient measure of ambiguity in our own public statements to keep this sort of speculation alive. And by the period 1976-77, there was a good deal of this, and we used to be concerned about that in the Embassy and tried to do what we could to provide assurance that we were not withdrawing from the Western Pacific. So that, I think, was certainly one consequence of our withdrawal from Vietnam that I do recall which we had to deal with.

The other side must have been a certain amount of relief on the part of the Japanese that we were no longer engaged in a war in which they had absolutely no confidence. They felt that it was the wrong place for us to be in, that it was draining away resources that we could better devote to other purposes and that it was damaging our position, not only in Japan, but throughout the region. So there must have been some sense of relief about that. However, I don't remember that. What I remember is this concern that this might mark a major shift in U.S. policy with respect to East Asia. In point of fact, those concerns continued into the 1980s.

Q: Yes, while I was in Korea -- I went there in 1976, and, obviously, this was a major concern in Korea. The more so because they were really on the front line.

SHOESMITH: That's right.

Q: Well, now, just one last question on this period, and then we might wrap this up, and I can come another time. I have a picture in my mind of President Ford coming on a visit, wearing pants that were too short. In other words, the wrong outfit. It almost personifies something really going wrong. How did the Ford visit...

SHOESMITH: It went off very well. His pants were too short. I understand why they were too

short. This was evidently morning clothes that he had had for many years. And his waist, probably, increased in girth. When that happens, your trousers go up. That was a story that was kicking around, and I heard it because I was at the detached palace where he was staying. I spent a lot of time there.

I suppose that I might just interject here to say one thing about presidential, secretarial, and congressional visits. It was my experience that the best embassy in the world, doing superbly on all functions of an embassy, if you had a major screw up on a presidential or a congressional or a secretary's visit, you had a blot against your embassy that was very difficult to overcome. So I spent a great deal of time on those visits in organizing them, making sure that we had everything nailed down as best we could. We did that with the Ford visit. The visit, I thought, went off quite well, as that sort of thing goes. It was the first presidential visit to Japan.

Q: Really? I hadn't realized. Nixon never made it?

SHOESMITH: No. And Eisenhower never made it.

Q: Eisenhower didn't. Why didn't Nixon? He was traveling all over. Was there any particular reason?

SHOESMITH: I don't know. I don't have any idea. President Grant made it, but only after he left office...

Q: On his world tour.

SHOESMITH: So there never had been a presidential visit until Ford's. I don't recall anything about the visit except there was a tremendous amount of work that was involved. I don't recall anything that went...

Q: No, it's just that one picture that sticks out in one's mind.

SHOESMITH: I think that it went off reasonably well. It was a good one. I know that they went to Kyoto as well and did the usual sort of things down there. But substantively, I don't recall that it did anything at all. I think that the Japanese were very anxious to have a presidential visit, obviously.

Q: Particularly, after the abortive Eisenhower visit.

SHOESMITH: Yes, that's right. But I don't think that there were any substantive issues that were resolved or surfaced to any great extent. We must have had trade problems at that time, but I don't remember them. I mean, I don't remember any in particular.

Q: Well, before we leave this and close off this interview, are there any other issues that we missed?

SHOESMITH: No, there was a MiG-25, I think it was, that defected to Japan during this period.

Q: Flew into Hokkaido.

SHOESMITH: Flew into Hokkaido. It was the first time that that aircraft ever came within our grasp. And so there was a great deal of anxiety in Washington to get hold of it as quickly as possible. The (U.S.) Air Force had the notion of flying something over to Japan and wrapping this thing up and taking it back to Wright-Patterson (Field) so that they could really examine it. No point in going into all of the details, but the Japanese had to handle this in their way. It was very time consuming. They had to have some concern for the Soviet reaction. Yet, they wanted to cooperate fully with the United States, but it was bureaucratically confused. We couldn't get to it as quickly as we wished. Comments and complaints surfaced about just how good is this security treaty, really -- the arrangement that we had with Japan. It surfaced in some rather high places in Washington, much to my distress. We were absolutely confident, and not only our Embassy but U.S. Forces/Japan were absolutely confident that at some point, we would get full access to that aircraft in Japan, as much as we wanted. That actually did happen, but it took weeks.

I mention the incident only because, despite the growing effectiveness of this security treaty relationship or of this relationship as a whole, over time, doubts about Japan's commitment and sincerity and so on and so forth kept surfacing very quickly, depending on an incident like this, as it did. Actually, the present Prime Minister was Foreign Minister at the time and was very helpful in working out this problem. But it was bureaucratically complicated. In Japan, the initial Japanese reaction was that this had been a customs violation. It was in the hands of the police and customs. So it sounds ridiculous. It was perfectly understandable if you have some understanding of how things work in Japan. The worrisome part was, as I mentioned, how quickly criticism of Japan surfaced under those circumstances.

WILLIAM CLARK, JR.
Economic/Commercial Officer
Tokyo (1972-1974)

Ambassador William Clark, Jr. was born in California in 1930. He graduated from San Jose State College with a B.A. degree in 1955 and served in the U.S. Navy intermittently from 1949 to 1953. In 1957, he joined the State Department. Ambassador Clark's career included posts in Sierra Leone, Japan, South Korea, Egypt, and an ambassadorship to India. Ambassador Clark was Assistant Secretary for the East Asia Bureau from 1992 to 1993. He was interviewed by Thomas Stern in 1994.

Q: In 1972, you were transferred to the Embassy in Tokyo as a member of the Economic Section. What were your responsibilities?

CLARK: I was the officer in charge of US-Japanese trade problems. It was a new title for the position. I was assigned to the Economic Section even though according to the Department's

personnel guidelines, I was a political officer. At this time, there was some concern in the Department that the commercial officers were seen as "second class" citizens. They were never involved in policy matters, but were kept busy writing reports. Nevertheless, I was interested in the job, I wanted to be assigned to it and Dick Sneider helped me get it. I had several years before been designated as an economic officer because I was in an economic job when "cones" came into fashion. Then, in going to Sapporo, I became a political officer, but as you can see, these designations didn't have much meaning to me -- or the Department either. In any case, one of the first things we did was to integrate the commercial and economic sections -- they had been in separate buildings -- thereby giving officers doing commercial work also an opportunity to develop some policies in their areas of specialization. The commercial section had been headed by a Commercial Counselor who reported to the Economic Minister; that arrangement only created friction in the economic complex and did contribute to meaningful policy making. We integrated the two sections; 18 months later it was torn asunder again when the US Commercial Service was established, which was later transferred to the Department of Commerce approximately four years later.

As became my practice in subsequent assignments, I also tried to bring the political and economic sections together. Since I was technically a "political officer" and since I was the first Japanese language officer ever assigned to the economic section -- which is an indicator of the Department's attitude in those days toward economic and commercial matters -- I began to go to the Political Section's staff meetings. From time to time, I even managed to get a Political Officer to come to the Economic Section's staff meetings, but not too often. During my 1972-74 tour, the Economic Section began to look at which Japanese politicians might have an interest in economic issues. It was a marginal beginning, which has greatly improved over time. In 1972, the perception was that political and economic work were two distinct and unrelated fields of activity, which did not need to be integrated. There were some suspicions as well in the Embassy, some of which still linger. For example, the head of our translation unit had before joining the Embassy worked for the Ministry of Trade and Industry. He worked closely with the Political Section and was therefore well attuned to its needs and desires. But I could never entice him to come to the Economic Section staff meetings and therefore we were never served as well by that translation unit. So even those Japanese employees viewed themselves as part of the Political Section and were not necessarily responsive to our needs. The Economic Section was the one that really needed the translation service because I was the only officer who spoke Japanese. It could have used material available from open Japanese sources.

The Ambassador, when I reported to the Embassy was Bob Ingersoll, one of the world's real "nice guys". He had replaced Armin Meyer, who was a Middle East expert. The DCM was Dick Sneider. The Economic Minister was Les Edmonds, who was one of the more thoughtful people I have worked with. Mike Callengar was the Economic Counselor and I was a First Secretary. Even today, we still have both an Economic Minister and an Economic Counselor. That is an indication of how serious trade issues were even back in 1972.

The day after I arrived, I went to Hakoni -- to the Fuji-one of the nicest old hotels there -- for the first ever trade talks between Bill Eberly, the US Special Trade Representative and his Japanese counterpart, the Vice Minister for Trade of the Foreign Minister, Mr. Tsuzumi. We spent three days there talking about trade. It was a time when the Japanese trade surplus with the US was

\$3.8 billion. That was the same amount as our world-wide trade deficit. It was something we "would not put up with"! The balance of trade shifted in 1970. The main Japanese exports at the time were textiles and electronics (transistor radios, etc). Our position was that the Japanese market was closed to US goods and that it needed to be opened up. What those talks resulted in was some forward buying of aircraft and wheat which brought trade into better balance. These talks were, as far as I know, the first full trade talks between the two countries. We didn't emphasize then the nature of the Japanese market as much as we were urging the Japanese to buy American goods, like cotton and wheat. It was Les Edmonds' idea for the two delegations to negotiate a side letter that would have allowed American retailers to open up stores in Japan to sell US goods as well as other foreign goods to fill out the line. No one ever took advantage of that agreement. The American merchandisers thought that land was too expensive, that Japanese were not super-market oriented and that there was a law which discouraged large stores. We could have taken care of the last problem if an American retailers was interested in overcoming the first two. Sears, JC Penney and others took a look and rejected the opportunity. If they just would have bought the land then, they could have made immense profits years later without ever building on it. It is true that land was expensive throughout Japan. When I was in Osaka in 1963, I did the first land survey at the behest of the Consul General, Owen Zurhellen. We were looking for a building site in Osaka; we had one in Kobe, but wanted to build in Osaka. The front of the main railroad station in Osaka was occupied by a lot of squatters who had occupied the land after some two story bookshops burned down. After the fire, the squatters hurried to occupy the land, thereby making it their own. That land in 1963 was worth more than any space in Manhattan of comparable size. Land prices were always high in Japan, but they also grew tremendously over the decades and of course became astronomical in dollar terms because of the dollar decline.

The important point that I wanted to make is that, had the Americans retailers been able to see over the cost consideration barrier, they could have opened chain stores in Japan. Starting in 1962, the Japanese themselves started enlarging their department stores, getting away from the standard "mom and pop" store. A large part of the LDP came from small shop owners; that tend was not acceptable to them and they revolted. That resulted in the "large store" law which required that any investor who wished to build a large store had to obtain the agreement of all the small store owners in the neighborhood. That was daunting for Japanese firms; the Americans figured that it would be an impossible barrier for them. But since we had reached agreement with the Japanese government that large American stores were acceptable, I think we could have worked out the modalities with the Japanese government. My assumption has never been tested, so that I can't be sure of the results had an American retailer decided to try to enter the Japanese market. It is true that American retailers faced the issues of costs, the "large store" law and the cultural Japanese aversion to large stores, but I hoped that a retailer or two would really test the market. In fact, during the time we are discussing, the Japanese had some large department stores, but not the large discount stores that were becoming popular in the US. That came later in Japan.

Eberly and his staff put a lot of emphasis on Japanese purchase of US aircraft. That was the year when Lockheed and Boeing were competing for Japanese orders. This was a very important question which eventually resulted in the resignation of Tanaka as Prime Minister because of alleged bribery. There was considerable discussion in Japan on whether our governments had agreed on one American supplier; I have never researched the issue, but I suspect that the rumor

was probably true. At the time, there was no Japanese competitor; the aircraft field remained open to foreign competition for roughly another fifteen years.

Our trade discussions with the Japanese during this period was mostly about commodities. No pressure had yet been brought to bear by the American auto industry to open the market to their products. That market at the time was still insufficiently developed to attract American interest. The Japanese were beginning their penetration of the American market, but it was not yet a significant factor. During my time as the officer-in-charge of US-Japanese trade matters, we had some discussions about "closed markets", but that usually referred to specific sectors.

The Department's interest in our commercial work varied from individual to individual. There was very little interest in commercial issues in EA, unless a commercial issue appeared likely to become a political dispute. But the Bureau of Economic Affairs, particularly in the commodity sections, were interested in our work. But those officers were also not as integrated into the policy development process as they should have been. Congressional interest had not yet developed to any great extent.

The Ambassador showed more interest in my work than the DCM. He had come from the business sector and was interested in trade. Dick Sneider was interested as well, but to a degree. He was occupied with the management of the Embassy and had other tasks to work on. Les Edmonds was responsible for the economic work of the Embassy. In any case, although trade imbalance was an issue in 1972, I don't think we ever foresaw the present situation. We viewed as a cyclical matter which would rise during some years and decline in others. But then we didn't foresee the huge trade that now prevails between the two countries. In 1972, we were trying hard to raise agricultural trade to \$3 billion. We reached that in 1974, shortly before I left. That we believed was a major achievement. Today, of course, that looks like peanuts, if you pardon the expression!

I did work very hard on trying to help the Brown Shoe Co. to penetrate the Japanese market. The Japanese had a "cultural" reason for trying to block that. In their view, shoe manufacturing was done by the "untouchables", who had been brought to Japan for specifically that purpose. Imports might create unemployment for those people and then what would they do?. That argument had some validity. In fact, a young lady whose family might own a shoe store would have had difficulty in finding a suitable husband. She would be suspect of having some "untouchable" blood in her veins. In reality, I conducted a survey and found that only 10% of the shoes made in Japan were made by "untouchables". But that didn't have an effect on the Japanese. They imposed quotas on leather and hide imports. So we decided that if we couldn't get shoes through, we would try for the higher quality end of the leather and hide lines. Even that was very difficult. The "cultural" rationale for blocking shoe imports was pure bunk. The argument could be made that, based on Buddhist philosophy, shoes should be brought in from foreign lands because then Japanese could not be charged with killing of animals and using their hides. The main reason for import restrictions was that the Japanese government sold quotas for imports of leather and hides. It was a lucrative income for the government and for the traders which they were most reluctant to give up. One Director General in the Foreign Ministry told me that importers were not beyond calling on him at his office and dropping a short sword on his desk. He was worried for safety. So the few importers that controlled the trade were not anxious

to give up their monopoly and would have gone to great length, I think, to enforce their privileged status.

Rice was never in question; there was an absolute prohibition against imports. But rice has had a curious history. When I first came to Japan and still in the mid-1960s, Japan was buying rice from us. It was not self-sufficient and was happy to buy the rice. I remember being in one of the better sake breweries in Osaka; I asked the owner whether his customers knew that he was using American rice. He said that they didn't and hoped they would not find out. The sake tasted the same regardless of the origins of the rice. In fact, the brewery was known for making sake from special rice grown in one particular region of Japan with special water. The rice came from us and the water probably out of the tap. So when the Japanese were not self-sufficient, they did not have any problems with import of foreign rice. In fact, the reason the Japanese have such great problems with rice imports now stems from their imports of twenty years ago. Then the Japanese government bought domestic rice at an inflated cost, but by mixing it with cheap imported rice, it could sell it to its people at a reasonable price. That ploy worked until the early 1970's when Japan became self-sufficient in rice. The government was then stuck with paying inflated prices to the farmers, but had to sell it to its consumers at a much lower level. That created a major budgetary drain which was not foreseen and Japan slipped into this difficult situation gradually without attracting much notice until it was too late.

A lot of food came through purchases of a food agency which had a monopoly on the imports of such commodities as wheat. There were quotas on citrus -- grapefruit, oranges, lemons. We finally got the lemon quota lifted after years of battles. The Japanese kept arguing that the imports of lemons might diminish their sales of Mekong oranges. There was no correlation between the two citrus fruits at least in our eyes. Now that oranges can be imported, Mekong sellers are still doing quite well. One could make the argument that the Japanese were using us for their own purposes because Mekong oranges were being overproduced by about 20%. The Japanese finally gave us a higher quota on oranges and then told the Mekong farmers that they had to cut down twenty percent of the trees because the "Americans had forced us to import more of their oranges." There was no causal connection, but it the government's ploy was used to its advantage both with its farmers and us. Our import quota was raised, but at the same time, the Japanese made us the scapegoats.

In 1972-73, some one in the Department of Agriculture, decided that the United States was running out of soybeans. One day, we received instructions to inform the Japanese that until further notice we were cutting off all exports of soybeans. We raised the question with Washington whether that ban included soybeans for tofu -- bean curd -- which was a staple of the Japanese diet. These were special soybeans for which the Japanese had issued contracts. The answer was that the export prohibition covered all soybeans. So I went to the appropriate Japanese Ministry and delivered the message. The next day, the press published the story; the price of tofu immediately doubled. Agriculture in Washington continued to study the problem and then soon found that in fact we did not have a soybean shortage. Our embargo in the final analysis did not reduce any Japanese soybean imports, but the price of tofu remained twice what it had been before we made our pronouncement. Every housewife in Japan hated us, for a while, since they saw the rise in the tofu price as an American-driven plot. It was not one of our finest hours!

Q: Did the Embassy have an Agricultural Attaché at that time?

CLARK: Indeed it did. It was a rather sizeable office which was part of the Embassy's economic cluster, reporting to Les Edmonds. The Attaché was primarily assigned to push American agricultural products. That is true even today. The Embassy in Tokyo has always had a relatively large Agricultural Section. Japan has always been both actually and potentially a large market for Americans products.

Our access to Japanese manufacturers at that time was pretty good. My Embassy job did not require me to do some of the things I had done in Osaka. For example, I did not make "end-user" checks; that is, investigating what foreign buyers were doing with military hardware they had bought from the military. I did have contacts with Japanese businessmen, partially because I was the only Japanese speaking officer in the Economic Section. But plant visits remained pretty much the responsibility of the constituent posts, although I did some just because I liked to do it. Even then, we were interested in finding areas in the prefectures that might lend themselves to American investment. Not much investment ever developed, but we did gather some interesting insights into Japanese development. There were some American investments, like Texas Instruments. It had a long fight to establish an operation in Japan with 100% American ownership to make semi-conductors. That was when we still had a monopoly on that market. The Japanese finally agreed and Texas Instruments build a plant in Kyushu. Now, that operation is well integrated into the Japanese market. IBM had already established a presence in Japan with 100% ownership. That was an interesting situation. Even in the early 1970s, although the operation was entirely owned by IBM (incorporated in Japan), its actual operations was run by a completely Japanese work-force, up to and including the president of IBM-Japan. The production of the IBM facilities was counted by the Japanese as foreign manufactured, until the 1980s; that bolstered their argument that they needed to subsidize their own computer development because "foreign" firms had such a large share of the market. So the Japanese, when analyzing the foreign penetration of their markets, included all IBM production, even though taking place in their country, as being "foreign".

The American business community in Tokyo in the early 1970s was fairly good size. It was not as large as it was as its height and it is now smaller, but even then there must have been about 1000 American business men in Tokyo. There was an American Chamber of Commerce, whom we worked well. This was the period during which the Japanese opened their market to foreign banks; that created mini explosion of American banks opening offices in Japan. Most of them started on the wrong foot; they insisted on having an office on a street corner for "walk-in" traffic, although that was not a good business opportunity. They paid awesome amounts for rental of real estate which was not very useful in the final analysis. The American banks had not done their home work; they knew little about the Japanese market. Banks in Japan were not allowed to advertise for "walk in" business; furthermore, the ordinary Japanese was very reluctant to deposit his yen in an American bank. They used Japanese banks or postal savings accounts which were exempt from tax declarations.

The Ambassador would meet with the Chamber's executive board monthly. At each of these session, one embassy officer would brief the group on matters that he or she were working on. In

exchange, the Chamber would brief us on what they were working on. That relationship has grown even closer as years passed. The Chamber had complaints, of course, but in those days, the business community appealed to the Embassy only as a last resort. That meant that the problems were usually quite large before they were brought to our attention. Even when they had a problem, most of the Chamber's members did not wish to be identified as the source of the complaint. They would ask us to help in the resolution of an issue, but didn't want to be publicly connected with the process. They were concerned about potential Japanese retribution.

I might add a couple of additional matters of interest. Because of an earlier assignment, I retained my interest in textiles. There was an official in USTR who dealt in textiles. His name was Tony Jurick; he had been involved in much of the Okinawa negotiations. He was sort of protégé of Strom Thurmond's. When I got to Tokyo, I noticed that Jurick was coming for a visit. I asked who had been assigned as escort officer. I was told that no one could handle Jurick; he just ran around Tokyo on his own. So I volunteered to shepherd him; I followed him around and learned a lot. This happened in a period when the Japanese were just about ready to support us in global textile negotiations. They were becoming increasingly concerned about imports and less about exports. Tony had a meeting with his counterpart in MITI, but never at MITI. They met in hotel rooms. I watched them hammer out the negotiations. After a week, they finally reached agreement. Then Tony wanted to know where the formal meeting would be held which would ratify what the two of them had already agreed upon. The Japanese official said that it couldn't be in Tokyo because there would be too much pressure; he said it couldn't be in Washington because then he would be accused of having sold out to the Americans. He therefore suggested Hawaii. Tony had problems with that suggestion, but he finally gave in. Then came the question of how long this ratifying meeting would take. The Japanese official said "Five days". Tony thought that this was excessive and suggested three. He thought that that was all that would be necessary. The Japanese said it had to be no less than five because for the first two days, he would balk at any American suggestion and fight for the Japanese position. At the end of two days, he would have to fly back to Tokyo; he would then return and sign an agreement, the terms of which had already been decided on during Tony's stay in Tokyo. And that is exactly how the drama unfolded. The American and Japanese delegations met in Hawaii, fought for the first two days, broke so that the Japanese could return to Tokyo and assembled again to finish the deal. That was an illustration of how American-Japanese deals are put together which we have seemed to have forgotten. Now we negotiate in the press, thereby preventing the Japanese officials to go through their elaborate *Kabuki* dance in order to show his constituency that he had been fighting very strongly for them. I found Jurick's *modus operandi* very instructive and effective. I also learned that the Japanese official had considerable limitations on his freedom of action, which today's press seems to ignore or minimize. He had to manipulate his own constituency, just as Tony had to manipulate the American textile industry. I am now talking about the early USTR days when it was a rather meek organization. The staff was still small. They essentially coordinated and directed the rest of the bureaucracy to contribute to the government's trade policies. USTR were the lead negotiators, but they were not an entity unto themselves as they later have been accused of being. If there were any difficulties then they usually stemmed from the lack of economic expertise in State Department. Commerce had more people than they knew what to do with. That meant that State was always outmanned on trade issues, but the government worked well in those days on trade issues.

All of the Japanese bureaucracy is beholden to its clients; that is probably true in most countries, but it is certainly so in Japan. There is a close relationship between a Japanese official and his constituency. Then and still today, bureaucrats retire at age 55 or 60, if they are very successful, and need to have a second career. There is the *Amakudari* -- the descent from heaven -- which brings the official into one of the organizations that he represented during his government career -- after a two year "cooling off" period during which the bureaucrat is given a job in a think tank or some other "purifying" activity. I have a good friend who used to be the Japanese Ambassador in London. He then became a consultant to Mitsubishi. I asked him what his duties there were. He said he had given that matter considerable thought at the beginning. He finally had reached a conclusion. He said he would remember a photograph of the chairman of a large Japanese corporation. There would be a lot of people in the background. In the background, somewhat indistinct, would be a Chinese vase, which you can not see clearly, but you know that because it is in the chairman's office, it must be valuable. He viewed himself as a Chinese vase -- a sort of decoration.

In those days, the Ministers themselves became involved in negotiations after the deal had been struck, if at all. On textiles, Ministers tried their best not to get involved so that their political future would not be endangered. One of the famous episodes in the US-Japan textile story took place in Hawaii when Nixon met Tanaka. Nixon insisted that he needed a concession; Tanaka, after a lot of arm twisting, gave him the Japanese political equivalent of the "check is in the mail" -- *Zensho shimas*, which literally means "I will make my best effort". Japanese experts understand that the term means "No way" or "I will give it a good shot, but I know that I will fail". Nixon took the literal translation and played it up as having achieved more than would have been expected. Neither Japanese or Americans liked to get involved in textile negotiations.

Agriculture was a little easier. There was no flat barrier in Japan against import of such commodities as wheat. The negotiations on those commodities was on how much would be imported. Beef and oranges were a different matter; there the argument was on whether any imports would be allowed. Those discussions took place until fairly recently. The present Foreign Minister, Hata, was a Minister of Agriculture at a later period and then was very helpful to us on oranges. He did get involved in the early 1980s when I was the DCM. I went to see him to talk about oranges just after we had gotten a small break on beef imports. At that time, he told me that he had done all he could for US agriculture for the time being. He needed some pause in the pressure. I think that if US can find an influential Minister who has the confidence of his constituency, then a deal can be struck. Hata was the right minister and he was able to influence his constituency. That doesn't always happen. Because the Japanese tend to rotate their Ministers every two years, there will be sometimes a Minister who will not be able to take any helpful steps. Then you have to go to the politicians who do have influence in the particular commodity area in which you are interested. This close relationship between the government and the politicians supports the thesis that in a country like Japan it is essential that the Embassy's political and economic sections have to work very closely together.

NATALE H. BELLOCCHI
Commercial Counselor

Tokyo (1972-1974)

Ambassador Natale H. Bellocchi was born in Little Falls, New York in 1926. He received a degree in industrial management from Georgia Tech in 1944 and was soon drafted into the U.S. Army to serve in a rifle platoon during the Korean War. His Foreign Service career included positions in Hong Kong, Laos, Vietnam, Taiwan, Japan, India, and an ambassadorship to Botswana. Ambassador Bellocchi was interviewed by Charles Stuart Kennedy on March 21, 1995.

Q: *I always like to get the time element. You were in Tokyo from when to when?*

BELLOCCHI: '72 to '74. It was in '74 that I was assigned to the Senior Seminar.

Q: *Who was the ambassador when you were in Tokyo?*

BELLOCCHI: Ingersoll.

Q: *He had a labor...*

BELLOCCHI: No. Chairman of Borg Warner.

Q: *I would imagine that he would be interested in the commercial side.*

BELLOCCHI: He did have a lot of functions for visiting businessmen at that time. Oh yes, he was very, very helpful, and really very nice, he and his wife. So they used their facilities, their huge reception room in the residence for business oriented receptions. So, yes, he was very interested and very easy to work with.

Q: *What was the principal work that you did? Both in commercial attaché and commercial counselor.*

BELLOCCHI: Well, one was to try to come up with these analyses of why are these Japanese trading companies successful, and what do we have to learn from them. So I tried to do a lot of reporting and generate a lot of reporting on how they operated. And secondly, of course, was export promotion. And in Japan that was very important to try to break down. The economic people were trying to work back here with negotiations to break down the barriers. We even had a trade center, and we had shows going on all the time, trying to increase our exports. Our biggest problem was the same old traditional one, the big companies don't need that kind of service. They know how to operate abroad. It's the middle and smaller companies that need it, and they wouldn't make the commitments to exporting in those days. I think the times have changed now, but in those days such companies looked on exporting as something they did when the domestic market wasn't doing well. If they wanted to maintain their production line, they would go into export. Then the minute the economy picked up in the States they would forget about exporting. And you can't really keep agents abroad doing your work for you very well if you're up and down that way.

I had an experience that was fascinating when Mitsukoshi, a big department store, came to us. Wine and cheese was a fad at that time in Japan. They said they understood that one of the big winery companies in California shipped wine in bulk in tankers around to the east coast, and bottled their wine in the east coast for distribution. And they would like to buy a tanker full of wine, and have it bottled under a Mitsukoshi label. In return, a certain percentage of their wine area in the stores would be for California wines. I mean we're talking about a tanker full of wine. So we tried to find, and get people interested, but could not find anybody interested in selling a whole oil tanker-type ship full of wine to Japan. Couldn't do it.

The next year, when I was in the Senior Seminar, we happened to stop out there on one of our trips to a California Wine Growers Association barbecue.

Q: I remember that.

BELLOCCHI: Yes, you were there, and they complained about not getting much help in exporting their wines. That was more than I could take. I got up and told them about my experience in trying to get a whole tanker full of wine. Their rationale was: "Well, but that was in a good year here in the States and we had the domestic market, we didn't have the wine available for export." That's precisely the point about why they couldn't develop their export market. So that was our main problem in that job, trying to get the American companies to understand there's a huge market there. But it wasn't free, they had to work for it.

Q: I had the same experience when I was in the Persian Gulf back in the '50s where Americans would once a year send somebody from Geneva through there, a small market, but it was obviously one that was going to develop. I was the economic/commercial officer in Dhahran, and they would come through once a year and they'd usually come through, they'd fly in on Thursday and leave on Saturday, and Friday was the day everybody was out. It was that type of thing.

BELLOCCHI: We did that. They were very unrealistic when they'd come to Tokyo and say they had ten appointments for two days in Tokyo. You know, that really didn't make any sense at all. Just the traffic in Tokyo alone assures you you're not going to be able to have five appointments in one day. That was a major problem in our job.

Q: We're speaking today, where I think the President has signed an order putting prohibitive tariffs on certain Japanese cars, or threatened to. I mean, this goes on, but one looks at this where we feel, one, the Japanese market is closed, and two, we don't seem to be able to commit ourselves to you might say, hard selling within the area.

BELLOCCHI: Times have changed. I'm not suggesting the same is true today as it was then. But I have little sympathy, for example, for the automobile people who complain about the lack of an open market in Japan. A lot of it was due to two reasons in my time. One is, first of all they didn't make a car that was very sellable in Japan. I mean, the steering wheel is on the wrong side to start with. Secondly, they liked to use local dealers who would treat the American car as sort of a special fad car which did not mean a large market, it meant a high price. That's what it meant. So they didn't have the distribution system developed there that they should have. So part of it was their fault themselves. They really weren't developing the kind of market that they

should be developing. We used to complain a great deal about the distribution system in Japan. They're all mom and pop stores, and therefore they favored the Japanese, and our companies couldn't sell on the Japanese market because of that distribution system. Well here we are in the States trying to redevelop the local communities stores. They are now, of course, chain stores instead of mom and pop stores. Here we were looking the Japanese in the eye and saying, you've got to change your distribution system so that our companies can sell over here. And they're looking back at you, and saying, "Hey wait a minute, these people vote and I don't particularly want to change." So in the commercial section we were looking at the Japanese side of it a lot, and trying to develop understanding back here. Whereas in the economic area, of course, they focused on the real obstacles to trade. There were plenty of obstacles to trade. There were non-tariff barriers that existed that had to be lowered. But time and again we'd finally get them to lower the beef quota, or shoes, or something and other countries would come in and sell. The Spanish would come in and sell the shoes, the Australians would come in and sell the beef, so all of our work would be for naught.

PAUL P. BLACKBURN
Japanese Language Training
Yokohama (1971-1972)

Director - Tokyo American Center/Embassy Cultural Attaché
Tokyo (1972-1975)

Paul P. Blackburn was born in Hawaii in 1937. He received his BA from Haverford College in 1960 and an MA from the School for Advanced International Studies in 1962. His postings abroad include Bangkok, Khon Kaen, Udorn, Tokyo and Kuala Lumpur. Mr. Blackburn was interviewed by Charles R. Beecham on November 18, 2002.

Q: Were you also preparing to go to Japan at that time?

BLACKBURN: Yes, I was. Fortunately, I had finished the first draft of the dissertation before I started Japanese training at FSI, so did not have that hanging over my head.

Having been interested in Japan for a long time and with some earlier self study under my belt, I was able to get a fast jump on the Japanese language training. I really didn't want to put aside two full years for language study, but hoped to earn the required 3/3 in one year and start working right away. The FSI teachers (especially Tanaka-sensei, a gifted educator known to many of her students as "Tiger Tanaka" for her boot camp type drilling of beginning students) really encouraged and pushed me. I got the S-3/R-3 after that one year, the first student ever to have done so, I was told. Still, there was no appropriate job for me in Japan, and my Japanese was not all that deeply implanted anyway.

When I got to FSI Yokohama in the summer of 1971, the teachers were very kind, but essentially said, "Burakuban-san, you may have gotten a 3/3 back in Washington, but you don't yet have a

3/3 by our reckoning.” The terrific team of Japanese teachers in Yokohama worked me over pretty well that year, while keeping my spirits up through ping-pong games, go lessons, and occasional drinking bouts. In the end I scored a 3+/3+, which was pretty good, but not the 4/4 to which I had earlier aspired and which some had predicted I might be able to attain.

One of the highlights of the Japanese language program was my participation in the annual Japanese speech contest for foreigners that is broadcast live on NHK. With enormous help from an extraordinary Japanese instructor, Konno-sensei, I wrote a speech on the stages of my supposed “love affair” with the Sony Trinitron TV set that aided my language learning efforts. Looking back on the experience today, I wonder why I came up with such a sappy subject. Still, it was a good speech, reasonably well delivered despite my on-air stage fright, the Japanese loved it, and I beat out most of the competition to win third prize – the best anyone from FSI Yokohama had ever performed in that contest, and a record that may still stand.

After two years of the exquisite agony that only Japanese language students know – and I can attest that spoken Chinese is a breeze in comparison – I was eager and ready for my assignment at the heart of Alan Carter’s would-be USIS utopia, the Tokyo American Center.

Q: When did you know you would be going to the Tokyo center, and who did you replace?

BLACKBURN: I knew about it roughly a year in advance. I replaced Warren Obluck, a superb officer who had made tremendous contacts within the Tokyo arts community.

Actually, Frank Shakespeare took an interest in my assignment to Tokyo, and told me he had personally and enthusiastically signed off on it.

Q: So while you were studying Japanese, Carter showed up as PAO, right?

BLACKBURN: Alan arrived there in 1970, replacing Ned Roberts, just as I was getting started in the language training. On his arrival he announced a determination to fundamentally revamp a program he viewed as almost totally inappropriate for advancing our interests in the Japan of that time. He said the operation had become flaccid. The bulk of the post’s key contacts dated back to the Occupation period, we were spending much of our time, energy, and money on “cultural centers” that had outlived their democracy-tutelage original purposes, and a scathingly-critical younger generation of Japanese viewed the U.S. as a nation in decline. Alan, I think correctly, concluded that USIS Japan, in both style and content, should reflect a vibrant, up-to-date America poised to exercise leadership in the decades ahead.

Although capable Japan specialist Dave Hitchcock served as Alan’s deputy, most of the post’s Japan experts and Japanophiles were moved to the sidelines or out the door. In their place came an extraordinarily talented and brilliant group of officers. Among them – besides Dave Hitchcock – were Barry Fulton, Don Hausrath, Ray Komai, and Dennis Askey. Harlan Rosacker, another outstanding officer and later the head of USIA personnel, ably handled press relations, but was not centrally involved in the “Carter revolution.”

First among the revolutionaries was Barry Fulton. Barry had Alan’s complete confidence and

was in overall charge of planning and implementing the new organizational concept. His first act was to “seize the mailroom” – to get a feel for what sorts of communications were passing between offices and in what formats. Soon we all had standardized letterheads for USIS products, with stationary and name cards that were all part of a modernistic design concept masterminded by Ray Komai.

Among Barry’s early tasks was to set up an integrated speaker system along the lines of the “packaged programming” concept first articulated, I believe, by Sam Courtney – and put into practice when Alan was Area Director for the Near East and South Asia just before being assigned to Japan. It was a great and, at the time, highly innovative idea. When a speaker came to us at the Tokyo American Center (TAC), it was not just a one-off event, but part of a broad-gauged effort that often included materials for distribution, other Japanese and American speakers, simultaneous translation, and lively A/V elements such as “trptych” slide introductions.

At the time we had branches in Nagoya, Kyoto, Osaka, Fukuoka and Sapporo. All USIS activities operated out of American Centers (ACs) in those cities. The TAC was part of a tightly integrated AC network, and my official Agency title was “Branch PAO Tokyo.” To emphasize our intention to address tough policy issues, the former “American Cultural Centers” had been shut down for refurbishment and then reopened as “American Centers.” All of the ACs used essentially the same speakers, had the same library collections, and featured the same modular furniture, for example. And we all operated according to detailed instructions, written or approved by Barry, that we kept in loose leaf folders by our desks.

Barry invented the first full-fledged “Audience Record System (ARS),” which later became the Agency’s standardized Distribution and Record System, or DRS. We worked hard to identify the key organizations and audience members we would try to reach with our activities, limited our invitation lists essentially to people we had identified, and kept track of how well we did in contacting them over time. In addition, each officer at the post was charged with maintaining his or her own “inner circle” of about 20 individuals who were supposed to receive our personal attention on a regular basis. We would report attendance at programs and other interactions to a central ARS office of the post. Every few months we would get a computer printout that showed how we and the other ACs were doing in terms of reaching our audiences with various types of program activities. Although Barry had thought through many of the fundamental issues, implementing his concepts brought out the Jesuit in each of us – as we struggled to define precisely who should be in or out of the system, how much of our effort should be devoted to bringing people to our centers – as opposed to taking speakers to other venues – what to do about keeping track of students in the ARS, and so on. And on and on.

Don Hausrath was in charge of the libraries. They were no longer called “libraries,” but became “Infomats” – to emphasize their new status as outlets for current “information materials.” The Infomats were technologically well ahead of most Japanese institutions of that era. We had video as well as audio cassette collections, including excellent materials on U.S. scientific achievements as well as VCRs of the best of our AC speaker programs. And, beginning in 1972, we used an early form of a FAX machine, with which we could communicate with the USIS Infomat support office and between ACs. It took about ten minutes per page for the transmission,

but it was very handy for answering reference questions and doing other business.

Besides the modular furniture, another important design feature was our beanbag chairs on the floor all around the Infomat. The Japanese loved to sit in them and read. And of course sometimes they would be so comfortable they would fall asleep. When Alan would come to the TAC and find a patron dozing, it seemed to make him mad, because he would go over and give the “chair” a little kick. If you have ever tried to sleep in a beanbag chair and had someone kick it, you know it wakes you right up. By the time the startled Japanese patron had his wits about him, Alan would be well away from the area, with an innocent but satisfied look on his face.

The most innovative, radical and controversial aspect of the Infomat was its approach to the collection itself. For starters, each of the six ACs had exactly the same 3,000 titles, 2,000 of them for circulation and 1,000 to meet the reference needs of our audiences. The TAC had an additional 1,000 reference titles, for a total in all of 4,000 volumes. The standard 2,000 circulating titles were divided equally among the five major themes – or post objectives – that also guided our speaker programming. These themes were: security and U.S.-Japan relations, economics, American society, arts, and what we called ““toward the year 2000” – the latter reflecting our desire to address the great Japanese interest in futurology. With 400 titles devoted to each theme, it was further decreed that no more than 100 of them could be more than five years old, and the other 300 should be roughly divided among works published in the previous five years. The concept was that we would collectively work together – with help from the Japanese staff who scanned Japanese newspapers and magazines as well as library support personnel back in Washington – to identify and procure the 60 most important and pertinent books published annually in each of the five subject areas. Further, to maintain the rigidly disciplined nature of the collection, we weeded out the same number of books we added to our shelves each year. A lot of people found this approach reprehensible, or at least astounding – especially the idea that after we had already disposed of tens of thousands of volumes from the old Cultural Centers we were now prepared to discard even perfectly serviceable newer ones to meet some kind of mechanistic formula. It was definitely a rigid approach, but I didn’t oppose it. I generally agreed with the thesis that such discipline was a necessary underpinning for our great exertions to obtain the most up-to-date materials – even to the extent of having books airshipped to us for use in programs or to feature on our shelves. And our key audiences appreciated what we were trying to do, and began to look to us as a major source for any research they were doing that related to the United States.

Ray Komai was the design specialist, who worked closely with Dennis Askey on the art work for the post’s upscale Japanese-language magazine. Trends was a beautiful monthly product that not only featured modern American art and architecture, but also carried in-depth articles on our other major themes.

In designing the centers, Ray worked with the incomparable Lynn Nyce of the central USIA space design office to come up with a contemporary look. The look featured supergraphics that showed visitors the way to rest rooms, “REFERENCE,” or whatever, tubular legs on tables and desks, white walls, large modern prints, and a strict policy of no personal items – including photos, calendars and flowers – on desks. The latter dictum was the hardest for many to swallow. All the public and working spaces of the ACs were intended to give a modern, professional feel.

Those of us who worked there were viewed essentially as temporary occupants of the space.

Q: How did you fit into this operation, and how did you get along with Alan Carter?

BLACKBURN: When I took over the Tokyo American Center, which was at Akasaka Mitsuke about a mile from our embassy, it had just been renovated and launched in the new format. We were the experimental ground zero for the new approach. People came to check us out all the time. The Japanese were fascinated by the experiment, stopping by in droves to sample our services or just see what we were up to. In Tokyo, as in other cities with American Centers, the revamped operations received extensive and positive newspaper, magazine, and TV coverage. Alan, justifiably eager to show off the TAC, regularly brought visitors, frequently including Ambassador Robert Ingersoll, when we were having a particularly interesting speaker program or cultural event.

Unfortunately, Alan and I did not get off to a great start. Being the officer charged with running the flagship operation of the whole program, I saw my responsibilities as divided between those of salesman/cheer-leader on the one hand and internal reporter of system glitches on the other. In the latter role, I was following one of Barry's management principles to the effect that a certain error rate in any new endeavor is to be expected, and no one should be surprised that things don't work 100% as planned. Alan, however, clearly wanted me to be a whole-hearted enthusiast, even in our internal discussions. Early on concluding that I was entirely too negative – and perhaps suspecting, completely wrongly, that I was bitching back-channel to his arch-rival, Dan Oleksiw – Alan started an office folder to document my transgressions, his secretary told me.

The low point was a BPAO conference in Kyoto, where Alan and I had several acrimonious exchanges during what were supposed to be relaxing social occasions – over, as I remember, some rather minor problems I had identified. The arguments didn't bother me so much, as I knew Barry felt my criticisms raised issues that needed to be addressed. What I literally lost sleep over – from fear that, if found out, I would be fired or at least severely reprimanded – was a serious mistake I had made before leaving for the conference. Foolishly I had agreed to let a Japanese avant garde theater troupe use the TAC programming space for a performance the same weekend we were all to be in Kyoto. I should have checked more closely to find out what was in their performance, because the same night Alan and I had our worst argument, back at the TAC a show was presented with a scene in which sympathetically-portrayed PLO soldiers paraded around the stage, their rifles at the ready to confront the Israeli enemy. I never should have permitted such a deviation from policy and good sense. I prayed that none of my bosses would ever get wind of my mistake – and fortunately they never did.

Later that first fall I organized some impressive seminars at the TAC, and put on a week-long video art festival that was the largest of its kind that had been held anywhere in the world up to that point. Having seen that I really was a positive force and an asset to his program, Alan's attitude toward me mellowed. A month or so later his secretary told me Alan had instructed her to remove and destroy the special file he had been keeping on me.

Q: What sorts of activities did you have at the center?

BLACKBURN: We put on lots of speaker programs, seminars, co-sponsored off-site conferences, exhibitions, films shows, and even a few concerts. I was aided by a terrific staff, with 22 Japanese Foreign Service Nationals and a Deputy Center Director, first Mike Haller and then Carol Ludwig. Among the many outstanding FSNs, I was closest to the wise veteran who served as the TAC's senior FSN, Kinji Ando, to arts specialist Kyoko Michishita, and to Matsuko Kyoto, who was the number two in the Infomat. Other notable staffers were programmers Mr. Soga, Mr. Kubo, and Ms. Tatara, chief librarian Mr. Fukuda, and the administrative genius Mr. Kitazawa, who regularly assured me that he would "leave nothing to chance." All the FSNs were thoroughly professional, dedicated to making the new arrangement work, and so cohesive that I could hand them a knotty planning problem in the confidence that after mulling it over they would present me with a workable solution to consider.

The TAC generally had two or three programs a week. In all, I think I presided over more than 200 separate speaker events during my three years in the job. The first program I handled featured Mike Armacost, who was Ambassador to Japan during my second tour there, talking about regional security issues. We had many prominent experts in all fields. For example, Paul Samuelson, the great economist who "wrote the book" – the one we all used when we studied basic economics. On the arts side, we had Isamu Noguchi and Louise Nevelson speak at the center, did a big event honoring the work of Sam Francis, who was living near the TAC at the time, and even cosponsored an event that brought Andy Warhol to Tokyo.

In addition to the challenges of running the Tokyo American Center, I was also designated the Embassy's Cultural Attaché. Alan felt that position and the access it afforded should go to the TAC Director rather than the Cultural Affairs Officer working out of the Embassy. Having those two hats, I was invited to a great many cultural events – performances, exhibits, avant guard film showings, and the like. Thanks to the great contacts that Warren Obluck had developed, particularly among composers and print artists, I was relatively quickly able to establish myself as a reasonably plausible member of Tokyo's cultural community.

Q: What was the biggest programming challenge you faced?

BLACKBURN: There were many difficult ones – relating to the Vietnam War, to our sudden opening to China, to increasing trade frictions, and so on – but the Watergate crisis certainly put us in a strange public affairs situation. The Japanese generally were quite high on Nixon, despite the "Nixon shocks" relating to China and our unpegging the dollar-yen exchange rate. They thought Nixon was a tough, effective Cold War leader. In Tokyo, as elsewhere in Japan and around the world, USIS officers suddenly found themselves in the odd position of explaining why our president's transgressions were so serious many Americans had determined that he should be thrown out of office. My Japanese contacts, no matter how versed they were in "American studies," simply could not grasp what was going on. They kept asking me if there wasn't really some sexual or financial scandal behind it all. I tried to explain the seriousness of Nixon's alleged participation in the Watergate cover-up, and to use the crisis as a way of informing Japanese about the arcane workings of our political system. Despite our efforts, the Japanese continued to view the cover-up as a very small matter that had been blown way out of proportion by Nixon's mean-spirited and opportunistic enemies.

Q: Sounds like you had a great time.

BLACKBURN: Well, it certainly was an enormously stimulating period in my life. I became well informed about all sorts of things and met many fascinating Japanese as well as American who participated in our events. In other ways, it was a humbling experience. Perhaps influenced by the Japanese penchant for self-criticism, I became vividly aware of my inadequacies. I soon realized that I would never really know that much about the subjects my speakers were addressing. I could never keep up with all the must-read books and magazines flowing into our Infomat. When we would have a high-profile speaker with us for a couple of days, like the novelist John Gardner, I made time to read two or three of his novels, but that meant I couldn't fully prepare for other speakers in the same time frame – perhaps experts on alternative energy sources, international trade theory, or Sino-Soviet relations. I also realized that my Japanese was not as fluent as I wanted it to be, and that I was not seeing as much of my contacts as I wanted to. To keep from being too hard on myself, I had to keep telling myself that I was just there to do the best job I could under the circumstances – and not to expect any more than that.

Tragically, this tendency toward excessive self-criticism when working as an AC Director became pathological in the case of my friend and counterpart in Nagoya, John Lepperd – who took his own life while en route to a direct-transfer assignment as CAO in Jakarta. John sent pathetic suicide notes to his bosses, including PAO Bill Miller, who had by then replaced Alan Carter, apologizing for having done such a poor job in Nagoya. We all realized after the fact that John had for some time been crying out for help in different ways, but that we hadn't heard him. I felt terrible about it, and was quite angry at those in the USIS chain of command who should have been more responsive to his pleas. These were the days before we had psychiatrists available to our overseas posts. Currently, there is one assigned to Tokyo.

Q: Are you saying that you think he was suffering from the kind of pressures you were describing as feelings of inadequacy on your own part?

BLACKBURN: Yes. I think we all had the same feelings to some extent, but he quite clearly went over the edge. He said in his letters that he felt he had done a terrible job as Nagoya AC Director, but we all – including his supervisors – thought he had done a fine job. He described his Japanese as mediocre, but he was easily the best of the six of us at the ACs. It was just an awful situation, and we all felt so helpless. I am still in regular touch with John's widow, Hemlata, who lives in Washington.

Q: The Japan program was pretty controversial back in Washington, wasn't it?

BLACKBURN: Indeed it was. In addition to those in USIA whose feathers Alan had ruffled over the years and were happy to take potshots at him, many in the Agency were genuinely concerned – in some cases even alarmed, at what they understood to be going on there. Jim Mocerri was sent out by Agency management to have a look at the USIS Japan program and see if it should be, A, strangled in its bed; B, kept alive but applied only to the peculiar conditions of Japan; or C, used as a template for changes elsewhere in USIA's world. After conducting his mini-inspection of the post, Mocerri concluded that while the program may have had some validity in Japan, it contained deeply serious flaws. It was, he said, much too mechanistic, it didn't take adequate

account of local sensitivities, and it didn't place proper emphasis on warm personal friendships, especially with intellectuals. I am not doing justice to his critique, but I believe that was the gist of it. Alan was summoned back to Washington for what some called a "star chamber hearing" to respond to Moceri's criticisms. According to those who attended, it was among the most dramatic confrontations in the Agency's history. People stood along the walls of the packed conference room for the four or five hours that Alan and Jim went head to head over nearly every aspect of the program. The upshot was that Alan prevailed, at least as far as Japan was concerned – which was all that he had been arguing for in the first place. The Agency's leaders congratulated him on putting together such a fine and carefully considered program, but reserved judgment about its applicability elsewhere.

As it happened, many of Alan's innovations did spread to other countries in the following years – for example, using modern design to draw trendy young audiences to the USIS centers, placing emphasis on getting the most up-to-date reference materials into the hands of key contacts, and instituting more rigorous distribution systems. In addition, USIS Japan's targeted speaker program, and the heavy demands it put on disparate Washington elements, prompted a full revamping of USIA's field program support apparatus, carried out under the leadership of Chas Freeman and Ed Schulick.

PAOs who came to Japan later, even those like Cliff Forster who had been early critics of the Carter approach, actually changed very few of the basic programming elements, as I saw for myself when I returned to Tokyo as PAO after an absence of 17 years. Yes, the beanbag chairs were gone. The Infomat had become an Information Resource Center. We had gone back to having an Information Officer, instead of a Media Relations Officer, and the Cultural Attache portfolio belonged to the Cultural Affairs Officer. The Audience Record System, now the DRS, was more sophisticated. And we had started having each AC book collection concentrate on a specific theme, and no longer insisted that a book be thrown out for every one that was added. More important was what was kept – the attention to carefully selected audiences, the dedication to constant upgrading of communications and A/V support technology, and a willingness to pass up activities that were "nice to do" in favor of a disciplined focus on our primary objectives. This approach continues to this day, under the leadership of another "true believer" from the old days, PAO Hugh Hara.

RICHARD W. PETREE
Consul General
Naha (1972)

Political Counselor
Tokyo (1973-1976)

Ambassador Richard W. Petree was born in Jamestown, New York. He attended Drake University before he was called into the U.S. Navy in 1943, where he studied Japanese. He later completed work on a B.A. at Drake and received an M.A. from Harvard University. In addition to serving in Japan, Ambassador

Petree served in Ethiopia. He was interviewed by Paul McCusker on July 22, 1993.

Q: So you kept up your contacts, and I presume also with the language. You finally did get back to the Far East though.

PETREE: That was because of Okinawan reversion in 1972 and I was picked up and sent on direct transfer.

Q: From Addis direct to Naha?

PETREE: Back to Naha. And I arrived there in early May just days before reversion on May 15th, 1972. I participated in the reversion ceremony down in Naha. I delivered greetings to the Okinawan people, in Japanese, which hadn't been done before. It made a stir in the press and it was fun to watch.

Q: Did you run into a guy named Jay Van Swekringen, or had he left already?

PETREE: Sure. Oh, he had left there but I had known him while I was on the desk, mostly because he was out there at that time.

Q: That's right, because I replaced him in Jakarta, originally as commercial attaché, but we didn't have any commercial business in Indonesia during the Sukarno period. Anyway, we eliminated the commercial attaché position, but I replaced him. He'd been in Indonesia for several years, and then he went off to Naha. That must have been a delicate business representing the American community. The Japanese, of course, I guess, were happy to have Okinawa back as part of their country. How did you find the dealings with the Japanese went?

PETREE: That was smooth. That was the smaller part of the problem. There was tension between Okinawans and Japanese authorities in Tokyo, principally because Okinawans have always traditionally been treated as second-class citizens on ethnic grounds, if nothing else. They were terribly sensitive about how they would be treated in the new era after reversion. And there was a great deal of nervousness between the two of them in that early period when reversion occurred. And there still is, but it has settled down now, particularly, I think, smoothed out by the amount of money Japan has spent on trying to bring them up to speed. They've thrown a huge amount of central government funds into helping Okinawa get on its feet again.

But the big job that I'll never forget was dealing with Americans. Understand it was then the Vietnam war, and the focus of the military commanders, who were all very, very senior people, Marine, Air Force, Army and Navy, and they were all present on the island, and they'd been there for many, many years and had their own environment that they had built and hated to see it go. And for the most part were emotionally pitched against the State Department's foolishness of trying to give Okinawa back to the Japanese. So, the big tensions that I had to deal with were in every day's dealings with the feelings and the other preoccupations that the military commanders tried to protect. The general thing that never had occurred to me before, is that we Americans are no different than anybody else in the world. We form attachments for a territory, or a turf, and a

place, just like the Panama Canal, and the Philippines more recently. But it was true in Okinawa too. We are colonialist just as much as anybody else, and that had never occurred...I always felt like that was one thing you could forget about. We Americans never did those bad things, never had those instincts that drove other nations. But it was true.

Q: So then you went from Okinawa...did you get another direct transfer? Or did you go back to the Department?

PETREE: Direct transfer up to Tokyo, and that was part of the package, the agreement, to go back to Naha, take one year to set the consulate general up, and then I would be permitted to go back to my area of specialization in Tokyo which I did for three years.

Q: You were counselor for political affairs at that time. That must have been equally exciting, at least you got back into your area of primary interest.

PETREE: Yes, that was important to me because I'd been away for a long time.

Q: What happened of particular note? Let's put it this way, what was your greatest crisis, personally, as a counselor for political affairs? I don't mean on a personal life side; I mean in your job. Did you have a great DCM, to start with?

PETREE: Oh, yes. Tom Shoesmith was DCM for that period, and he and I are good friends, and were good friends. We went to Harvard together. He came out of DRF, just like I did. While you speak of crisis, I think that the one thing I remember was in 1974, or '75, just before President Ford was going to visit Tokyo, the first Presidential post-war visit, and, of course, he brought back to mind all of the troubles that Eisenhower ran into when his visit was canceled in 1960. So there was a lot of tension about whether the American President ought to be permitted to come in and out of Japan with no overlay of trouble and tension, and instability. The left-wing people jumped up again, and it was also during a period when we were building a new chancery. So we were living in, not a Quonset hut, but a temporary building near where the chancery was being built.

Q: Were you living, or working in it?

PETREE: Working, as a chancery. So some Japanese radicals, activists, stood up on the roof of the Okura Hotel, or near the roof, the 12th floor, and threw fire bombs onto the roof of the American embassy one afternoon. I was, I guess, the only senior officer in the building, and immediately after that they attempted to ram the gates of the embassy with a truckload of people who were armed and out for no good. They did break into the compound and we were wrestling all over the parking lot.

Q: Were the Marines on hand?

PETREE: They were on hand helping, but, of course, the number on duty are not that many, and they're not armed. But nothing serious happened, it was just terribly...

Q: Did they tear down the flag and burn it?

PETREE: No, they didn't have time. We got them out of there before anything like that happened.

Q: The local police showed up?

PETREE: Yes, they came very quickly.

Q: That's very different from what it was in Indonesia in the mid-60s. The local protection didn't exist in Jakarta in those years. The crowds of paid protesters were storming the gates, and tearing down the flag and burning it.

PETREE: The serious part of the work for the political section during that period really was the movement in the U.S.-Japan relationship to try to renegotiate in great detail the terms of our base presence in Japan. This involved the effort to get Japan to pay more for keeping us there. They now, of course, over the years have continually moved the ratio of their subsidy of the base presence upward. I don't know what the current figures are, but it's something over half the total cost, and it's paid for by Japan, which most American people don't really know about.

Those negotiations, along with the different military rules of engagement, command and control understandings, etc., which came along with new weapons systems -- there were missiles to be accounted for. There was a different kind of submarine war with the Soviets going on off Japan. And the ways of patrolling and protecting Japan in the light of all of these threats involved different uses of the bases than had ever been true before. And negotiating all of that was really what kept us up at night. And thirdly, I'd say, very closely related to this business of the pattern of the relations around our military presence, had to do with the rather rapid switch of our forces from conventional weapon systems to nuclear weapon systems. So that it no longer was possible to bring in Army units to do something without considering nuclear weapons problems. This changed the debate, the political exposure, the tensions between the two governments a great deal when we came to try to negotiate around these issues of nuclear powered warships, and nuclear weapons.

Q: Nuclear-powered submarines, were they allowed? And there was a base for nuclear powered...

PETREE: We eventually got the right for them to enter port, but it has only been in very recent years that one of them has been based in Japan, down in Sasebo, and I think it's still there. They've reactivated a support group down there.

Q: Well, of course, nuclear weapons is a very sensitive subject and I can't imagine very many other places quite as sensitive as it is in Japan.

PETREE: That's right.

Q: You had obviously a successful tour from your point of view, I think, in Tokyo that time.

WILLIAM PIEZ
Japan Economic Desk Officer
Washington, DC (1972-1975)

Mr. Piez was born and raised in Rhode Island and educated at the University of Rhode Island and the Fletcher School. After service in the US Armed Forces, he joined the Foreign Service and was posted to Frankfurt, Kabul and Manila as Economic Officer. During his career Mr. Piez dealt primarily with economic matters of East Asian countries, particularly Japan, where he served first as Economic Counselor and, from 1983 to 1985, as Economic Minister. In the Department in Washington, Mr. Piez was Deputy Assistant Secretary of East African Economic Affairs, and from 1989-1991, Deputy Assistant US Trade Representative. Mr. Piez was interviewed by Charles Stuart Kennedy in 2009.

Q: Well then again here we come to 1971. Whither?

PIEZ: Ok, in May of that year, I was transferred. I stayed that long because the academic year for the kids in school ended about that time. I was transferred to Washington and assigned to the Economic Bureau.

Q: In the economic bureau was Frances Wilson the czar there?

PIEZ: She was administrative director, yeah.

Q: She was a civil servant but a major and a very positive person for the Economic Bureau.

PIEZ: Well she did manage the career situation of economic officers, whether they were in the bureau or not, by setting certain rules and working hard to get compliance. She must have had a prodigious memory for names and the qualities of economic officers. Every economic officer was supposed to be assigned to the bureau early in their careers. Once you started there, you were expected to stay for four years. You might switch to a different office or a different DAS (Deputy Assistant Secretary) within the bureau at the two year point. That was the way she got to know the people and she got to have some say in the kind of assignment they should have in accordance with what their talents were. She was very effective.

Q: My understanding I have talked about her influence. One thing was she basically raised the standards of the Economic Bureau. The other was she helped in her own way just looking to develop a very professional core who had not really been there before.

PIEZ: And she firmly supported economic training programs.

Q: I am sure she did.

PIEZ: I didn't participate in the six months economic course that she successfully fostered. I was a little too early for that. But that training course really made a huge difference. I noticed it when abroad and I would be in charge of an economic section, and I would get a new officer out of that course. That officer really knew his or her stuff. If you asked about a marginal propensity to consume, he would know what you meant.

Q: Well you know it is one of the grand stories of development within the foreign service the political officers always dominated. You might say it was a much softer philosophy. You can write what you think about something. Whereas with economists you are trapped within...

PIEZ: You are supposed to analyze a situation and stay with the facts.

Q: And the recruitment of foreign service officers for political work tends more toward the BS [bullshit] side.

PIEZ: Well, yeah. A political officer could say well Marcos is going to win the next election. Now a wise political officer once told me never to forecast an election. Report what the experts and the political community are saying, but don't yourself predict what is going to happen. Whereas, as an economic officer, you can't get anywhere near that sort of speculation. Anyway I always felt I had plenty of scope. Reporting and analysis of economic facts and interests was always well received.

Q: Well where did you go in the economic bureau?

PIEZ: I was assigned to the office of trade in the section concerned with developing countries. "Developing countries," of course, was how we described countries that had not developed. Whenever, in the assignment process, I was asked what do you want to do I always put down my interest in working with developing countries. That was tied in with my suggestion that I would like to go to Africa. Anyway in my new job we were working at the time on generalized preferences. The UN and the UNCTAD were very much committed to it. The proposal was simply that developed countries should charge zero duties on their imports from developing countries. The U.S. was still considering terms and conditions. Finally President Nixon decided that it should be done. Fred Bergsten was then working in the White House and I think he marshaled the arguments and wrote the necessary papers, and the President made a decision to find a way to do it. One of my jobs was to work on those details and to deal particularly with the Commerce and Labor Departments because they had interests in this matter. Zero duties on imports from so many countries could, after all, have impacts on American workers and business.

Q: Were you on the trade side the whole time, all four years?

PIEZ: Well no, and what happened, and maybe we are coming to a breaking point, is that I was telephoned quite by surprise one day by the Japan Country Director who said, "Come and see me." He offered me a job, and knowing Frances Wilson's rule, I said, "Maybe I am interested but I don't think so." Well I turned out to get the job anyway, and that was after I think 17 months in the Economic Bureau. Well I had come to a breaking point on GSP (generalized

preferences) because we had a complete legislative package to go to Congress with all of the agency support in place and it wasn't a bad time for me to move on. But it was breaking one Economic Bureau rule.

Q: Why you and why Japan?

PIEZ: Well they had a need for an economic officer, not someone who spoke Japanese but someone who spoke economics. Because we had cabinet level talks with the Japanese coming up.

Q: Well this is the Nixon administration, and Japan economics were a major thing because it had political implications in the Republican party in the south and...

PIEZ: There were specific issues like that. Textiles was one, and there were general issues like the balance of payments and the trade deficit.

Q: Also had the Nixon Shocks happened at that point yet?

PIEZ: Yes, they had.

Q: These were the two, one was going off the gold standard and the other was the recognition of China, which had hit Japan particularly hard.

PIEZ: We could have easily avoided that by just tipping them off at the last minute that Kissinger was on his way to China. But at the last moment it was decided not to do that, to catch the Japanese surprise, but also to assure that the Japanese would not be able to leak the story.

Q: Do you want to stop here?

PIEZ: I think it is a good breaking point.

Q: Today is 25 September 2009 with William Piez. Bill, where are we now?

PIEZ: Well we are just at the point where I was re-assigned from the Economic Bureau to the East Asia Bureau, Japan desk as the senior of two economic officers.

Q: What year was your assignment?

PIEZ: Ok, it was early in '73.

Q: And you were doing that until '75 or so.

PIEZ: Yes, until the summer of '75.

Q: Well this was right around the time when we were going through, I mean Japan loomed very high on our economic agenda. The Nixon shocks on gold but also textiles and China recognition.

PIEZ: Well we had running problems and negotiations with the Japanese on textiles. We also had running discussions on Japan's growing trade surplus with the United States and the world.

Q: Well what piece of the action did you have while you were there?

PIEZ: Well I was specifically wanted because for some years we had had an agreement with the Japanese establishing a U.S.-Japan Economic Council, called ECONCOM for short. It had been invented after the failure of the planned Eisenhower visit way back in 1960.

Q: Oh yea, I have ambassador MacArthur talking about White House Press Secretary Haggerty and him getting mobbed on the road in from the airport and the whole canceling of the visit.

PIEZ: Secretary Haggerty arrived at the airport, and his limo never got downtown I guess. There was a huge student demonstration particularly focused on the new security treaty.

Q: Was it Zengakuren or something that the student movement called itself. It had a name.

PIEZ: It was one of those Japanese acronyms. It was called Zengakuren (National Federation of Students' Self-Government Associations). But anyway because the President couldn't go to Japan, it was felt we needed another high level forum. It was decided to have the economic oriented members of the two cabinets meet roughly once a year in alternating capitals. I think that the first conference would have been held sometime in the 50's. They had proceeded, not absolutely every year. When I arrived at the Japan desk, we had one maybe a year and a half before with the Japanese coming to Williamsburg, and then to Washington where, using the State Department auditorium, there was a meeting of the Secretary of State, the Secretary of the Treasury, the Secretary of Labor, the Secretary of Commerce and others, plus their Japanese counterparts. The two countries really discussed the whole range of economic issues. There was a little story of some interest at that time. The meetings at Williamsburg were primarily social and tourism oriented. The main event was a big dinner for all the Japanese representatives in the very elaborate dining room of the Williamsburg Inn with all of its colonial fixtures. Everyone was in a reception room, and when the dining room was ready, the doors were opened and everybody entered into this beautifully arranged and outfitted candle lit dining room. One of the American foreign service officers overheard a Japanese saying in Japanese to another Japanese, "They must have had a power failure." I think that is a good illustration of cultural difference. The Japanese had no familiarity with the idea of a candle lit dinner. That was a first for them.

Q: What were our concerns?

PIEZ: My job was to make arrangements for the next ECONCOM, which was scheduled for June of '73. They brought me in without quite saying we are dropping this hot potato into your lap. It was like a presidential visit in that you needed a complete briefing book for all the U.S. cabinet members with a paper on every issue that was going to come up or might come up, and there were a lot of them. Every U.S. agency with an interest in Japan, and there were many, contributed to the preparations and all briefing was cross-cleared with them. We bureaucrats were up to our necks, and this was before the time of word processors.

Q: There must have been a lot of coordination between the Treasury and the White House and all this.

PIEZ: Oh yes. The first step was an inter-agency meeting. I think it was nominally at the deputy assistant secretary (DAS) level, but many agencies sent lower level people. That was Ok because the lower level people are often better informed about the particulars. At that meeting there was agreement on all the topics we thought should be covered and every agency contributed to that list.

Q: Well the list at a certain point must have gotten way too long didn't it?

PIEZ: Well actually I think we had it pretty well under control, and there was always the possibility of combining topics. It had to be judiciously organized so that every agency knew they were full participants. One way you did that was to parcel out the initial drafting, which we did. Treasury got to write on all of their own issues, for example, as did Commerce and Labor and other agencies.

Q: Were you drawing on what had gone on in the year before?

PIEZ: Very little. I looked at the book and the record of the previous Williamsburg ECONCON and realized most of that was history. We had moved on. Now we had exchange rate issues. The yen was still fixed at 360 and Treasury was beginning to show an interest in that and the implications of Japan's fixed rate.

Q: Had we already gone off the gold standard by that time.

PIEZ: That was one of the *shockus* when Nixon had announced that the U.S. would no longer buy or sell gold at \$42.00 an ounce.

Q: That must have caused a real dislocation in financial relations.

PIEZ: Well I think in the event the changes really weren't that great. The Japanese still had a fixed dollar price for the yen and they didn't change it until much later. They were able to defend it. Foreign exchange markets weren't telling us the yen was improperly priced, but there were still questions about it. The Japanese kept the Yen stable by using surplus dollars to buy U. S. Treasury securities. It worked, but later on those issues certainly had to be dealt with.

Q: I particularly think of textiles because Nixon's political base had moved into the south which was textile country, so he was particularly sensitive to the textile things. The Japanese at that time were a textile country before they had moved beyond that. How did that play out?

PIEZ: Well we had annual negotiations with the Japanese over textile quotas. Year by year those negotiations became ever more complex because the quota was split up into categories, blouses, dresses, underwear, men's trousers, even textile findings, a category which comprised things like waist linings and pockets and parts of, say, men's trousers. The Japanese had a quota for a

certain number of those “findings” which they could ship to the U.S. U.S. companies would then sew those into the trousers they were making. You had various interests involved. Some people in the United States wanted those quotas to be quite high, retailers for example. There were others who thought that was really a bad idea. I remember at one point Nixon had appointed a former Chicago bank president named Kennedy as chief textile negotiator. He was given the rank of ambassador, and he was given access to the White House pool of aircraft, so he would arrive on an official aircraft to conduct those negotiations. He came to the Philippines when I was there.

Other issues, especially market access problems faced by U.S. exporters became important. We had annual talks on those problems also.

Q: What sort of role did the Japanese embassy play at this point?

PIEZ: I don't think they had a major role in most of the negotiations. The negotiations for the most part tended to take place in Tokyo. Perhaps one reason was that the Japanese liked it that way because then all of their agencies could be represented, and their presence in the room was always double or triple the number we had. They liked to bring in junior officers for training and experience and note taking.

Q: Well did you find, you almost were negotiating with two powers. One with the Japanese national interest at the time, but also the Japanese bureaucracy. Did you almost feel that the bureaucracy which can in many countries become dominant just because they can say no. Did you find them a power to be reckoned with, or did you get decisions at the top and they would be translated down the line?

PIEZ: Well, the Japanese bureaucrats certainly were a power to be reckoned with. The Japanese had this concept of administrative guidance. It was called “*gyoseishido*” In Japanese it came up so often that even Americans untrained in the language would call it “*gyoseishido*.” Anyway the bureaucrats could take advantage of some pressure from us because it allowed them to go to their industry people and say, “This is what you need to do.” They liked being in that position since we would be strengthening the authority they already had. The interest of the industry was not necessarily to eliminate the quota. They wanted to resist on principle, but they did a good business under quotas because then they could plan their production in detail, and each company would, for example, have a quota share of so many men's shirts, allowing it to ship say 50,000 men's shirts. They would say Ok, we are going to do 5,000 a month, and we are going to have two months off for refitting the production line for next year's fashions. We will auction our production to the big American retailers. They could make a lot of money. And the market in the U.S. was not flooded with competition, so they got pretty good prices.

Q: As we were dealing with the Japanese at that time were countries such as Thailand important? Obviously China was not in the business.

PIEZ: Not at that time.

Q: At that time were you but also others people looking at how the world was going to change,

Japan was going to move more into electronics. Were you watching a moving stream where the stream is moving to a different area.

PIEZ: It was definitely a moving stream. They were big in electronics and big in autos. At one point a bit later in my career we negotiated TV quotas with Japan. They got a quota to ship us about 1.8 million TV sets a year. Later we negotiated automobile quotas with Japan. Those were in effect for about three years.

Q: I have to say that when you think about this, we make a big deal about sort of free trade and all. But here you worker bees in the State Department and elsewhere were sitting around and saying Ok, you can make so much and you can send so much. This isn't free trade. This is regulated trade.

PIEZ: Definitely. Free trade in theory, quotas as a matter of practice. But I will say this about textile quotas. I found that, although so many countries were highly competitive in textile and clothing production, when I wanted to buy clothing for myself or my family, we bought in the United States. We ordered from Woodies. Why? Because, although the quotas were protecting the U.S. industry, the best quality, the best selection, and the best prices were obtained in the United States, even though the products might have been imported. We could go to Hong Kong or Korea. We did not find textiles or clothing there that was better than clothing from home. If you want a not so great suit, have it custom made in Hong Kong. It is an anomaly but what I think it tells us is that, although a number of economists have figured out that our textile quotas were quite costly to the American consumer, if you were a smart buyer, the quotas weren't really hurting.

Q: Were you dealing with anything else or was this pretty much it?

PIEZ: We started off dealing with ECONCOM. That ECONCOM was held in '73 in June. It was so successful that we never had to have another (ironic tone). No, in fact what happened was that the Jerry Ford administration broke the ice and President Ford went to Japan. There were no demonstrations, and everything went beautifully. It was worked out in a very interesting way. The Emperor wanted to come to the United States and because of the fact no American president could go to Japan at that time there were reservations about this. But eventually it was worked out. The Emperor came to the United States, which he very much wanted to do, and the visit was a public relations success. That was all you could ask because the Emperor had no political role whatsoever. With that event as background, Japanese good manners could not fail to invite the U.S. President to visit Japan and receive him warmly.

Q: Well, he got along. He was very much a part of the war with the United States.

PIEZ: Oh yes, but he came to the United States, and then President Ford was able to visit Japan without any untoward events. And after that we could exchange presidential visits, and Japan also eventually hosted the group of eight (G-8), which would involve a presidential visit as an add on. That high level back and forth became part of the structure of the relationship, and we didn't need ECONCOM any more.

Q: Well it is interesting to go back to that time because we haven't been since the Eisenhower visit, if your chief of state can't go to a country, it does complicate things. That puts a reservation on things. It is not that things are awful but it doesn't speak to a full relationship.

PIEZ: You can compensate any way you want to and you may be able to deal with every political issue, but there still is a gap at the top.

Q: Yeah. Did you get involved in anything else?

PIEZ: Immediately after ECONCON we began to become much more involved in the exchange of regular negotiations with the Japanese on issues like textiles. Michael Smith was a foreign service officer who eventually became our top textile negotiator. I started dealing with him when he was in the economic bureau office of textiles as a working level officer. He and I became pretty good friends. Whenever he was negotiating with the Japanese and later on even with other countries, I tended to be involved, one of the people at the table.

But one example that might have escaped notice was the subject of cigarettes and tobacco. We had repeated negotiations with the Japanese on the subject of their informal controls over imported cigarettes. Interesting history there because during the Russo-Japanese War the Japanese were literally running out of money, and they went to the New York bankers who said, "We need some security if we are to lend to you. What you might do is set up a tobacco monopoly because that will be very profitable and it will give you the means to service the loans you are asking for." The Japanese said, "Oh, that is a smashing idea." And they did it. That tobacco monopoly still existed in 1973 and still exists today, although it is not as strong a monopoly.

Q: Tell me in the country of Japan what a tobacco monopoly means.

PIEZ: Well it meant that the production and marketing of all tobacco and cigarettes was controlled by a government agency.

Q: For sort of snob appeal and all, American brand cigarettes for better or worse, maybe for worse, are desired by people, Lucky Strikes, Camels and all of that. I mean would the Japanese buy them and sell them?

PIEZ: They would, but under Japan tobacco monopoly control. The monopoly would buy them all packaged and ready to go and they would arrange for their marketing in certain tobacco outlets. The monopoly would offer foreign brands only in a limited number of tobacco outlets, thus holding down sales. Advertising was limited, and advertising of foreign brands was subject to additional limits. These could be quite subtle, such as never advertising a foreign brand on tobacco delivery trucks. Imported brands paid import duty at rather high rates. Local and provincial taxes were also imposed at equal rates for all brands.

Q: With stamps. Revenue stamps.

PIEZ: Yes, of course they would have the Japanese revenue stamps. But the package looked very

like the American package because that is what the Japanese consumer wanted.

Q: Was there any feeling that you are dealing with a deadly poison. I mean we know today that smoking kills thousands of people.

PIEZ: American negotiators were well aware of that. We would go into negotiations with the Japanese and their negotiators would all be smoking. None of the Americans would. I remember we had negotiations where we had ten or a dozen American representatives at the table and not a single one of them smoked.

Q: That is interesting because it was 1964 that the surgeon General's report came out. I knew the year because that is when I quit smoking.

PIEZ: Well by the late 70's many Americans weren't smoking.

Q: Americans of sort of the educated level had pretty well stopped.

PIEZ: Yeah, I mean...

Q: Did you feel any twinges of guilt?

PIEZ: Oh yeah, and there were some Americans on our side who were saying we really shouldn't be promoting these cancer sticks. But the response was we were not promoting them. We are only asking the Japanese to treat the imports the same way they treat the domestic product.

Q: How did the negotiations come out?

PIEZ: Well in negotiations we said to the Japanese, "If you want to solve the problem, you will only be allowing the market to work. In other words you will let Japanese cigarette buyers buy foreign brands as they want, and not limit the supply, and not limit the number of outlets that can carry them, and you will either abolish the tariff or abolish the monopoly." Well they weren't about to abolish the monopoly. But they did finally abolish the tariff.

Q: In your experience particularly in the 70's you found that Americans and Japanese could reach agreements.

PIEZ: Oh yes.

Q: I mean this wasn't a matter of both sides stonewalling.

PIEZ: Right. And interestingly enough as I look back on it, I cannot really recall a situation where the Japanese really gave up anything important to them. They would ease up on the beef quota. They would throw in 10,000 additional tons of beef this year, "But don't ask us for the same next year," they would say. "It is not a precedent." On all of these issues we would make some progress. Our negotiators would go home and say, "Well here is half a pound of bacon. It

is not a whole pound but it is something.” We were able to manage the relationship that way. As I look back on it, the Japanese, the tobacco monopoly still survives. It is still an important source of revenue for the Japanese government. I suspect that demand for cigarettes overall in Japan has tapered off a bit, and the American market share sort of settled in at around eight or ten percent. But we resolved issues.

Q: Were there any other issues you were particularly involved in?

PIEZ: Well we had long running negotiations over the Japanese managing of the exchange rate, and by degrees they backed off on their market interventions. Treasury was the lead negotiator. The yen is now maybe 93 to the dollar instead of 360. However, the details of the negotiations were quite fully controlled by the Treasury Department. That was a proper role for them. My experience with Treasury was when you met them in an inter-agency meeting preparatory to dealing with the Japanese or anybody else, they were smart and tough and very demanding. But when they sat down with the Japanese they were skilled diplomats in their approach. They were very cool and correct in dealing with the Japanese. They might tell me we have really got to pound the table, but when they talked to the Japanese they weren't pounding the table, but they were persuasive .

I recall one Treasury negotiator who was prepared to be quite tough on the Japanese representatives. The day before the talks opened he went shopping and lost his wallet with money and his passport He went back to a store he had visited and they sent him to the local police station. It was nearby. In Japanese cities small police posts can be found in every neighborhood. At the police post he found his wallet had been turned in with money and papers untouched. His impatient attitude with Japan changed remarkably after that. I would not say he backed off on any negotiating essentials, just that he became more patient.

Once I lost my wallet in a hotel restroom. I did not miss it until I got home and found that the hotel had already phoned to tell my wife that they had it.

Q: You know sort of knowing the Japanese pounding the table really didn't work very well did it?

PIEZ: No.

Q: It just wasn't negotiating.

PIEZ: In Japan if you lost your temper, the Japanese concluded that it was a moment of insanity that will pass. And it would.

STANLEY ZUCKERMAN
Japan and Korea Program Monitor, USIA
Washington, DC (1973-1974)

Mr. Zuckerman was born and raised in Brooklyn, New York and educated at the University of Wisconsin. After service in the US Army, followed by newspaper reporting and a position with the Governor of Wisconsin, he joined the USIA Foreign Service in 1965. He subsequently served as Information, Press and Public Affairs Counselor in Congo, Belgium, Mexico, Canada and Brazil. He also had several senior level assignments in Washington at USIA and the State Department. Mr. Zuckerman was interviewed by Charles Stuart Kennedy in 2004.

ZUCKERMAN: Well, they put me in the East Asian bureau coming out of Korea, and gave me the Japan and Korean programs to monitor. I was, of course, very familiar with the Korean program. We had a very interesting program underway in Japan which gave rise to a good deal of controversy within the agency. Alan Carter was the PAO, and he was developing a very experimental program that was upsetting some of the old timers in the Agency, in part because Alan was getting the attention of younger officers in other posts who wanted to put some of his innovations into their own programs. Alan had been the director of our public affairs program in Vietnam as the war drew down, and had held other senior position. He had run the motion picture and television division for awhile. Later on, he was the deputy director of a division that went under various names but was essentially the central programming division of USIA.

Alan was trying to institute a program in Japan that took account of its very advanced appreciation of design, its outstanding educational system, and its deep interest in and concern over the impact of US policy on its own security and its economy. His approach corresponded more directly with the kind of analysis that a private public relations firm might make in dealing with the affairs of a client. The audience was more thoroughly analyzed than in most programs to identify the key people who the post wanted to reach. Every program that was developed was carefully thought out, and had a beginning, a middle and an end. It ended with an evaluation by officers who did nothing but evaluate the work that was done and made an effort to candidly assess its strengths and weaknesses. He had certain theories, one of which was that we did our best work when the programming, whether they were conferences or video or film showings or lectures, took place in our own facilities. Japan, certainly Tokyo was a difficult place to get out to the institutions we dealt with – media, educational, governmental, arts – because of the size of the city, the traffic and the dispersion of those institutions. And he felt that once we brought them into one of our centers, (and we had centers in six cities, Sapporo in the north, Tokyo, Nagoya, Kyoto, Osaka, Fukuoka, and Okinawa) we could create an American experience.

He also seemed to some observers to have rules that were extremely rigid and unrealistic. I remember one instance in which they were having a major conference on US Japanese relations and needed a high ranking official participant from Congress or the Executive Branch. I went to the director of the agency, James Keogh, who was able to get the then minority leader of the U.S. Senate, Hugh Scott, to agree to do an interview with the Japanese audience from a studio in the Voice of America. The problem was that Scott, given his schedule, could agree to participate in principle but had to withhold firm confirmation until we got closer to the date in question, because he had no notion of what the Senate's calendar would be on that date. Because all of our programs involving important people always ran the risk of falling through and disappointing our audiences, Alan had set a deadline for all speakers to absolutely confirm their participation no later than three weeks ahead of the event so that the post could do all the preparatory work, print

the biographies and all of the displays that were necessary to create this total experience that he had in mind. He called me up at dinner time in Washington, to say, "We are going to have to pull the plug on Senator Scott, because the three weeks are up." I said, "Alan, you can't do that. He is not only a leader of the U.S. Senate; he was personally recruited to do this program by the director of the Agency. We just have to wait and keep our fingers crossed and try to have a backup set up in case it falls through." Well we went to the mat on it and Alan understood that it wasn't going to help his program any if I had to tell the director of the Agency that we're pulling the plug on the Minority Leader of the Senate. Ultimately Senator Scott did appear and made an outstanding presentation.

Sometime after that an inspection of the post was carried out, led by a notorious opponent of the Japan program, that returned scurrilous findings. One of the inspectors noticed that a picture of President Ford was pasted on a square block, a design feature, and he took it to mean that the post was conveying the message that the president was a blockhead. The inspection report was full of silly observations like that which made it plain that the inspection had been set up to do Alan Carter in, to do the program in. I had mixed feelings about some aspects of the program, but it certainly did not deserve that kind of treatment. It was achieving a lot in an environment that was far more culturally complicated than was true of most of our posts. Alan came to Washington and participated in the kind of face to face showdown that was reminiscent of what Erasmus must have faced in challenging 16th century Catholicism, because the dispute was both theological and political. Alan survived, but the real effort of his opponents was not to destroy the program in Japan but to make sure that nobody else tried to copy it. Well, this was a new experience for me. I had never truly worked in Washington before except for a brief period a few months before I went to language training and then to Africa. The other year I was in Washington was spent at Johns Hopkins. It gave me a totally different picture of the kind of problem that you are not aware of in the field, particularly of the bureaucratic infighting. It was a useful exposure for me once I had major overseas assignments of my own, and prepared me for handling relations with Washington from abroad.

Q: Well did you mean it really sounds like you are up against a religious experience on one side or the other. People were Carterized or weren't Carterized. Did you get any feel for this? Why were people so adamant?

ZUCKERMAN: Some of it I guess was politically tinged, but I think more of it came from the old way of doing business in the Agency, in which a public affairs officer turned over his card file to his successor with the names of his contacts. Well, we had gone through several iterations of trying to keep really coherent records of people we had contacted, when they had been contacted, what programs they had participated in, what we knew of them, followed their careers. But Alan developed this to what some felt was extremes, almost a secular catechism. I couldn't second guess that. I had visited Japan when I was in Korea, but when I was assigned to back up the program in Washington I spent a month visiting all of the posts and getting a feel for their program. I started in Sapporo on the northern island of Hokkaido and ended up in Okinawa. When I got back to Tokyo Alan was waiting for me with fire in his eyes because he had been getting reports back from each of the branch posts of questions that I was asking which gave him the impression that I was being critical. We had a real set-to, but I observed to him that his branch posts were manned by very young and inexperienced officers, some on their very first

assignments after their training assignments, who had nothing to compare the Japan program with. They were obedient practitioners and followers of his system, but had little sense of the need to sometimes color outside of the lines. I showed him the schedule that awaited me at my hotel in Sapporo, where I arrived on a Thursday. Nothing was scheduled that day, Friday was a local holiday, and my schedule showed several appointments on Monday and Tuesday. I called the young man, who was single, at home and invited him to dinner that night. We had a nice talk. I said, "Maybe there are some people who I would like to meet despite the holiday or on the weekend. The schedule was so loose I was wasting a tremendous amount of time. I finally gently conveyed to him the understanding that I wasn't there as a tourist. So we did get some things going, and I did meet some people and learned something about the program. By the time we got finished talking he was able to concede that perhaps there was not enough awareness at the post of how beneficial it would be to the whole program if I understood and could represent the posts' program in Washington.

Q: Did you get the feeling that had been conveyed to you, here is a guy from Washington and he is trying to screw us or upset or do it in, so let's not open up too much. Were they were suspicious of you?

ZUCKERMAN: No question there was suspicion. I don't think on Alan's part, but I think these people had been visited by many people interested in what they were doing, and the program had been the object of concern by some of them. Alan knew what was going on in Washington; that the old guard felt that he was trying to be scientific about something that was ultimately intuitive. Well, I didn't come to be a convert to the church of Alan Carter because I didn't think it was applicable to all situations. But I believed that it was extremely important that he try to see if that system would work in a place where we hadn't done a very good job before. Japan had media circumstances that were unbelievably more complicated than most of what any PAO confronted anywhere in the world, and were remarkably advanced. I mean when you had giant publications like Asahi and Yomiuri or TV networks like NHK, these were gigantic media empires. They covered the country by helicopter. He deserved a chance to see if his system worked in such an advanced environment. I think he ultimately did get that chance. I think when they did replace him, they sent out someone with strict orders to resort to more traditional methods of reaching people. I am not sure that worked better. I doubt it. On the other hand, I think Alan was not well served by having people at the posts who were so inexperienced that they were in no position to question whether all things in the program were effective or not. But nonetheless I admired him. He was one of the few people in the Agency who really had the guts to experiment with new techniques. I think they did wonderful things with their Cultural Centers. They redesigned them so that they were up to speed with Japanese design, which was extremely experimental, extremely full of wonderful new ideas which has affected our own sense of design in the US. So I thought it was a narrowness on the part of the Agency to be so skeptical and demeaning of something it should have been proud of. Well I only stayed in that job for a year, but it was a very good experience for me. I got a chance to visit Seoul as well and was able to keep in touch with the program and with the friends I had made there, Korean and American.

HANS BINNENDIJK

**Japan Foundation Fellowship, Sophia University
Tokyo (1973-1974)**

Mr. Binnendijk was born in the Netherlands and raised in Pennsylvania. He was educated at the University of Pennsylvania and Fletcher. During his career he held responsible positions with the State Department, the National Security Council and with the Senate Foreign Relations Committee. His other career activities include: Director, Center for Studies in Foreign Affairs; Director, Institute for Study of Diplomacy; Director, Institute for National Strategic Studies; and Fellow, Japan Foundation. He was also a member of President Clinton's Transition Team. Mr. Binnendijk was interviewed by Thomas Stern in 1996 and 1997.

BINNENDIJK: In the summer of 1973, I was given the opportunity of a lifetime. I was granted a Japan Foundation fellowship to live in Tokyo for a year--all expenses paid--with my new bride. I had applied for the fellowship; my work on Okinawa reversion was known in Tokyo. The Japan Foundation, a completely Japanese enterprise, had just been established. It was looking for a couple of people for their first fellowships. I had developed contacts with the Japanese Embassy staff in Washington--Yukio Satoh in particular--now the Japanese Ambassador to Australia. He came to me one day and told me about the new fellowships; he asked whether I would be interested. I certainly was; I was eager to fill in the many gaps in my knowledge of Japan. I didn't for example know the language, I hadn't lived in Japan for any extended period. I was aware of the gap. I had done my Ph.D. work on Japan issues but knew too little about the country and culture. I saw the opportunity provided by the Japan Foundation as a way to enhance my knowledge of Japan.

There is no question that my work on Okinawa raised my interest in Japan. I was attracted by the opportunity to further study Japanese culture--and the comparison of Japanese and American societies with the former so highly structured and formal. The year in Japan gave me an opportunity to round out my education on that country, which, as I mentioned, started out as a job and ended up as a real interest.

The fellowship was very flexible. Under its terms, I could do almost anything I wanted. What I ended up doing was to associate myself with Sophia University. I taught a graduate course during the second semester on US-Japan relations; that was a lot of fun. One interesting aspect of my University experience was that I was teaching in the graduate school while studying in the undergraduate program--Japanese language. I wrote an article for a Japanese quarterly and several newspaper articles. We traveled throughout Japan and to Korea. As I said, my goal was to fill in my gaps of knowledge on Japan and I think I essentially succeeded.

As I said, we traveled widely in Japan. We visited Kyushu, Hokkaido--skied on the Olympic slopes. One recollection: Mary and I were looking for the perfect *onsen*. We found one in the Izu Peninsula. We went there and were sitting comfortably in one of the many tubs that were available, when we heard some giggling behind us. Along came Ed Schumaker, at the time a stringer for *The New York Times*, who was a friend. He was carrying a camera around his neck. He snapped a few pictures and I didn't give the matter much thought. A few weeks later, I began

to get letters from friends all over the US. In fact, there were pictures of Mary and me all over the front page of *The New York Times's* travel section sitting--discreetly--in the hot tub.

By mid-way through the year, it became clear to me that learning Japanese was a major commitment. We attended classes a couple of hours each day and studied the language a few more hours besides that. My progress after a few months made it eminently clear that to learn Japanese would take me two or three years if not more. I would have to become a Japanese scholar. That was not the road I wanted to chose. I was sincerely interested in learning about Japan, but my first love was Europe. So I gave up on the idea of being a fluent Japanese speaker. Of course I gave my lecture at Sophia in English--which was fine since the graduate school gave most of its courses in English. Most of the students were Americans; there were some Japanese. I learned enough of the language to use it in social environments; I could not have used in any professional setting, but I knew enough to be comfortable getting around. Mary learned about as much as I did, but ironically enough probably found it more beneficial because later in her life, she was a Senate staffer specializing in Asian affairs.

We lived in *Shinanomachi* in Tokyo in a little apartment--since torn down. The apartment consisted of a 7 ½ *tatami* mat room--the size of a one car garage. It had windows overlooking *Kao* Hospital. Every night, we would get the *futon* out and spread it on the floor. That room was a living room, a bedroom, a dining room. We had to go across the hall for the toilet. The bath was down the street. We did not have a cultural shock despite the un-American living accommodations. In fact, I enjoyed the living style.

I came away from Japan with a sense of a very formal society--very conscious of hierarchy and the relationship of one individual to another. After drinking a couple of cups of *saki*, they do loosen up. Then they are a different people. They are so different from other Asian, like the Koreans. The Japanese world view was almost sheltered. They could not think in geo-strategic terms. I think the Japanese have learned how to behave internationally, but others obviously had concerns. One day I plotted out the changes in Japanese foreign policies between Perry and WW II. The line had peaks and troughs, causing some very rocky times for US-Japan relations. The Japanese are capable of radically changing their world views, but I think that the advent and blossoming of democracy in the post-WW II period will be a major restraint on Japanese military involvement off-shore. I trust the Japanese.

I did develop friendships with several Japanese. I broke through the formal barrier. I found it easier to establish a personal rapport with students than with the older generation. They had not yet entered the professional life. I was not too much older than they were; so we were able to communicate rather freely. I also made friends with some of the professors--e.g. Prof. Mushakoje who was fairly western in his outlook. And there were others as well.

Even in 1973, I think it was very clear that economically Japan would rise. It was during the period when Zbig Brzezinski wrote *The Fragile Blossom*. I always felt that he had understated Japan's strength. It had a lot of staying power. Its economy, already important, was bound to be of increasing importance in the world. It was obvious to me that Japan was moving very rapidly; evidence of that economic surge was clearly all around us. I was really impressed by the energy and dynamism of the people. They were willing to work incredibly long hours; they were willing

to live in ways that westerns would never find acceptable; they saved and saved and saved and spent very little on consumption. They placed an extremely high priority on their children's education--perhaps too much. They had all of the characteristics of a strong society.

Despite that economic strength, I felt Japan would remain constrained in terms of its security and military role. In part because of that view, I gained an increased appreciation of the importance of the US-Japan security treaty as a fundamental aspect of their orientation. The security treaty was the cardinal factor in preventing Japan from returning to its historical swings, which I mentioned earlier.

I had the opportunity to meet some of the Embassy's staff. I ran into Bill Clark once again--he now having been assigned to Tokyo. I used the Embassy staff frequently in my course. Mike Armacost, then the special assistant to the Ambassador, gave a lecture. It was clear to me then that he was a super-star in the making. I thought that the Embassy in general was doing a great job. As an academic, I looked at their performance more theoretically and I found that the staff performed well day and day out on a myriad of details, but when lecturing to my class could theorize and put the US-Japan relations as well as their day-to-day routine in a context which made it meaningful for my students--and me....

During our year's sojourn in Japan, we also traveled to other Far East countries, like Vietnam, Thailand, India and Nepal. We went to Vietnam as tourists because this was the country that had had so much impact on my life and I just had to see it. We went to Saigon and surrounding areas. By summer of 1973, the war was still on, although our troops had been withdrawn. There was still some optimism in Saigon that the South could survive, but it was clear that it was a very dicey situation.

In general, through my travels, I got a fairly broad exposure to South Asia. I had been in India previously while doing the Okinawa study. The abject poverty of that country is an image that one does not forget. It was also a country of contrasts with the wealthy, well trained elite at one end of the spectrum and the "untouchables" at the other. I remember well, the dirt, the heat, the visible misery. We went to New Delhi, Agra, Jaipur. We went from Delhi to Jaipur in third class--unreserved seats--wooden benches. We went with some people who had been in the Peace Corps. It was one of those experiences that are part of youth--third class on an Indian train! I remember sleeping on the floor of the car--I was worn out--with Indian bare feet dangling in my face. It was a fun trip.

Nepal was a beautiful version of India. I remember the airport in Kathmandu well--a runway on the edge of a cliff. I have a vague memory of one aircraft which did not stop in time and was lying at the bottom of the cliff. We spent about a week in Kathmandu seeing sights and soaking up the local culture.

The year in the Far East gave me a much better appreciation for foreign cultures. I think I acquired the willingness to listen and to try to understand other perceptions--more than I might have done so otherwise. I think it is too often our approach to top issues: "What is in our interests and that is what we need to protect regardless." The year in the Far East I think sharpened my ability to understand where another might be coming from and his or her cultural context. I

should mention that I stopped in other countries as well--Israel, Greece, France etc--for a week each. I came away with a clearer sense of how large this world was, how varied it was, how many different cultures it hosts, how complex it is. Spending a week in ten different countries gave me a lot of snapshot impressions.

We did not really encounter many anti-American attitudes during this year. The US had withdrawn from Vietnam; so that period was pretty much over. We were pretty warmly received where ever we went. We were young graduate students and were able to deal on a person-to-person level. We were able to see the countries as an ordinary citizen would; we lived very frugally as I have mentioned before. We wrote a number of papers based on our experiences. The most prominent was on US-Japan relations. In those days, the buzz phrase was "fine tuning." I argued that basically the relationship, by and large, was strong, but that it needed a little more firming up than the Embassy thought, although in general the paper was very supportive of US policy. That paper was published in the *Japan Quarterly*--a publication which I think does not exist anymore.

I think that the year in Japan serves me as a reference point because that was my last major involvement in Far East issues. As I think I always knew, my heart was really in Europe. After that one year, when working in the Executive and Legislative Branches, I concentrated on Europe and Middle East affairs--with the exception of Korea--but the year in Japan was a touchstone to which I could always return. My wife Mary of course stayed with Far East issues during her career. We both left Japan with a warm feeling towards Asia, but for me that was not enough to overcome my heritage. Mary had spent a year in Grenoble, France, but she did not have the same feeling of heritage that I had.

ROBIN BERRINGTON
Assistant Cultural Affairs Officer, USIS
Tokyo (1973-1975)

Mr. Berrington was born and raised in Ohio and educated at Wesleyan University Harvard Universities. After service with the Peace Corps in Thailand, he joined the Foreign Service (USIA) in 1969. During his Foreign Service career Mr. Berrington served at posts abroad in Thailand, Japan, Ireland and England, variously as Public and Cultural Affairs Officer. He also served several tours at USIA Headquarters in Washington, DC. Mr. Berrington was interviewed by Charles Stuart Kennedy in 2000.

Q: Today is May 8, 2000. Robin you are off to Tokyo 1973. That tour was from 1973 to when?

BERRINGTON: 1975. In fact I wasn't even supposed to go to Tokyo. I was assigned to Lagos, Nigeria. Quite frankly I was not interested at all in going to Lagos, Nigeria then or now.

Q: Was that as a result of Secretary Kissinger's GLOP [Global Outlook Program where officers were assigned to areas for which they had no background, as a way of stemming parochialism]?

BERRINGTON: Yes, exactly. I had already spent four years in Japan, two years in Thailand, so that meant six years in the area. For the personnel gurus, that was enough, so they decided to GLOP me to someplace else. We in USIS didn't use that term. That was really a State term, but the concept, the principle was the same. The PAO, a man whose name I have mentioned before, Alan Carter, as I said, he had really been there about a year I think, a year or two. He was trying to really reinvigorate, redo, modernize, update the USIS program in Japan. One of the ways he saw to do that was to retain a knowledgeable Japanese speaking, young staff rather than accept the typical personnel assignment of older or more experienced officers who were now in personnel eyes it was time for them to have a time in Japan. I don't know how Alan did it, and frankly I never asked him to do it. He told me that he would check into this and would I be interested. I said, "Yes I would be," and that was for me to stay another two years in Japan. So he must have talked to somebody back in Washington, and they got the Lagos assignment turned around, and suddenly there I was going from Fukuoka to Tokyo for an additional two years, which would have made a total of it six years in Japan. The assignment was to be what was called the program officer or the program development officer; the title kind of depended on which business card I had printed up at the time.

In effect the job was the ACAO, Assistant Cultural Affairs Officer for USIS's program development. What that meant was organizing the speaker programs, the seminars, developing what Alan liked to call a packaged program which was...you identified say four or five program themes for the year. Say one was opening the Japanese market to American investments. Let's say another was maintaining the U.S.-Japan security treaty. Let's say another was demonstrating American achievement in science and other domestic activities. Let's say another was showing to the Japanese the innovation and imagination of contemporary American art. Let's say another might be proving to the Japanese the value of a democratic society, what is happening in American society in terms of civil rights, human rights, all of that. Now I picked those out of the air, but those were concrete examples of some of the things we were trying to make a central part of our program in USIS Japan in the early to mid 1970s. The concept was the program development office, of which I was in charge, would identify the ways in which we could support those program themes i.e. getting speakers, getting presentation books to give to people who might or might not have participated in the speaker program on the same themes. Perhaps even books written by the speaker. Not just taking any old speaker that USIA would send down the pike but actually identifying the best people in those fields, requesting them by name to USIA in Washington, having them come to Japan, not just for one or two days, but often for two or three weeks to go around to all of the six USIS centers, producing letterhead on which invitations would go out on which bibliography would be printed, identify the bibliography from the USIS library, send out if there any U.S. government publications send them out in advance of the program. In other words it was sort of a multi pronged approach in which we would try to support or promote that program theme through a variety of program tools.

I would work with the press office to make sure that they would be trying to place items in the papers or provide opportunities for interviews on television on the same theme. I used to call it the sort of the Mount Everest approach. A month or two before the arrival of the speaker and the big seminar, maybe a whole day long seminar, we would have small events, kind of preliminary events. These events were the foothills of the Himalayas. Maybe a month or a couple of weeks

before the event, we would be doing something a little bit bigger or more splashy. In other words, leading up to the big thing, the Mount Everest, the big seminar which might have been in Tokyo. It might have been in Osaka. It could have been in any one of our center cities. We would usually invite two or three people, specialists from the selected field. All two or three would participate in the seminar or big event whatever it might be, but then after that, they would go around. The team would break up so to speak and they would go around to the other center cities speaking on the same topic but maybe being a solo performer instead of the whole team.

For those people that we felt were really important out in the other center cities like Fukuoka or Sapporo or Nagoya or whatever, we would sometimes invite them in, pay their way, and have these Japanese lights actually participate in the big seminar that might be in Osaka or Tokyo. In that way we would kind of get a national impact, because very often these would be Japanese people in the papers or television or scholars who had some caché.

These would be people from our target audiences from each of these center cities. So a national conference like that would insure that the theme message would get out. Then we had an angle to all of this as well. Very often that person, if he or she had been invited in to a big seminar in Tokyo or Osaka, by the time the team of speakers split up and went out to the various center cities to do their solo performances on this issue, that person might then be the moderator for the program in the city when that person came through. So it was very much an organizational, planning kind of operation. When I had been in Fukuoka, I was very much on the front line. I was dealing with Japanese audiences, using my Japanese, being the spokesperson for the consulate, going out to various events. But this job in Tokyo, this planning job was basically an inside job. Most of my dealings were with the bureaucracy back in Washington or within the embassy itself trying to line up all these various materials and programming tools we had in support of the chosen theme, this particular seminar, this particular approach we had to the issue at hand. I must say I think we set the standard for a lot of USIS posts in presenting a full program like that, a well rounded approach to what USIS posts for many years had been doing but not in quite so planned and organized a fashion. We used to really anger USIA in Washington because we kept insisting on really high level important speakers. We wouldn't settle for just the familiar name and face. We often used to joke that there were a lot of kind of old time speakers who had been at the trough of USIA for years and years. Whenever Joe Blow wanted to take his trip to Europe or Asia, he would just call up USIA and they would send out cables and arrange for speaking programs and what, you name the issue. Whether it was relevant to their country plan or not is something else. We would not settle for that. We had to break a few eggs to make the omelet that we were trying to make.

Q: Do you have any idea of some of the people who came?

BERRINGTON: We had senators, we had congressmen. We had for example Herb Stein from the council of economic advisors in one of our economic programs. We had, arms control was an area that we did a lot in. Most of the big names, the names just, I'll have to go back and check on those.

Q: How did you find that this interface worked, given the cultural differences? Americans aren't too aware of how the Japanese approach issues, how did you find this worked?

BERRINGTON: It worked very well. The Japanese are...well first of all there are potential problems on both sides. Fortunately, the Japanese are very much into what you call a study type of activity. They are used to coming to a lecture or a speech by somebody with their little notebooks and pencils ready to take notes. It is almost as if they never left college or the university. They are always in a note taking mood. Whenever we would put on one of these presentations, it was never a problem getting an audience.

The more they became familiar with the idea that we were bringing in not just well known, name people but people who were extremely knowledgeable and accomplished in their fields. The more the word got around that you had to be at the American Center to find out what was going on, the less problem we had getting the kinds of quality audience we wanted. Before this program started, before Carter really instituted some of these reforms, too many American Centers in Japan has sort of relied on what I used to call the camp followers, the people who would just come to the American Center because it was heated in the winter or air conditioned in the summer. You got a free drink after the program was over. You know, the sort of people that would just hang around embassy or consulate operations like that. We tended to dismiss that and really went after getting, as I said before, significant, influential people in the media, political, business, academic, and other important communities. Because the Japanese were used to this kind of format of a speaker and an audience, they would come. Now the problem however, of course, is that most of our invited American speakers, not all, but most of the people we had come in couldn't speak any Japanese. Of course, the audience was largely a Japanese speaking audience. Some of the people in the audience could speak some English, but not well enough to really engage in a high level discussion on say arms control or trade negotiations or whatever. So everything had to be done through interpreters.

There was always that question of whether you do simultaneous interpretation or what we would call consecutive interpreting. Of course simultaneous is when one is going on the same time the speaker is speaking and the audience is wearing earphones. Consecutive speaking was where the interpreter would sit at the table with the speaker; the speaker would speak for two or three minutes; the interpreter would be taking notes furiously, and then he would speak for two or three minutes. The speaker would speak for two or three minutes and then the interpreter would speak for two or three minutes. It was always a debate as to which was the better way to do it. The simultaneous certainly provided a better flow and more spontaneity, except there was always that issue of how much accuracy because of just the need to keep up with the speaker and occasionally making an error, and how much would sometimes get left out. Sometimes the real flavor of it might not be there because the speaker was a fast talker and it was difficult for the interpreter to keep up. Consecutive was probably much better for accuracy and reliability, but it did break up the flow of conversation and for those people who might speak some English, they might tune out for two or three minutes. It was a little bit more awkward. So from the Japanese side there was always that problem of interpreting.

Another problem for the Japanese side is that we were interested in dialogue. Now Japanese from high school, university days on, the whole idea is for the lecturer, the professor, the teacher, the sensei in Japanese, he or she. I shouldn't say she, it is usually he. He would come in, give the lecture; the students would take the notes, lecture is over; students leave the hall, end. Questions?

No way! Exchange of ideas? Forget it! It is just not part of the Japanese system. What we were trying to do with the American Center programs is to encourage that kind of dialogue. In fact, we made a point of not calling these things lectures. We had another Japanese word that we used which was more an exchange of ideas rather than lecture. For many Japanese it took them awhile to get used to this. The idea of the speaker speaking for maybe 15-20-30 minutes and then the next hour and a half – for a two hour program, for example, the next hour and a half would be Q&A (questions and answers) or commentary from the audience with the speaker responding. For many Japanese that was never done. Once they got used to it, it was OK.

But the kinds of audiences we would bring together, well occasionally it might be a media only audience or an academic audience or a "politician only" audience. I mean one time I brought Mayor Koch out from New York. We just got him together with a bunch of young politicians. So that we might do a very specialized audience for something like that. But most of the time it was a mixed audience of all of these categories. The Japanese are very conscious about who in the audience is, well getting back to hierarchy, who is the sort of a senior group, who is the junior group, who is the in between group, who is higher than me, who is lower than me. It would be seen as very unsettling or rude if maybe one of the junior persons was the first one to speak up, to raise his hand and say "Mr. Professor, I would like to ask you about." So whenever the presentation part of it was finished, there was always this, you could see a kind of rustling in the audience. People would kind of be nervously looking around in their seats. Everybody is trying to figure out who is the most senior, most respected person to kind of break the ice and get the discussion going. Once that got settled, then things would usually...

Q: Did you ever load the thing by going up to the top dog in the audience...

BERRINGTON: Does a bear do what he does in the woods? Of course, but it still was no guarantee that it would always work out that way. No there is a Japanese word called sakura which is the word for cherry blossom. In terms of audiences, I guess you would say the claque or the claque in question or whatever, that is called sakura in Japanese. So we would sprinkle our audience with all sorts of sakuras to make sure that. You know I would pull somebody aside and say, "Make sure you ask about this or don't hesitate to sort of get things going." So those were the kinds of challenges in organizing presentations for a Japanese audience. First of all, to engage in dialogue, secondly, to break through - with our assistance of course the interpreters - the language barrier as well.

On the American side, there were always the problems that, well first of all just in dealing with Japanese behavior at events like this. Now this may sound rather silly, but the Japanese have a habit of when they are at a program like this, even though they have got their little notebook and pencil or pen ready, very often they will sit there with their head down and their eyes closed, and it looks like they are falling asleep. In fact, they are not. I guess it is just a way for them particularly they are listening to interpreters. I guess it is a way for them to kind of really concentrate and get the message. Frequently after the presentation American speakers would talk to me and say "Oh boy did I bomb. I mean look they are all asleep in the program." As a result, one of the things I would always do in advance of the program, and this was a very important part of the planning kind of preparation process is I would brief the speakers on just how the Japanese behave in these kinds of programs. Another problem for me and the speakers was the

Japanese seldom asked a direct question. That is almost considered rude. So what they would do is they would make usually a long winded statement about something, and maybe there would be a slight question at the end of this. If you were lucky there was something with a question mark at the end of this. But more typical would be this kind of long winded statement, and the implication would be what do you think of what I have just said. Americans even with the interpreter because the Japanese would be doing this in Japanese and the interpreter would then be rehearsing the process back to the speaker. Even with the interpreters in tow like that, a lot of the Americans would find this difficult to kind of figure out what the speaker was really after. The Japanese as a people are not given to much public displays of emotion or feeling or anything like that. So that it would be hard to get any kind of feedback from the audience if you were really doing well.

There wouldn't be, for example I would tell the speakers don't even bother with the jokes. I know that things go over well in America, but I assure you here most jokes just won't make it. Some of them would take my advice and wouldn't bother, and others would brush me off.

My point was maybe the audience wouldn't understand the joke because of the interpreting, but more importantly, this was supposed to be an educational serious occasion. Professors, learned people in this culture don't make jokes. So anybody who tried to do it would just be, you know, it just wouldn't go over. People weren't expecting it and didn't know how to react to it. This would often discombobulate the American speakers. If they weren't getting any feedback from the audience that things were going well and that there were some kind of response. So there were those rough edges. Then also I think as much as Americans would study up on the issues, and these were all very specialized, accomplished people in their fields,...as much as they would study up, and we would often before they came to Japan, would send them a list of things they might want to read and familiarize themselves with. Even if they did that before they came to Japan, once they got there, they would find the real Japanese attitudes and feelings about things so different from what they had expected. from the papers that often they would have to totally tailor their remarks or change their presentations.

Q: How would they find this out, the difference? I mean would you sort of be somebody with you explaining how, I mean did you sort of have to bring yourself up to speed on the issues?

BERRINGTON: Well first of all, I said the briefing was a very important part of this whole preparation process. I don't mean just the briefing a half hour before the program begins, which we did of course. Also we would arrange briefings with embassy officers in the various fields literally within a day after these people would arrive and got over the jet lag, we would schedule a full day of embassy briefings or briefings from other American and Japanese specialists in the country who would kind of bring them up to a kind of working level of how the Japanese understood or regarded these issues or how the American government wanted the issues presented. Of course the speaker was then free to use or disregard any of that information as he or she saw fit.

But probably as much as that, even more important was the eventual feedback they would get from their first presentation or two. They would figure out gosh they really do think that or they really don't understand that. It wasn't just at formal presentations because we would always as

part of this package program process; we would usually arrange media interviews before or after a major seminar. There were always representation gatherings, maybe a lunch or a dinner or a reception where the drinks and the food would certainly be abundant. The Japanese are, things always worked much more smoothly with a few drinks. They relax; they kind of let their hair down. It just is a much more sociable and candid occasion if there is a bit of liquor around. So, we would make sure that those kinds of opportunities were there for the speakers as well. In fact, let's face it, these programs even though it was allegedly bringing in the Americans to deal with the Japanese, to give them our views about positions, to present them with the latest information about X or Y. A lot of this was allow the Japanese giving it back to the Americans for the Americans to take back to the United States to their various constituencies there. So we saw ourselves very much as conduits for a two-way exchange of information, and given the high level and influential nature of the people who were participating on both sides, this was a significant learning experience.

Q: Did the Japanese have anything comparable to this in the United States?

BERRINGTON: They do, but it is not nearly as...the quantity is not as great. One of the big things we used to astonish our Japanese audiences with was that, let's say we did a program on arms control and we brought out three speakers. One of the speakers might be opposed to U.S. government policy. We would purposely go for a range of views. We weren't just trying to get the toadies or the kind of knee jerk U.S. policy supporters. We wanted the specialists in the field. I should add, we did this in cooperation with a very important institution so that they would be our co-sponsors, our co-hosts. It would give it more credibility to do it that way. But then the Japanese audience would then be very surprised that people, organizations as important as the embassy and our co-hosts would literally sponsor a program featuring people that were opposed, that were critical.

I must say it was not infrequent that our embassy colleagues would have snit fits about this as well. And people back in Washington would say, "Are you really sure you that?" We'd say, "Yes, we were really sure." We had done our homework. We had decided these were the people we wanted, and we were looking for a presentation that reflected the range of views in the United States. You can't understand the dialogue in the U.S.; you can't understand the political debate in the U.S. unless you know what is happening on both sides of the issues. This seems common sense. This is basic to the whole process of learning. I don't know why people would get upset about this, but some did.

Q: I am looking at the dates you were there, 1973-1975. We were going through probably the greatest constitutional crisis since the Civil War i.e.. Watergate. How about that?

BERRINGTON: Well, we did not program specifically on Watergate. I mean there was really no need to do something on that issue per-se because it was being treated daily in the papers. You know kind of like Monica Lewinski, there was a certain amount of Watergate fatigue setting in. But what we would do is we would program on the more fundamental idea of say impeachment. How the impeachment process works or on some of the issues in constitutional law that would affect the whole Watergate process. And people knew what we were doing. It wasn't that unclear to them. There were certain issues that quite frankly there wasn't much point in programming.

For example, violence in America, the drug scene, why all of that is the way it is. There wasn't much we could do with that because there is not much way you can come out looking good or providing any answers that the Japanese don't already have. And besides it was only those issues that were really issues that directly affected the U.S.-Japan relationship that we were most interested in.

Q: How do you handle preachy topics which some might feel is none of our damn business, women's rights, treating minorities - which Japan had had and has a problem with. This buzzing around in their backyard. Were you feeling these were topics that in a way affected our relationship?

BERRINGTON: In a way they did, because they would affect the whole and I guess even crime would fall into this category as well, but nevertheless we felt there was nothing we could say about crime that would make people feel better about it. I mean it is there and there is not much you can do about it. Something like women's rights or civil rights, blacks all of that, yes we could say something about it. We could demonstrate not only governmental outrage and support for progress in these fields but we could also demonstrate a kind of local level support and reasons for this. The whole point of it was we found there was a potential problem of losing confidence in America as a nation, to hold together as a nation. If you realize this was a time when there was a lot of conflicting constituencies, you know, the women, the African Americans, the pro-war, the anti-war, the abortion, the anti-abortion and all of that. America in the 1970s looked like a very fractious, divided place. Our concern was that the Japanese would lose confidence in our ability as a nation to govern ourselves and to remain a leader throughout the world. So there was a need to show that some of these issues like say the women's issue or the black or whatever was part of an ongoing process of achieving greater rights for all of our citizens and providing more democratic opportunity. If the Japanese thought gee, we could use some of the same thing here that was their conclusion. We did not make that leap. We did not say we are doing this and you ought to be doing it here, too. Of course not, that would have been interfering in domestic affairs.

Q: And these were billed as basically explaining American society.

BERRINGTON: Of course, yes. And again, you know we brought out, I mean now that we start thinking of specific areas a couple of names. In women's rights, we brought out both Betty Friedan and Gloria Steinem separately. They were fantastic, you can just imagine. On African-American issues we had Mrs. Martin Luther King. We had others as well, but she came out and did a program for us. We were looking for the people, and again these are not necessarily the people who supported the government line. This period coincided with the Vietnam War, and we would often have problems. One of them, some of my speakers who really, I would say look, you are here to talk about women's rights or African-American civil rights or whatever. I said, "If somebody raises their hand and asks you a question about American relations with China or Vietnam, that is your business whether you want to answer it or not. We recommend you don't because it just opens a can of worms and you are not a specialist in this field, and that is not what the point of this program is about, but you are free to do whatever you want to do." Some of them would take that advice and would say look, I don't know a thing about Vietnam. I am not going to get into that. Others would suddenly say, well now that you mention it, yes, I think the

Americans are mad dog, imperialists, suppressing the Vietnamese, or whatever it was. We would think Oooh. But invariably most of the Japanese realized that they have their people in Japan that are specialists in economics or maybe foreign policy but know nothing about issue X or Y and say silly thing there, so it didn't do much damage.

Q: I would think a subject particularly at that time, you mentioned Vietnam, would have been of major importance to us. This is a period of when they were pulling out of Vietnam. Both in Korea and Japan particularly, they were looking long and hard, and wondering if the Americans were dependable or not?

BERRINGTON: You just put your finger on the nub of it and that was Korea because by this time Vietnam was really winding down. There was still a residue of ill will, and there were still things to talk about. But the issue was if we had done this in Vietnam, are we going to do this in Korea too. We did a lot of, not aggressive programming, but we did a lot of smaller programming just to reinforce the point that look, we are in Korea. We are going to stay. We have been there since the Korean War. We have massed all those American forces. We have got too much at stake there. In spite of if you recall Jimmy Carter made a statement when he first was inaugurated or maybe during the campaign that he would withdraw the Second Division from Korea. Now that caused quite a stir.

Q: But that was a year later. I mean did the Japanese sort of as a nation or as a group see Korea not only their feelings about Koreans themselves, but see Korea as a very dangerous place if the communists were able to take over?

BERRINGTON: Well there is the old adage that Korea is a dagger aimed at the heart of Japan. Yes, I think most Japanese thought about these issues, were very concerned that there is always something ready to boil over there. Tensions were even higher back then than now. Yes, I am sure a lot of Japanese were very worried about that. But at the same time, they saw our constancy there as we assured, and we kept wanting to reassure, that we are not going to leave. We did.

Q: Were we able with this program to reach some of the audiences I think we would be interested in. You mentioned women, I am talking about influential women and people who were there, and also the young students?

BERRINGTON: Well the student audience was a big question mark for us. Obviously we wanted to get younger audiences. We were not looking for the presidents and the editors in chief or people like that when we attracted. We were really looking for what we call the next generation. Our target audiences, the key people were not the top people. I mean we had pretty much written them off, one because they were older, and two because they were just too damn busy. They couldn't afford the time to come to a lot of things we were doing or inviting them to. So we would go for the kind of mid level or slightly younger audiences. They would really be our prime audience for this sort of thing. This would include the assistant editors or as I mentioned before, the young reporters. In Fukuoka I would assemble a group of young reporters and meet with them about once every two weeks. We would have drinks, usually some snacks, and we would sit down and just talk about whatever was in the news. It was off the record, informal. They knew they couldn't quote me. I knew that there was no danger, no danger of

finding something in the papers the next day. They saw it as much as a familiarization process of how the embassy thought about these things and learning for them. It would be people like that, that we would be trying to encourage to come to these programs knowing full well that they would then when they got promoted and would move on to Tokyo, they would be in a position to do something with that.

Students were always a bit of a conundrum for us because first of all, the student audience is huge. You have got to realize that Japan is a country that values education very highly. Almost everybody goes off to university. The university system in Japan is just like everything else in Japan, it is highly structured and very hierarchical. You know, there are the top universities like Tokyo University and Kyoto University and Waseda and a few others. Then there are the mid-level universities, and then quite frankly there are the universities that are barely good enough to be called universities but they are. So given this huge student audience, how would we start attracting people? We couldn't just say, we couldn't send out you know, blanket invitations.

The way it works in Japan is that most students, there aren't things like student unions or anything where you could get the word up to people. The best way would be to attract them through student clubs. The clubs were not very well organized. They were a very difficult audience to reach, literally to reach in physical terms. One of the principles of this whole new program that Carter wanted to put into place was not only that you put out a high quality relevant program, but that also it go to the right members of the audience and not just once but repeatedly. So, we weren't inviting Mr. Tanaka once a year. We were trying to contact Mr. Tanaka once a month. If your student audience is that large, which it is. I mean even at a school like Tokyo University which is by most people's definition one of the top universities, there are thousands of students there. So how do you get back to an audience that large repeatedly? Well, you really can't is the point.

Q: In a way you were trying to pick them up I guess, once it had gotten within their career path which is a pretty good...

BERRINGTON: OK, so having come to this conclusion that as much as we would like to get to them it is pretty difficult to get to them on a timely and repeated basis, so we decided that we, you know, through the sort of ink stain or oil stain whatever your analogy, you get to the professors. The professors will get to the students; that's one way. Or you get to the students once they graduate. If they had stayed within the academic system to go to graduate school, that filters down the numbers considerably. By that time every important professor will have several graduate assistants. Now those were people we could get to, and their numbers were not so great, and they were knowledgeable about the issues, and they would come. So we would get to them that way, or we get to them you know, if they joined Mitsubishi or if they joined the Ministry of Finance you know, as the new young members of the organization, we could reach them there. We would very enthusiastically make the effort there. So we kind of discounted the student audience per-se, but we were really trying to get them as they moved into the next phase.

Q: Were there any segments of the society that you felt were either unapproachable or off limits or something?

BERRINGTON: Well, there were, as I think I mentioned last time, Japan is a government with you know, the ruling party has been the liberal democrats, the LDP. The permanent opposition was the socialists. The socialist party was split between the really left wing socialists and the right wing socialists. The right wing socialists were no problem. We could deal with them pretty quick. The left wing socialists for ideological reasons often refused to deal with us. They just didn't want to be seen with the Americans. The left wing socialists could sometimes be more rabid than some of the extremist splinter parties. The one party that by embassy dictate we avoided was the communist party, because we did not want to honor them with an invitation or give them the opportunity, the platform to say anything or do anything at an American Center or university event. Of course the Zengakuren type, you know, even though Zengakuren is a student organization, and even though it is very well known and would make a lot of noise and get attention in the papers, it was hardly a student group. I mean many Zengakuren leaders were in fact in their lower 30's. These were just kids who stayed in the system and never really graduated. They found their niche in extremist politics and that kind of student radicalism and they just hung around. We just never bothered with the Zengakuren because those people were not interested in dialogue. They were just interested in making noise and getting attention. So those were probably the only two groups that we consciously chose not to reach or just didn't think it was worth the effort.

Q: I was wondering about in Japan the court around the Emperor. Was this sort of an unapproachable area?

BERRINGTON: It is funny you asked that. I was the person in the embassy who kind of by chance just fell into becoming one of the main liaisons with the imperial family. The Emperor and his immediate family is, and I will have much more to say about this later on when my connections with them become even closer which they did in the 1980s and 1990s. The emperor and his immediate family is really non political. They don't say or do anything of a political nature. Of course that has a basis in the problems of WWII and Emperor Hirohito and the criticism about his involvement in war decision and various councils that either kept war going or ended the war so the culpability and the war guilt of that Emperor sort of made it difficult for any Emperor today to express any political views. If the Emperor did say anything of a political nature it would cause such an uproar. So the Emperor's position was basically a very symbolic one. He goes around and opens factories and you know, presides over poetry readings and very much ceremonial and harmless protocol. They are very much like the Queen of England. When is the last time you heard the Queen of England say anything political or substantive. So the imperial family we didn't really try to make any effort with. Of course for protocol reasons when the President would visit or other social reasons, yes there was a need to maintain a connection with the family, but as far as our programs were concerned, no.

Q: The greatest challenge in American diplomacy or any diplomatic establishment is between the various departments within our own government. How did you relate with the political section or other parts of the Embassy?

BERRINGTON: Pretty well. In fact I think largely because of my experience as the program officer for USIS and because of the high substantive nature of things were doing, I mean policy nature of things we were doing. As I have said before we weren't doing literary studies of

Hawthorne or you now, happy events on July 4 in America. That sort of programming was long gone. We were really seen as a very integral part of the embassy process of getting the message out. I was a participant. I sat in on all of the political and economic section staff meetings, more to pick up than to give. I mean I was more interested in what the issues were for me to then go back and start thinking gee should we maybe be doing a program on that. Of course, whenever we would do something, let's say we did a program on arms control at the Center, we would make sure to include a couple of embassy staff people from the political section or the military or whatever to be there just to sit in the audience. And invariably we would have a reception afterwards, and it would give them an opportunity to meet with our audiences. Because of the kinds of high level Japanese audiences we had, the embassy people were thrilled to be there because it gave them opportunities to broaden their contacts and meet some of the new young faces in the field. I think the USIS embassy relationship must have been one of the strongest, when I say embassy I mean political and economic or Pol-Mil (political-military) that sort of thing. It was one of the strongest kind of most synergistic of any embassies I have been in. The ambassador always supported us.

In that time the Ambassador was Bob Ingersoll, who was a political appointee, had been the president of Ingersoll Rand from Chicago and was terrific. [Editor's Note: Ambassador Ingersoll presented his credentials on April 12, 1972 and departed post on November 8, 1973.] He ranks as one of the best ambassadors I have ever had, a very decent, human person, very knowledgeable about economic and trade issues, and great with the staff. He knew how to motivate and utilize his staff. He was ideal. As I say most of us regarded him extremely favorably. The ambassador was in support of this kind of a program. There might have been a few people around the Embassy who would joke, "Oh what's old useless doing." ["useless" in this context is a negative homonym in English for USIS.] But by and large I think the kind of program we were developing and putting together there came to be highly accepted by the other members of the mission.

Q: Well is there anything else we should talk about at that? It sounds like a very fruitful period.

BERRINGTON: You know it's funny, I have got notes and I have forgotten to bring them. I made notes last night and I forgot to bring them. We had a lot of high level visits. For example, Gerald Ford came out just after he became President [November 18-22, 1974]. Certainly our involvement in that was very strong. I remember I was Ron Ziegler's control officer. He was the spokesperson for the White House.

I remember there was one very funny incident where because of my experience in Japan before as a student, my language, and I was one of these people who did get out. Even though the program developing job was an inside job, I would still get out and meet people and try to learn as much about what was going on in Japan. I guess this is when my Tokyo contacts really started to expand. I got to know a lot of the people in various fields, not just the policy business politics foreign policy field but also the arts and other social fields. As a result whenever there was a high level event like that, the protocol office would invariably come to me and ask for me to help draw up the guest list for big receptions or big events that needed not just your parliamentarians and your foreign ministry and you know, not those usual suspects, but some other people to add a little bit of color and flavor and interest to this. So one of the persons that I suggested we

include, because I had met him a couple of times and he was very sociable, was the actor, Mikone. He came. This was to the Ford reception. The Japanese papers the next day just went bananas. The reason was that Mikone was going through a very messy divorce with his wife at that time, and he brought his girl friend to the embassy reception to meet the President of the United States. We thought this was terrific. We didn't mind any of this at all. It got us more publicity and it was kind of amusing publicity. But the Japanese just went berserk over that one. It was an amusing incident.

Another thing which I used to do which again is more in the fun category than in the serious side, but you know these are the things that make foreign service life interesting. Because of my interest in music and the things we would do with music and arts and all of that. Tokyo saw the first visit of the Metropolitan Opera. The embassy organize it, it was done through local sponsorship. Nevertheless, we arranged to do a big party at the embassy for all the singers of the Met, everybody. There were hundreds of people there. The orchestra, the tech types, the stage hands plus the stars and the kind of sub level stars and all that. I can remember for their performances they came to me and said, "Look we need some extras on-stage because all the performers are going to be Caucasian or black with enough makeup so they look western or look Caucasian. We can't have Japanese extras on-stage. They will stand out; it will look funny." Extras of course, are the people that wear the costumes, the spear carriers, the picadors, the toreadors, that sort of thing. They said can you help round up some extras which I did. For Carmen and for La Boheme we arranged for a number of men, women and children from embassy or the local American Chamber of Commerce. For most of those people that was one of the great plays of their life to as some people said, they made their debut with the Metropolitan Opera in Tokyo

Q: Did you get to carry a spear?

BERRINGTON: Actually I got to dance. Since I was the one who put this all together for them, they gave me the plum role. I was a picador or matador in Carmen, but then in La Boheme in the act II scene, I don't know if you are familiar with it. It is the big café scene on Christmas Eve. Musetta is trying to make her sugar daddy very jealous, so she kind of plays around with people in the audience. At one point she goes and picks a young sailor and dances from one side of the stage to the next and laughs and gives him a drink and then moves on to somebody else. I was the young sailor. So there were some things like that in that time as well. These tended to develop because of the opportunities the job gave me to get out and meet people and make arrangements.

Q: You mentioned the high level visits. Over the years a Japan visit seems obligatory for ranking American officials. As a Japanese hand, what was the impression about this? Did friendships develop or was this just an obligation to get through

BERRINGTON: Oh, yes. I mean, it got to the point where some of them, I'd have to tailor my comments really. We are talking about those Japanese who were more sophisticated, more westernized and usually, I would say nine times out of ten, had enough English language ability where they could really make a connection. Yes, between economic policy makers, Japanese people in the economic policy business whether it was government or the private sector, yes,

there were some strong relationships developed. Which for us was terrific. We liked that; that's what we were in the business of doing. We would often, I think I mentioned earlier the international visitor program, send younger members of the Japanese government, private sector, business, academic, media or whatever to the U.S. and they would meet people there. Then when this person over the years as they both kind of grow up in the system, maybe now this person came to Japan as an assistant secretary or you know the vice president of the American Chamber of Commerce or something, they would get together with those people, dinner or maybe even a weekend. If say the person brought his wife with him, they would get together over a weekend and go out to their summer place. Yes, it was very encouraging to see the number of good relationships develop. Now I don't want to overstress this. It is not like there were thousands of these, but there were enough to be encouraged by this.

MYRON B. KRATZER
Science Counselor
Tokyo (1973-1975)

Myron B. Kratzer was born in New York City. He graduated from the University of Oklahoma and Ohio State University. He has worked for the Atomic Energy Commission and has served as Science Counselor in Japan and Argentina. He was interviewed by Charles Stuart Kennedy in 1998.

KRATZER: I was in Japan from 1973 to 1975. That was to be a somewhat longer assignment but in 1975 I was asked to return to the Department to be deputy to Dixie Lee Ray, who after having been chairman of the Atomic Energy Commission became the first assistant secretary of the new bureau of Oceans and Environmental Science when the AEC was dissolved. I don't know whether I was required to take the job of deputy assistant secretary, but I thought it was a sensible decision to make.

Q: In 1973 to 1975 who was the ambassador to Japan?

KRATZER: The ambassador, when I arrived, was Bob Ingersoll, who later became deputy secretary. He was from the private sector, an industrialist, and a very fine gentleman. He left about mid-way through my two years there and was replaced by Jim Hodgson but pronounced "Hodson." He was a nice gentleman but I think somewhat less active as ambassador than Ingersoll had been. He had been Secretary of Labor.

Q: Obviously, Japan in those days was full of development in electronics? What were your concerns there?

KRATZER: Let me give you an anecdote, one which helps answer that question and which helps illustrate change that Herman brought about in the whole program of embassy science counselors. I was preceded by a gentleman named Bob Hyatt who had been president of the University of Hawaii. I forgot what his field of science was but he was a recognized scientist. Shortly before I got out there, there was about a two-month hiatus. Hyatt had already left to

become president of the University of Alaska. That's kind of a switch in climates! I knew Bob quite well, and he was a fine person but I don't think he saw the job in the same way that Herman did. When I got there, I discovered that an agreement was being negotiated which was of some importance in the U.S. view. It was an agreement with the Japanese government on energy research and development. The responsible officer in the embassy was the commercial counselor or commercial attaché, and I was, to put it mildly, upset by this. I thought that this was my responsibility, and I began making phone calls back to SCI and Herman and others. To make a long story short, the responsibility was changed and assigned to me. We did negotiate a useful cooperative program in energy research and development. I should have added that I did not carry with me out there the responsibility of AEC scientific representative, because there was already an AEC scientific representative there that I had worked closely with while I was at the Atomic Energy Commission and in fact had assigned there. While he was, to some extent, autonomous, there was, in effect, a little science office which, as science counselor, I headed. It included this gentleman, the AEC scientific representative, and two National Science Foundation people. Before I came there was also a representative of National Institutes of Health. That position was discontinued but later, largely at the initiative of the Office of Naval Research [ONR], but with my support, we set up an ONR office that included two or three scientists. It did not focus on military matters but on general science matters of interest to the office of naval research that perhaps had a naval aspect but were basically scientific. The science counselor's office was a multiperson office and I, for the first time, had a junior FSO assistant. It all adds up to the proposition that it was a pretty active place. While I was there, one example of what one does was this negotiation of an agreement on energy research and development.

Another area toward the end of my stay that became very important and for which I took responsibility in the embassy was the Atomic Bomb Casualty Commission. This organization existed from 1945 or 1946 onward. This was a joint U.S.-Japan scientific program to study the survivors of Hiroshima and Nagasaki, following them medically to see what was happening, to see what the incidence of various diseases was, and so on. It was very important scientifically but also very sensitive politically. At the beginning, we paid 100 percent of this. As time went on and Japan became more affluent, we became a little less willing to pay the full cost. We began to feel that they ought to fund a good part of it, maybe all of it. To make a long story short, while I was there, the Atomic Energy Commission re-negotiated the terms of reference of that body. Its name was changed to the Radiation Effects Research Foundation and the funding formula was renegotiated. I was the local embassy representative and an active participant in the negotiations by which we were able to reduce very substantially our cost of running the thing. It was an expensive operation in those days. I believe that the successful outcome of this negotiation was a major factor in my being requested by Dr. Ray to return to Washington to serve as her deputy.

The environment became an active issue while we were in Japan. The whole proposition of Japanese progress, which we saw very readily, was well along when I got there but it really built up steam. It didn't take a rocket scientist to see that they were outstripping us, particularly in consumer electronics, and I reported on this. I don't know who read my reports, but I reported extensively on this.

There was a very interesting event that took place while I was there. Boeing had been involved in the development of a supersonic transport. That was in effect terminated by U.S. government

action because of environmental concerns about it. It wouldn't have much effect now, but that termination put a considerable dent in Boeing's prospects. As a result, Boeing was looking for partners to develop the next plane, which they then called the 7x7. I'm not sure, but it may have become the 737. In any event, Boeing was in the process of developing a partnership with the Japanese aircraft industry, which was not a very active or advanced industry by world standards because Boeing needed help in the funding. It struck the Japanese as very curious that a private firm, Boeing, would be able to risk U.S. leadership in civil aviation, without any real consideration and approval by the U.S. government.

I was generally concerned that the Japanese were getting a lot of U.S. technology for very little; that they were getting U.S. technology largely through effective negotiation and playing off one potential supplier against the other, at very little cost. They were scouring the world, and that meant primarily us, for technology. They weren't self-sufficient at that time in the development of technology. They were exceedingly good then and, of course, now at adaptation and improvement but they generally derived their basic technology from other places, primarily the U.S. This was true in space when they started their space program with U.S. help. It was true in many areas.

I thought then and still do that you can't keep other countries out of these advanced things, and it makes sense to cooperate with them, but on a carefully thought-out basis of mutual benefit. I do have reservations about how well the government can run things like this, but I think there has to be a degree of governmental involvement in terms of which technology is made available and on what terms. That didn't exist. We were not really, in my view, getting what we were entitled to for transferring this large volume of technology. In any event, I felt that things were going on that people didn't understand at home. I guess that everybody in the field tends to have the feeling that headquarters isn't listening and I had that feeling in that position. The point I am trying to make is that there is a lot of science and technology policy regardless of what side you might take and how you report it. There was a lot of that happening between the U.S. and Japan then, and I'm sure it still is.

Q: You are saying this is pretty much one-sided as far as technology is concerned. Was it that the Japanese had management techniques which, at least in those days, was working well? That's what gave them the edge?

KRATZER: Well, I think, frankly, there was a certain amount of naivety on the part of the U.S. suppliers of technology. I don't think that they fully took into account the extent to which the Japanese could attain scientific predominance - technological, I think, is a better word - by exploiting and often improving on the technology they got. In other words, I don't think we fully understood that we were putting a competitor into business. I don't think we, as a country, or our industry, were being properly compensated for that risk.

Q: Was there much contact between you and, say, the commercial office to alert American business of what was happening?

KRATZER: I think the answer is there probably could have been and should have been more. I didn't have any problems with the commercial people other than the initial one of finding them

running the energy research and development negotiation and we were good friends, but I don't think that was the way they saw their job. The answer is there was very little. I would write my messages and airgrams, and I don't recall, in general, that I felt the need for any clearances from them.

I'll give you another example of this, IBM. The details were very complicated even then, and I certainly don't pretend to remember them all now. IBM was obviously, in those days, more than dominant in the U.S. computer industry. It was pretty much the whole game. It was quite unusual, but IBM had a wholly-owned Japanese subsidiary, which was in existence when I got there. Japan was a lot more closed to foreign investment then than it is now. It was just not done. They preferred technology licenses for their firms to foreign-owned subsidiaries and in the computer business had Japanese licenses, but IBM had a wholly-owned subsidiary. In exchange for that, IBM had agreed to license all of their technology and all of their patents to Japan for a period of time. There was also an arrangement, whereby, for every computer which IBM imported into Japan, there had to be, say, two built in Japan by IBM Japan. It was a clear effort, on the part of the Japanese to use the IBM arrangement to create a Japanese computer industry, which is natural. IBM knew that this was happening but felt it was worth it to have a share of the Japanese market. They also agreed that there would be a certain amount of export activity by IBM Japan, maybe to the U.S. I know that there were IBM people posted out there from the States that thought that the arrangement was not a good deal for IBM. My point is that I don't think anyone in the U.S. government had a clue that this type of thing was taking place. I did report on it. I have my doubts about the audience, but it seemed to me then and it seems to me now that these are things of enough importance that somebody in the U.S. government ought be aware of them.

Q: What about Japanese commercial people and officials that you would call on? How did you find them?

KRATZER: First of all, I had a wide acquaintance with the nuclear community before I went to Japan. I tried to keep that up even though there was an AEC scientific representative. The other people I met in all of the Japanese government departments and in the companies couldn't have been nicer. I had a local employee who was a competent interpreter. I couldn't have done it without him. Not so much to communicate with the responsible officials, because a lot of them spoke acceptable English, but just to set things up and to go through secretaries who didn't speak English would have been totally out of the question without local interpretation. I had good relations. I still admire the Japanese and have continuing contacts with many of their nuclear people.

Q: Were there any particular points of conflict that you got involved in between the Japanese government and ourselves?

KRATZER: The most significant thing that took place while I was there was the final Japanese decision to ratify the NPT, the Non-Proliferation Treaty. They had signed it earlier but, for a variety of reasons, held off their ratification. I had a friend in the Japanese nuclear community that I kept in close touch with. I don't think that I had much to do with their eventual ratification, but I certainly had a useful contact. It was useful for them to know from people, including me,

that their ratification of the NPT continued to be important to the U.S. I don't think we had any major outright disagreements other than my feeling that what was happening was not being paid a great deal of attention to in Washington. It was just a feeling that they were rapidly gaining on us in a lot of fields, which is fair game, but largely as a result of the base of U.S. technology that they were very consciously using. There was nothing unconscious about this process.

Q: Did you make this known? Obviously, you were writing your reports in but how about other contacts within the embassy? Was this picked up as a theme?

KRATZER: I don't think so. Perhaps that was a feasible avenue to express my concerns, but I guess I didn't see it that way at the time.

Q: I am not sure. I probably would have gone but I am just wondering?

KRATZER: I don't think it would have gone very far, but I really didn't try. Another nuclear area that I had gotten involved in, which was a presidential initiative on our side, was uranium enrichment. At that time, the balance of payments thing was heating up, and there were a number of efforts being made to help reduce the trade deficit. One of these involved the proposition that we might get the Japanese to invest in a private uranium enrichment activity in the United States. That may have been a couple of billion dollar investment. It was big enough for the president and prime minister to talk about. I became actively involved in the discussions on that, which were between the private U.S. company involved, Bechtel, and the Japanese. There were a lot of interesting projects but I would characterize them in two ways, at least in terms of whether I found them interesting and found them worthy of reporting and spending significant amounts of time on: first, if they were really not science but technology; second, if they had policy implications. Anything in the nuclear field has policy implications, sometimes of a non-proliferation nature. The business of the rate of progress, that is our competitive standing with each other, also has policy implications. I don't for a moment think that I was the one who discovered it, but the whole issue of competitiveness with the rest of the world and Japan, in particular, became a really major issue in the U.S. several years later. I think it happened to some extent because we didn't keep our eye on it.

Q: Did you feel that Japan was at that time a really closed market?

KRATZER: Oh yes. Sure. I never knew how they accomplished it. Anyone who spent time there believed this was true. You didn't see U.S. goods except in rare circumstances, especially in those days. You could buy their goods cheaper in the U.S. or in the PX than the Japanese could buy them in their own outlets.

One of the small but very significant outcomes of my assignment in Japan took place on a trip home from Japan. There was a conference of U.S. science counselors and attachés from around the world. I told Herman Pollack during the conference that I thought he ought to rename what were then called generally the science counselors to science and technology counselors. He did not delay. He thought that was a legitimate point and he did that. To the best of my knowledge, they are now called science and technology counselors or maybe minister counselors, I'm not sure.

Q: During your time from 1973-1975, was it a matter of some frustration you think?

KRATZER: Oh, no. I wouldn't put it in those terms. I was just trying to address the question of what I thought was important and interesting. There was so much to do that I didn't have time to be frustrated. I'm sure I must have been having feelings about who is reading my reports. I guess I still wonder, but I think I know now a little bit better than I knew then what some of the obstacles are to action in fields like this. It is very complicated. I still think - and I don't know the answer to it - that reporting by science counselors or science and technology counselors requires that a considerably higher level of attention has to be achieved for anything to be done. The whole issue of competitiveness, that became so prominent, is still unsolved, though now we think we have solved all the problems. I don't believe we have. I think there is still a major gap in many areas. Everything looks good because our economy is healthy and theirs seems not to be, but I can't believe that we can continue to have something like a \$200 billion trade deficit, of which \$30 or \$40 billion is with Japan, indefinitely. I don't think that's sustainable.

THOMAS PARKER, JR.
Economic Officer
Tokyo (1973-1976)

Mr. Parker was born and raised in South Carolina and was educated at Davidson College, the University of Michigan and Duke University Law School. After service in the US Army, he joined the State Department in 1967 and was posted to South Vietnam, where he worked in the CORDS program. Mr. Parker subsequently served in Japan and Uruguay as well as in the State Department in Washington. His assignments were primarily in the economic development and management fields. Mr. Parker was interviewed by Raymond Ewing in 2009.

Q: And where- So that- the old building was demolished while you were there, and where was the temporary?

PARKER: Sort of up the hill behind it and just a plain rectangular three story building, very simple, very bare bone, small offices.

Q: But on that compound or the ambassador's residence, the old chancery?

PARKER: Probably the far side of the ambassador's residence. As I recall we were across the street if not from the Okura Hotel itself at least from that hotel's compound. It had more property than the hotel itself occupied. So we were in the immediate vicinity; I think we were on the far side uphill of the ambassador's residence and were there for a couple of years while the embassy was built.

Q: And were you still there when the new embassy was occupied or used? Or had you gone?

PARKER: No, I think we must have left before then.

Q: And in terms of your work in that period you were doing sort of reporting, same kind of thing, or-?

PARKER: Yes, reporting, a little bit of negotiating. We had an agreement with Japan stemming from the Second World War; what was this one called? An agreement between Japan and the United States of America concerning the trust territories of the Pacific islands, a lot of those islands that were fought over in the Second World War, some, maybe all of which, I don't remember, had been given to Japan as trusteeships after the First World War. Anyway, we took them in the Second World War and we negotiated somehow with the Japanese an agreement under which they were paying claims of civilians arising out of the occupation and the fighting, something. So I was in charge of that little agreement which had a very small amount of money, I think a few million dollars, and the way it worked was this amount of money could be used for not to pay individual claims but for procurement by the trust territory government of mutually agreed items. So I did, I supervised that. I don't know if I really did any negotiating or not; I did a little representation to the foreign office regarding aid to Egypt following the 1973 Arab-Israeli conflict, but basically it was mostly reporting. I'm just drawing a blank right this minute but my area of responsibility was Japan's economic relations with developing countries. So that's pretty broad but- so we were interested in Egypt, for instance, or the relations with the Middle East, economic relations, I'm sorry.

Q: And in those days, the early 1970s, Japan was taking on an increasing burden, responsibility in terms of an aid program for developing countries-

PARKER: Yes.

Q: -in Africa and elsewhere.

PARKER: So I paid attention to that. I mean, of course Africa, Southeast Asia, of course, so I paid attention to that. Occasionally there would be issues and I used to talk to them occasionally about aid to Cambodia. I mean, along with us they were providing aid to the Cambodian government so I would discuss that with them, information to be exchanged, questions posed and answered.

Q: Were your main interlocutors, the main people you had contact with about these various issues the foreign ministry?

PARKER: Yes. Not exclusively but primarily. I mean, I knew a few people in the Ministry of International Trade and Industry, MITI, or their environmental- do they call theirs the environmental protection agency? In any event there was some issue involving maybe emissions standards and how to measure emissions, pollutants, I discussed once or twice or half a dozen times. Again, you know, not negotiations really, just discussions and exchanges of information.

Q: Let me back up for a second; you at some point declared your interest in being an economic cone Foreign Service officer. You, college your major was English literature, minor in history.

You'd worked for a bank; what sort of economic training- you've had wonderful language training in your, what, five year Foreign Service career at this point, roughly; Vietnamese and Japanese. To what extent did you have economic training?

PARKER: I had nothing in college, absolutely nothing in college but my first job out of college was with the telephone company in Charlotte, North Carolina, and I used to walk around during my lunch hour, and as it happened there was a branch of the Federal Reserve right down the street, and in those days they actually had sitting out on the street, well the sidewalk, a tract rack full of all these nice publications by the Fed about the economy and monetary affairs and financial affairs, just free for the asking, so I started picking those things up and reading those so that's how I began to learn something and began to develop an interest and so that's why I expressed the interest in the economic cone when I signed up. So other than on the job in Tokyo and of course I could read, I could write, I could add, so those skills all served me in good stead but at that point it was just paying attention to what I read and what I heard and trying to be careful and accurate. So after Japan, which was the summer of 1976, my next assignment was the FSI economics course so I did that and then several years later I was assigned to, dare I say it, advanced economic training. I don't know if that phrase is used or not.

Q: Yes, it is.

PARKER: I went out to-

Q: Or university economic training.

PARKER: University economic training; went up to the University of Michigan for a year so that's my formal training; FSI, University of Michigan.

Q: Okay. Well you must have done well in the economic commercial section in Tokyo but that's certainly, you know, in that period or probably today as well that was one of the most important embassies in that field in the world.

PARKER: Yes, yes. I'm sure that was the case. Well trade and in particular Japanese exports and our trade deficit and sensitive items in international trade such as textiles from the southern United States, those were all big issues and so a lot of attention was paid to quotas or threats of quotas or voluntary restraints on Japanese exports to the United States. It would have been done by the minister and/or the counselor and not somebody at my level. Also, the exchange rates were of great interest. I mean, in the beginning we had the post-war 360 to one exchange rate.

Q: I well remember that.

PARKER: Yes, yes, the good old days which finally gave way and the yen began to float, I forget, 1973, 1974, 1975, something like that. So that was an intense interest but Treasury had its attaché and an assistant attaché and occasionally even higher level visitors would come through. Paul Volker came through; what was he at the time? He was a senior Treasury guy at one point, wasn't he?

Q: Oh yes. He was undersecretary for international policy or something in the early '70s.

PARKER: Probably in that capacity he came through. So not only did I not work on that issue but State Department people didn't work on that issue either. They might have kibitzed a little bit around the edges but I'm sure Treasury guarded its prerogatives very carefully.

Q: In the period 1970, '71, maybe '72, I was in the embassy in Rome working as a financial economist, reporting to the Treasury attaché, part of the economic section. Was there a State Department counterpart in Tokyo in those days in the Treasury attaché's office, do you remember?

PARKER: I don't think so. I mean, maybe there was and I don't remember but I don't think so. I mean, there was the attaché and his assistant, who was another Treasury guy.

Q: Well in Rome we had- Treasury Department had a Treasury attaché and assistant attaché also from the Treasury Department and I was the third wheel, third officer in that office and did a lot of the financial- the macroeconomic reporting under their direction, supervision.

Who was the economic minister during this period? Was Bill Colbert still there or most of the time?

PARKER: Yes, I think he was there until I came home. I think just Les Edmond to begin with and Bill Colbert afterwards.

Q: Then who did you say replaced Peter Lande?

PARKER: Mike Calingaert.

Q: Mike Calingaert, yes. Well, all very strong, as I said before, economic officers.

PARKER: Well one would hope that Tokyo would get that kind of person.

Q: Right. Although, you know, it sounded like, from my understanding and recollection that you had by far the strongest language skills in that section probably, Japanese language.

PARKER: Well none of the four people I've mentioned had language skills. I mean, some of the other working level people had them. I mean, my contemporaries included, for instance, Don Westmore, who was an excellent language officer; Bill Breer, was a little ahead of me in Japan though we did overlap. We had some time in Japan together and he was superb at Japanese. One of my contemporaries was Ira Wolfe; I forget if he got he advanced training or not, to be perfectly honest.

Q: Okay. Well, we're coming, I think Tom, to the end of our discussion of your time in the embassy in Tokyo. Is there anything else you want to say about your- that period of your career?

PARKER: Well I guess nothing immediately occur to me. I mean, obviously it was a wonderful

experience, both Vietnam, believe it or not, the war going on, and Japan, wonderful experiences. Japan was different from the first perspective and also because I was now married and since, as I said, we were married three weeks before going out there, we always considered Japan to be our five year long honeymoon.

Q: So you were there for about five years?

PARKER: Yes, about five and a half, yes, but I did work hard, I stayed busy. I don't know that I've described any traumatic happenings to you; survived an earthquake or two, which always gets your attention. I think it was early in our stay in Japan that we had the first oil crisis; that was late 1973, as I recall. It wasn't that I was brand new in Japan when that happened, but the irony that I recall was that just months before the first oil crisis the Japanese had closed maybe their last coal mine, which is on an island way up north somewhere. It was actually featured in a TV program within the last three or four months; I happened to see it, which made it refresh my memory enough to remember it this morning. Yet, how ironic is it to have shut down their last coal mine just literally months before the price of oil quadrupled or did whatever it did.

Oh, one very pleasant thing I will say about Japan at about that time, after the first oil crisis, was that the Japanese in very short order introduced car-free Sundays so we could just walk around Tokyo to our heart's content and not breathe the fumes or fear getting run over or be deafened by the noise. Those were delightful; we kept waiting for the United States to introduce car-free Sundays but we never did.

Q: You lived in the period after language training in Yokohama; you lived in what, an apartment in the embassy housing?

PARKER: Yes, after language training we came back to the embassy compound and I think at the time there were three buildings, Perry House, Harris House and Grew House and in their turn we lived in all three. Our first daughter was born in Japan; that was exciting but not especially professionally relevant, perhaps.

Q: It is certainly important to you and your wife and to your daughter.

PARKER: Yes, indeed.

Q: Okay. Did you travel around Japan a lot or not really all that much?

PARKER: Not as much as we should have and I regret that. We had what seemed like a good excuse at the time. You also probably know the name John Emerson, a distinguished American diplomat who finished his career as DCM in Tokyo. It was felt that his career was stunted or retarded because he had been, I don't know, peripherally connected with the China hands during the Second World War and although I think he himself escaped any serious blame or accusations, nevertheless a little something sort of rubbed off and it was thought that kept him from being ambassador or going further than he did. Nevertheless, the point is he had a very nice rental house in Nikko. Did you ever visit this place, Akamon in Nikko? Anyway, in our day there'd be a group of embassy people who were in charge of the place, we paid the expenses nine

months out of the year and he and his wife would always come for late summer and fall.

Q: He was retired at that point?

PARKER: He was retired by that time. So since we had the use of this wonderful house a couple of hours by train from Tokyo we spent many weekends up there and loved every one of them, but that kept us from traveling elsewhere as much as we otherwise might have so that was too bad.

Q: Well I remember Nikko very well but I don't remember that house or that property.

PARKER: It's very close to the big temple complex and to the red Sacred Bridge that crosses the river there, the Shinkyō, if you remember that, the Shinkyō.

Q: Well I think with the consulates, I guess in those days, in Sapporo and Kobe Osaka and Fukuoka.

PARKER: Yes.

Q: I don't remember a lot of encouragement to embassy people to travel, at least in my period officially. I mean, when we would- I was single at the time and would go skiing and you know, do other travel but not so much for professional reasons.

PARKER: Yes. Well I guess I'll have to say I never felt pushed to travel because if I had felt pushed I probably would have done it. Took a couple of trips under the auspices of the language school; they wanted us to do that as part of our training. It was required to go off somewhere and speak the language for a week. So I did that.

**NICHOLAS PLATT
Liaison Officer
Tokyo (1973-1977)**

**Japan Desk Officer
Washington, DC (1977-1980)**

Ambassador Nicholas Platt was born in New York in 1936. He attended Harvard University and Johns Hopkins University, entering the Foreign Service in 1959. In addition to serving in Japan, Ambassador Platt served in Hong Kong, China, and Washington, DC, and was ambassador to Zambia, the Philippines, and Pakistan. Ambassador Platt was interviewed by Paul McCusker in 1994.

Q: How long were you in Tokyo?

PLATT: I was in Tokyo almost four years and I became thoroughly embedded in the US-

Japanese relations and the life in Japan. I really enjoyed it and the family really enjoyed it. It was a lot easier place to live than Beijing. The Japanese were a lot easier to deal with than the Chinese. And the contrasts were so marked. It was to me so interesting to have a full hands on experience in both countries. I had wanted that long before the Liaison Office position came up. I really thoroughly enjoyed it. I found the language training a great therapy from all the difficulties we had been through in China. It was just like going out and sawing wood.

Q: Then you went back to Washington, I gather, around 1978?

PLATT: I went back to Washington in 1977 to the Japan Desk. I was lucky. They were looking for a Japan country director and there were people more senior than me who had more Japan experience. The new Assistant Secretary was Dick Holbrooke who was a younger guy who was not attracted to the older Japan hands who were served up to him as possible Japan country directors. He asked me, who he knew, I had known him for years, whether I would like the job, and I said, "Yes." I was an FSO-3 and it was an FSO-1 job, so I grabbed it. I spent a year and a half doing that. It was during Mansfield's first year. Then I spent two years working for Brzezinski on Japan and Korea on the NSC. I really spent my time persuading President Carter to leave the troops in Korea. I did that in a variety of elliptical bureaucratic ways. Then I went over to the Defense Department to work for a year for Harold Brown.

The Carter years for me were very instructive because I had a chance to deal with the same set of issues but from three different bureaucratic points of view -- the State Department, the White House and Defense Department. We had a kind of round robin going in which people at the deputy assistant secretary level, all of whom knew each other, were taking these jobs one after the other. So we had a very tight coordination mechanism in which each of us were able to represent our institutions and their points of view, but not with the suspicions that came from not knowing each other and what you were dealing with. So, when Vance, Brzezinski or Brown were talking to each other about an issue that couldn't be decided at a lower level, they not only knew what they were supposed to say from their own institution's point of view, they knew what the other institutions were thinking. So it worked very well.

ELDEN B. ERICKSON
Economic/Commercial Counselor
Tokyo (1974-1975)

Elden B. Erickson was born in Kansas in 1919. He served in the U.S. Air Force and the U.S. Army in World War II before joining the Foreign Service in 1946. His career included posts in China, Algeria, France, Laos, Japan, Lebanon, the Netherlands, Canada, and Germany. Erickson was interviewed by Charles Stuart Kennedy in 1992.

Q: Then you left there and went off to Tokyo.

ERICKSON: Right. Back to Japan.

Q: How did you feel about that?

ERICKSON: Actually, I was happy to go back to the Far East. I loved working with the Japanese, contrary to many people. I felt that they were totally honorable. My opinion in dealing with them, though, was just to be frank, and if they didn't want to have reciprocal responsibilities, then you did something about it. But don't just go on and on saying how bad they are. You have to take measures against their protectionism. And they understand that.

Q: What were you doing?

ERICKSON: I was Economic/Commercial Counselor. But I was really just doing commercial work rather than economic.

Q: Had the commercial situation changed by this time?

ERICKSON: Tremendously. They were really going great guns since 1964. In ten years, it had turned around totally and was becoming a big force in world trade. And things were so expensive. When I was there as a junior officer, we could travel everywhere in Japan, stay in the most expensive places and enjoy them. But this time, three bites of celery cost a dollar, and we couldn't afford to stay anywhere. We couldn't really afford to travel either. Official travel, yes, but not personal travel.

Q: How about James Hodgson as Ambassador? He was former Labor Secretary wasn't he?

ERICKSON: Yes.

Q: How did he operate?

ERICKSON: He was very low keyed. A very sincere type of person, but very much different, obviously, from Ambassador Reischauer, who had the language and the respect because of his background. I don't think Hodgson was either a great plus or great minus. But he certainly was a good person and didn't do anything to reflect unfavorably on the U.S.

Q: Were you given a lot of pressure to "change" the Japanese system as far as protectionism, etc.?

ERICKSON: No. Again, there were quotas, quotas, quotas. Negotiations all the time.

Q: We have been playing this game now for twenty years or so. At that time, how did we approach it?

ERICKSON: It was all "temporary." The Washington position was that our restrictions were just temporary restrictions to give our people a chance to catch up.

Q: Was it one of these things...I found in other circumstances as Consular Officer, we would

scream and yell about what happened to American citizens, yet we were drafting foreigners if they were on non-immigrant visas in the United States. If something like that were to happen in another country, we would protest like mad. It was very difficult for our people to see that what we did had a counterpart in another country. Were you spending a lot of time explaining to both sides?

ERICKSON: Yes.

Q: Did anybody listen?

ERICKSON: No.

Q: Did you find either Treasury or Commerce difficult to deal with?

ERICKSON: Treasury I found more difficult to deal with. Commerce was not so bad. Again, it was textiles and cars.

Q: What was the Treasury people's main concern?

ERICKSON: I can't think of anything specific, but I remember they seemed to be inflexible on every point where we tried to do anything. They would be against it.

Q: Did you find yourself able to get to the various concerns that were importing and exporting to the United States? Did you have easy access to the higher echelons of Japanese business?

ERICKSON: Well, I was very lucky, having been in Osaka first. I knew really as friends heads of the top trading companies. I was a Rotary member in Osaka, and many of them were members. I saw these same people when they came to Tokyo. So I had an advantage there. But I really didn't have top echelon contacts with them.

Q: What was your impression of MITI?

ERICKSON: Ministry of International Trade and Industry. That was where they really regulate everything by administrative rules. They don't have laws enabling one to challenge their protectionists laws. They just do it administratively, and very often it doesn't become known, but the effect is obvious that they are doing that.

Q: Were you able to make any contact with them?

ERICKSON: Oh yes. We had meetings with MITI all the time on various problems such as protectionism.

Q: How responsive did you find them?

ERICKSON: Very often it was really tacit denial that they were doing it. But they were always polite. Our problem is that we never said that if they didn't stop this, we would do something.

Q: We couldn't drop the shoe.

ERICKSON: Yes. They would have understood if we had. They still would.

Q: Did you find that these rules...there are bureaucracies and bureaucracies, and some are very much run from the top and everybody jumps, but other ones, and I found this in some Oriental societies, middle and lower level people...

ERICKSON: The top would be caught because they really felt something probably should be done, but the middle bureaucracy was really solid against moving in that direction.

Q: This is what I found in Vietnam and Korea, where I served. The middle bureaucracy...the top people really couldn't control them. There wasn't much of a way of ordering down.

ERICKSON: Yes, that was true of Japan.

Q: You were in Japan only a couple of years.

ERICKSON: I was only there a little over a year. My wife became ill from the pollution in Tokyo and was medically evacuated. I just stayed on until they found a replacement.

Q: The pollution was that bad?

ERICKSON: Yes. We were right there at the Embassy Compound, just below the big overpass, and all the pollution just dropped right down on us. That was unfortunate for everybody, but it happened

ISABEL CUMMING
Public Affairs Officer, USIS
Tokyo (1974-1976)

Isabel Cumming was raised in Boston, Massachusetts. She served with USIS in Korea, Sweden, Poland, Italy, Japan, Yugoslavia, and Germany. Ms. Cumming was interviewed by G. Lewis Schmidt on January 15, 1990.

CUMMING: I went to Tokyo after -- I went to Tokyo, and I worked for Alan Carter in Tokyo.

Q: I want to ask you a question, and I don't know whether you want to answer it. What Alan did, of course, was largely to dismember the old list of our contacts and the library programs and install this -- what was it he called it -- it was a forerunner of the computer operations.

CUMMING: Oh, yes. Computer. What was it called? What was it called?

Q: Anyway, anyone wishing to obtain information had to bring it up on the monitors...

CUMMING: On the monitor -- right. I give Alan his due. On the first staff meeting I ever attended, he had a group of young men in that establishment in Tokyo, and I'll tell you they were a scruffy looking bunch of people. I had just come out of Rome, where people wore ties and shirts and coats.

Q: I am surprised to hear that because everybody in Japan in my day wore suits and coats and ties...

CUMMING: Well, they were there in -- I tell you -- I never saw -- I can't believe some of the outfits that some of these young men were wearing. Alan himself was sitting in shirt sleeves.

But they were a solid group of young men. They were really sharp. Paul Blackburn was one of them. At that time, Blackburn was the Tokyo Center Director.

Q: He was a JOT in Thailand at the time I was there.

CUMMING: I give Alan -- he really had some young men -- and he let them talk. He gave them an opportunity to really discuss. He didn't always say we can do it, or I agree, but he did give his staff the opportunity to throw out ideas, and if he felt they were good, we would work on them.

Q: What did you think was the attitude of the Japanese staff to Alan's renovation or changes in the USIA program -- USIS program -- and did you have any feedback as to what the Japanese public thought about it?

CUMMING: Well, the staff was mixed. They either liked him, or they hated him -- loved him or hated him, let me put it that way, because Alan was the kind of person that did not like a cluttered desk. He didn't like papers on his desk. You know, you put it here, and it went out there, and as soon as it was "there," it was supposed to be gone.

He would walk through the office and he would just -- if there was too much, he would just go like that (indicating with an arm swipe) and wipe all your papers and all your books on the floor. He just couldn't stand it. So they either liked him or they disliked him.

Alan was liked in the community. I saw both him and his wife socially quite a bit, and they had a wide variety of Japanese friends; he seemed to be very popular and very well-liked.

Alan is a different type of person, as people know, and he is not a bashful man. I had worked for him before, so I had known what to expect. I mean, he goes right in there. They did not object.

Of course, the Japanese -- we all sort of towered over them because they are a smaller race of people, although that's not true anymore because they're getting taller and taller. I think they are eating our type of food. So we always felt that we towered over them. But I think they admired Alan. He traveled a lot so that he went out into the boonies and he saw what was going on in the

post, and he seemed to care. He called on his people a lot in the post, he also went visiting so that he knew what was going on. He had his finger on the whole program. He had a wonderful information staff.

Harlan Rosacker -- I don't know whether you know him from...

Q: I know him slightly. He is now a personnel officer for the Agency.

CUMMING: He is now a personnel officer in the Agency. He was our Information Officer, and he had a wonderful rapport with the Embassy, with the Ambassador, as did Alan. They relied on Harlan and our office greatly for the information.

Q: Who was the Ambassador at that time?

CUMMING: There were two political men.

Q: Mansfield, did Mansfield come during your term?

CUMMING: No. No. Mansfield was not there. The last one was a TWA -- the man who had been with TWA, and he was being criticized when they were having that thing about TWA -- I think he was from Hawaii originally. I can't remember their names.

But he never -- I remember meeting some TWA people, and I said, "Oh, our Ambassador."

And they said, "We would never know it because he never comes to the TWA office." He divorced himself entirely from his job because there was -- his previous job -- and just was the Ambassador to the country.

Q: This was again in what years?

CUMMING: It was '75 to '77, somewhere like that, in the late '70s.

Q: Because Alan was in.

CUMMING: Alan left and went to Saigon because there was another man who came who has since retired -- Bill Miller -- Bill Miller. He was my PAO also.

Q: I interviewed Bill last year, too.

CUMMING: But, yes, because Alan went to Saigon. Right. Right. He got the word from Washington that he was going to Saigon.

Q: The reason I asked if he was there that late in the program is because he was in Tokyo the last time I made a trip out there officially, which was in December, 1971. So I guess he was still there later because there was a Japanese local who had been on my staff when I was in Tokyo in

the early '50s and who had been transferred to Nagoya; her office mate in Tokyo was the woman who is now my wife -- a Japanese woman.

So when she was brought to this country as a local employee trainee, we invited her to stay with us. The staff in the Nagoya office had very little use for Alan Carter, and she said whenever the word was out that Alan was coming down, everybody spent the afternoon before picking up all the papers off their desks and locking them in the safe, leaving the desks clean; then, when Alan left, they brought them all out again to work.

CUMMING: Well, I can believe that because this is the way he operated. He did not like -- he would come, and if he saw papers on the desk, he wanted to know what they were doing.

Q: Yeah.

CUMMING: He didn't care whether you were a Japanese national or whether you were an American. I mean he just would not -- that, to him, was just -- of course, the building was rather weird -- I thought it was kind of fun except for the downstairs. But you got sort of used to it, the way he painted it. But we also had an Exhibits Officer who was very modernistic and, of course, he would do all this, too. It was all changed when Bill Miller came because Bill came and revamped the whole thing.

But I think it was -- because I was in Rome I think until '74 -- and then I went to Tokyo, and I was there just two years, and then I went to Belgrade after that.

Q: Was John Clyne in Tokyo when you were there? He would have been the Executive Officer.

CUMMING: No, but John Clyne was in Washington. John Clyne was the Deputy Personnel Officer. Wasn't he deputy to...

Q: I think he was head of Personnel's East Asia section.

CUMMING: Yes, okay. I met him in Washington at that time. He had been in Bonn, and when I was going to Bonn, he then gave me some information on Bonn.

Then John went back to -- but John Clyne had been -- no. I'll tell you -- Fred Hawkins was my...

Q: Oh, Fred Hawkins.

CUMMING: Yes. You know him from the USIA.

Q: Yeah, very well. John had been to Germany as Deputy PAO before he went to Tokyo. Then he went to Tokyo for a second tour where he was Executive Officer again. Then he came back to Washington and was put in the personnel assignment, which he thoroughly disliked.

CUMMING: Yes. He hated it.

Q: Finally, they said, well, you can go back to Germany if you want to, but you will have to go back as Executive Officer.

CUMMING: Yes.

Q: He said, well, I would rather do that than stay here, so he went back to Germany. That is where he was when they diagnosed him with his cancer.

CUMMING: Yes, exactly. But I met him in Washington when he was working with Angie.

Q: While we were talking about Tokyo before we temporarily went off the tape, do you have anything further that you want to refer to as taking place in the Tokyo program while you were there? I know we had a big Fulbright program.

CUMMING: You know my mind is blank. I can't even think who our Cultural Affairs Officer was. I can't even think in my mind where they sat. I've got the whole information section, but I can't even -- and the exhibit section. Isn't that strange.

I'm sure we had Fulbright. I'm sure we had a student program. But my mind is -- sorry. I can't tell you, but I am sure Alan Carter would be working with students, and we would have had a program because he was very youth-oriented. I'll tell you.

Q: Yes. He got that from the Bobby Kennedy/Ted Sorenson connection.

CUMMING: Yes, because he was very much for young people and for youth. So, I am sure we did. My mind is -- I am sorry it is a total blank now.

Q: Do you have anything further that you want to say about Tokyo?

CUMMING: No, I don't think so.

ROBERT B. PETERSEN
Executive Officer, USIA
US Pavilion, Okinawa's World's Fair
Okinawa (1974-1976)

Mr. Petersen was born and raised in Ohio and educated at Oberlin College. He entered the USIA Foreign Service in 1965 and served as Public and Cultural Affairs Office in Embassies or Consulates in Vietnam, Malaysia, Japan, Mauritius, Israel, Morocco and Cote d'Ivoire. He also served in several senior USIA positions in Washington, D.C. Mr. Peterson was interviewed by Charles Stuart Kennedy in 2001.

Q: You were in Japan from '74 to when?

PETERSEN: I left again in '76. I went to Okinawa and set up shop in a Hilton hotel. If I wanted to sum it up in a couple of sentences, I could describe the whole expo. It's like the circus coming to town. You go in, you put the tent up, you do the show, take the tent down, and away you go. That describes to some extent what I did. I was the executive officer. The person in charge of the pavilion was hired from outside the Agency, Allen Beech from Seattle, who had had experience working at international fairs in different capacities. He was hired to be the pavilion manager. As a deputy, the Agency provided him a fellow named Nikita Gregorovich Barski from USIA, a career employee. I was the executive officer, handled the administration, which included personnel, security, maintenance, and so forth. Quite a change for a public diplomacy specialist. When I got to Naha, I think I was the third one to arrive. Al Beech was there. Nik Barski was there. When I left in '76, I was the last one to leave, turned out the lights. It included tearing down the site and returning the land to the same contours that it had before the pavilion was there. It was an impressive building. It was modular in design. We had an administrative module and about seven exhibit modules, one that had to do with weather forecasting using satellites over the ocean, another that was all about deep sea drilling. In one module, we had a huge saltwater aquarium. In addition to the fish, we would have people go in with television cameras and they'd be filming the artificial reef and filming the fish. We'd have monitors outside showing what the people were filming inside. It was very interesting. From late '74 until sometime in late spring of '76, I was attached to the pavilion. We had 75-80 employees, maybe more, who were direct employees. I had security and maintenance teams who were just contractors who were hired. It went smoothly to the visiting public and was very impressive. Of course, behind the scenes, it was just an incredibly mixed up, challenging thing to provide support, see that the pavilion was constructed according to plans, that the exhibits got there, were installed properly. I continued recruiting personnel once I got to Okinawa. My first couple of months there, a lot of time was spent on that, interviewing and hiring appropriate personnel. I did not hire some of the technical people, the people doing filming. I certainly didn't have anything to do with hiring anybody involved in construction per se. That was all done under a blanket contract. It was mainly to hire guides and administrative staff, support personnel. I hired a librarian to set up and run our library at the pavilion.

Q: How did you find the interaction? Okinawa is out in the boondocks for most Japanese.

PETERSEN: One of the reasons for having the exposition there was to help with Okinawan development. Reversion had occurred in '72. The Okinawan prefectural government and the Japanese national government, was looking for ways to develop Okinawa. It was felt that tourism could, would, and should play a major role in Okinawa's economic future. It was felt the International Expo. would be a good way to kick off an effort to increase tourism to Okinawa, both Japanese and international tourism. But also it fit in with road building, developing roads to the center of Okinawa and into Nago and out to the Motobu Peninsula, where the exposition was placed. All sorts of infrastructure upgrades, not only such things as roads, communication upgrades and so forth, but beautifying Okinawa, planting the palm trees along the highway and doing other things to really make it attractive to tourism, building additional hotels, increasing hotel space, restaurants, and so forth. It was all designed to not just ease the way into increased tourism, but to really jumpstart tourism to Okinawa. Behind the scenes, for us, it was a real

challenge to not only get it constructed but to put appropriate exhibits into the pavilion. Congress provided what could be described as seed money. But to have exhibits and so forth was dependent on going out and going to organizations and getting them to donate exhibits or material that could be used as part of exhibits. Lockheed provided something that occupied all by itself one of the modules, a model of a future floating city that showed how you could have a self-contained thing that a few thousand people would live on. It used the thermal difference in the temperature between the surface water and deep water to set up a circulation that powered this floating city. It was a grandiose, greatly expanded floating oil derrick. It was a model made out of plywood or something. It showed how such a thing could operate. The Jansen company was approached and provided some of the costuming for our guides. Bayliner provided a boat to us. We had a nice inboard-outboard 28-foot Bayliner. I'll tell you a funny story. From the company's point of view, it was an opportunity to show off one of its products to people who would see it in the midst of this exposition. I was an executive officer, so I guess you could call me a bean counter. My fellow bean counters back in Washington took a jaundiced view of this and were disturbed that we had this boat on our inventory there. There was discussion about how it would not only be used for representational purposes by the commissioner general of the U.S. pavilion but that it would be available for emergency commuting from near Kadena Air Base up to Nago when the roads were not passable because of construction and so forth. It may have been used that way a couple of times, but it was a several hour trip by boat, much longer than going by highway when the highways were open.

In any event, at one point during the exposition, word came down from Washington that we had to get rid of that boat immediately. We got rid of it just prior to the end of the expo. Somebody in Washington was disgruntled that we had that boat there. I had to find a buyer and sell the boat.

Q: Did you find that you were bringing in Japanese tourists?

PETERSEN: The expo was a bust financially. People who invested money, the collateral people, not the official exhibitors, of course, the big company, Mitsubishi, had a nice exhibit there, and other major companies did. It must have been part of their marketing budget and they accounted for it as marketing. People like us, it was an expenditure for our government, the seed money. For some of our exhibitors, I don't know which ones, there was a marketing benefit. But the people who invested money in restaurants, hotels, and particularly souvenirs didn't make out very well. I know some of them were extremely disappointed. They said that the estimates about the projected number of visitors had been highly inflated by whoever was originally in charge of conceiving the idea of the expo. There was a lot of disgruntlement by businesspeople.

Q: Looking at it from a distance and not knowing the territory, I would think you've got Okinawa, a relatively poor area with not a huge population. You'd have to rely on a lot of Japanese particularly flying down there. I wouldn't think Okinawa would be the place the Japanese would fly to.

PETERSEN: The number of visitors did not reach the projections. There are lots of reasons and explanations, everything from the general state of the economy, to the remote location, but it's true that it was not an expo that provided a lot of monetary benefit to people who invested in the collateral parts of it.

Q: I realize you were really tied up with the Expo. Okinawa had reverted to Japanese control just a few years before. How was this working?

PETERSEN: Aside from just a brief airport visit once on my way to Malaysia in '68, I had not been in Okinawa until I arrived again in '74. The return of Okinawa to Japanese control had been in place for a couple of years. There was still a rather healthy expatriate American community there. People were involved in business, many of whom supported the American military presence, a few who had branched out and were just a regular part of the Japanese economy. I got to know quite a number of them very quickly because we turned to them for some services, some work that we needed at the pavilion as well as just general guidance as to what was going on in economic and business sense in Okinawa. But a few things stand out. One time, an American schoolteacher who taught in the military school system there for many years, said to me at a social event, "This was terrible, this reversion. This was a number one territory that the U.S. needed. We'd developed it. We should keep it." I remember looking askance at her and thinking, "I never thought I'd hear..." She was a schoolteacher but employed by the military system, so technically she was a U.S. government employee. I was surprised to hear a fellow U.S. government career employee talking in that fashion. I heard echoes of that from a few other Americans who were irate and felt that we had done so much and that our contribution to developing Okinawa was not appreciated. These people said to me, "Every Okinawan wanted to remain part of the United States." I was thinking, "Oh, are you out to lunch. What nonsense!" I forget the technical word for someone who wants to hang on to a territory that way. I heard a few stories told half humorously about the bumpy transition to Japanese control. One of them might be an urban legend about a Japanese businessman who was visiting Okinawa and was caught speeding in his car. He told the policeman, "You have no right to arrest me. Okinawa belongs to Japan. I'm a Japanese. You can't do this." He was talking to an Okinawan Japanese policeman supposedly. I'd hear stories like that. I heard a lot of nonsense, frankly. I did not observe any significant difficulties, wasn't really aware of any.

Q: Recruiting from former missionaries, did you have any problems with them reverting back to missionary reflexes?

PETERSEN: Wanting to prosthetize, they'd go out and spend their free time going door to door? No. That was not an issue. I don't know the number of former Mormon missionaries we got in, probably six, certainly fewer than 10 out of the total number of guides that we had. We had quite a diverse group. We ended up recruiting quite a number of people who had grown up in Okinawa, sons and daughters of longtime residents, people who had U.S. citizenship but who had grown up and lived in Okinawa, gone to American schools there and were fluent in Japanese. Our guides were divided into different groups. Some were the outside greeters. All the guides were costumed. Some of them on the exterior were welcoming visitors and would be dressed in American colonial costumes, the men in the colonial seaport look. We had some models and displays of American sailing ships showing the development of seafaring technology in the U.S. from the first years of the Republic. The women guides were dressed in colonial period, something like hoop skirts and bonnets. Inside, depending on the location, we had some people dressed as oil-rig people with hardhats and so forth as they'd look if they were working in oil exploration. Others in the modules having to do with future technology were dressed in

futuristic costumes. It was quite a diverse group of men and women as our guides.

Q: In '76, you moved on. Did the fact that the fair was sort of a bust carry over?

PETERSEN: It did. Having been associated with it didn't work to my advantage in terms of a corridor reputation. At the same time, it would be greatly exaggerated if I suggested that was some significant impediment to me in any way. You know how it works in Washington. You come back and meet somebody on the elevator and between three or four floors you exchange your recent vita. If you've come from a hotspot and done something, you get off the elevator and that person's mind says, "Wow! So-and-So is up to great things and just continuing with his stellar career." If I said to somebody, "Well, I just got back from this expo, it wasn't the greatest thing in the world." They'd think, "Petersen's on a downward slope." But it was a frustrating, difficult experience.

I was the last person to leave the expo staff. We finished it in January of '76. All the others had departed over a period of many weeks. Come late spring, I was still there returning the last of our equipment and vehicles that we'd gotten on long-term loan from the U.S. military.

There is a little interesting sidelight. Congress provided seed money but we had to go around and get donations in order to make this thing work. In one sense, we were living hand to mouth. We needed a fleet of vehicles. When I got to Okinawa, it was arranged that we would borrow them from the U.S. military. I went over and in a series of meetings with some of the DOD people worked out an arrangement where we were going to be provided with six passenger vans.

This technicality was that the rules of participating in the exposition were that you had to import the things you were going to use. Other countries that were participating had to purchase an imported vehicle or actually physically import vehicles that they were going to use for their pavilions. No one else had a military presence on the island. I patted myself on the back for being able to figure out a bureaucratic way of dealing with that. We took those U.S. military vehicles and technically exported them out of Japan and then reimported them a few seconds later with the appropriate paperwork. We weren't doing anything dishonest and we weren't doing anything that the Japanese didn't agree to and know fully well what we were doing. We imported the vehicles for the use of the U.S. pavilion on paper. But then we took the vehicles and had them all repainted from the olive drab and painted over any identifying marks of the military, painted them all white, and then had the USA pavilion logo stenciled on the sides of the vehicles. It made a very handsome fleet of vehicles. When I left, I had to go through the whole thing again, export those vehicles and have them reimported by the U.S. military. I dropped them off at some military lot. Presumably, they repainted them back to olive drab again and put them back into use. We did that with a number of things.

There were all sorts of things that I went through in dealing with personnel, security, and shipping. I'm often asked about what it was like to work in Japan and I sometimes use as an example my experience negotiating a shipping contract, which I did shortly after arriving in Okinawa while we were still housed in the Hilton Hotel and using the Hilton as our office base. All the pavilions, all the national exhibitors, had to have shipping contracts to have things shipped in, as did we. I went into this and the negotiations took a couple of weeks. It was an

elaborate and not unsatisfying act that we went through sitting down with the team, never fewer than five or six people across the table from me from the Japanese representing the expo organizers. They offered us an array of potential shipping companies that had been approved by the expo organizers. I was free to select among them. I knew going in prior to the first meeting that they knew which one they wanted me to pick and I wasn't sure they knew that I knew they knew. But we went through these long negotiations. At the end of it, although we talked in great detail about what would and wouldn't be covered, what the fees would be, could we get a discount here or there. I'll never forget standing up, reaching across the table and shaking hands and knowing in my heart of hearts that, yes, eventually we're going to put pen to paper and sign the contract but this thing was going to work because I was dealing with a Japanese company whose reputation was on the line and once the handshake took place, that was it. There would be no deviousness on their part, nothing unfulfilled. They were going to make sure that we were happy. I also knew or suspected that everybody on the Japanese side knew the outcome before we began, certainly which of the companies I was going to be steered to. I felt we got a very good deal on the shipping contract. The same thing happened on contracting with the security company to provide a staff of guards. I enjoyed it. I since have had some experience negotiating with American companies and sometimes there can be a big difference. But there was this certain sense of honor and confidence that I could really trust. I knew the outcome would be good and indeed it was. We never had any problems with any of the Japanese companies that we dealt with. We had problems with some American companies, but not the other way. But I don't want to come across sounding like some naive Japanophile here. It's not that. But it was an interesting process, the negotiations.

RUSSELL O. PRICKETT
Deputy Economic Counselor
Tokyo (1974-1976)

Mr. Prickett was born and raised in Minnesota and attended Hamline University and Harvard Law School. He entered the Foreign Service in 1959. During his career he held posts in Switzerland, Yugoslavia, and Japan, also working in the State Department's Office of Economic and Business Affairs and Trade and Finance Division. Mr. Prickett was interviewed in 1999 by Charles Stuart Kennedy.

PRICKETT: Then I went to Tokyo, and as I said, I didn't have a chance to learn Japanese before going, and Japanese language study was a long, long course. I had to make do with an hour a day while I was on the job, and most of us couldn't always make time for that hour a day, either. So I learned to say *biromo itan kurasai*, which means 'another beer, please.' And some other things that sound very, very Japanese but basically mean 'driver, please turn right at the next signal.' But I did learn enough Japanese so that I was able to take my kids and a bunch of other teenagers to a ski resort up in the mountains, and I was the only one there with any Japanese at all. But in the land of the blind, the guy with one eye is king.

Q: *Well, that was how many years, Tokyo?*

PRICKETT: I was in Tokyo '74 to '76. It was to have been a three-year tour, but my second wife left and came home after, I think, a year and a half or so, and so I curtailed my tour and came back to the States after two years in Japan. But it was the Far East. I got to travel a bit. I got to Taiwan and Hong Kong and to the Philippines.

Q: *You were in the Economic Section, or were you running it?*

PRICKETT: Yes, let's see, I was deputy economic counselor.

Q: *Oh, well, you were moving right along.*

PRICKETT: Yes, and I had just been promoted to O-3, just before leaving the Department. And my predecessor was a Class 3 officer, and I think he had made 3 in that job. So it was not a bad job. On the other hand, I was writing the Economic Trends Reports on Japan, and I had been writing the Economic Trends Reports back in Belgrade from '64 on, so here I was ten years later doing essentially the same thing.

Q: *For a bigger economy.*

PRICKETT: Bigger economy, certainly a more significant economy in the world, of more impact on the United States, and I had supervised four or five officers in Washington, and I had three or four officers to supervise in Tokyo. I had a very high batting average getting promotions for my people. One year in Washington I got three out of five, and one that I didn't get had just been promoted the previous year, and it was essentially the same thing in Tokyo. I was always really happy when I could get people some recognition for what they had been doing.

Q: *And who was ambassador and DCM?*

PRICKETT: The DCM was Tom Shoesmith. Tom Shoesmith never got an ambassadorial appointment. I think he was cross-wise with some folks up on the Hill.

Q: *Yes.*

PRICKETT: I believe they eventually gave him the consul general job in Hong Kong.

Q: *Oh, that's not bad.*

PRICKETT: Not bad at all. It's better than a lot of ambassadorial jobs, no question about it.

Q: *Of course it is. He was a Far East expert.*

PRICKETT: Yes. And let's see. The ambassador was a guy from Minnesota, as a matter of fact, who'd been at the University along with Eric Sevareid and Bud Schulman and a bunch of people. He was a former Secretary of Labor and a very genial fellow. We got along great. We talked about the Minnesota Mafia. He did some very nice things at the embassy, and he ran basically a

happy shop, and it was fun serving under him. And he would come back from consultations in Washington saying, “They see things as very quiet out here, and they just want us to keep it that way.” We had an era of good feeling with the Japanese at the time.

Q: *Trade was in balance, was it?*

PRICKETT: No, but the deficit wasn’t intolerable, either.

Q: *Was this the time of the Japanese economic boom?*

PRICKETT: Yes, it was. Now let me think. I think they were. . . . No, I think they were in recession, which meant they had annual growth of about three percent, we were all wishing we could have a Japanese recession. The dollar was sometimes over 300 yen, which is a lot of yen for the dollar, and still, the Japanese restaurants were so expensive that you had to read the menu outside the door before you set foot because you could go broke in a Japanese restaurant.

Q: *So that didn’t make life very comfortable.*

PRICKETT: Well, there were plenty. You could go to the Yakitori places and you could go to the noodle shops, and there were nice restaurants, and we had very good Japanese staff who could give us good advice on these things. And we could travel. We had to drive on the left side of the road, or we could take the bullet train — that was fun.

Q: *And housing?*

PRICKETT: We lived in embassy housing that had been built right after the war. Our embassy had very, very valuable property right in the heart of Tokyo, and I had a four-bedroom apartment in New House. I was there with my second wife and her two little boys and my oldest daughter, and we had four bedrooms, which was the biggest of the apartment buildings. All of that now has been replaced with other buildings.

If you entertained, why the Japanese were amazed at how much space we had because they lived in such small digs themselves. And after my second wife went back to the States, I did some bachelor entertaining, and we had a balcony where I could put my charcoal grill. Beef was terribly, terribly expensive, and we had access to commissary beef, so I would always do a London broil if I was entertaining, and that went over great with the Japanese counterparts.

There was, again, an English language theater group over there, TIP, Tokyo International Players. I did some Shakespeare and some other stuff with them. And while I was there I formed a little chorus that went around and serenaded various ambassadors. The Embassy Recreation Club owned a bus, and so when we got our group of carolers together, we were able to take that bus, and we didn’t have to fight parking problems or anything, and we went on two different evenings, I think, around and sang Christmas carols at the various embassies around town, and we wound up at our own ambassador’s place. He was in the residence where MacArthur had lived, and had a big, big, almost like a medieval hall, where MacArthur had had his desk at one end of it, and people who approached him had to come the whole intimidating distance of that

long hall, which had, you know, nice beams and rafters atop it all.

Q: *What about MacArthur? How is he revered by the Japanese at that stage? Was he still the great hero?*

PRICKETT: Oh, yes. Very much, very much. And we were considerate, and we had been very considerate of the Japanese. The predecessor — doggone! Why can't I remember our ambassador's name? But his predecessor was Edwin Reischauer, who was the great Harvard Japan scholar married to a Japanese woman. And so the Japanese knew that we had been very thoughtful. Again, it was Jack Kennedy who appointed Reischauer to that one. He was able to get some very fine people working for him in important positions.

Oh, I found out some of the backstage stories about how my friends in the International Organizations Bureau had let me down up in New York from a Japanese counterpart who had been there at the time. He told me that the guy, an old AID hand, sponsored by IO, had been actually absent from the chair of the Committee of the Whole in the Economic Committee up in New York — had been absent from the chair when a bunch of stuff went through that later was so embarrassing to us down in Mexico and elsewhere. But he just couldn't be bothered with it. That was a little late to find those things out.

Q: *Well, but that's good to know.*

PRICKETT: Yes. I guess because of my previous experience, I had the job of liaising with the Japanese on international multilateral economic matters. And I was able because with this one guy that we had shared some experiences with before, I was able to find out what the Japanese were planning to do and so on. There was in it a bit of embarrassment. We had a very able Agency station over there, and it seems that they had some folks in the Japanese Government that were telling them things, and they were getting some second-hand information about what the Japanese delegation was going to advocate when they went into some of these multilateral meetings. Sometimes their stuff was wrong. Sometimes they were getting it second- and third-hand from inside the ministry. I complained about it, and nobody thought we ought to fuss with the Agency about it, so we didn't, but my analogy was — and somebody said — “Well, you know, isn't so-and-so responsible for this?” No, I'm responsible for it. And so-and-so, of course, was a reserve officer, had a reserve commission, *et cetera*. I said, “It's damned embarrassing when you go right up to the front door and you ring the bell and you present your credentials and you go in and you ask, in all honesty, what are your plans here, to find that somebody else has been skulking around to the back door trying to sneak information from the servants.”

Q: *Yes.*

PRICKETT: And that kind of thing I'd heard echoed from colleagues, you know, with experience elsewhere. I remember a friend who had served in Panama said that he couldn't get people to talk to him because other people were paying him to talk to them — and this was when we were into the Canal negotiations. And that can poison the wells of information.

JAMES D. HODGSON
Ambassador
Japan (1974-1977)

Ambassador James D. Hodgson was born in 1915. He spent 25 years as an executive for the Lockheed Aircraft Corporation. He was Secretary of Labor during the first Nixon administration and was appointed ambassador to Japan. Ambassador Hodgson was interviewed by Hank Zivetz in November, 1988

Q: Mr. Ambassador, you were appointed and confirmed as Ambassador to Japan in June of 1974. Why were you selected and why Japan?

HODGSON: This was a subject that puzzled me because I had very little experience with respect to Japan. I knew nothing of the Japanese language. I admired the Japanese people, and as a West Coaster, I took more interest in the Asiatic side of the world than perhaps most people would. But other than that, I really felt I had no credentials.

I learned, however, that I became Ambassador because of an unusual combination of circumstances I will outline for you. When Mr. Kissinger was appointed Secretary of State after Bill Rogers, he wanted an experienced executive to run the Department while he handled the geo-political policy aspects. He sought Bob Ingersoll, who was then Ambassador to Japan, to come back to become Assistant Deputy Secretary of State. Bob resisted at first. The Japanese didn't want Bob to leave because they liked him. However, Henry insisted he needed Bob, so Bob eventually accepted.

Henry, being sensitive to Japanese displeasure with what he had done, asked the Japanese to outline for him the kind of a person that they would to see appointed Ambassador. They had four requirements. Number one, they wanted somebody who knew all the top people in government so they wouldn't be prisoners of the bureaucratic chain of command, someone who could go directly to and get responses from higher sources. Second, they felt that their nation was essentially economic in character, so they wanted somebody who was strong in the economic aspect of life, particularly somebody who had been in business, if possible. Third, they wanted someone other than a Foreign Service Officer. They had had bad luck with one or two Foreign Service Officers, and finally, they said, "We're an unusual culture, select somebody who is people-sensitive."

Later, Kissinger was having a conversation with the President and Secretary Shultz one day and said, "Where shall I find somebody like that?"

Shultz says, "That sounds like a tailor-made job for Hodgson."

Of course, I had worked with Shultz while he was Secretary of Labor and Secretary of the Treasury, so he knew my background. He knew I knew everybody in Japan because of the Cabinet-level meeting I attended between the U.S. and Japan. He knew that I had come out of the "personnel business," so I would be people sensitive. I just seemed to fit the requirement.

Henry said, "But, of course."

And that's how I became Ambassador.

Q: Interesting. Could you tell us a little bit about your background?

HODGSON: Well, I spent, after college, the first twenty-five years of my life as an executive for the Lockheed Aircraft Corporation. Largely in personnel, labor relations and administrative activities.

It was because of that background that, when Secretary Shultz was made Secretary of Labor, he asked me to come back and be Under Secretary. When they promoted Shultz to become head of the Office of Management and Budget, they tapped me to become Secretary of Labor. So I was Secretary of Labor during the first Nixon Administration. Following that, the events I've just described occurred.

Q: Thank you. In October of 1974, a former U.S. Admiral, Jean LaRoque, contended that nuclear weapons were stored aboard U.S. naval vessels porting in Japanese harbors, in possible contravention of the U.S.-Japan mutual-security treaty. What was the American Embassy strategy to counter the public furor that arose in Japan after the LaRoque statement?

HODGSON: Actually, there had been a claim of that same nature made either by a Japanese source or an American source approximately once every six months since the middle of the 1960s. The claim was nothing new. So it was simple to restate the American policy on the subject, that is, to never confirm or deny the existence of nuclear weapons at any place, at any time.

Q: It was charged that there existed a secret agreement. Did the Embassy respond to that at all?

HODGSON: Well, that same charge had been made several times. There was nothing new about LaRoque's charge. So the subject did not become a major issue in Japan. It was a one or two day story and then dropped. So there was no need to devise any special strategy for that occasion.

Q: Shortly afterward, there was an announcement that President Ford would be visiting Japan. Using the nuclear issue as an excuse, more than two million Japanese were said to have demonstrated throughout Japan against the Ford visit. Did you find that there was similar hostility or second thoughts on the part of some people in government in Japan at that time?

HODGSON: No, none whatsoever. Let's go back a bit. Demonstrations against the United States had been long-standing, a standard behavior pattern of activists and leftists in Japan. From the time Mrs. Hodgson and I arrived in July of that year, they continued right up until the visit of President Ford. President Ford's visit was so uniformly successful and so widely acclaimed that immediately after that visit, all these demonstrations stopped, and there were no further problems with the leftist Japanese press.

Q: So the Embassy's position, if I understand you correctly, was to generally ignore?

HODGSON: No, it was just to continue policy positions that had been laid down earlier and to resist further pressure to elaborate on them.

Q: I see. From what I read, they made a lot of a demonstration in Kyoto at the time of the Ford visit. Was this overstated, or was there any real concern at the time?

HODGSON: During the Ford visit, there were practically no demonstrations. I spent a day and a half with him in Kyoto. No demonstrations were then discernible to the President or to his entourage. If there was a demonstration, it was held privately in some part of Kyoto where the presidential party did not visit.

Q: Very soon after President Ford's visit, Tanaka resigned. What was the American Embassy reaction to this resignation and the charges that accompanied it?

HODGSON: My first reaction was to be puzzled. So I sought out the then Vice Minister of Foreign Affairs, Mr. Togo, and told him I needed to get an explanation.

He said, "Okay, let's have lunch."

At lunch, I put the question to him, "Why did the Prime Minister resign?"

He said, "We have an old Japanese proverb."

"And what is the proverb?"

He replied, "The proverb is 'a nail that sticks out gets hammered down.'"

What he meant was that the Prime Minister had become too assertive and too dictatorial by Japanese standards. So they forced him out of office.

Q: Togo was obviously not a member of Tanaka's faction?

HODGSON: He was a member of the bureaucracy, the superb Japanese bureaucracy that runs all their ministries.

Q: But Tanaka had a very effective faction?

HODGSON: That's right. He continued to have one even after he was no longer Prime Minister.

Q: Yes. Just shifting a little bit. We'll come back to Tanaka. In September of 1975, a group of Japanese Democratic Socialists visited Washington. How was this trip arranged? Was it on their initiative or the Embassy's initiative?

HODGSON: Previous to that time, the Democratic Socialist Party had not particularly

cooperated with the LDP running the government. They had been members of the opposition. When President Ford visited Japan, he made a point of seeing not only the party that was in power, but the head of the Democratic Socialist Party. Later, the head of the party asked whether it would be considered appropriate for him to visit Washington, and the Embassy arranged that visit.

Q: Did you accompany this group?

HODGSON: No. I only accompanied officials of the government when they came to Washington.

Q: I see. Now, how much contact in this period did the American Embassy have with political parties other than the ruling LDP?

HODGSON: Very considerable, with all parties, with the exception of the Communist Party. I became close to Daisaku Ikeda, who was the head of the Komeito Party, the so-called "clean government" party. I admired the idealism with which he pursued international peace and the intellectualism he displayed in that pursuit.

Second, I became on speaking terms with the top people in the Socialist Party and with the top people in the Democratic Socialist Party. You see, I had been Secretary of Labor, so the labor movement in Japan was something in which I had a great interest. Thus, I spent a good deal of time with top labor people, most of whom were in the Socialist Party.

Q: In your view -- this is going off and projecting perhaps -- did you see the possibility of the socialists ever achieving power or any party breaking the hold of the LDP in Japan?

HODGSON: Not until they adopt positions that are realistic with respect to running the government would this be a possibility. At the present time, and in the last twenty-five years, all they have been able to do is to muster a series of negative positions, rather than developing a program for governing. They do not feel they are in a position to develop such a program or have enough support to do so. I don't think there is any possibility of them taking over until they change.

Q: During your tenure in Japan, were there any special Soviet overtures toward the Japanese? Was the issue of Soviet influence in the area a major one during your tenure?

HODGSON: It was a significant one but not a major one. You will remember this was a time of detente in our relationship with the Soviet Union. In Tokyo, I had developed a good relationship with the Soviet Ambassador, who, at that time, was the dean of the Tokyo diplomatic corps, Oleg Troyanovsky. He later became Ambassador to the U.N. We exchanged visits. I was able to arrange appointments for American journalists to meet with him.

But with respect to the relationship between the Soviet Union and Japan, Ambassador Troyanovsky's principal objective was to build the economic relationship, and he was successful. He doubled the level of trade between the two countries during the time he was there.

There was, at that time, as there is today, deep resentment on the part of the Japanese for the Soviet occupation of four islands north of Hokkaido. As long as the Soviets continue to occupy those islands, it will be difficult to have anything approaching a really amicable relationship between the two countries.

Q: Would you say that American interest in Japan was, at that time that you served there, more in the economic sphere than in the political sphere?

HODGSON: I thought it was mostly geo-political. The economic sphere was very smooth during my time. This was, if you will remember, the mid-70s. It was a period when in no single year was a trade deficit as high as \$2 billion. Today the deficit is in the \$50 to \$60 billion range and has become a real problem. So there were then really no major economic arguments between us.

There was a major effort on the part of the Japanese during this period to cut back on protection they had provided their infant industries. The American trade relationship with Japan, because they were taking such positive measures, was an unusually good one.

Q: Was it so good that there was little indication of what lay ahead? Was there any indication that you can recall?

HODGSON: Yes, during my last year, there was such an indication. Mr. Nakasone, who at that time was Cabinet Secretary, took me aside one day and said that the projections that had been made for the trade deficit for 1976 probably were going to be wildly wrong. Instead of the deficit being at about the billion and a half level, it would be up around the \$5 billion dollar level. I knew from previous experience that such a deficit could become a very serious problem, so I made a great effort during my last few months there to convince officials like Prime Minister Miki and Prime Minister Fukuda that they were flirting with danger by letting the trade deficit get out of hand.

Q: Did your reports to Washington evidence this concern?

HODGSON: Yes, not only my reports to Washington, but if you'll remember, this was a period when Arthur Burns was the head of the Federal Reserve. He came through Japan. Arthur is a long-time friend, and I spent a good deal of time discussing it with him because he would be in a great position to spread the gospel back in Washington.

Q: Well, obviously, that wasn't done, or at least it wasn't heeded. Can you say that?

HODGSON: Well, as to what happened after I left there and why it happened, I'm not certain, but the United States, in pursuing its basic policy of free trade, evidently was willing to allow the deficit to reach levels I had not expected it to allow.

Q: The argument today is made that what we want is a level playing field. Did you feel at that time even that we were operating on a level playing field vis à vis the Japanese trade restrictions?

HODGSON: Well, both sides want a level playing field. The problem is each side wants the playing field to be their's. What we have is a situation where the Japanese would like to see everybody play by their rules. We would like to see everybody play by our rules. The level playing field argument really doesn't mean a damn thing as far as solving the problem is concerned.

We've got to find out in the years ahead what the new international economic world we now live in needs in the way of rules that everybody can live by. They probably won't be the rules of any one country. Some adaptation will be made of all countries. I think that this is one of the most unresolved, long-term issues.

Q: Thank you. Now we come to something that has intrigued me -- the Lockheed scandal. You had been an executive at Lockheed and now the American Ambassador in Japan at the time the scandal broke. How did this affect your performance?

HODGSON: Well, it obviously had a potential for being very embarrassing. But two things were very fortunate in these circumstances.

Number one, I had been in Japan more than a year. I had established what kind of person I was, the kind of trust that could be placed in me and my objectivity in dealing with issues affecting our two nation relationship.

Second, at the time of the hearings in Washington where the Lockheed scandal broke into public view, a question was asked of the man from Arthur Young, who was the principal testifier, the man who had audited the Lockheed circumstances and disclosed the payment to the Japanese that was the essence of the scandal. He was asked, "Do you have any knowledge of, or in your investigation, did you find any evidence that our Ambassador to Japan, who at one time was a member of the executive corps at Lockheed, knew of or had anything to do with this matter?"

His answer was, "None whatsoever."

Further hearings were held in executive session. I appeared before the Church Committee, and they properly concluded I knew nothing about this matter -- that it occurred at a time when I was not at Lockheed but was serving the government.

Q: Did the media press this with you?

HODGSON: No, that was a wonderful thing from my standpoint. The media treated this in a very straightforward way and did not editorialize on it. In fact, I got great support from the media.

Q: I wasn't aware of this until I did the research. It undoubtedly made you uncomfortable.

HODGSON: It made me uncomfortable for about the first month after the story broke because I didn't know, first, how the Japanese media and people would react. Second, how it might change

my relationship with the Japanese Government. It didn't change that relationship in the slightest, and after one month, my role in the story became a non-story in Japan.

Q: Did it affect the relationship between American businesses in Japan and Japanese business and Japanese government? Was there a spill-over?

HODGSON: I believe not. In fact, during the year in question, 1976, there was a significant increase in the business relationship and level of trade between the two countries.

Q: During your entire tenure as American Ambassador to Japan, which issue was considered the most important from the American perspective? Was it the Japanese defense posture, for example? I know that we've always been after the Japanese to increase their expenditures for the military. We talked slightly about the growing trade competition. In your view, what was the major focus of your tenure?

HODGSON: I arrived in Japan in 1974, when the Japanese were very upset with the Americans. They had experienced what they called "three Nixon shokku," three shocks that Mr. Nixon as President had inflicted on them. They felt Japan was a friend of the United States and hadn't been treated like a friend.

The three shocks were these: first, they had been told that if we were going to open a relationship with China, they would be involved in consultations before that occurred. They were not involved in consultations before it occurred, however. The first they knew about it was when Kissinger was already in China. So they were upset by what they considered a breach of an agreement.

Second, the August 1941 economic measures adopted by the Nixon administration included a 10% surtax on all imports from all countries, including friendly countries like Japan. Japan could not understand that.

And third, shortly thereafter, we clumsily installed a soybean export embargo. Japan depended on the United States for about 80% of its soybeans.

As a result, they were upset by all these things. In effect, they felt the United States no longer loved them.

So my first job over there was to re-establish trust and assure Japan that these shocks had nothing to do with a desire to change the relationship between the United States and Japan. In other words, my objective was to restore the relationship to an amicable, business-like, friendly bond.

I faced a unique situation. For years, the *Asahi Shimbun* newspaper had run a biannual survey of Japanese attitudes. One of the questions asked was, "To which country should we, Japan, be the most friendly?" Every year, until two years previous to my arrival, the United States had been the country so designated. After these Nixon shocks, however, the United States fell into secondplace ranking after the PRC. After President Ford's visit, a new survey was made. This time the United States was again back as number one.

President Ford was the first President in history to visit Japan while in office. Japan was the first country outside of the continental United States he visited. The visit showed Japan that he and America valued their goodwill. The U.S.-Japan relationship thus got back on track.

So my biggest challenge was to get our relationship re-established on an amicable basis. That was accomplished with two events -- President Ford's visit to Japan and the Emperor and Empress' visit to the United States the following year.

Q: You accompanied the Emperor to the United States, and you would say that that was a major factor?

HODGSON: I have never been so proud of my countrymen. You can't control American behavior. No one can predict how they are going to react. This era was, if you will recall, during the tag end of a period of activist unrest in our country. I had no way of predicting whether the Emperor would be met with placards and demonstrations or how he would be treated.

Actually, the Americans, in every city we went to (there were eight of them) and at every stop we made, greeted him in a dignified, gracious way. The trip was a conspicuous success. It probably did more to cement our long-term relationship between the two countries than anything that's happened before or since.

Q: It's rather sad today to be seeing the newspaper accounts of how they are keeping the man alive. I feel distressed myself. I have a feeling that maybe they should let him pass away.

HODGSON: Well, it certainly is a testimony to the efficacy of the state of Japanese medicine at this point in history.

Q: Whenever people talk about the Japanese economy, anybody who has any knowledge of how it operates brings up MITI, the Ministry for International Trade and Industry. In your view, how much influence has MITI had on the course of the Japanese economy?

HODGSON: Tremendous influence, for reasons Americans consistently refuse to understand. The whole Japanese institutional scene -- by that I mean business, government, labor, science, educational institutions, etc. -- does not operate on an adversary basis, as in this country. They operate on a more congenial basis. They have established collegial relationships through which they influence each other.

Under these circumstances, as a planning and resource allocating unit, MITI has gained tremendous influence. Japan owes a great deal to MITI in achieving the Japanese economic miracle. But MITI is only one piece of a total. It is not in sole control. It is merely one part of a cooperating whole.

Q: Some people say that the Diet, the legislature, the Japanese government, are less important in the course of Japanese events than say, the bureaucracy, MITI, particularly, or the Keidanren. Some people say that the government is a creature of the Keidanren. First, for the benefit of the

tape, could you, in your view, describe what is the Keidanren?

HODGSON: The Keidanren is the top business organization in Japan. It consists of a kind of organization that would occur in this country if we were to put together the Business Roundtable, the Business Council, the American Chamber of Commerce, the National Manufacturers Association, the Iron and Steel Institute and other major institutions that represent American business. We have never, in this country, put those organizations together to serve as a single spokesman for the American industrial scene. In Japan, that's what the Keidanren does.

Q: How would you evaluate the influence or the importance of the Keidanren vis à vis the operation of the Japanese government?

HODGSON: It is the spokesman for the Japanese business community, the way MITI is the spokesman for the Japanese economic bureaucracy. It plays the role of partner.

HODGSON: I thought it might be interesting to review my concept of the role of an American Ambassador in contemporary times.

The interesting thing to me is the way that role has changed, dramatically changed. This change upsets so many people who went into Foreign Service work at a time when an American Foreign Service Officer serving abroad was required to make at least minor policy decisions for his country. Because of the limited nature of communications and the lengthy time it then took to get answers from Washington, he did this.

Two things came along in the 1950s to radically alter the diplomatic world. One was the communications satellite and the other was the jet engine. With these two devices, travelers now could go to or talk to any part of the world in practically no time at all. No part of the world was now more than twenty hours travel time away from Washington. No part of the world was more than twenty seconds away by telephone communication.

As a result, in an inter-related world, Washington held together its policy apparatus, keeping decisions all there. This meant that officers out on the forefront of diplomatic life in various countries no longer had to make, nor were, in fact, allowed to make, decisions on their own. They had to plug in headquarters to make sure decisions were consistent with policy and would avoid negative fallout elsewhere.

As a result, there is among many of our older Foreign Service people, a sense of having a job near the end of their career not nearly as satisfying as they anticipated at the start of their career. This sentiment has frequently surfaced in news stories citing bad morale in the American Foreign Service. Actually, we have a tremendous amount of talent in the American Foreign Service. Those who have adjusted from their original concept of ambassadorial life to the contemporary realities have performed admirably.

This leads to what I consider to be the main job of an ambassador. His job is a *relations* job. It is not a policy job. It is not a decision-making job. He can influence policies, and he can effect decisions through the information he supplies and advice he gives, but he cannot control them.

As a result, his job is to make sure that the relationship with the country where he is posted reflects the kind of relationship that overall American foreign policy dictates. It is not a job that requires a great deal of individual decision-making, nor the setting of policy. This has been a hard thing for some ambassadors in the Service to understand, but I believe increasingly it is being accepted as the norm. The process can't really work any other way.

Q: Thank you. That's quite interesting and in my experience, quite true, both in terms of the new definition of the job and also in terms of the frustration that that sometimes entails. We tend to think that because we are out on the firing line, that we have a greater impact on the policy than we really do. It's reflected very often when a major issue arises in a country, there is always a delegation coming from Washington to handle it. And the political officer, in particular, is put out because he knows the players, and he knows the issues, and who are these guys? But that's the reality of the new situation. Could you, as we discussed before, tell us a little bit about your experiences that might not have a weighty impact on event, but would be of interest and would give us some background on Japan at the time?

HODGSON: Well, I divided my approach to the ambassadorial job into three parts.

Statecraft was number one, meaning enhancing the relationship between the two countries, both from a bilateral standpoint and from the standpoint of long-range geo-political strategy.

Second came economics, promoting a healthy economic relationship between the two countries, especially an understanding of how our respective economies work. They work so differently that grasping the differences continues to elude peoples of both countries.

The third part, of course, is cultural. Here was a sphere that many ambassadors probably don't have to concern themselves with heavily. They may be posted to countries with a Judeo-Christian tradition, with a background in Greco-Roman philosophy, and conditioned by the great minds of the Europeans over the years.

You have an entirely different flavor to life living and thinking in Japan. I found that in order to understand the differences between these two countries, I had to go back almost to the cradle of civilization and examine how these differences got started. It seemed to me that somewhere back in the mists of history, the Judeo-Christian tradition went off in one direction into the Greco-Roman era and eventually into the European reformation and enlightenment eras. That was one stream of human thought. The other stream went off in the direction of the Orient, developing Confucian and Buddhist and Hindu thinking and eventually flowering into Taoist and other kinds of philosophy that has conditioned current thought there.

What I find is that one society, the American society I came from, believes strongly in the individual. It believes in supporting the individual by guaranteeing him rights.

In Japan, the individual is not the focus; the group is the focus. And rights are not something by which they reinforce group identity. Relations are. So we contrast the individual on one side of the Pacific with the group on the other. Rights on one side with relations on the other. A consensus way of achieving decisions and making policy on the Oriental side contrasts with an

adversary, up and down, majority vote in our particular society. For these two societies to understand each other is very, very difficult.

To simplify the differences between the two and track down these differences right down to the bottom line, you find that in Japan, the individual attempts "to fit in." In Western society, the individual attempts "to stand out." The difference between these two will explain a great deal about the approach each society brings to the table when they sit down together in the diplomatic world. Unless one understands these differences, reaching an agreement can be exacerbated enormously.

Q: I understand that this creates problems for the businessman, for the diplomat, for anyone who has to have relationships. Would you say that we have been more successful diplomatically or in the business field when we accede to the fitting in, to the relating, rather than to the standing out, to confronting?

HODGSON: Well, I don't think either side necessarily needs to fit in or to stand out, in other words, to adopt the other's approach. I spent my life in what might be called conflict resolution -- labor management relations, minority group relations, relations between business and government and relations between countries. One doesn't merely adopt another's point of view or values in order to reach agreement.

A good bridging device is to integrate what each side has in common and find a way to achieve commonality that satisfies both interests. That is not as elusive as it might sound. Sometimes it must end up in compromise. But compromise is necessary when you cannot find a satisfactory resolution by integrating what each party has in common.

First, you try to integrate what both sides have in common and then compromise the differences that remain.

Q: You felt that this approach was successful for you in Japan?

HODGSON: Yes, it's been successful for me in every phase of my life's endeavor. Labor management relations particularly is where I generated this approach.

Q: And are there any specific examples while you were Ambassador that could illustrate this? I can say I have had occasions where I have had to convince my Japanese counterpart of something, and it's been, for me, a very frustrating experience when I've got no answer, which some people accept as an affirmative response. But I was wise enough to know that I wasn't getting any response because they didn't want to agree. Where does that leave you? Do you do anything specific?

HODGSON: Well, let's start with a generality. I developed what I called Hodgson's law for dealing with the Japanese. It's quite simple. If you will bend toward the Japanese in matters of *form* and in matters of *pace*, they will try to come your way in matters of *substance*. In other words, to get what you want, you better accept their approach as to the form of the deal and the speed for reaching an agreement on it. But if you accommodate the Japanese on those two things,

they will try to give you the substance of what you want.

I have found this a very useful concept. I'll give you one example. In late '76, September of '76, a Soviet pilot flew out of Siberia and surprised the world by setting his MiG down on Hokkaido and defecting, thereby placing in Allied hands a late model MiG, a real intelligence coup for the free world. The American Defense Department immediately asked me to get them access to this aircraft.

I made such a request to the Japanese, and they said they would be glad to consider it. I then got a lot of pressure from Washington, raising a great hue and cry that the Japanese were not going to cooperate, that they were being difficult to deal with. None of those things were the case.

The Japanese had to go through a certain procedure for matters of this kind. Standard procedures control the Japanese way of doing things. I knew once they had completed the procedure, doing it at their own pace and following their own form for releasing the information, we would get what we wanted. That is exactly what happened. But if I had listened to the impatient Americans, we could have stumbled into a difficult argument over what became a very amicable resolution.

Q: Did you find that your staff in general at the Embassy was as sensitive to their Japanese counterparts as you suggested is important, and as knowledgeable of Japanese history and culture and so forth, and as competent in their particular specializations as you would like?

HODGSON: First of all, the staff in the Embassy taught me a lot about what I have just described, especially men like Mr. Tom Shoemith, who was my DCM. He is an old Japanese hand, speaks Japanese beautifully; his whole career had a strong Japanese focus, and he understood the country. I tended to put a little different stamp on things and maybe put it on a different philosophical level than he and others did, but they were very, very helpful.

There were some Embassy people who, because the Japanese system seemed to frustrate their particular personal objectives, were unwilling to accept Japan's cultural parameters. I accepted them as the best way to get something done in service of my country. To do my job most effectively required accepting them. I am a fairly impatient man. I speak definitely, and try to give straightforward answers. That these approaches were not part of the scene in Japan did not strike me favorably. It seemed to me, however, that my role was not to convert the Japanese, but to deal with them.

Q: When you were in Japan, were we in the old Embassy? Had the new building been constructed? What was the housing situation?

HODGSON: Well, I had been in Japan in 1969 with the American Cabinet committee, had visited the old Chancery then and had lunch at the old Embassy residence. I thought it was a beautiful arrangement. When I was asked to be Ambassador, I was looking forward to participating in the kind of life that involved a lovely residence and a classical Chancery.

After I had accepted the job, Secretary Kissinger told me, "The Chancery is no longer there. It has been torn down. We've got a little private office that you're stuck in for the next two years

while we're building a new Chancery."

The residence, however, was fine. It was one of the finest residences American Ambassadors have anywhere, in my opinion. A marvelous place. The Ambassador and his wife occupy a couple of rooms off in one corner of the second floor, but the rest is a public house, and it's a very nice public house.

The new Chancery, however, was a great disappointment to me. I had to dedicate it while I was there. I thought it was one of the most ugly buildings I'd ever seen. It resembled a New England loft building of the last century, built at minimum dollars per square foot with very little in the way of aesthetic taste. It really didn't fit the site in Tokyo at all. I had a terrible time trying to think of words that wouldn't express my true view about it, so I came up describing it as an imposing, commodious building. Both terms could be characterized either negative or positive.

Q: But you never really occupied the new Chancery?

HODGSON: Yes, I was in it from September '76 until March '77. It's a fine working building, but it adds nothing to the Tokyo scene. That's the least unkind thing I can say about it.

Q: Well, Tokyo architecture is eclectic, isn't it? Whatever they see, they put up, regardless of where they've seen it. I would agree with you, it was a shock to me. I served in West African Ghana, where they have a fantastic-looking Embassy, but it's a terrible place to work in.

HODGSON: Well, it's like the one they have in India that Pat Moynihan says is the worst place to work in that he'd ever been in.

Q: Well, I've seen it, but I did not have to work there. You touched upon a question of morale, staff morale, before, in another context. I know it's difficult for an ambassador to gauge staff morale because, to a great extent, much of that is taken out of your hands by the DCM.

HODGSON: Not if you've spent your life dealing with morale, as I have done in my career.

Q: But how would you gauge it? It's a big Embassy, lots of people, rather impersonal as embassies go. How would you gauge the morale of the people while you were there?

HODGSON: Well, there are really two different groups there. Three-fourths of the Embassy personnel are Japanese, and one-fourth are Americans.

The Japanese, when I arrived there, had been very well treated, especially from the standpoint of wages, salaries and perks. They worked for an employer who viewed things in a different context than a Japanese employer would have. Japanese industrial employees, during the period from the end of World War II until about 1970, were held under very tight rein. Though Japan was then a low labor-cost part of the world, the Embassy employees were well taken care of. So their morale was very good.

However, during the time I was there, private-sector wages started escalating faster than the

public sector. I could see that perhaps later on, there might be morale problems among the Japanese employees. I understand there has been some of that.

With respect to the U.S. employees, morale, I think, depended upon the extent to which they felt a fascination with Japan as an assignment. You can either be fascinated with or repelled by Japan. I happened to be extraordinarily fascinated by it. Men like Mr. Shoesmith, who were Japanese specialists, were also. There were some that could never understand the Japanese, feeling that the Japanese were beyond understanding. Their morale was not the best. So, I would say that those who liked Japan liked the assignment. Their morale was good. Those that did not found the assignment negative. The proportions were probably two-thirds who liked it and one-third who didn't.

Q: Are there any highlights that you haven't touched on yet? Something that sticks to your mind?

HODGSON: Well, I always find it awkward to answer such questions as, "What was the biggest event you had in Japan?" or "What was the major crisis you faced while you were in Japan?" I characterized my tenure there as the "no-problem era" in our relationship. The Embassy managed to keep under control anything that appeared as though it might become an incipient problem. My relationship with officials like Mr. Miyazawa, who was Foreign Secretary, and Prime Minister Miki, who was Prime Minister, during two-plus years of my three-year stay was just outstanding.

I believe it's axiomatic that the greatest thing in life is timing. I timed my stay in Japan impeccably. It worked out to be an outstanding period in my life, a very satisfying one, as well as a period in America's relationship with Japan that hasn't been bettered before or since.

WILLIAM D. MILLER
Public Affairs Officer, USIS
Tokyo (1974-1977)

William D. Miller was born in 1921 in Altoona, Pennsylvania. He served with the CIA and the USIS. Mr. Miller's career with USIS included assignments in India and Japan. He was interviewed by G. Lewis Schmidt on March 4, 1989.

MILLER: All right. Now, Japan is almost the opposite of India as far as its general communications, as well as for the type of programs one should have there. First of all, Japan has practically the same amount of media exposure as the United States does. In some areas, perhaps more. And it has roughly the same level of sophistication. You've got a highly educated audience.

Q: Ninety-eight percent literate.

MILLER: Ninety-eight percent literate, if you can believe that given the difficulties of the Japanese language. It's a great accomplishment.

Q: It is.

MILLER: And so the idea of issuing press releases, of putting out your own materials and having them used is ridiculous. The Japanese media are so capable of gathering information on their own that they have no need for this at all. And they recognize a handout for what it is, a handout. So the question is how do you crack a market like Japan? And the answer to that is you find out what it is that we want to say to them, what they are interested in hearing about from us, and you say it to them in a way that they'll accept it. And the best way, the easiest way to do that, is through various exchange programs. We -- now, this was not my doing, this was done well before I got there -- but I think at that time, Japan had the most sophisticated program in the world, exchange program, in that we invited people from the United States to come to Japan, usually two or three at a time, to meet with Japanese counterparts in the same field and discuss their respective subject specialties. And we had to get people of sufficient importance so that they would be important for the Japanese media to cover. If you could get the Japanese media to cover them, then you'd have all of Japan at your feet reading your information.

That basically is what the Japanese program was all about when I was there. You had to use a variety of weapons. Some of them were sending Japanese to the United States to cover things. But normally, the Japanese would do that. But maybe your Information Officer, talking to somebody at NHK, might suggest why don't you send somebody over to cover this or that? And quite often the Japanese were very willing to do that.

Personal contact in Japan was very important. We had to work very hard to keep our contacts with the various media and the academic and cultural sections of Japan. And through that personal contact, we were able to get on to the Japanese media frequently. And frequently we got across a good solid message. It could be a hard hitting message. If it comes from an important American official visiting Japan, he can say what he wants to, and they will print and broadcast it, televise it. And we had very good access to NHK, the Japanese national television service and the other television companies and practically all of the major press. Not for hand outs, but for things which we could develop. And we also did have a sufficient number of important Americans visiting there, mostly on their own. Our program merely rounded out the elements that we could scrounge up from people who were coming through on their own. If they listened to only one particular segment of America, for example, businessmen, then they'd get an imbalance.

But one thing that comes to mind was the Law of the Seas Conference that took place while I was in Japan. The Japanese were very interested in this, especially the idea of putting a 300 mile limit or fifty mile limit or whatever out there, as they saw it, to obstruct their fishing, which was a lifeblood question in Japan. Fish constitutes a very large part of the Japanese diet. Their fishing industry is quite large, and they were very concerned about limiting catches of whales for example. We in this country were very disturbed about those Japanese killing all the whales. The Japanese were concerned about us keeping them from eating whale meat, which they like.

We saw that that was going to be a problem very early in the game. And we began to invite Americans who were interested, who were involved, in the Law of the Sea and particularly the

fisheries thing, to Japan and have them state their case outright and state it in as hard hitting terms as they wanted. I think by and large, we blunted the Japanese opposition to the Law of the Sea by doing this. They began to understand what a real problem it was and why large parts of the rest of the world were so concerned about it. So they understood that while they might be eating a little less whale meat, this had to be done, or they wouldn't be eating any at all sometime in the not too distant future.

Q: I wanted to ask you another question. Did you immediately succeed Al Carter?

MILLER: Yes.

Q: What was your evaluation of the very substantial change that he made in the Japanese program?

MILLER: I thought his basic changes were good. But I thought it had gone too far. We were too exclusive. Naturally, the cost of doing business in Japan was so great that we had to be very limited in our targeting, very, very limited. But I felt that we had to be limited in our targeting without appearing to be. So we didn't have to go around telling everybody that we don't want you in our cultural centers. And there was a general sort of attitude of that kind in the American staff there. My mandate at that time was to make changes in the program because it had offended a number of people who had gone out there to look it over.

Q: It offended quite a number of prominent Japanese, too, I think.

MILLER: Oh, but I think that was the biggest problem. We practically told people at the doors of our library -- this is an exaggeration -- but they couldn't come in unless they were on this particular list. And so we had to put a stop to that, and we did. And I think I was resented by a good bit of the American staff there for insisting on that.

Q: Were they still using those -- oh, it was I guess a form of the computerization. They had these TV-like monitors in each of the centers, and they were virtually eliminating the books at one point. You had to get your information from the center by going through this monitor system in which you had a monitor screen.

MILLER: There was an awful lot of that. And it was more than that. It was a slavery to technology to the extent that you almost eliminated the human element.

Q: Yeah.

MILLER: And we had to humanize the program more. That was the biggest problem. There were also, I felt, we seemed to go overboard on things like paint, you know, being extremely modern in designing our libraries and so forth. I thought we should be up to date. But I didn't think in a contest with the Japanese we were going to win any prizes for leading the world, not USIA at any rate, with the limited budget we had.

Q: The Japanese have great pride in their own particular decorative capabilities.

MILLER: Exactly, exactly. And so I thought our facilities ought to be modern, neat, clean, but warm. We found things like an insistence on the part of some of our people that even the glasses we used to serve cocktails had to be the finest quality glasses that you could find. And my administrative guy found at one point that they were spending something like four or five dollars per glass, which tend to get broken fairly frequently, too. And we put a stop to that kind of thing over considerable opposition.

But no, the program needed to be humanized. That was the biggest thing. I think basically Carter had the right idea, that you had to cut out the hand outs sort of thing and stick to what you were trying to do. But they have a tendency to carry things a little bit to extremes. I hope within my stay there we managed to do that -- humanize.

WILLIAM C. SHERMAN
Bureau of East Asian Affairs
Washington, DC (1974-1977)

Ambassador William C. Sherman was born in 1923 and raised in Kentucky. Ambassador Sherman served in Japan, Korea, and Italy, and he was Deputy Assistant Secretary for East Asia Affairs from 1984-1986. He was interviewed by Thomas Stern on October 27, 1993.

Q: *What was the Bureau for East Asian Affairs like in 1974?*

SHERMAN: I reported for duty just around the time when Bob Ingersoll returned from Tokyo to become the Assistant Secretary. Ingersoll had been appointed when Mac Godley could not win confirmation because of his alleged involvement in the Laos fiasco. Kissinger had just moved from the White House to his offices on the Seventh Floor. Ingersoll only stayed for about six months before being promoted to Deputy Secretary and was then followed by Phil Habib. Bob was the nicest person, but he was really a neophyte in the Washington bureaucracy. He worked hard at being Assistant secretary and had good policy sense. He was determined to serve the Secretary as best he could, but I think he eventually found the role of Deputy Secretary hard to accept because he found himself working on all the issues that Kissinger didn't want to touch. That made him the Department's front man on many sticky matters. Habib was replaced by Art Hummel in mid-76 when Phil became Under Secretary for Political Affairs. I spanned three Assistant Secretaries. Habib was the most interesting one to work for. He was the most exciting boss that I ever had.

As Japan Country Director, I first reported to Dick Sneider, who was the Deputy Assistant Secretary for a brief time before going to Korea in the summer of 1974. Then Owen Zurhellen succeeded Sneider. He lasted for less than a year because he offended Kissinger in 1975 and was shipped out as Ambassador to Suriname. Zurhellen ran into trouble when the Japanese Prime Minister was due for a Washington visit. The event had not been publicly announced. The President, Kissinger and a number of VIPs were scheduled to take a trip to Europe, but it was not

publicly known that the President was going to extend the trip to Romania and perhaps to another country. In any case, no one knew for sure when he would return to the United States. I brought the Japanese Ambassador to see Kissinger before his departure on this European trip. The Ambassador wished him well and said that he hoped that all was set for the Prime Minister's visit. Kissinger asked in his usual elliptical fashion: "Mr. Ambassador, would a postponement of a couple of days make a great deal of difference to the Prime Minister?" The Ambassador thought that was manageable as long as the visit dates had not been publicly announced. Once the visit was public and so announced to the Diet, it could not be changed; that would create a disastrous P.R. problem. The President and his entourage went off to Europe and the plans for the Prime Minister's visit proceeded. When it became apparent that the President would not return on his previously announced schedule, Zurhellen, then acting Assistant Secretary in Habib's absence -- he was out of the country -- told us to keep sending telegrams to the Secretary asking about when the Japanese Prime Minister might be welcomed. We told the Secretary that the announcement would be made soon; each cable had a stronger note of urgency because we knew that the Japanese might announce the visit at any time. We kept asking for guidance because if the dates were not satisfactory, we would have to tell the Japanese immediately, if not sooner. We spelled out the consequences; i.e. once the dates are announced, there could be no changes. Cable after cable went unanswered; we got nothing but silence back from Kissinger. No guidance at all. The Japanese schedule was announced in the Diet. The President and Kissinger returned one night; the next morning the Japanese Prime Minister arrived at ten o'clock.. By this time, Habib had returned and he and I and Zurhellen were summoned see Kissinger for a briefing. Habib was asked to step into the office alone. I was later told that the Secretary gave him holy hell; then he called Zurhellen and me into the office and yelled and screamed at us. He asked how we could have let such a thing happen. The President and his staff had just returned from a long trip; they were exhausted. They couldn't possibly receive the Prime Minister and his delegation. He really raved and ranted; Zurhellen tried to explain that we had sent cable after cable asking for guidance. Henry would not be placated; he just thought that we had failed miserably and completely. The Prime Minister's visit came and went, as did Zurhellen soon thereafter. We never found out what happened to our cables. It would be tempting to think that the staff screwed up since the volume of traffic to the Secretary was always very high when he traveled, but I think it is more likely that Kissinger just wanted to wait; he was well aware of the matter and decided for whatever reason not to pay any attention. I am sure that he could have found a few minutes to give us some guidance; he was tireless and always on the go. But he didn't choose to do so and until today I don't know how and why the whole mess developed.

Then Oscar Armstrong became the DAS for a while; he was followed by Bill Gleysteen who stayed there until he became Ambassador to Korea in 1978.

I mentioned earlier that the concept of Country Director was born during Crockett's regime. By the time I became Japan Country Director, the theory had become well entrenched in practice. I had wide ranging authority to monitor and direct most of the activities that took place in and with Japan. The China Country Director operated in a similar fashion. Both of the occupants of that position had a lot of credibility within the Department and within the U.S. government. In fact, I think the whole Bureau operated as envisioned by Crockett and others. Both within the Department and the U.S. government, East Asian country directors were viewed as linchpins of policy making and implementation. Scott George was then the German Affairs Country Director.

We would often say that we had the best jobs in the Department; the problems and issues for both of us were major and of course we handled matters that pertained to two of the most important countries in the world. I would not say the same thing for all other parts of the Department.

Phil Habib gave me a lot of leeway. Once he came to know me, he relied on my advice and provided a lot of support. Phil would be quick to run with the ball if he thought he could do it better than anyone else; he thought that most of the time. But once he was convinced that you could do a satisfactory job for him, he tended to keep supervision at a minimum. I had a very good relationship with him.

Phil's trademark was to appear to be enraged by anything that was going on at the moment. He would always find fault with what was done; he never seemed satisfied. He would bluster and shout, particularly with Dan O'Donohue, at every staff meeting. Dan was the Korea Country Director. Dick Sneider used to refer to himself as the "Charge for Korean Affairs" because Phil always tried to micro-manage Korean programs. Actually, Phil and Dan were very close, and Phil helped Dan in his career on many occasions. But you had to understand Phil's *modus operandi*; otherwise you would be overwhelmed and respond in exactly the wrong way and be left in utter oblivion. I did not know Habib before he came to the Bureau, but I quickly adapted to this boisterous exterior. He would ask a few questions out of the corner of his mouth and then he would grumble some instructions. He always had some gracious comment at the end to the effect that he could have done the job better and quicker himself. If you understood him, you didn't take any attention to these rumblings. Indeed, I think I developed very close relationship with Phil Habib. He started out being suspicious of Japan and of Japan experts, but that didn't last very long. Soon, as I said, he came to trust my work and judgement and I found him to be a most inventive and persuasive leader. He was always ready to take up your cudgel if that were necessary. At one point, during the Miki visit, the Prime Minister wanted to modify slightly the security relationship between the United States and Japan. He was seeking some minor change in the Far East security clause of the 1960 US-Japan Treaty. Miki just wanted to move Japan slightly away from the responsibility it had under the security treaty for considering a threat to the security of the Korean peninsula as a threat to the security of Japan.. He didn't quite know how to go about doing it. Kiki Kuriyama, then the Political Counselor at the Japanese Embassy and I spent days finding an acceptable formulation for this relatively minor change. We finally agreed on a statement that said that the security of Korea was essential to the security of the Far East, which seemed to satisfy Miki as being sufficiently different. None of the rest of us saw it as a change of existing policy or formulations, but it appeared to satisfy Miki's domestic political requirements to present himself as somewhat more independent of the United States than had been the case with his predecessors. After we finally had come up with satisfactory language, we had to get Kissinger's approval. It was one of those days when no one could get to the Secretary through established channels. That evening, at a small White House working dinner, hosted by Ford, to which, much to my surprise I was invited, I carried with me the text and sat on it during the meal). This had been worked out in advance. As we left the table -- there were about thirty guests -- Habib took the paper and grabbed Kissinger and briefed him on the change. The Secretary looked at it and grumbled and said "OKAY", but only if the Japanese would publicly state that US-Japan relations had never been better. That was an easy task and so we wrapped it up. But it was an interesting illustration how diplomacy sometimes is conducted.

Furthermore, Habib was loyal to his troops almost to a fault. He could yell at us, but he would not permit anyone else to do so. No one, but no one, could criticize his "boys and girls". He was probably more adept at handling Kissinger than any other Assistant Secretary in the Department.

The relationship with Habib in addition to the policy challenges, made the Japan job an exciting one. It kept me on my toes all the time partly because I worked for a capricious and unpredictable Secretary of State who would become involved in problems and then just as quickly become disengaged. Fortunately, he did not involve himself in Japanese affairs very often -- he had more urgent matters to attend to. But every once in a while, Japan would come up on his screen and then we would have to find ways of satisfying him. Usually, the matters that he became involved in were very petty. He was always trying to recover his status in Japan which had plummeted after the "China shock". He tended to dismiss Japanese sensitivity to having been ignored on the China initiative. He used to defend himself by saying that information leaked out of Japan faster than any other place in the world and therefore it would have been too risky to share his plans with the Japanese. Any time his name appeared in the Japanese media, Kissinger seemed to find out about it. If the story was even remotely viewed as critical, he would call Habib and ask for an explanation. He always felt aggrieved by these stories and always wanted them stopped. That is an illustration of the matters in which Kissinger became involved. He stopped in Japan on several occasions and he saw Japanese Prime Ministers and Foreign Ministers in Washington on a number of occasions. The first visit, which came shortly after the new Administration was inaugurated, was scheduled after Prime Minister Miki through his son who was a student in Washington inquired whether he could make contact with the new team. The son went to see Jim Wickel who was the Department's official Japanese translator and worked for me in The Office of Japanese Affairs. Miki said that his father wanted to have this contact, but found it difficult to initiate it. He would however send Miyazawa then the Foreign Minister, to meet with Kissinger secretly. When we informed Kissinger of Miki's plans, he was delighted because he loved to operate in this fashion -- that is hidden from public view. But Miyazawa dawdled around and didn't schedule any meeting. He instead wrote a letter asking whether he and Kissinger couldn't get together at some international meeting that might take place in the near future. That of course didn't please Kissinger at all; he thought he was being led around by some upstart who didn't understand how to conduct international diplomacy. So when the Foreign Minister finally did arrive, he was scheduled to meet Kissinger at 10:00 a.m. He arrived punctually at the scheduled time only to find that Kissinger was at the White House (where he was writing his annual "State of the World" report). So Bob Ingersoll received the Foreign Minister and hosted a lunch for him. The Japanese reporters were very upset by what they perceived to be a major insult and breach of protocol. Finally, Habib and Eagleburger prevailed on Kissinger to return to the Department. So toward the end of the meal, in sweeps Kissinger, full of apologies and contrition. Miyazawa, who spoke excellent English, was able to make few well chosen points, but at the end, all was smoothed over. Kissinger said that he had "to return to the White House to translate his report from German.", but that he would host another lunch for the Foreign Minister the next day. Luckily this could be told to the Japanese reporters before their deadline and nobody reported that their Foreign Minister had been snubbed. It ended well, but for a while, the atmosphere was very tense and we were on edge of a precipice. If Kissinger had not arrived when he did, the reports back to Japan would have been very harsh indeed.

We spent sometime worrying about trade, although those issues had not risen to the decibel level of the last ten years. The trade imbalance was probably on the order of \$7-8 billion at the time, which seemed huge in those days, but was not close to the today's level. There were people in our government -- Commerce and Treasury -- who were concerned with the imbalance. There was some interest shown by Congress, but little on the part of private industry. The list of commodities under scrutiny were the standard ones: textiles, citrus, automobiles, television sets. The pressure to do something about the deficit was just beginning to build, but it was not yet the major preoccupation.

We focused primarily on security issues. We worried about Japanese contributions to the support of our forces in Japan and the self-imposed Japanese budget limitation of 1% of GNP for defense expenditures. DoD was pressing us to take a stronger position on this defense expenditures issue; they wanted the Japanese to spend more. We did in fact pressure the Japanese on this questions through the Ford and Carter administrations, but it was essentially an unproductive initiative. The Japanese did not take kindly to us telling them they had to spend X percentage of GNP on defense. The Reagan administration, in addressing the problem, talked in different terms. I think this primarily due to the influence of Rich Armitage. The US in the '80's did not talk about levels or amounts of expenditures, but rather discussed the issues in terms of roles and missions that Japan had agreed to undertake after joint consultations. We then said that sufficient amounts had to be spent to conduct those roles and missions without ever specifying exact levels of expenditures. That put the issue in a much more acceptable framework for the Japanese.

Q: Does that comment suggest that the other parts of the US bureaucracy had little understanding of Japanese culture and modus vivendi?

SHERMAN: I think that was true. It is the standard complaint of the expert. Japan is different from a Western country and even from other Asian countries. That fact requires that a lot of education be provided for those in the US government who are not familiar with Japanese customs and mores. We spent some time explaining Japanese perspectives and motivations for their behavior. That doesn't mean that we should not try once in a while to change their behavior or their policies, nor should any one in the US government take on the role of apologist for the Japanese. But if you want behavior modification, you have to understand how that can be done in the Japanese framework. US goals can be achieved with a minimum of bruised feelings if approached in manner acceptable to Japanese society. It has been done and continues to be done in certain instances. The most effective way to change Japanese behavior is to identify common points of interest rather than the points of disagreement. Japanese do not respond well to a confrontational style of negotiations. They do respond to consensus and compromise which is carefully worked out. It is important for negotiators to insure that "face" is not lost on the part of either side. Too often these important, and sometimes vital, aspects of negotiating with the Japanese are ignored by Americans, who view using these tactics as "coddling of the Japanese" who, they feel, are smart enough to do things the American way. There are easier, better and probably more successful ways of negotiating with the Japanese than the tactics we use today and did in the '70s as well. There is always someone in the US bureaucracy who wants to bull his or her way through the "Japan shop". That perhaps is an appropriate tactic if all else has failed; sometimes the "shock" approach is the only one that will work, but we must recognize

that every time we use the direct and forceful approach, we pay a price. I was very fortunate that Habib particularly understood that question; if he didn't, he trusted that I did. Both Habib and Hummel relied on the advice of their country directors and that made for a smooth working operation.

My relationships with the Pentagon were good, in general. I worked primarily with ISA. For part of my tour, I worked with a War College classmate who was in ISA handling Japanese matters. In the Department, we worked with the Bureau of Politico-Military Affairs and that worked well. Of course, it helped that by the time I had finished my tour as Country Director, I had lasted in that position longer than any of my predecessors and I should add, longer than any of my successors, even though it was only three and a half years. But that gave me a familiarity with issues that many others did not have. I set a record which I don't think has been broken to date. I don't think that length of service in a particular position gives a State Department official an advantage in the Washington bureaucratic in-fighting. I do think that State is at a disadvantage in that arena because its officers serve overseas more than they do in Washington. Washington is a unique environment that requires some familiarity with its processes. Bureaucratic in-fighting is a skill that Foreign Service officers either do not have or do not cultivate and therefore that puts them at some disadvantage in the Washington environment. The State Department officials who navigate well in Washington are often the civil servants who do not serve overseas, but are in Washington all the time. It is the constant rotation between Washington and overseas that puts a Foreign Service Officer at some disadvantage when he works in Washington. We don't know where the power lies either within the Department or in other agencies. And we don't have the opportunity to build up the personal relationships which the civil servants develop over decades.

Q: What other agencies were you in close contact during this period?

SHERMAN: In those days, the NSC was in tight control of inter-agency contacts. They supervised inter-agency work closely to insure proper coordination and control. This was the period when Kissinger was both Secretary of State and National Security Advisor. That "dual hatted" role did not affect us in our daily work. The Seventh Floor and the NSC had their own channel of communications so that both staffs were fully apprized on current matters. So we didn't have to worry about keeping both staffs apprized; their coordination was very good. The Seventh Floor was, as far as we were concerned, Kissinger and his close collaborators. Despite the fact that Ingersoll was the Deputy Secretary, he had little, if any involvement in Japanese affairs. The same thing happened when Habib became Under Secretary for Political Affairs. Even he didn't get involved in Japanese matters. We had semi-annual planning talks with the Japanese, which were led on our side by the Policy Planning staff. The Japanese delegation was headed by their Foreign Ministry's Office of Research and Intelligence. Win Lord -- the Director of the Policy Planning Staff -- Sam Lewis -- his deputy -- and I would go to Japan for the meetings, most of which were held in remote locations to minimize outside distractions. We would talk about world problems and try to coordinate where we could our policies. Then six months later, the Japanese would come to the US and we would continue our discussions. The focus of these talks were global issues, to US-Japan relations. I thought that these exchanges were useful; Win Lord seemed to enjoy them as had his predecessors. They helped maintain close relations with the Japanese.

We also had separate discussions on China and the Middle East, although Japan's involvement in that part of the world was very limited and didn't grow until later. The Japanese participated fully in these discussions; the issues were of interest to them. They did not however try to stake out independent policy positions; they were primarily interested in being brought up to date on our views. They tried to support us as productively as possible on our positions. In those days, the key goal of Japanese foreign policy was to maintain close relationships with the United States and to support us to the best of their abilities in our global goals. We agreed that the Japanese basic policy was correct; we did not try to push them to be more active. We were very mindful of the limitations imposed on the Japanese by their Constitution and did not try to urge them beyond the limits of foreign policy activity that they had decided on. Their Constitution prohibited military alliances outside of the United Nations and limited Japanese participation in military strategic planning. At the time, we did not see Japan as a possible surrogate for our policy in any parts of the world. We did believe that Japan could play a constructive role in the area surrounding that country. We thought Japan could be a stabilizing force, particularly in the economic field and especially in Southeast Asia. We didn't expect much, if any, political leadership from Japan because neither we or the Japanese could foretell what the reaction of other Asian countries might be if the Japanese were to try to bring any massive political influence to bear. The scars of World War II were still too fresh in Asia to expect any of those countries to follow the Japanese on political issues. The Japanese would have been willing to play a constructive role, but were not about to rush in where they might not be wanted and we were certainly not going to push them faster than they wanted to go, in the mid-70s, at least.

We thought that the Japanese could still play a constructive role on China in this period. It was still early in our relationships with mainland China, we had just been re-initiated only a few years earlier. The Japanese, by now, had more or less gotten over the "China shock" and they were anxious to support as much as they could our opening to China. They followed our lead; they would not stake out an independent path, but they did give us full support as an independent nation dealing with China. We thought that the Japanese could be very helpful in assisting China's economic development. There were several large projects, like the Chumen oil fields, which the Japanese supported.

Once the Shanghai communique had been issued, we did not believe that the Mainland-Taiwan issue was any longer a major impediment to Far East stability. We essentially viewed those tensions as resolved by the communique. Essentially, we did not see the United States having a policy in the Far East independent of the over-all Cold War strategy that governed all of our foreign policy strategies. In the Far East, as well as in all other parts of the world, all major issues were viewed through the Cold War prism. For example, we viewed Japan as a logistic and intelligence base for our confrontation with the Soviet Union -- the "unsinkable" aircraft carrier - - 300 miles away from the Pacific end of the USSR. Japan provided a base for air coverage of the eastern portion of the Soviet Union, if that became necessary. Our bases in Japan were well located to provide a very potent strategic arm which would, while forward bases for our defense, could at the same time be a vital component of Japan's defense. Our problem was to manage this defense concept in a political manner acceptable to them so that it would not infringe on their strict constitutional limitations on military actions. The government undoubtedly understood that it was part of our "containment policy", but it had to be careful in its explanation to its citizens of its defense expenditures and policies. The political opposition stood firm in its strict

interpretation of the Constitution which prohibited Japan to be involved in any military operations except self-defense.

The NSC official for Japanese affairs was Dick Smyser, a Foreign Service Officer. He had responsibility for all Far East issues. He was an expert on Vietnam having worked with Kissinger in this issue for sometime. He and I talked almost every day. Whenever the NSC wanted to reach a policy decision or adjudicate a inter-agency dispute, it would issue a NSSM. The bureaucracy would crank one up and then a Presidential decision would be made.

We kept in close touch with the intelligence community and Defense Department. The intelligence community served us well and was quite responsive to our needs.

There wasn't enough Congressional interest in this period on Japanese affairs to require me or any of my staff to spend much time with Members of Congress or staffers. If there were any hearings, they were handled by the Assistant Secretary or sometime by the Deputy Assistant Secretary. I remember that I briefed one Congressman one time; he was the chairman of the Far East subcommittee of the House Foreign Affairs Committee. Soon after that, he was moved to another subcommittee.

Q: I would like to just briefly return to the question of the Japanese bureaucracy. Did you have any difficulty dealing with that bureaucracy in the 1974-77 period?

SHERMAN: No. The Japanese bureaucracy was, by and large, essential to the operations of the Japanese government. It was more important to work with the bureaucracy than it was to work with the politicians. Regardless of what might have been said about it, I think the Japanese bureaucracy is still the largest single collection of well-trained and idealistic -- in their own terms -- people in Japan. They feel that they have a mandate to get a job done and they get it done, most of time well and in a timely fashion -- according to their clocks. I dealt again primarily with the Foreign Ministry, although I also had contacts with MITI and the Finance Ministry. Later on, when assigned to Tokyo, I also became acquainted with other Ministries, such as Postal and Telecommunications - which has been causing so much trouble on the current Motorola issue -- and the Health and Welfare Ministry -- on import of medical equipment, and the Justice Ministry -- on American lawyers practicing in Japan. Those Ministries are much more narrowly focused and domestically-oriented. They have little knowledge, and perhaps even interest, in international affairs and therefore are much more difficult to deal with, unlike their sophisticated counterparts in the Foreign Ministry and MITI. In the '74-77 period, these American investment and export issues were just beginning to emerge; they of course became serious bones of contention in later years.

This period between 1974 and 1977 was very active. The Japanese Emperor paid his first visit to the United States. It was of course purely ceremonial and strictly governed by protocol. The Emperor had done a little travel outside his country, but not much. So the Japanese required strict conformance to their practices, not for security reasons, but just because that was protocol. They were greatly concerned that the royal institution not be minimized in any way. Practically, the whole Imperial Household Agency was in the US at one time or another checking on this or that detail. For example, the Emperor was scheduled to visit Shea Stadium to see a football game --

baseball season had unfortunately passed by the time he visited. The Japanese called Angier Biddle Duke's office in New York -- he was then the city's Chief of Protocol -- wanting to find out how many times a visitor had been booed at the Stadium. They were assured that it would not happen to the Emperor and it didn't. The visit went very well; in fact, as the Emperor was leaving, just before the game concluded, some fan raised his beer cup and said: "Thanks for coming, Emp!." The Japanese also insisted vigorously that the Emperor would not have his picture taken except with another chief of state or that he would not sign any guest books. Of course, in the final analysis, the Emperor had his picture taken with everybody from the President to Mickey Mouse. He signed every guest book that was put in front of him, signing "Hirohito" in laborious Japanese script. He was very human and warm and the trip and the pictures that came from it did wonders for his image in Japan. The Japanese had never seen that side of their Emperor's personality, and they liked it. It was a typical case of staff over-protection. He had a marvelous visit. We were deeply involved in the trip's plans down to the last detail. It took months. I was supposed to accompany the Emperor during his U.S. stay, but unfortunately my mother died at the time and I had to send a substitute. She died slowly over a six-weeks period and I wrote a note to Phil Habib saying that I couldn't devote full time to the Emperor's trip. I suggested that he bring someone else to the desk to take over my responsibilities. Habib called me immediately after he had read my note, saying that I should not worry about the visit and that arrangements would proceed as planned. They did and the visit was a great success. The Emperor very kindly gave me a gift: a box which I still have and an autographed picture of him and his Empress.

EDWARD W. KLOTH
Japanese Language Training
Yokohama (1983-1984)

Economic-Commercial Officer
Fukuoka, Japan (1984-1986)

Mr. Kloth was born in North Carolina and raised in New York. After service in the Peace Corps and private business, he worked with the Department of Defense, later joining the State Department. In his career with State, Mr. Kloth served several tours in Japan and Korea, In Washington assignments he dealt with East Asian, Political/military, Economic and Environment matters. He also spent two years on Capitol Hill as Department of State Pearson Fellow. After retirement, Mr. Kloth continued as advisor to the Department on variety of matters and served a tour in Iraq as Economic Officer. Mr. Kloth was interviewed by Charles Stuart Kennedy in 2008.

Q: What did you do after your year and a half back in the consular section?

KLOTH: Then I went to Japan, to Fukuoka via a six month refresher Japanese in Yokohama to bridge the December 1983 to July 1984 gap before the incumbent in Fukuoka transferred. Japan was very popular as an assignment. There was a boom of interest at U.S. universities too. Japan's economy was booming, and the trade friction with the United States made the trade issue number

one. Now I understand that China is all the rage and understandably so. That's where my interest in the Far East started.

When I was in Tokyo in the late '70s as a graduate student, the Japanese press was full of trade issues and the back and forth about U.S. complaints about Japanese protectionist policies which were accurate. The Japanese, of course, said U.S. companies didn't try hard enough and that had some truth as well. For my second tour then, I thought I'd like to see the situation from outside Tokyo, and got a job at the consulate in Fukuoka as economic-commercial officer. A friend of mine recommended a consulate as fun, and it was. I did a lot of public speaking everywhere from Rotary clubs to Chambers of Commerce. I had two very good Japanese employees; we worked with American businessmen who were in the area and helped them sell everything from women's leotards and Texas beer to nuclear power plant equipment. I was there from summer of '84 to summer of '86. We had a consul, economic/commercial officer plus a consular/admin officer because at that time Japanese citizens needed visas to come to the United States. We also had a USIS cultural center.

Q: Was the Japanese Red Army an issue at the time?

KLOTH: No, it was pretty well gone. We did computerized name checks for visas. Occasionally we'd have demonstrations in front of the consulate, but they were rather small and not a danger. Japanese police would always bring a police bus around, but I never saw a confrontation.

The Chinese consulate general was down the street from us. A big black right-wing bus would come by sometimes with its loud speakers blaring. Just after they passed my window you'd hear the guy changing from the anti-US to the anti-Chinese tape.

Q: Okay. How would you describe particularly from your perspective relations with the United States at that time?

KLOTH: Because of the heated negotiations over trade issues at the time, a key mission of the consulate was to get out and tell the U.S. side of the story. We also helped U.S. firms enter or expand in the market. We knew the people in the companies in the region as well as the local economic situation.

Japanese in our area felt the overall U.S. relationship was important to their country but that Japan was being picked on unfairly on trade. In their view, Japan needed to export to buy raw materials such as oil and minerals it did not have. Japanese companies' success was a result of finding out what foreign markets wanted and making it at a good price. Most Japanese I met felt that the basic problem was U.S. companies weren't any longer internationally competitive vis a vis Japanese companies. Trade complaints, and automobiles were the big centerpiece, were unfair. In their view, U.S. companies had gotten lazy and were not producing high quality goods from TVs to cars.

While U.S. buyers of Japanese products were clearly saying the same thing, in its post-WW-II drive to grow its economy, the Japanese government had, in large part by design but also because of the way its bureaucratic system worked, closed its market to protect its companies. One major

issue in negotiations was the difference between U.S. and Japanese standards. We can go further into this and other trade problems later. In a consulate you do not negotiate but you certainly investigate and provide useful information and perspective to Washington.

Take the case of autos. I went to the Cadillac dealer in Fukuoka. And I said to him, “You know, I’m reading in the press about all these safety requirements that are being levied on all foreign autos to conform to the Japanese ‘safety standards.’ Could you show me on the Cadillac what has to be done to pass Japanese inspections?”

He clicked off the list which meant that Cadillacs, like other foreign cars, had to have a number of modifications done in a GM shop in Japan. That added to costs. For example, cars were required to have turning signal lights visible from the right and left sides as well as from the front and rear, so GM had to put on additional little lights on. That’s probably not a bad idea for safety, but the “standard” that really got to him was that the requirement to have a metal plate under the engine. He had been told that was so if you parked on grass the hot engine wouldn’t set the grass on fire. Where, he wondered, do people park cars on grass in Japan?

I used to do a lot of factory tours and saw the strength of the relationships between Japanese firms and their suppliers that was very difficult for a foreign firm to break into. I visited a shipyard in Nagasaki in ’85. They said, “Well you know the competitive pressure is coming on from Korean shipyards, so we have to cut our costs which means our suppliers are going to have to cut their costs. But we send engineers around to them; we send bookkeepers around too and see if we can help them to cut back, to rationalize and improve the efficiency of their operations.”

The yard was reluctant to look for new suppliers even in Japan, let alone abroad in the US. Yard management knew their suppliers and felt they could count on them. From their viewpoint, the start-up costs of a new supplier were high. Nevertheless, shipyards are businesses. When in 1985, the Plaza Agreement greatly strengthened the yen against the dollar, we got a call from them asking for to help finding U.S. suppliers!

Rice was a very sensitive issue, you may recall. I went to Saga City to talk to rice farmers. They were pretty excited that the U.S. was demanding that they open their rice market. But it was not personal. They were gracious hosts. In that area, the farmers blamed Japanese government farm policies for making it difficult for them to be competitive internationally. Cheap farm credit and taxes, especially for small farm machines, let “weekend farmers,” people with office jobs, buy equipment and supplies at favorable rates and encouraged them to hold on to small plots and made it very expensive for full-time farmers to increase their farms size, and so, my farmer friends pointed out, become more competitive.

Q: Well, that rice thing was very tricky wasn't it? I mean, as agriculturalists in the United States know European agriculture is protected.

KLOTH: The U.S. also has quotas for agricultural products such as sugar. It is my bottom line is and still is my bottom line: trade friction is an economic problem; it’s a political problem. At any rate, our job was also to give hands-on assistance to U.S. firms. We had a number of success

stories for companies large, medium and small, on both sides of the Pacific. I worked with Westinghouse in Tokyo and a Japanese power company in Kyushu to restore their frayed relationship on purchase of nuclear-power-plant equipment. I spent about a year and a half and the result of a \$10 million deal. As econ-commercial officer, I was not a Westinghouse salesman per se, but lived in Fukuoka and could act as a go-between. Living in Fukuoka I could make drop by and talk to the Japanese firm about how things were going. I could anticipate issues, call Westinghouse and tell them to come down and head off problems. We did the same thing for small U.S. businesses or new-to-market companies too. For example, our work resulted in a U.S. firm finding a Japanese franchisee after years of trying.

I also enjoyed living in Kyushu, having lived in Tokyo as a grad student.

Q: This was a period where the Japanese system seemed to be the world model.

KLOTH: Do you remember Ezra Vogel's popular book on Japan as number one? But there was another side; the Japanese companies did not escape the economic challenges businesses anywhere have. The Nippon Steel in Kitakyushu and Oita had had to institute a RIF (reduction in force) in the '70s and '80s. They didn't like to fire people, but tough business conditions forced them to stop hiring, offer buy outs; and "early retirement" workers, often by placing them in suppliers' companies.

I asked one supplier of industrial-size steel containers how that worked: did he need more help? I had heard some argue that because of "unique Japanese culture," Japanese large firms and their suppliers "cooperated harmoniously on such issues.

The small company manager I talked to had perhaps a different perspective. "Yeah, they did the RIF. I had a hundred or so employees. The economic situation was hitting my sales too. The steel company approached me to take three of their people. You've got to understand I buy the steel for my cans from the steel mill. The mill is also my major customer. Now, if they ask me to help them out, what am I going to say?"

I loved going to the plants and talking to the managers someone else not from the PR section. I worked at a Sikorsky helicopter plant one summer in college, worked on the production line. The best plant tours are always from a manager, engineer or foreman. You want someone who knows the business and the plant floor. A PR person knows a script. The foreman can really know what's going on, what it takes to keep production and quality up, and also some time perspective on changes at the facility. The most impressive thing for me in Japanese plants for all the excellence of the Japanese work force was that every plant I went to would start out the briefing with how they were automating further to cut down on labor costs.

Q: Was it apparent at that time that the Japanese had a real problem in demographics?

KLOTH: Yes, but the automation was being driven by a desire to be more efficient overall. Remember in the 1980s, the Japanese were very confident. Japan seemed to be number one; the economy was booming. Pollution and other such issues popped up in the '60s and '70s, and the

government had started to address them.

Q: Were you seeing the change of the social dynamics of women, particularly businesswomen?

KLOTH: Yes, but it was still a very conservative society.

Q: They weren't, I mean I remember in Korea when I was there it was somewhat the same thing, people loved working for the American embassy, particularly women did. They were top rate people because if they worked for a Korean business, if they were married they'd have to quit. With us we didn't care.

KLOTH: That was true when I was in Korea too. And Japan. Big and medium companies let women go when they got married. Of course, women in both countries did and still do run many small businesses.

Life was no picnic for men in even big companies. For example, the companies in Tokyo and Osaka would rotate their people to the “provinces.” The big companies had one-room company apartments in Fukuoka for these tours. Families did not want to move the kids around and disrupt their education, when Dad did a two-year tour in Fukuoka.

Q: How did your wife find it being Korean?

KLOTH: Overall she enjoyed Japan and Japanese friends, and still found time to write her PhD dissertation, and have a baby, our son. A lot of the potters in Kyushu came over in the 16th century from Korea, so, while there was some prejudice, in that area, there is also a special relationship.

Q: Did the American military presence there cause any problems?

KLOTH: There are two major bases: the Iwakuni naval air base and the Sasebo navy base, both modest in size. As the economic guy, I wasn't involved directly if there were issues, the consul handled them. People in the area appreciated the security relationship, but criminal incidents or accidents grab headlines. There was one bad incident where a serviceman got into an altercation at a Mr. Doughnut's shop in the middle of the night. The Mr. Doughnut clerk wound up dead, so the consul worked with the base commander to ensure that the citizens of Iwakuni understood U.S. dismay at the incident. Expressions of regret are very important in Japan among Japanese, so it is critical that U.S. representatives be proactive. That is very important.

In Sasebo, if ships came in some demonstrators would go out in their boats and the Japanese police would be out there; but it was not like the situation in Okinawa. The footprint was pretty small in Kyushu. At least in the Japanese business circles I traveled in throughout the region, I didn't hear concerns about base-related issues.

Q: How were your relations with the embassy?

KLOTH: Actually my closest work relationships were with the commercial section of the

consulate general in Osaka-Kobe. Our work was not negotiations and policy, but focused on helping U.S. firms come into the market or Japanese firms buy U.S. products, that is, establish relations with U.S. companies. We had a very good and experienced consul in Fukuoka.

For my commercial work I would go up every six months to Tokyo, and see the American Chamber of Commerce. That's how I learned of Westinghouse wanting to come back to Kyushu. Day in, day out. The Commerce Department's Foreign Commercial Service officer in Osaka was my closest colleague. We talked regularly to exchange ideas and leads.

We collaborated with Osaka to get more American business people to come down to Fukuoka. The likely candidates were those who already had made the mental leap out of Tokyo and were willing to go to Osaka, that is to the provinces. I had good relations with the Tokyo econ section and FCS. I did a lot of speeches, talked to people and local media, so I needed to know what was going on in the trade negotiations. But in terms of the real work on the commercial side Osaka was the big help.

WILLIAM T. BREER
Interpreter Training School
Yokohama (1974-1975)

Political Officer
Tokyo (1975-1978)

Mr. Breer was born and raised in California and educated at Dartmouth College and Columbia University. After service in the US Army, he entered the Foreign Service in 1961. Throughout his career, Mr. Breer dealt primarily with Japanese, Korean and general Southeastern Asia affairs. His overseas posts include Kingston, Tokyo (three times), and Yokohama, His Washington assignments also concerned principally Japan and Korea. He served as Deputy Chief of Mission in Tokyo from 1989 to 1983. Mr. Breer was interviewed by Charles Stuart Kennedy in 1999.

Q: In 1974 where did you go?

BREER: To Japan. They were looking for developing an interpreting capability within the foreign service and they picked me. So, I was sent to the language school which by that time had moved to Yokohama. We had closed our consulate and the school was housed in the old consul general's residence, a western style house. I was supposed to learn how to be a professional interpreter.

Q: How long were you there?

BREER: From 1974-75.

Q: I would think this would be something that you would dig your heels in against because this puts you not in the right line unless this leads to other things.

BREER: Eventually it did and I was looking at it as an opportunity to go back to Japan and it was in the political section so it wasn't a clear transition at that point.

Q: Being an interpreter I would have thought demanded such a language skill that one would have to think on a dual track, one is just plain remember what is being said before it comes out and I wouldn't think everybody would have it. I sure wouldn't.

BREER: I don't have it to the extent that a lot of simultaneous translators do but I got fairly good at it. Actually one of my first interpreting jobs was for Kissinger and President Ford's visit in the fall of 1974. I was still in school at the time and was called out. I remember one time when Phil Habib and the chief of staff visited I was called upon to interpret. There are various techniques and I went to an actual interpreting class at the International Christian University (ICU) as well. Of course you take notes. Even simultaneous interpreters take notes. There were all kinds of drills that we went through, vocabulary, learning the latest slang in both languages, or trying to.

Q: I would think you would have to have a certain number of Japanese proverbs that would relate to American proverbs. You can't say, "I only go to third base on that," in Japanese and expect it to be understood. There are sports or cultural terms that don't correspond to a particular culture and you would always have to have a mental list of ones to pick from.

BREER: You do that to some extent but again that is unending. There are books now that have saying equivalents, but there weren't any then.

Q: Ever get to a point of saying, "So-and-so made a joke, please laugh?"

BREER: No, I never had to do that. The other problem with Japanese and English is the predicate comes at the end of Japanese sentences.

Q: So you have to wait?

BREER: Yes. Oftentimes subjects are not expressed in Japanese.

Q: Could we talk a bit about your working on the Ford visit because the press played this up making fun of him quite a bit early on, I think. If I recall there were pictures of him in too short trousers and things like that. What was your impression of Ford and Kissinger?

BREER: I thought it was a pretty successful visit. It came at a time when the prime minister was clearly on his way out. I think he resigned the next week. Tanaka had been exposed for corruption just a few weeks before in connection with the Lockheed incident and in connection with the sale of a hotel to Japan and I think also in connection with the Lockheed 104 program we had with them. I can't remember the details but there was a big scandal and Tanaka, who was probably the most dynamic and powerful politician that Japan has had since the war - a real boss type operator with a lot of ideas of his own - was kind of humiliated because he was on his way

out and everybody knew it. Of course, Nixon had just left and Ford went ahead with the planned visit. So, there was some chaos but I thought Ford handled himself very well. His trousers were too short.

Q: I think he got caught off guard. His staff probably didn't warn him that he needed morning clothes.

BREER: Yes, and Japanese morning clothes and ours are slightly different. Americans don't generally have such clothes hanging in the closet, but all Japanese do because that is the standard wear for weddings, funerals and formal occasions any time day or night. Otherwise I think he conducted himself quite well. Kissinger wanted to be very much part of the scene so table arrangements were made. In those days you had a return banquet. The imperial house had the banquet one night and the president the next night. I was the control officer for the imperial guest house and one of the events was the president's banquet. Nobody had come up with a guest list with the dinner two weeks away, so I made one up and submitted it and they had no ideas of their own. The protocol people at the White House and State Department made a seating plan that didn't include [the foreign ministers] at the head table. The emperor and empress, and the crown prince and princess and the royal family were all there and Kissinger and the only other ministers sat at other tables. That created a bit of a stir in Japan. It was the first visit by our president ever and I think it was pretty successful. He spent four or five days in Japan.

Q: From the people at the embassy, one had the impression that Kissinger didn't spend much time thinking about Japan. Obviously there were other things on his plate, particularly the Soviet Union. Was that manifest at all?

BREER: He was there. He engineered the China opening on Nixon's instruction and the Japanese were having trade problems with China which started in the early Nixon years. The Japanese didn't just roll over. They complained about trade policy. They were very protective in those days of their blossoming industries. I don't think Kissinger regarded Japan as a great power whereas I think he did regard China as one. Japan just never played very large in his strategy. I haven't read his new book. I don't think Kissinger's Japanese interlocutors enthralled him as the Chinese did.

Q: I would have thought there would be a problem dealing with Japan the same way there is dealing with Italy. There was really, after Tanaka, hardly anybody to talk to. It is a collegial government with the prime ministers changing fairly often. Certainly this was the way in Italy with a revolving set of ministers.

BREER: That is somewhat true, yes. But it depends on the prime minister. Some are more in a debating mode than others. I think the current prime minister, for example, is pretty good, Keizo Obuchi.

I forgot to mention something. When I was in the marine corps my wife and I flew to Anchorage to join the president and she was the interpreter for Mrs. Nixon when the president greeted the emperor and empress.

Q: This was when Hirohito came?

BREER: Yes, he was on his way to Europe but he made a refueling stop in Anchorage. I think I wrote the memorandum recommending that the president go meet him, so he did.

Q: After you left the language school was your interpreting just a skill that you had but you were doing other things?

BREER: I was a political officer in the embassy.

Q: So, this was just honing up your skills so you could be called on.

BREER: Yes.

Q: Well, you were in the embassy in Tokyo from 1975 to when?

BREER: From 1975-78.

Q: What slices of the political pie were you given?

BREER: The first couple of years I was in charge of the opposition and part of the LDP for political reporting. So, I tried to develop as many contacts as possible and I still have many of them today. I think that is the first time I met Obuchi. I just wandered around talking to people seeing what they thought about the direction of Japan, about relations with the United States, etc. The last year I was pol/mil officer at the embassy.

Q: How did we view the opposition at that point? Did it seem to have a chance of becoming powerful or was it almost destined to be second fiddle to the LDP?

BREER: I guess we felt there was a possibility that the opposition, the Socialist party, could disrupt the LDP majority. I don't think there was the same kind of concern about the communists as there was in the '60s. There was a new party by then, begun in the '60s, called Komeito, which was the Buddhist based party. It hasn't grown very much since then. The Socialists were not all anti-American but they were anti-security treaty, anti-bases in Japan, and for unarmed neutrality. It is really kind of an ironic position for them to take because if there had been no security, Japan probably would have rearmed to a much greater extent calling it self-defense. Then there were big struggles about nuclear submarines in the '70s, because our submarine fleet was becoming nuclear. We had to walk a careful line between Admiral Rickover's feelings about his boats and the Japanese desire to know whether they were emitting radiation or not. The question of nuclear weapons on naval ships was around

Q: Were the Socialists interested in talking with you?

BREER: We communicated. The door was open. We had protest delegation people who wanted to come to see us and talk to us about their issues, about nuclear issues, about American policy all over the world. We had an open door policy and would see anybody including the

communists.

Q: By that time we were able to talk to the communists?

BREER: Well, when I was first in the political section in the '60s we received communist protestors. We limited the numbers.

Q: Were we able to go out and make contact with them?

BREER: No, we didn't seek them out and talk with them, although we did with the Socialists.

Q: Was there any concern at this time about the LDP and indications of corruption?

BREER: Well, it was always lurking in the background, but Japan's economy was growing so fast and people's livelihood was growing so fast that nobody wanted to rock the boat very much. I think Japanese, and most Asians, view gift giving as an essential part of life. They realize that it screws up their system a lot in extremes, but I think there is more tolerance for fairly substantial gift giving to officials or somebody who can affect their future. Not that we don't have it.

Q: We call it political contributions.

BREER: I think political contributions of a \$1000 an individual is fine.

Q: But, you don't give \$50,000 and not expect something.

BREER: Right. But that doesn't apply to political appointments in Japan because it is a professional government.

Q: As you say much of Japan is ruled by professional bureaucrats. Were these a group to be cultivated?

BREER: Sure.

Q: Was somebody assigned to that or did you all do this?

BREER: There were various functional assignments in the embassy in both the political and economic sections and traditionally the internal affairs officer was the one who dealt with the foreign ministry on coordination and bilateral relations. But we all participated in that as well.

Q: Who was the ambassador in 1975-78?

BREER: Jim Hodgson, who had been secretary of labor, was ambassador from 1975 until 1977.

Q: How did Hodgson do?

BREER: He was quite conscientious and did quite a good job. But, he was plagued by having

been Lockheed vice president for labor relations at one time. He was a very nice fellow, very smart and low key. He worked at cultivating Japanese.

Q: And Michael Mansfield?

BREER: I was there for his first year, 1977-78. I also served with him from 1984-87 as his political counselor. I was junior in the '70s and didn't see that much of him, but I did do some things for him. We had a terrible incident. Two jet aircraft took off from Misawa and crashed into a house in Yokohama killing two people and severely injuring some others. The Navy was kind of slow about paying [respects] we thought in the embassy. So, Mansfield sent me out to the hospital to see this woman whose child had been killed and she terribly burned. I tried to be a go between, between the embassy and U.S. forces who didn't want the Japanese monkeying around the investigation of the accident. The pilots had bailed out and were sent home before the Japanese could talk to them. This raised all sorts of jurisdiction questions, the status of foreign forces in Japan, etc. It was in the line of duty so arguably it was American jurisdiction, but the fact that the planes crashed into civilian territory raised issues. We finally found out that there had been a misalignment of some part of the aircraft during a major maintenance time in California some place.

Q: Did you have any work on Okinawa during this time?

BREER: Yes, sort of managing daily issues. I can't remember them all now. The Okinawa reversion had taken place and things had settled down some. I don't recall any huge issue.

Q: How about the governor of Okinawa?

BREER: I don't remember who he was. I think he was a conservative.

Q: There was a point where you had a leftist who first, I think, was mayor and then governor, I'm not sure.

BREER: The recent past governor, Governor Otah, was a university professor at Cal, I think.

Q: When the Carter administration came in did you sense any difference in how they were approaching Japan?

BREER: There were trade issues at one time but I can't really remember the pyrotechnics about them. The one big issue that came up while I was pol/mil officer was the Carter administrations' policy of withdrawing ground forces from Korea..

Q: Yes, taking the 2nd division out.

BREER: Right. And a number of visitors came to Tokyo including Habib and I accompanied them on some of their discussions. The Japanese were very hesitant to tell us how to run our military and still are to some extent because of war time experience, a rather more passive diplomacy and the fact that we were a senior partner in their security relationship in relation to

Korea. But, they were very, very nervous about our removing ground forces. The South Koreans knew that as well as did our ambassador in Seoul, Bill Gleysteen. That was kind of a major issue which was eventually resolved.

Q: From 1976-79 I was consul general in Seoul and a member of the country team. We thought that the Carter administration had made a campaign promise that made no sense because it just heightened the chance of war rather than lessen it. But, Carter was more insistent in carrying out campaign promises than most presidential candidates. He was a little too honest for his own good. In the end it was all fuzzied up and the 2nd division remained in Korea. I think it was resolved by removing some obsolete missile batteries and probably eventually putting some better equipment in. I would think Japan during this period would be looking very closely at Korea because they had a very powerful North Korean army and if it attacked, and nobody really knew what was going on in the mind of Kim Il Sung, this would make the Japanese nervous.

BREER: Oh, I think very uncomfortable, because they knew that we would have to massively use facilities in Japan to support our operations in Korea. I don't think they felt a direct threat to Japan but just the politics of trying to support the United States. They had gone through that in the Vietnam war when the government was a loyal supporter despite all the protests. I am not sure they had the stomach to do it again. But, there is no question that they wanted us to stay in Korea.

Q: What about the Korean community in Japan? For some odd reason, at least to me, it all seemed to be so North Korean oriented. Did you all get involved in looking at this phenomenon?

BREER: We never did much in the embassy. Occasionally someone would write a cable about it. In actual fact, in those days I think it was evenly divided with Korean loyalty to North and South. But, the North supporters were more vocal and engaged in activities on behalf of the North. I think the North supporters stuck out more because they were tracked by the Japanese security people. Also, they were a good source of money. We didn't know how strong the North Korean army was in those days. Our intelligence wasn't very good then and isn't very good now.

Q: In those days, when I was sitting there, the common wisdom was they could be in Seoul in three days but eventually would be badly beaten.

BREER: I think that is still the common wisdom.

Q: What about the northern territories held by the Russians?

BREER: The Japanese and Russians talked about these islands from time to time over the years and at one point were on the verge of making some progress on it when something happened domestically in Russia and the Russians pulled back. I think the Russians at one time offered to return two of the islands, but the Japanese insisted upon all of them. I think the Russians are not prepared to make territorial adjustments around the periphery. They weren't then and I don't think they are much more interested in doing so now. There has been some opening up involving fishing and tourism.

Q: But, not during this period?

BREER: Not much. I'm sure there were some Japanese fishermen who bribed the Russian coastal people and were able to take seaweed and I suppose shell fish.

Q: Was this a period of increased Japanese interest in ties with Mainland China?

BREER: Yes, because they recognized China shortly after the Kissinger visit. The Japanese saw a big market there and were intent on expanding relations, more in the '80s than the '70s, but still they were very interested in China.

Q: Were we concerned at the embassy level about the Japanese looking to China? Were we concerned that this might make the Japanese a less cooperative partner with us?

BREER: There was some concern in that regard.

Q: I assume human rights never came up, this is the Carter administration, but were there any problems in Japan?

BREER: The human rights report started about that time.

Q: I think it started under Ford.

BREER: The Japanese were offended by the remarks that we had to make about the way the minorities, including the Korean minority, were treated in Japan.

Q: On the political/military side what was your main concentration?

BREER: The first set of guidelines set out the rules and ways we would interact in the event of an attack on Japan. There was no codification of what Japanese entities would do to support the American forces in the event of an attack on Japan or other emergency crisis. In 1977 we set about to write up guidelines of what kind of support the Japanese would provide us and this was restricted to the defense of Japan.

Q: What was the scenario? Was North Korea a problem?

BREER: Not then, no. The guidelines didn't cover North Korea.

Q: Was it the Soviet Union at that time?

BREER: It was the defense of Japan, so I guess it could have been North Korea, too. But, it wasn't us responding to a North Korean attack on South Korea..

Q: Basically the main possibilities were the mainland Chinese and the Soviets.

BREER: Yes.

Q: Were we able to get much coordination with the Japanese or were we doing this on our own?

BREER: The guidelines were done with the Japanese. It was a jointly agreed set of guidelines on how we would cooperate with each other. What kind of support the Japanese would give American forces in operations for the defense of Japan. This includes use of highways, ports, hospitals, etc. all of which are under the direct jurisdiction of the central government. Now we have a new set of guidelines which cover not only Japan but also operations in areas around Japan.

Q: Did Taiwan enter into anything we were doing those days? Carter recognized China and we set up the American representative in Taiwan, the American liaison. Did this cause much of a problem?

BREER: Well, the Japanese were doing the same thing. Actually, they did it before we did. Their liaison office was set up in 1979, I guess. I don't think there was much controversy between the United States and Japan on the issue. There was a lot of coordination to make sure we weren't doing anything really stupid in regards to our bilateral relations.

Q: On the political side, was the growing imbalance between trade a major factor in everything we did during this period?

BREER: Yes. It's acuteness depended on the unemployment rate in the United States or what town was being put out of business by foreign competition. And, that is true. There were all kinds of towns throughout New York state, Ohio, etc. that closed up. Not entirely from foreign competition because a lot of stuff moved to other parts of the country, but the political reality was that people believed it was due to foreign competition and the most prominent foreign competitor in the '70s and '80s was Japan.

CRAIG DUNKERLEY
Japan Desk Officer
Washington, DC (1974-1975)

Political Officer
Tokyo (1976-1978)

Ambassador Dunkerley was born in Wisconsin and raised in several states in the Midwest. He was educated at Amherst College and the Fletcher School of Law and Diplomacy. In 1970 he entered the Foreign Service, serving abroad in Da Nang, Tokyo, Yokohama, Fukuoka, Brussels and Vienna. During his career Mr. Dunkerley became a specialist in NATO and International Security, Disarmament and Arms Control matters, and served as Special Envoy for Conventional Forces in Europe from 1997 to 2001 with the personal rank of Ambassador. He also had

several tours of duty at the State Department in Washington, DC. Ambassador Dunkerley was interviewed by Charles Stuart Kennedy in 2004.

Q: You moved to the Japan desk?

DUNKERLEY: William Sherman was the Japan Country Director at the time. My own duties involved at first a variety of odds and sods. Over time, I picked up increasing responsibility for several bilateral science issues, including work on initial U.S.-Japan cooperation in the development of Japan's own space program. As various other issues came to fore, I ended up following bilateral fisheries negotiations and the like.

Bill Sherman became a very good friend and mentor. My work with him back then steered me towards what was turning out to be a major interest for me: US-Japan relations. So my initial year on the Japan Desk was necessary for deciding to undertake a long-term investment in language training.

Q: Had you applied for Japanese language training earlier?

DUNKERLEY: No, this was something that came about from my time with Bill Sherman – and colleagues like Tom Hubbard and Rust Deming – on the Japan Desk. It grew as a personal interest and then as a professional opportunity.

Q: How did you find language training?

DUNKERLEY: I think long-term hard language training can always be difficult in the Foreign Service. You take individuals who by their very temperament and selection are very articulate and you require them essentially to return to a very basic “me Tarzan” level of discourse for eight hours a day over nine months or a year, a long time before you begin to gain some fluency. That can be grating.

Q: Believe me, I know.

DUNKERLEY: Japanese can be particularly ferocious in that regard. I did a year of basic Japanese training in Washington before going out to the Political Section in Tokyo for two years. I then did more advanced language training at FSI's branch school in Yokohama, a second year of language instruction, before going down to be Principal Officer at our Consulate in Fukuoka in Kyushu.

Q: So you had one year of Japanese and went to the embassy, worked for two years and had another year of Japanese in country. Japanese foreign relations in 1976 to 1978, I assume that the LDP was in control?

DUNKERLEY: The LDP was very much in control. Indeed, the back and forth of domestic politics at that time related, in the first instance, to the internal factional competition within the party. This was the post-Tanaka period of Prime Ministers Ohira, Fukuda and Miki and before Nakasone's prime ministership.

That was the domestic political context. Among the foreign policy issues that I followed in the Embassy Political Section's External Division was tracking the course of a long stalled Peace and Friendship Treaty between Japan and the People's Republic of China: essentially a political complement – or rubric – for what was then the beginning of a burgeoning economic-commercial relationship with China.

At the same time, we followed Japan's relations with the Soviet Union – and the never-ending frictions between Tokyo and Moscow regarding the disputed Northern Territories, various disputed islands in the Kuriles between Japan and the Soviet Union.

And those of us in External also spent a good deal of time in following Japan's dealings with Korea which, as you know, is bound, on the one hand, by considerable political and economic and even strategic common interests. But on the other, it is also a relationship carrying particularly strong and continuing animosity, friction and suspicion given past colonial history.

One of the issues that came up while I was there with the advent of the Carter Presidency was the decision by the new Administration to rescale the American military presence on the Korean peninsula, revolving around possible withdrawal of the U.S. Second Division. That generated a whole set of anxieties on the part of the Japanese; that in turn generated an extended period of high-level consultations with the new U.S. team. The embassy political section played a particular role in that regard by providing running commentary, analysis and interpretation of the Japanese concerns.

Q: Let's talk about the Korean relationship. What was the feeling? They didn't want the Second Division out?

DUNKERLEY: At the time, the Japanese seemed concerned as much about what this particular move by the new American Administration, and its apparent manner of decision and announcement, might have conveyed about overall American intentions in the region over the longer term. Much of their commentary was cast in more specific terms of reliance upon the American military presence on the peninsula to provide continued stability. I had impression their anxiety was less motivated by a careful calculation of specific military factors—weighing various elements in terms of a dynamic strategic balance – than out of a more fundamental and inchoate concern about our longer-term level of interest, engagement and staying power.

Q: To put it in its time context, this wasn't too long after we pulled out of Vietnam. We had been forced out of Vietnam so there was considerable doubt about us. Carter had made pronouncements about withdrawing forces from Vietnam during the political campaign. I think he said, 'we'll get our troops out of Korea.'

DUNKERLEY: He made certain statements to that effect during the 2006 campaign; after the inauguration these were reiterated during an early visit to Tokyo by Vice President Mondale, the first visit by an Administration senior figure out to the region. You are correct that one of the basic themes of that particular period was the effort by the United States, in the aftermath of the Vietnam debacle, to redefine, readjust, reaffirm the nature of its role in East Asia. The challenge

was to do so in such a way as to provide reassurance to our partners in the area. That could be said to be underlying much of this. It took time – and some trial and error – to do so credibly.

Q: What were you doing on this particular issue?

DUNKERLEY: I was spending a lot of time with the Japanese Foreign Office and their Korean Desk in particular. But I was also seeing a number of Japanese journalists, politicians and the like, especially those engaged on international issues. Again, at this particular time the role of the embassy's Political Section was not just that of a passive watching brief on Japanese concerns and attitudes but that of a more active effort to help the Japanese interpret a new Administration in Washington. The ebb and flow of Japanese concerns, being political in nature, tended at times to be slightly irrational.

Q: During the same period, I was Consul General in Seoul. We were very concerned. It seemed like a stupid move at the time presenting the North Koreans with an opportunity to do something. As time played out, essentially they really didn't do it. They moved some batteries out. How were your Japanese contacts reading this? Did they understand the political life in the United States and why this came about?

DUNKERLEY: That covers a broad sweep of the Japanese. On the one hand, the Foreign Office's America desk, the First North American division, usually had – I thought back then – a sophisticated and realistic understanding of both American policy and American politics. On the other hand, that sort of sophisticated reading was not necessarily shared in the wider range of political thinking in Tokyo, especially as amplified in popularized generalizations.

Q: Were the newspapers playing this up? Were they across the political spectrum saying things like 'you can't trust the Americans, they're not committed to the Far East,' that sort of thing?

DUNKERLEY: I would hesitate to say that it was as blatant as that. But with allowance for the sense of understatement that is so often the case in the Japanese language and especially the language of politics, there were clear signs of uncertainty and in some cases anxiety.

Q: By 1978 how was it?

DUNKERLEY: Much of the open controversy had died down by then. As you probably noted from your post in Seoul, once an extended process of consultations between the United States and the Republic of Korea, and with Japan and other interested parties got well and truly underway, at a certain point, the issue began to be defanged.

Q: Was there much consultation with Ambassador Richard Snyder? He was a real Japanese hand.

DUNKERLEY: Obviously having him in Seoul, given his extensive knowledge and experience in that region, was a great benefit. He was very much involved. I had known him from my earlier job in the East Asia Bureau Front Office.

Q: As you were working on this, what sort of attitude were you picking up from the Japanese about the Koreans?

DUNKERLEY: Certainly the official Japanese were entirely correct in the views they expressed in their conversations with us. As you know from your own experience in that part of the world, however, if you're talking about broader society, there continued to be prejudices voiced towards the Koreans and vice versa.

During this time a new ambassador arrived, former Senator Mike Mansfield. He came to be very important in steering the Embassy's approach on this and other issues. He was an excellent man to work for; like others, I learned a number of lessons just in being able to watch how he operated. About the same time, Bill Sherman, for whom I'd worked earlier on the Japan Desk, became DCM for Ambassador Mansfield.

Q: What were some of the lessons that you picked up?

DUNKERLEY: In terms of management and leadership, Mansfield conveyed – among many other things – an excellent sense of how to prioritize, choosing among those issues on which to expend personal time and energy as ambassador and the President's personal representative in Tokyo, and those better to leave to a large and capable staff at the embassy. Not surprisingly, given his history as a veteran within the Senate, you could note how he'd go about carefully building political capital on this or that issue, and then deciding the right moment and manner to weigh in with either the Japanese or policy-makers back in Washington. Throughout he would display an exquisite sense of personal diplomacy in all his relations with the Japanese at all levels. It was useful reminder of the importance of conveying a sense of personal integrity in all your dealings – that very much characterized all that he did.

Q: Were trade pressures from the United States running counter to trying to have good relations with the Japanese?

DUNKERLEY: That's always been a recurring theme – of varying intensity and urgency. Indeed one can say that has been true of U.S.-Japan relations for as long as most of us can remember, certainly going back to the 1960s. There were all sorts of trade-related strains in the relationship when I was there, but sometimes taking new or unfamiliar forms. For instance: in the early 1970s there was a brief but abrupt cut off of soybean exports from the United States to Japan. That was driven by reasons extraneous to Japan as I recall, but for the Japanese body politic, it was very off-putting in its effect – a “shock” in the terms of that time for the larger relationship.

Q: Were the Japanese doing much with North Korea at that time?

DUNKERLEY: No...and I suppose yes. As you know from your own experience in the region at that time, the Japanese did not have a formal governmental relationship with North Korea – even as they enjoyed diplomatic relations and a web of close, but at times difficult, political and business ties with the Republic of Korea in the South.

Nonetheless there was geographic proximity and a long history at work as well. As a

consequence, there was a certain amount of commercial trade and interaction between the DPRK and Japan, though it was much more important for the former than latter. And of course you had within Japan itself a large resident ethnic Korean population. Within this were significant organizations – some were supportive of the ROK and some that were very strongly and vocally pro-DPRK. Indeed, some of the latter were very much creatures of Pyongyang, Chosen Soren being foremost. These generated a modest degree of political leverage and a continuing stream of economic support, not least in the form of remittances, for the DPRK.

As a consequence, North Korea was a particular neighbor of special interest for us at the Tokyo Embassy. We would seek to follow North Korean developments to the limited extent we could. We did so, in part through regular discussion with Japanese counterparts working Korean issues and exchanges with those third-country diplomats with either a reporting presence, or first-hand experience, in Pyongyang. But in hindsight I continue to be struck by just little information, let alone insight, was out there.

Q: With China during this 1976-78 period, we had already gone through the opening of China and actually we recognized, we opened formal diplomatic relations during this period. Where were the Japanese standing on this? Were they trying to almost move ahead of us? Or, were they still annoyed about Nixon?

DUNKERLEY: I think it had been said by someone at the time that the ideal of Japan's foreign policy towards China would be to stay one step ahead of us – but only by about six hours. That is to say, while differences as to degree or detail might be periodically expressed among individual politicians or journalists, most political and business leaders of Japan seemed clearly interested in moving towards some form of greater normalization of relations with China. But, in the daily effect of its policies, the government seemed not so precipitate as to get very far out ahead of the U.S., presumably wanting to avoid any bilateral problems too great a divergence on this issue might entail. At the same time, government policy-makers were exquisitely sensitive, still raw, that they not be surprised once again by the U.S. on something so important for Japanese interests as China – as they had been so visibly embarrassed in the Nixon-Kissinger period a few years before. And so, at this time in the mid to late-70's – one had the sense of Japanese diplomacy on China as being in a state of constant testing, modulation and adjustment.

Another aspect affecting Japanese calculations in their evolving relationship with China was, of course, what this might mean for their relations with the Soviet Union. At that time a regular feature of Chinese public diplomacy was the expression of concern about Soviet ambitions in the Far East, casting this in terms of resisting aspirations towards hegemony. As a consequence, one of the recurring questions wrapped up in the on-again off-again efforts to conclude a long-stalled Japan-China Peace and Friendship Treaty came to be whether or in what form Tokyo might accede to language, however oblique or elliptical, characterized as being “anti-hegemony” in intent.

I recall that, as an embassy reporting officer, I had any number of conversations with Gaimusho – that is to say, Foreign Office – colleagues on this or that turn in the unfolding of this negotiation. Interestingly enough, most of the Japanese concern then seemed related the degree that all of this might be perceived as being overtly anti-Soviet. At that time at least, the Chinese

were not assertively pushing the public notion of “anti-hegemony” as applying to U.S. bases in Japan.

Q: Were you or the political section primed to encourage or discourage anything about the Japanese-Chinese relationship at the time?

DUNKERLEY: Not really. Given the delicacy of U.S.-China relations (recall we were also moving slowly and quietly towards a normalization of diplomatic relations with Beijing as well); given the number of domestic factors that were in play in Japanese-Chinese relations, both pro and con; and given the degree to which the Japanese government seemed to be fairly cautious – advancing a step, testing the water and moving back slightly as necessary, there was no overt lobbying on our part either way – certainly from the perspective of my level. At much higher levels of our bilateral discussions . . . I wouldn’t directly know but at that time saw little sign of any major campaign on our part.

Q: What about our relationship with Taiwan? How were the Japanese dealing with Taiwan during this period?

DUNKERLEY: This was a bilateral relationship of many different levels and different forms. There was, just as there continues to be now, important economic ties between Japan and Taiwan. Such commercial interests were matched by longstanding relationships among individual conservative politicians and various political support groups. Their relative weight within Japanese politics had evolved over the post-war years. So by this time, one had the sense, at least as an outside observer, that the interests underlying the Taiwan relationship – and its advocates – certainly were a factor that needed to be taken into account, could not be neglected, but which by themselves would not prove to be the most decisive factor as Japanese policy came to develop.

Q: One last relationship is the one with the Soviet Union. It has always struck me that the Soviets could have made great strides on some of those islands. It was almost as if we were paying the Soviets to maintain this high line stance in the Kuriles.

These are, of course, the famous “Northern Territories” – four disputed islands in the southern Kuriles chain – all of whose names I much regret have slipped my memory today. Again this was a long-standing problem that the External Office of the Embassy Political Section had to follow in our reporting – not as a breaking issue (it certainly wasn’t) but more as recurring environmental factor for the conduct of Japanese foreign policy vis a vis the Soviets.

You are correct: There was a particular Moscow-Tokyo dynamic at play in those years which suggested at times almost a quality of strategic irrationality, not least on the former’s part. Territorial disputes are often tough because of the popular political emotions they can excite – and for a variety of reasons, both parties appeared to have boxed themselves into a cul-de-sac. But this seemed counter-productive in terms of the Soviet tactics – especially given what we assumed could be significant strategic objectives to be gained by them through a more normalized, more upbeat relationship with Japan as an emerging economic super-power whose investments and technologies could greatly assist in further development of the Soviet Far East.

From the Embassy's perspective watching this play out, day-to-day diplomacy on Moscow's part with the Japanese seemed clumsy, at times pugnacious. I remember that, at the time, Japanese colleagues in the Gaimusho and in the press would speculate about how particular personalities involved on the Soviet side, in either the MFA or Central Committee, with personal experiences in the past dealing with Japanese POWs in Siberia, tended to reinforce a particular tone to all of this. You see that Japan-Russia relations, even now, continue to face problems arising out of this long-term legacy of the Northern Territories.

MARILYN A. MEYERS
Language Learning, FSI
Washington, DC (1974-1975)

Economic Officer
Tokyo (1975-1978)

Ms. Meyers was born in Virginia and obtained degrees from Southwestern University and Johns Hopkins School of Advanced International Studies. A Japanese and Burmese language officer, she served tours in Tokyo, Yokohama and Fukuoka in Japan and as Principal Officer (Chargé d'Affaires) in Rangoon. Other assignments include Johannesburg, Canberra and Washington, where she dealt primarily with economic matters. Ms. Meyers was interviewed by Thomas Dunnigan in 2005.

Q: Well, following your interesting assignment in South Africa, you were selected to take a course in Japanese. Which you'd asked for?

MEYERS: I had. During a vacation break, while in South Africa, I took a trip to the Far East over Christmas and New Year's vacation. One of the officers in Johannesburg and his wife had previously served in Hong Kong and Jim told me how quickly the Far East, at least in appearance, was changing, becoming modernized, more westernized. So I decided to go have a look and one of the places I went was Japan. And I was absolutely struck, captured by Japan in two ways. First of all, I had never been in a culture that seemed so different. I'm talking about the arts -- kabuki, and music and flower arranging-- and dress -- the kimonos. And at the same time, here was the city of Tokyo very much a part of the modern world. And all these businessmen racing back and forth, in their black suits and white shirts, no pastels yet. And I thought, "These guys are going to give us a run for our money when it comes to trade and commerce." And I also thought, "I want to be part of that." I came back to Johannesburg and on my desk was a circular asking for volunteers for hard language training, beginning in the summer of '74. One of the languages offered was Japanese. Others were Urdu, Chinese, and Farsi. I thought Farsi might be interesting, although I'd never been to Iran. I talked to our new CG, John Foley. And I said, "I want to volunteer for hard language training; I have the aptitude for it. And I'm vacillating between Farsi and Japanese." I gave him my reasoning, my thoughts on Japan. And he felt Japan was the smarter choice. So I volunteered for Japanese. In light of subsequent events in Iran, I'm certainly glad I did!

Q: What was that course intended to do? To help you speak the language, or to read it, or even to write it. Or to get you over the 2,2 hurdle?

MEYERS: To get you over the 2,2 hurdle. Basically what that meant was speaking at the 2 level, which is a basic speaking capability, and a rather elementary reading ability. I got the 2,2 after the year. Originally, my onward assignment was Fukuoka in Kyushu. But that got changed because somebody was leaving early. So I went to Tokyo, instead, after the one year. I was glad, because I hadn't had the chance to work in an embassy, only consulates. The downside of going to Tokyo language-wise is you're going to be dealing primarily with Japanese bureaucrats -- in the Foreign Ministry and the then Ministry of International Trade and Industry (MITI), and, in my case, Transportation. And most of the guys I dealt with had studied English for years. So, I'd go make my calls and of course we would converse in English because they knew what they were talking about and I would have been sitting there with my Japanese dictionary. So I went to Tokyo for three years, actually, from the summer of '75.

Q: Where you specialized in transportation problems. That includes, I presume, the automobile problem.

MEYERS: Yes, I had the transportation portfolio. At first I thought, "Ah, the Embassy's motor pool; I'll have control of the motor pool. That's going to be real power!" Of course, really, I dealt with trade issues in the transportation field. Yes, it had to do with the beginning of the automobile trade problems between the U.S. and Japan. Too many of their cars coming here; none of our cars going there, for which there were very good reasons. For one thing, U.S. vehicles were huge. And we made only left hand drive, whereas in Japan, you drive on the left. But, also, very importantly, the major part of my time was devoted to airline negotiations and which carriers got to fly where. The only international carrier for Japan then was Japan Air Lines (JAL). In those days, we had three carriers flying to Japan -- Northwest and Pan American and Flying Tigers which was only cargo. All went to Japan and beyond. The Japanese wanted to update our aviation agreement, which dated back to the mid-Fifties. They felt it was very unequal in that Japan wasn't being given enough landing points for JAL here.. So there was a lot of friction on that. And I found the airline portfolio absolutely fascinating. And then also there were maritime issues on occasion.

Q: Were we still encouraging Japanese auto exports to the States or had we stopped that?

MEYERS: Aside from our free trade principles, I don't think you could say that we ever "encouraged" Japanese exports to the States. I mean, the Japanese were very, very adept at studying markets and making products consumers want. The U.S. had been through its first "oil shock" in the early Seventies. I got to Japan in '75. The American consumer by then was interested in buying cars that were fuel efficient and smaller. And the Japanese were making those cars, and they found a tremendous reception here. So the cars were promoting themselves.

Q: Were you there for the Lockheed scandal?

MEYERS: No, I arrived after that. The scandal was '73-'74. Our ambassador to Japan when I

arrived in 1975 was James Hodgson, a former Lockheed official. He was the last Nixon-appointed ambassador. No scandal ever touched him and he remained as ambassador through the Ford Administration.

Q: What about the Japanese growing trade surplus with the U.S. Was that much of a problem to us at the time?

MEYERS: The number itself was not a problem. What caused the problem was the perception that Japanese saw trade as a one-way street. In other words, trade meant they could export but, so far as importing, they were not interested in importing manufactured goods but only raw materials since Japan is a natural resource poor country. When it comes to iron ore or natural gas or oil, they're all ready to bring it in and it was the finished goods they would send out. Pressure against Japan began to build, particularly as the Congress here began to see the impact of Japanese exports on various sectors -- automobiles, color televisions, steel -- and on American jobs. And the perception that the U.S. manufacturer was not able to penetrate the Japanese market, that trade was not a two-way street, caused the problem, rather than the numbers.

Q: Were you there when Vice President Mondale came over on his visit? Was he concerned with these problems?

MEYERS: I think he was. I did not accompany him on his calls. I was only a First Secretary. But I was there in the control room, saw his comings and goings from the hotel. He was very gracious and also obviously a politician. He arrived late one night, having flown directly from Brussels. President Carter had dispatched him shortly after the inauguration to reassure major allies there would be no significant shift in U.S. policies. And he came to the hotel. And we were all standing in the doorways of our rooms to greet the vice President as he came down the hall. He must have been tired as all get out. But he stopped and greeted everyone. I said "hello" and that my family was from Minnesota. And the next morning, as he left, I was back on duty. So I went to the doorway to meet him again and he looked at me and said "I met you last night." And I was impressed that he remembered my face.

Q: Did you have any other problems we should talk about there?

MEYERS: I don't think so. It was an interesting tour. I was actually supposed to be there two years and I extended to three.

MORTON I. ABRAMOWITZ
Deputy Assistant Secretary for East Asian and Inter-American Affairs
Department of Defense
Washington, DC (1974-1978)

Ambassador Abramowitz was born in New Jersey and educated at Stanford and Harvard Universities. He entered the Foreign Service in 1960 after service in the US Army. A specialist in East Asian and Political/Military Affairs, the

Ambassador held a number of senior positions in the Department of State and Department of Defense. He served as Assistant Secretary of State for Intelligence and Research and as US Ambassador to Thailand (1978-1981) and Turkey (1989-1991). He also served in Taiwan, Hong Kong and Vienna. Ambassador Abramowitz was interviewed by Thomas Stern in 2007.

ABRAMOWITZ: Japan also loomed large on our “client” list. We visited Japan frequently, often in connection with a trip to Korea. Our main objective in Japan was to try to convince the Japanese to increase their military capabilities and to minimize, if not entirely eliminate, the ever recurring politically sensitive issues arising from our bases. I was among the first U.S. officials to push for Japanese assumption of our base costs. This was a multi-year push which finally came to a successful culmination during my tour in ISA after CINCPAC.

We held an annual meeting between American and Japanese leaders. CINCPAC was one of the designated participants. I didn’t go to the meetings but I would go to Japan with the CINC which gave me the opportunity to sort of rub elbows with principal staffers.

In my year at CINCPAC, the two major issues I got deeply involved in were the base issues in Japan and the defense of South Korea. In general, we pushed hard, as I said, for increases in Japanese military capability and for a continuation and strengthening of U.S.-Japan military relationships. In the mid 1970's, unlike today, the U.S.-Japan alliance was not taken for granted. There was still a huge animosity against our policies. Americans disliked Japanese pacifism. Today, few question the need or the desirability of a U.S.-Japan alliance. But in 1970's, there were many issues, large and small, which were aggravating and often raised by the Japanese left just to “keep the pot boiling.” These issues like noise pollution managed to keep the tension levels at times between the two countries at a high level. We spent considerable time massaging our relations with Japan, dampening down the tensions rising from these incidents and at the same time encouraging the Japanese to increase their defense capabilities.

I was assigned to develop a response to Nunn’s efforts. I took the position that in the interest of preserving our position in Asia (and most of our facilities), we had to make some offer to reduce our presence somewhere in the area. In 1975-76, we undertook a major base structure study that was requested by Nunn. At the end, we made only minor changes, which satisfied the “withdrawal crowd” without damaging our military posture. My view was that we should continue to maintain robust forces in Thailand, Japan, Korea, Okinawa and the Philippines. As I said, we made some minor adjustments in our total presence as well as closing or reducing some bases. This gesture satisfied our immediate political requirements, both domestic and foreign, and permitted us to preserve our essential base structure.

Early in my tenure in ISA, I became involved in the issue of financial compensation by the Japanese for our military bases in their country. I am pleased that we managed to get the Japanese to begin to bear some of the costs of our presence. The Japanese had recovered quite well from the war, at least in economic terms. I felt it was time for them to assist in maintaining our military facilities in Japan, which to a considerable degree were required for Japan’s defense as well as Korea’s. We negotiated the first labor costs sharing agreement in which the Japanese became responsible for the payment of a significant portion of the local labor costs

involved in the management of the bases. The negotiations were actually conducted by our embassy and military establishment in Japan, but we provided the initiative, guidance and back-stopping. Eventually, this small step led to a major Japanese investment in our bases; today the Japanese pay the lion share of the costs. This was a concrete and measurable achievement. Our focus on reaching this agreement was in part stimulated by our interest in showing Congress that we had vibrant allies in East Asia who were willing to share the defense burden.

Q: You mentioned earlier the efforts to have the Japanese pay in part for our presence in their country. What else did you work on with the Japanese?

ABRAMOWITZ: In my last year in ISA (1977-78), the Japanese appointed a new defense minister, whose name was Sakata. We became close and he was also deeply interested in working with SecDef and other senior DoD officials to strengthen our defense relations. He and I began to work on a paper which would establish guidelines for the development of our defense relations. This became ultimately a key document which was worked on for years after I left the Pentagon. It was the basis for the enhancement and improvement of our defense relationships and the beginning of an expanded Japanese role in the defense of their country. This expanded role was in my mind one of the key ingredients in our post-Vietnam military posture in the Far East. As I said before, my goals were to try to prevent any weakening of that posture; to try to strengthen our relations with Japan and Korea; and thirdly, to help accelerate the enhancement of our relations with China, in great part, as a counter-balance to the Soviets. In the case of the third goal, I must admit that the improvement of military-to-military relations moved very slightly because we really had no platform from which to operate. It is true that Brzezinski wanted DoD representation on the team he took to Beijing both for cosmetic reasons – so that the world would know the deepening of our relations – and to actually begin a relationship between the two militaries and defense cooperation. I became the personification of the “cosmetic reason”; specifically, I was charged with briefing Chinese officials on Soviet involvement in Asia. I did make a presentation which took about an hour and showed them pictures of Soviet deployments, but I must admit that I don’t think it was a very satisfactory meeting because the Chinese refused to engage in any exchange of views; they listened to us carefully, but were not prepared for a dialogue. They did have some questions about some specific issues raised in my presentation, but there was no real exchange of views. The Chinese were not ready to become seriously involved in major issues such as Soviet activity in Asia. The briefing served the purpose of breaking the ice, a necessary first step. The Chinese had an opportunity to have new facts and intelligence brought to their attention; that in itself was useful. I had hoped that my presentation would have been the start of a serious discussion; in fact, that would take more time. The Brzezinski visit was a crucial step in the development of Sino-American relations, and a fascinating first experience for me in mainland China.

As for Japan, I mentioned that we had some successful negotiations concerning Japanese financing of our military presence in that country. By “we”, I mean the whole American team, our military in Japan, our embassy, and ISA of State. We had first of all to collect a lot of detailed information – financial and otherwise – about our operations, which our military supplied. Our senior Air Force officer in Japan, who had been the secretary’s military aide and whom I knew well, was deeply involved and did the lion’s share of the negotiations. The Washington team which I headed discussed the general principals and the U.S. objectives with

the Japanese foreign office and defense officials, but the nitty-gritty was left to the Air Force general and his staff. Our discussions lasted a year and produced concrete results, ultimately leading to billions of dollars of savings each year.

The Philippine and Japan base negotiations illustrate two common problems that have held true for almost, if not all, base issues, at least two decades ago. First of all were problems associated with the American presence – drunken behavior, inadvertent accidents, noise generated by our planes, etc. Such problems are not solely connected with bases; naval port calls often generate the same kind of negative behavioral actions. We in ISA, usually in connection with the Joint Staff of the Chiefs of Staffs, spent a lot of time negotiating such issues. The second problem was the status of forces agreements and all the negotiations which had to be undertaken in order to preserve the judicial position of U.S. military on foreign soil. This was always a major issue, and was always on our desks.

The “status-of-forces” agreements were generally a challenge. We had to protect our men and women from arbitrary actions by the host country while it had a responsibility to its citizens to protect them from a wayward American soldier or sailor. The signing of an agreement was only the beginning; the daily workload was frequently generated by activity on the ground which required an interpretation of the agreement. Some of the incidents had the potential of developing into serious political friction and we obviously did our best to try to avoid such escalations. But the process to handle these incidents was time consuming as were the inter-and intra-agency deliberations leading up to and including these instances and the broader international negotiations. An office in ISA/DoD was charged with conducting status-of-forces agreements. Phil Barringer headed that office where he had worked on these issues for at least 25 years. U.S. policy on both sets of issues was set by an inter-agency group with this ISA office being the chief implementer.

Personally, my involvement with base negotiations was limited to the Philippines and Japan and later Turkey, where we also held a number of discussions about our base structure in that country.

I should not end the discussion of base negotiations and status-of-forces agreements without tipping my hat to our embassies in the countries with which we were negotiating. They were of vast help.

HUGH BURLESON
Policy Officer, USIS
Tokyo (1975-1978)

Mr. Burleson was born in South Dakota and raised in California. After graduating from the University of California, Berkeley, he served in the US Army before joining the United States Information Agency in 1957. A specialist in Southeast Asia Affairs, Mr. Burleson served variously as Policy Officer and Public Affairs Officer in Niigata, Tokyo, Saigon, Madras, New Delhi and Seoul.

He also had several tours at USIA Headquarters in Washington, DC. Mr. Burleson was interviewed by G. Lewis Schmidt in 1996.

Q: So when you got back and after your home leave, where did you go then?

BURLESON: I was assigned to Tokyo and again in Policy. It had been almost purely in the research position that I had held in '64-'69. As a matter of fact, in policy/research. I was more involved in the strategic planning, drawing up country plans, running the DRS. We originally called it Audience and Records System. The aim was to computerize the records of all USIS activities and have audience records in your computer too. I was also running and evaluating programs, surveying reactions to our programs and to our publications, and so on. So, it was a broader job that I went back to and did for the next three years, '75 to '78.

Q: Who was the head of your operation at that time?

BURLESON: First it was Bill Miller. Then, Cliff Forster. He had been Deputy PAO when I was in Tokyo in the '60s, and now in the '70s, he was back as PAO.

Q: They have now moved back to California.

BURLESON: Yeah, they just went up there, Tiburon, near Sausalito. We are still in touch.

The job was more complex and I was very much involved especially in the country plan process and then in evaluating programs. We did surveys among opinion elites to see how well our activities were reaching them -- level of awareness. A few times we did before-and-after surveys of program participants; and we did surveys to measure relative exposure to USIS publications versus commercial or organizational publications treating foreign policy. We continuously analyzed reports of Japanese opinion surveys, and did some of our own surveys as piggy-back polls. A large number of Japanese opinion surveys were being done, and it kept me busy analyzing and reporting on them. It eliminated much of the guesswork over how U.S. policy was perceived.

DAVID LAMBERTSON
Japan Desk Officer
Washington, DC (1975-1977)

Political Officer
Tokyo (1977-1980)

David Lambertson was born in Kansas in 1940. He received his BA from the University of Redlands in 1962. He entered the Foreign Service in 1963, and his assignments abroad included Saigon, Medan, Paris, Canberra and Seoul with an ambassadorship to Thailand. Mr. Lambertson was interviewed by David Reuther in 2004.

Q: So, now having spent all your time overseas, you can't get out of Washington. Your next assignment is to the Japan desk?

LAMBERTSON: It actually worked pretty well for me. I'd gotten married when we were in Paris and I acquired three stepchildren, so it was rather good for us to establish ourselves as a family and have a semi-normal life in the Washington, D.C. area, in Alexandria, Virginia, from the summer of '73 until the summer of '77. In '75 after two years in EA/RA I joined the Japan desk. That was a very good move for me. I'm extremely glad I did it.

In that case it was Bill Sherman, the Country Director, it was Bill Sherman's initiative. He came to me and asked me if I would be interested in becoming deputy director of the Japan desk. I certainly was. I wanted to broaden my horizons. Japan loomed larger in our thinking then than it seems to in 2004. Bill Sherman was a man that I had gotten to know a little bit and I admired him, so I was very happy to move around the corner in the bureau to the Japan desk.

Q: Now, you're deputy director?

LAMBERTSON: Right.

Q: A deputy directorship is a major assignment in the State Department, so he obviously had a very high opinion of you.

LAMBERTSON: Yes, I think he did and I appreciated that at the time, and I've always appreciated Bill's tutelage and mentoring - all of that that he provided over the years to me. He was the best Foreign Service boss I ever had. Quiet, soft spoken, very wise in the ways of bureaucracy, wonderfully knowledgeable about Japan and policy toward Japan and policy toward lots of other things, and just a very good teacher. It was a great opportunity for me.

Q: How big was the Japan desk at this time?

LAMBERTSON: It was quite small. Six officers and three secretaries; might have been seven officers, but certainly no more than that.

Q: It would be split into economic and political sections and maybe a consular officer?

LAMBERTSON: Right. Yes, I think we had a POL/MIL specialist.

Q: POL/MIL specialist, right.

LAMBERTSON: For the security relationship.

Q: Okinawa had gone through some...

LAMBERTSON: By then, Okinawa was once again fully part of Japan. I joined the desk just a few weeks in advance of the visit to the United States by Emperor Hirohito which was a very big

deal in U.S.-Japan relations, and significant in U.S.-Japan history I think. A tremendous amount of preparation had gone into that visit as you can imagine. The Japanese being as careful as they are about anything like that and doubly so when the emperor was involved. It was a highly choreographed operation, but there was very good symbolism to it. I think it in a sense put a final “period” to one important phase in U.S.-Japan history.

Q: Were there particular highlights that one side or the other wanted in the schedule as particularly symbolic or were both sides pretty much on the same track, oh yes, he should see this, he should do that?

LAMBERTSON: I don't remember any particular controversies over the schedule. He was elderly at that time of course. We had a wonderful welcoming ceremony on the South Lawn and that was followed by a reception in the East Room of the White House. Sacie and I just made the cut for that event. We went through a receiving line and shook hands with the Emperor of Japan, which no Japanese could have ever imagined doing. Then that evening we didn't qualify for the State dinner, but we did qualify for the “after dinner entertainment” which meant white tie and tails and fancy dresses for the ladies. We were ushered in through the south portico and went upstairs, as I remember, to the main north entrance to the White House where once again there was a receiving line, where we once again shook hands with the emperor. Then there was a little orchestra and there was dancing right there on the marble foyer in the White House. Gerald Ford took the floor first with Ginger Rogers, who was a little long in the tooth but still very graceful on the dance floor, as was Gerald Ford, so it was a great evening, a great day.

The substantive issue that I remember most from that job, 1975 to 1977, was the so-called Lockheed scandal. Lockheed or its agents had allegedly attempted to bribe some Japanese politicians to improve prospects for the sale of, probably, the P-3 (anti-submarine warfare aircraft) and it became a huge scandal in Japan. There were reverberations back across the Pacific. Frank Church, who was chairman of the Senate Foreign Relations Committee, seized the issue and held hearings on it. I think there was an investigation of some kind that preceded the hearings, and I got very much involved in the Department's response to that whole process. It included among other things passing information back and forth between the Japanese government and the congress. We were sort of the conduit for information requests from the Senate Foreign Relations Committee, which were conveyed to us by Chuck Meissner, the late Chuck Meissner. Moose and Meissner, remember?

Q: Oh, I thought it was Moose and Lowenstein?

LAMBERTSON: Well, it was Moose and Meissner at first. He was an assistant secretary of commerce in the Clinton Administration and was on Ron Brown's airplane in Yugoslavia, unfortunately. Anyway, Meissner was the staffer involved and I was the middle man, and the Japanese Embassy officer involved was a good fellow by the name of Kazuo Ogura, who became a very senior Gaimusho (Ministry of Foreign Affairs) official. As a result of all that, the Foreign Corrupt Practices Act was born.

We had visits by Japanese prime ministers as always happens. There were two of them during my two years, two different prime ministers. I was involved in those visits. Prime Ministers Miki

and Fukuda.

Q: That's LDP (Liberal Democratic Party) prime ministers, still?

LAMBERTSON: Oh, yes.

Q: Prime ministers. Was there any particular significance to that political change?

LAMBERTSON: I don't recall. I think it was essentially internal LDP politics.

I remember flying on Fukuda's airplane from Washington to San Francisco on his return to Japan. Evan Dobbelle was also on that airplane and I sat next to him. He was the chief of protocol under Jimmy Carter. I guess this was very early Carter Administration. This would have been early '77. We landed in San Francisco and were met by the city's chief of protocol, Cyril Magnin of the I. Magnin department store family. He was a very nice, elderly gentleman and had been doing this for years. He organized the San Francisco portion of Fukuda's visit. I rode in from the airport with George Moscone, the mayor of San Francisco, who was an attractive guy. He was killed not long after in the Harvey Milk shooting incident. We had dinner at a fancy hotel and Cyril Magnin I think was a little embarrassed because the evening was so dominated by San Francisco's Italians, not only Moscone, but a lot of other people whom he considered a little bit nouveau riche and not very sophisticated. His reaction was amusing. It was a nice event.

Q: Is that fairly typical for the deputy director to escort a prime minister?

LAMBERTSON: Oh, I don't know how typical it is. It was just something that Bill Sherman let me do. I wasn't "escorting" the Prime Minister, but I was a member of his party.

Q: You were traveling commercially?

LAMBERTSON: We were traveling on a chartered Japan Air Lines (JAL) aircraft. It was Fukuda's personal plane.

Q: So, there were certainly enough Japanese embassy people there, too?

LAMBERTSON: Yes.

Q: Sitting in Washington you must, and having done it in the field, the presidential visit, you must have looked out the window and thought "I know what the embassy, the Japanese embassy guys are going through."

LAMBERTSON: That's right, although I guess up to then I had not done a presidential visit. I did my only presidential visit in fact in Japan in 1979.

Q: Now, when you're on the desk you had the opportunity, which is fairly typical at that time of making an orientation trip to your post. Had you not been stationed in Japan, you probably passed through Japan to get to Saigon because that's a great circle route and all that. What did

your introduction to Japan, how did that strike you in October of '76? You went to Honolulu first, you probably saw the CINCPAC people?

LAMBERTSON: Yes. I first visited Japan in 1965 on an R&R from Saigon. You could do that sort of thing. I flew into Tachikawa air base, which by 1976 had been closed down. Japan in 1965 was still a far cry from an economic super power. It was interesting to go back and see it again in 1976. I was impressed by the sense of power that you felt around you in Tokyo, sort of a pulsing energy and the same kind of feeling you get in some other Asian cities now - the same sort of feeling you get now in Beijing, and in Tokyo, still. Things are happening, really moving.

I spent a good deal of time with Nick Platt, because by then I knew I would be replacing him the following summer. I met many of the people at the Gaimusho (Ministry of Foreign Affairs) who I would later get to know very well. I went with Nick to a couple of Gaimusho-hosted dinners in cozy little Japanese restaurants, with serving girls, the modern equivalent of geishas – unbelievably expensive evenings I'm sure, but Gaimusho funds at that time seemed to be unlimited. I talked with lots of people in the embassy, in all sections. I'm sure I met people from USFJ, although I don't recall specifics. I visited Sapporo – it turned out to be my only trip to Hokkaido, unfortunately. A fascinating place, I thought, a distinct variant of Japanese culture. I was hosted there by Larry Farrar, the consul general, as I was a few days later by the ConGen in Naha. One of the things I remember from the Naha visit was looking out over the plain and the sea from the consul general's residence and watching an SR-71 circling to land – it no doubt having just returned from a run along the DMZ in Korea. I stopped in Honolulu on the way out for a briefing and I'm sure I paid a courtesy call on the Admiral. I stopped in San Francisco on the way back where I met my parents. We had a nice few days together, touring wine country among other places. During my absence, Carter had beaten Ford.

Q: At this point you're on a desk in Washington at the time of a change in administrations. My experience is this is the time of drafting transition papers where recent history and policies are summed up. How did that process sweep through the Japan desk?

LAMBERTSON: I don't remember specific papers quite frankly, Dave, but I know that was the process. Everybody did it. "Where are we going" kinds of papers for the new guy coming in. I think we learned fairly early on that our new guy was going to be Dick Holbrooke.

Q: Old Saigon friends getting together?

LAMBERTSON: I suppose. Actually I was happy to leave the bureau when Dick came in. Partly, perhaps, because I still considered him a peer and felt uncomfortable about the idea of his being my big boss. Partly also because his style bothered me – a little too aggressive for my taste. I was pretty well convinced that I'd be better off watching his performance from a distance. Japan seemed about right.

Q: You're doing these papers. I guess what I wanted to ask was there any particular policy that you thought needed to be highlighted as you passed things on to your replacement or was Japan fairly stable at that time. I know the reversion of Okinawa had earlier been a very major event.

LAMBERTSON: Yes, that was done and I think in 1977 the relationship was in pretty stable condition. Indeed during the entire time I was in Japan it seemed to me that it fundamentally was. I had an interesting job there because I was dealing with foreign policy issues, but the bilateral relationship was steady, and in good shape. We had just appointed Mike Mansfield; that happened before I left the desk in the spring of 1977. That met with everyone's great acclaim. I thought he was a wonderful choice.

Mansfield had first visited Japan in the '20s, as a young Marine returning from China. He had a lifelong interest in Asia and in addition was a distinguished political leader – Senate Majority Leader longer than anyone else before or since. He was a man of great age – 75 or so at the time – which alone was enough to earn him the respect of the Japanese. And as I got to know him, which I was lucky enough to do, I admired his modesty, his unassuming nature, his warmth. All of those qualities made him a wonderful ambassador. One of his favorite phrases was that the U.S.-Japan relationship was “the most important bilateral relationship in the world, bar none.” That might have been an arguable proposition, but Mansfield believed it, and so did I.

I have a photo of him over there on the wall, with a very generous inscription. One of my favorite souvenirs.

Q: I was going to say one of the things that happens in Washington at that presidential transition time, you do the transition papers as a handoff and then you often get a new ambassador, particularly Japan had a long line of outstanding political leaders, that's a political appointee job. The desk has a major responsibility to Mansfield in his hearings; to brief him up. Do you go to him or is there an office at the Japan desk? How is he introduced to the Foreign Service?

LAMBERTSON: I don't know that we had an office for him, but he came into the Japan desk a number of times during that period. I had the good fortune of going around town with him to call on various people. The Undersecretary of the Treasury. Bob Strauss, who was the Special Trade Representative at the time. Commerce Secretary, I don't remember who that was. I went with Mansfield on all those Washington calls and he was a wonderful man to be around. I also went with him up to the Hill, where his Senate colleagues gave him a going away reception in a room in the Capitol. It was very nice, to see him lionized by his peers as he was. I felt very privileged to witness that. I really liked Mansfield and I got to know him pretty well in my three years in Japan, and kept up with him at least occasionally in the years that followed. I called on him in his downtown office not too long before he died. I admired him very much, and I appreciated having an opportunity to work for him and get acquainted with him.

Q: Those are major responsibilities of the desk, the transition stuff, the new ambassador. Mansfield obviously had done a lot of traveling, he knows the Foreign Service, so he probably felt very comfortable coming onboard. As you said, your next move is from the desk as deputy chief of the political section of the embassy in Tokyo. Tokyo's expensive. Why did you want to go there?

LAMBERTSON: Well, really it was a great job, because Japan was and is an important country and we have such very important relations with them. There was a need for, for want of a better term, “coordination,” so that we could speak with the same voice toward third-country issues,

international issues. So the external affairs portfolio, which was what I had in addition to my title as deputy, was a really good one. It meant that I worked with the Gaimusho on a daily basis, and I developed great respect for the Gaimusho and its ability to represent Japan to the world, and respect for the individual talent of so many of its officers, especially the ones in the American affairs track, who were the best. There were many young Foreign Service Officers in middle grades and some at sort of the early senior level with whom I worked directly and who later rose to the top of the Japanese Foreign Service. Ambassadors to Washington and vice ministers and things like that.

The other reason it was a good job was because of the quality of the people in the embassy. Mansfield was the ambassador, Bill Sherman was the wonderful DCM, Al Seligmann was my prickly, but brilliant boss and I had a lot of respect for him. Then there were all the other good people in the political section. Tom Hubbard was the internal affairs guy. Bob Immerman was the labor attaché and his deputy was Chris LaFleur. Bill Breer was the political-military man. His deputy was Don Keyser, who typed letter-perfect telegrams at 75 words per minute on his IBM Selectric. I had working directly for me, as my external unit, Craig Drunkenly, Mark Minton and Mark Mohr. A great bunch of people.

Q: It was and that's a great list of names, but something you said earlier. There was a Japan crowd. You often say there's a Japan crowd, there's a China crowd, how did you crowd into these?

LAMBERTSON: The only senior job in the political section that allowed for that was the one that I had, the external affairs portfolio. Nick Platt had had it before.

Q: So, it was non-language designated?

LAMBERTSON: It was non-language designated. We were working with these superb English speakers in the Gaimusho. I managed to get to Japan that way. Yes, most of the members of the political section were new or in some cases old members of the "Japan club." They had done two years of language and some were on their second tour. They intended to spend much of their careers working on Japan and on U.S.-Japan relations. It was a high quality group. It was a specialty that attracted real talent and I am sure still does.

Q: You mentioned that your portfolio was the external issues, so, Japan's relationship with the outside world. The Carter administration comes in and says it wants to reduce troops in Korea. Korea is in Japan's backyard.

LAMBERTSON: Yes, that troubled the Japanese needless to say. We always tried to put the best possible interpretation on what Washington was saying and doing on that issue. They were bothered by it.

Q: Obviously it was raised in the diet, Gaimusho would be saying it was out there. They're getting reports from their own embassy.

LAMBERTSON: Yes. The Carter approach to Korea was a matter of concern to the Japanese. A

lot of things happened in Korea during the time I was in Japan. There was the assassination of Park Chung Hee and all that followed, eventually the Kwangju massacre, which happened while I was still in Japan in the spring of '80. Bill Gleysteen, the ambassador in Korea, came to Tokyo a couple of times at least while I was there, once shortly after the assassination of Park and the assumption of control by Chun Doo Hwan, basically to brief the Japanese. They had their own embassy in Korea obviously, but they very much welcomed Bill's insights into what was going on. I went with Bill to all of his meetings and it was fascinating. I was extremely impressed with Bill Gleysteen, always had been. I had not had much contact with him before, but he was so articulate and so thoughtful and so clear in his explanations that I couldn't help but be greatly impressed. So, I'm sure, were the Japanese.

Q: How high did he brief?

LAMBERTSON: I suppose at least up to the vice minister of the Gaimusho. Then he had a couple of dinners with senior people who were very anxious to hear what he had to say. Bill asked me to be his political counselor before I left Japan. I was pretty tempted. I relied in part on Bill Sherman's advice as to what I ought to do next. He thought it would be good for me to go off to the RCDS, so I did that.

Q: We're illustrating how issues in third countries impact on our bilateral relationship and how the bilateral relationship responds to that. Isn't this the same period as Afghanistan?

LAMBERTSON: Yes. The Soviet invasion of Afghanistan and our response to that, which meant keeping as much political pressure as we possibly could on the Soviets and that included of course generating a boycott of the 1980 Olympics, which was one of the issues that we dealt with in Japan. They reluctantly agreed to go along with us and they did not attend the 1980 Olympics.

The Iran hostage crisis was happening as well and the Japanese were helpful to us, as I recall. They had an embassy in Tehran which was a good listening post and they had a very well connected Iranian ambassador in Tokyo who had been a confidant of the Ayatollah Khomeini. There was something of a channel of information there.

Just about anything significant that happened internationally during that period was somehow on our agenda. If you're in any embassy you're going to get instructions relating to things that happen half a world away, but that occurred more often in Japan than in most other places, and there were probably more often action requests connected to such messages, because we wanted Japanese support, expected it in a lot of these situations. The Japanese were not always totally anxious to give it, but they usually came through.

In a larger sense, we were always talking with the Japanese about their role in the world. We encouraged Japanese activism in foreign policy, because we knew that if they exerted their influence, it would bolster ours. We were of course aware of the political constraints under which the GOJ – and Gaimusho professionals – labored. The Gaimusho was almost always “out in front” of the rest of the government, the Diet and the public at large when it came to the idea of Japan being more activist internationally. Even today, the Japanese are mulling over what

their role should be, and activism is still considered controversial. When I was working there, almost 30 years ago now, the constraints – political and even constitutional – were much stronger.

Q: That's of course exactly to the point and exactly why you need the Foreign Service. The other country is not at your beck and call. You make your case and he filters it through his interests, but I suspect it's a very close relationship in which you probably talked of Africa and Asia. You were talking about Russians seeking political asylum during the time that you were there?

LAMBERTSON: We had several incidents of people seeking political asylum from Russia, from the Soviet Union. I can't remember how many members of the Leningrad Symphony ended up under our care during my time there.

Q: You mean in the embassy?

LAMBERTSON: They sought political asylum and we provided it. But we had one bona fide defector case - a Soviet KGB colonel. It was an important defection. My involvement in that, apart from being up much of the night, was to inform the GOJ, which I did in a very early-morning meeting in the Gaimusho, and to ask for their cooperation in getting the fellow out of the country.

Q: President Carter visits Tokyo for the economic summit or was it something other than that?

LAMBERTSON: It was for the 1979 Economic Summit. The first of those things to be held in Japan. I guess it was the G-7 in those days. It was I'm sure a typical presidential visit. All the other presidents and prime ministers and their entourages were comfortably housed in the New Otani, a huge high rise hotel near the Akasaka Detached Palace where the meetings were to be held. We of course needed something much more than that and so we decided on the Okura Hotel, which was at the time the best hotel in the city and right across from our embassy. We made do with 600 rooms there – two-thirds of the hotel's capacity. So, we had a few members of the cabinet as well as the president and all that that entails. Bill Sherman, the DCM, was the control officer and I was his assistant. I spent a lot of time with the pre-advance team of a dozen or so individuals. Lots more with the advance team, 60 or so. Then all my waking hours as the visit drew near. Have you been in a presidential visit?

Q: Yes, I have. That's a point I think to emphasize here. Tokyo is a large embassy. You've got a lot of people. We've got one in Bangkok, but these visits are actually major, require major allocations of officer time and effort. I mean you have, but you're allocating assigning officers to individual cars to see that the darn things work and they've got gas and nothing can go wrong, so everything has to be done in great detail which means the embassy stops, right?

LAMBERTSON: Yes, certainly anything of low priority quickly gets wiped off the agenda and the visit takes absolute top priority over everything else. Individual officers have to be assigned to each venue, there are officers assigned to motorcades for example, all of those things have to be done. This was a state visit for the president in addition to his participation in the Economic Summit, so there was some travel involved, some events that took place outside of Tokyo.

Immense logistical preparation was of course required for all of that. Tremendous demands were made of the Japanese government, and more than once we came up against the inherent rigidities of the Japanese decision-making system. The Japanese would want everything thoroughly orchestrated well in advance and it was always very difficult to change plans at the last moment. Anything not conforming to the graven-in-stone plan was very hard to get approval for from the Japanese. We ran into that during the Carter visit.

Occasionally we simply ran roughshod over the Japanese, as we do routinely with presidential visits wherever they may be. We do things that are embarrassing to the embassy, that require the embassy to go around and mend fences afterwards. I think this is always part of a presidential visit. The role of the embassy is to make it work for the president, and to the extent possible limit the bruises among local officials. It always is an important political event for the host country and in that sense, generally speaking, a major “success,” but there always also are abraded feelings among people on their side, in this case the Japanese side, whose sensibilities have been trampled upon by advance teams or some other part of the visit machinery.

Q: Let's look at that point for a minute because I've found that advance teams representing the president really don't care what country they're in or what society they're in.

LAMBERTSON: It could be Pittsburgh.

Q: There's an incredible lack of sensitivity and in one sense any lack of what the economy can provide for them. Advance people are the first ones the embassy wants to strangle before they get to the real delegation. How did you find advance people? I mean the security guys are tough enough.

LAMBERTSON: I thought that Carter's advance people were quite good. The team had a very young chief. I think he was in his late '20s. He was running a very big operation. He was a professional advance man. I respected his abilities. We got along pretty well. I got a very nice letter out of it at the end of the trip - one of the nicest of those things I ever received. Yes, you're quite right, they are fixated on doing exactly what they believe the president wants or what they believe is best for the president. It makes absolutely no difference whether that fits or does not fit with realities in the host country. So, you're bound to have conflicts and you just have to kind of try to massage the hurt feelings of your host country counterparts after wheels-up.

Q: You mentioned off line that when Carter came he wanted to do some jogging or something there.

LAMBERTSON: That's right, he was a jogger and he was staying in the ambassador's residence right across from the Okura Hotel. He had tried jogging in the small backyard of the residence once and he didn't like it. By then he had been to the Akasaka Palace for the first meeting of the Economic Summit and its grounds were very spacious, beautiful, 50 or 60 acres, and he thought, why can't I jog there? So, we informed the Japanese that the following morning the president would like to go jogging at the Akasaka Palace and the Japanese immediately said, that's not possible. We had a meeting that night in the Okura Hotel between the Japanese police, who were the ones who had vetoed the idea, and ourselves, ourselves being myself and Chuck Kartman

who was my number one assistant as well as my motorcade man, and we tried to get the Japanese to let the president go jogging in the Akasaka Palace grounds the following morning. The Japanese police were absolutely adamant. There were two Gaimusho fellows there trying to be intermediaries between us and the Japanese police. That was the only time I ever saw a Japanese official cry.

The Japanese police were everywhere during that visit and the city was completely shut down. It was a very bizarre scene. Jimmy Carter could have jogged down the middle of the Ginza quite safely I'm sure, but the Japanese police would not let him use the palace grounds.

Q: You were saying that, as we all often experience, there is a point past which you have to make apologies for how a couple of things came down. I think in this visit you were saying...

LAMBERTSON: Yes, in this visit the president of course called on the emperor in the palace, and the audience with the emperor was obviously limited in numbers. The president and a few of his top people. One of the people who made the cut for that event was Dick Holbrooke. Incidentally I remember when the advance team came to Tokyo and we were talking about some event and went down a list of people and the advance man said, "Who's Dick Holbrooke?" Another member of the advance team said, "Oh, he's one of Vance's guys." It put a different perspective on who was a big shot and who was not within our system. In any event, for the call on the emperor, Dick Holbrooke was one of the participants, and the dozen or so people who were allowed into the reception room proceeded toward it. Apparently Dick Holbrooke had with him Nick Platt who was the country director, the fellow who I had replaced and who had in turn replaced Bill Sherman as Country Director, and Dick said, "Come on Nick, you can join in." So, Nick did and they marched in numbering 13 instead of 12, past the outstretched white-gloved hands of the imperial household staff. The Imperial Household Agency was outraged, and within two hours of the departure of Carter, Bill Sherman was called over to the palace. I went with him and we were reprimanded by the Imperial Household Agency's chief of protocol for this incredible breach of custom. We thought our people should have known better. Dick Holbrooke should have known better and Nick Platt, the country director, should certainly have known better. Anyway, the world didn't come to an end.

Q: The point is having a presidential visit in Japan, which is a major ally, and when you're dealing with the emperor whose status is so incredible. I mean Japanese language alone, you can't even talk to the gentleman, the vocabulary requirements are so extensive, so I mean this isn't just a visit down the street or to Ottawa. It has layers upon layers of protocol and meaning and you survived.

LAMBERTSON: That's right.

WILLIAM PIEZ
Economic Counselor
Tokyo (1975-1980)

Mr. Piez was born and raised in Rhode Island and educated at the University of Rhode Island and the Fletcher School. After service in the US Armed Forces, he joined the Foreign Service and was posted to Frankfurt, Kabul and Manila as Economic Officer. During his career Mr. Piez dealt primarily with economic matters of East Asian countries, particularly Japan, where he served first as Economic Counselor and, from 1983 to 1985, as Economic Minister. In the Department in Washington, Mr. Piez was Deputy Assistant Secretary of East African Economic Affairs, and from 1989-1991, Deputy Assistant US Trade Representative. Mr. Piez was interviewed by Charles Stuart Kennedy in 2009.

Q: Well then where did you go after...

PIEZ: Well I stayed on the Japan desk until '75 and then was assigned as economic counselor in Tokyo and I went to Tokyo in '75.

Q: Tokyo from '75 until when?

PIEZ: 1980. It was almost exactly five years.

Q: Good God.

PIEZ: I was assigned for four. I asked for an extra year for personal reasons. The tour extension made it possible for my son to remain in the same American high school in Tokyo until graduation.

Q: Ok, you are out in Japan in economics. Who was the ambassador?

PIEZ: Well when I arrived there it was James Hodgson. He had been Secretary of Labor and he was the ambassador then. Our embassy at that time was in a temporary building. Our old embassy, going back to maybe 1930, was being torn down and rebuilt. Part of the contract called for a temporary building nearby which the contractor put up. It was all made out of prefabricated panels, so it would be easy to take apart and trash. When I arrived in Tokyo there was no economic minister, no economic counselor until I got there, and no commercial counselor, so I had all three jobs.

Q: You say you were an economic counselor. You say there was an economic minister.

PIEZ: There was an economic minister, one of five in the world at that time.

Q: An economic minister would be a rank above you.

PIEZ: Yes, and he was presumably in charge of the State People, the Commerce People, the Treasury attaché and others as a sort of inter-agency economic complex...

Q: Because we had so many important economic ties to Japan and we had all these different people there he was made sort of the super director in order that he or she could direct all these

units. That was, and you would be in charge of sort of the Department of State and that type of stuff?

PIEZ: Yes. The economic portion.

Q: First let's take an overall look. In '75 how stood relations with Japan?

PIEZ: Well relations were I think on a very positive basis. It was in '72, after approval by President Nixon, that the reversion of Okinawa to Japan was concluded. That really removed a major impediment to a friendly relationship, and the Japanese immensely appreciated it.

Q: Well you know we have talked about this before. In State Department language there was a quick battle for Okinawa which was between essentially State Department people and U.S. marines who didn't want to give up any sovereignty or control over Okinawa. This was a battle that raged for some time in the corridors of the State Department.

PIEZ: But actually the Pentagon found a very capable army general to take command in Okinawa, and he worked very effectively to make reversion work while protecting the interests of both the Marines and the army contingent there.

Q: Richard Snyder...

PIEZ: Dick Snyder, yes, he was the major negotiator in the State Department.

Q: Yes, it is quite a diplomatic history there.

PIEZ: Yeah.

Q: So this thorn in the side had been cleared away by the time you got there.

PIEZ: Yeah. One interesting consequence of reversion was that the Japanese came into possession of the dollar funds in circulation in Okinawa. Under U.S. administration all of Okinawa used U.S. dollars, not yen. At reversion the Japanese Government replaced dollar cash and bank accounts with Yen. The question was what to do with the dollar funds. It was agreed to set up a U.S.-Japan Friendship Commission as an independent federal agency endowed with the dollars released at the time of reversion. The Commission promotes education and information programs conducted in both countries.

Q: And also the opening of China and going off the gold standard, those shockus had run their course, so were things on a pretty stable course?

PIEZ: They were on a pretty stable course. There were glitches, sometimes quite unexpectedly. While I was on the Japan desk it was decided in Washington we would suspend exports of soybeans in order to reduce ran-away prices in the U.S., so we had the soybean shock. That occurred in '74.

Q: Yeah, what was behind this?

PIEZ: Well what was happening, particularly on the commodities market in Chicago, was that the price of soybeans was just going crazy. It was decided, and this was cleared by the Secretary of Agriculture with Secretary Henry Kissinger, that we would just suspend exports. Well Japan was a huge market for soybeans.

Q: You are talking about soybeans.

PIEZ: And the Japanese had committed contracts with U.S. suppliers of soybeans and poof, the contracts were suspended.

Q: This is like cutting out hamburgers to the United States. This was huge. I mean when you were doing economics at the time...

PIEZ: I was on the Japan Desk when this suddenly occurred. I called my counterparts at Commerce who agreed with me immediately, and then I called Agriculture and said, "What have you done?" Their Japan experts immediately reacted. Within a day they had changed the order to say half of the contracts could be fulfilled.

Q: What happened. I mean had this thing worked itself out by the time...

PIEZ: It did work itself out very quickly in a practical way in that half of the contracts were approved for fulfillment the day after the announcement. I think they announced it on Sunday and the half-way pullback appeared on Monday. The price in Chicago immediately moderated. Then within about 45 days the whole thing was lifted. So for 45 days the shippers were working on half the contracts. Using that allowance they were able to make normal shipments.

Q: Of course the problem is if you do something like this, if you are in Japan soybeans are as important as oil practically. If your major source shows up as untrustworthy.

PIEZ: In 45 days the practical problem had disappeared, but the emotional problem was still there after I arrived in Tokyo. It reminds me of President Roosevelt's statement that he and Eleanor didn't mind political criticism, but Fala did. The shipment of soybeans to Japan continued, but still the Japanese minded.

Q: The dog.

PIEZ: Well the Japanese had to concede that they were getting all the soybeans they could use. But they still resented it. When the Secretary of Agriculture made a trip to Japan some time thereafter to smooth the waters, if you will, the Japanese invited him to a dinner where the menu consisted entirely of soybeans.

Q: Well you can do that with tofu and all.

PIEZ: They have so many things you can do with soybeans, so they put together a complete

meal.

Q: Well in the first place how did you find the embassy apparatus there. I mean you were pretty high up in the hierarchy of the embassy. How did you find the officers, the morale, the efficiency?

PIEZ: Well Ambassador Hodgson was I think a very effective representative. The basic work of the embassy was left to the DCM. That was Tom Shoesmith who was a very competent language officer. The political section was heavily staffed with Japanese speakers. We had an excellent translation section. I got complete translations of the daily press in Tokyo. The local press was very active and the morning papers had huge circulations. I would have those translations by 9:30 or 10:00 in the morning. So we had a very good system for keeping track of public events and personalities. Now on the economic side I will say that Shoesmith rarely interfered. He wasn't sending me memos of instructions. He would sometimes ask me a question, usually a relatively difficult question, but he used a kind of Socratic method of managing. It worked as long as you did your job. Many assignments came by telegram from Washington. Because of the time difference we would get most traffic during the night.

Q: When you say assignments, what do you mean?

PIEZ: They would say we want you to convey the following to the Japanese government, and to obtain their cooperation or assistance or information, whatever is needed. The request might relate to strategic export controls. Japanese exporters did not always conform to the rules, even though the Japanese Government had imposed agreed restrictions. Another example would be a message about someone in Washington who wanted to go to Tokyo to open discussions about an issue. Or we would have a Congressional visit to arrange. My practice was if possible to answer those instructions the same day, which was good because with the time change the State Department people would be receiving my late afternoon response in the morning of the next day.

Q: How did we view, was it MITI?

PIEZ: Yeah, Ministry of International, Trade and Industry, now renamed the Ministry of Economics.

Q: But that at that time was your principal...

PIEZ: Mostly we went to the foreign ministry and the foreign ministry was quite jealous of its prerogatives. At times they would say don't go to MITI; come to us first. But it just couldn't always work that way. We would need to go to MITI without the advance permission of the foreign ministry. But we worked it out. We kept the foreign ministry informed.

Q: I assume that the LDP, Liberal Democratic party was very much, did they have any policy towards the United States. Was it get along or were they confrontational? Did you have any fears that might be translated into...

PIEZ: I would say the top policy maker was really the prime minister because the U.S. was too important to leave to the generals, as it were. Our ambassador had access to the prime minister, and our DCM, Tom Shoesmith, had access to the office of the prime minister for any critical issues. The questions often related to security. Day to day the security relationship was quite smooth, but then really bad bumps in the road that would occur, such as when a marine had raped somebody. Rarely one of those really dreadful incidents would occur.

Q: Down in Okinawa you had really young troops there, and every once in awhile one or two would go wild. Well tell me, you got there in '75 and the whole situation in Vietnam collapsed at that point.

PIEZ: Yes.

Q: Did that have any effect in say well the United States said it would stand by South Vietnam and it didn't. You know sort of a requisitioning of our commitment to Japan.

PIEZ: I don't think the Japanese felt that was their problem at all. I think they were just relieved.

Q: They just got that off.

PIEZ: Their real concern was Korea and Japan itself.

Q: And Korea at that point was pretty much under Park Chung Hee. I mean it was a pretty good period. I know because I was there from '76 to '79 as consul general. There wasn't any great love lost between the Koreans and the Japanese.

PIEZ: Well, no, the Koreans actively hated the Japanese down to the very bottom of their guts. I think maybe it has ameliorated since, but much of it is still there. You don't have 40 years of Japanese colonialism of the type the Japanese imposed without creating enormous resentment.

Q: Well the Japanese made the Koreans change their names, adopt the Japanese language.

PIEZ: The language of instruction in schools during the occupation was Japanese. The names issue, I recall learning from Koreans, was intensely sensitive. Within a day, after the Japanese occupation ended, all of the Korean names reappeared because the Koreans all knew what those names were supposed to be according to Korean tradition. Anyway the enmity was certainly there, but the Japanese greatly valued the American military presence in Korea. Most of what the U.S. military did in Japan was keep a logistics base.

Q: Did you go over to Seoul from time to time. We were always having somebody from the embassy including Ambassador Mike Mansfield and Secretary Hodgson come over.

PIEZ: Well some Americans came to shop, although I must say I did not find Itewan a good place to buy anything. My kids, when they found I was going to Seoul would say, "Don't bring me any clothes from Itewan."

Q: Our ambassador in Korea at the time was Dick Snyder who was the great Japanese expert having basically done the Okinawa treaty. This was sort of his reward. Was there any stirring that came to you about I guess it was the northern territories, the Kuriles. I always thought this was the greatest gift we could have had was the Soviet intransigency on restoring these stupid little islands. It kept the Soviets from having any influence in Japan.

PIEZ: Yeah, that was the effect. The splinter Japanese rightist organizations would sound blast the Soviet embassy from their trucks about twice a month. The Japanese security police would be all over them protecting the Soviet embassy, but not obliging them to lower the noise level.

Q: What about we had just opened our relations, we didn't have a full embassy, we had an interest section in China at the time. But the Japanese just have been looking at China as big as it is as being a potential if nothing else in the trade business. Were you getting this from the Japanese?

PIEZ: Well it was very much under wraps. The interests of the Japanese included trade; the potential for trade with China was enormous. But they were very cool. They had so many issues with China over apologies for World War II and over the prime minister's visit to the graves of Japanese war dead.

Q: Japanese war cemetery.

PIEZ: Yeah. This inevitably irritated the Chinese, and the Chinese had a number of issues about the content of Japanese school textbooks.

Q: Well the Japanese never really attacked the problem of war guilt. You go to Germany the Germans have done a remarkable job.

PIEZ: They were side stepping. The Japanese policy was one of what I would call bob and weave. They just kind of hoped it would go away.

Q: What was your impression of the Japanese bureaucrats that you dealt with?

PIEZ: The Japanese had a very effective education system going all the way back to the Meiji era based on European standards up to University level where they based their system on American standards. It was an effective education system and their bureaucratic recruitment for all of the key agencies was quite similar to the State Department's system for recruiting foreign service officers - tough exams and real screening. Now in the foreign ministry employees are at four levels. The top track, we call it top track or first track, was drawn from college graduates in international studies or law as they called it. Their law faculties were much broader than law. Students graduating already had a fair command of English. That was absolutely required for a top track job. Beyond that there was a second track of officers who became country experts. They were also expected to have a good command of English. They might be experts on the United States, Canada, Great Britain, India or any other country where English is important. Second track officers might also specialize in Arabic or Spanish or French. They would spend their entire careers in their language areas. The third track was like our foreign service staff level,

and in the bottom track were code clerks and typists and that sort of thing. If you were recruited into the top track you were virtually guaranteed an ambassadorship unless you really blotted your copybook badly along the way. So they were well educated, well trained, smart, and very effective.

Q: Did you find you had to know more about some of the people you were dealing with than let's say if you were talking about an American. I was wondering if you had to know which high school and which university they went to and some of the ties. These ties are very important aren't they.

PIEZ: They were certainly important to the individuals. We knew what they were because they were quite free about telling you about that. They would say, "I have been to Tokyo University." The acronym in Japanese is *Todai*, and a very large number of their officers in MITI or the foreign ministry or the finance ministry came from there.

Q: With the economic slump were we also looking at the labor movement in Japan?

PIEZ: Well to some extent. We had a labor attaché and an assistant labor attaché and the Department of Labor would fill the attaché position. His job was really to keep track of the labor unions. They could really be of political importance. So he was counted as part of the political section. But the embassy was always quite well covered in that respect.

Q: Were we at all concerned as Americans we get more concerned about social matters than other countries. Were we concerned and looking at the role of women in Japan?

PIEZ: Not too much. There were always questions from time to time about the prospects for the women we knew who were working their way up in the Japanese bureaucracy. MITI, I remember, had one woman who became the trade minister in the Japanese embassy in Washington. For political reasons recently she was foreign minister for a while. So we were beginning to see the appearance of women in the Japanese bureaucracy in the top tracks.

Q: As I say I was in Korea almost the same time you were in Japan, and we found ourselves in Korea just as a hiring practice, the American embassy was considered to be a top job even in a secretarial level because if you were a woman and you were married, you were sort of dismissed. We didn't care if they were married or not. And also our hours were shorter, and they were also treated better.

What sort of things were you looking at in Japan?

PIEZ: First of all the economic prospects for Japan and their economic plans. The Japanese are great planners. Particularly we were concerned about the impact their economic plans would have on trade with the U.S.

Q: Were we seeing sort of the proclivity of the Japanese, the normal Japanese saying they were not as good a consumer of our stuff as we would like them to be.

PIEZ: Yeah, and we had particular sticking points with the Japanese. We had very important

markets in Japan for grain and soybeans. But when it came to processed foods, no. Those industries in Japan were quite well protected with tariffs and they observed informal practices of simply not buying imported stuff. Orange juice, for example. It was notorious if you ordered orange juice for breakfast in a big hotel this was an extra. It would cost you ten dollars because there was a quota on citrus fruit. A very strict quota.

Q: Well also on rice, I was told that American rice wouldn't fit the Japanese stomach or something like that.

PIEZ: Well, we had in the United States a pretty active lobby for the U.S. rice producers in California. They would work very hard to somehow make a breakthrough into the Japanese market. At one point there was a severe rice shortage because of a crop failure in Korea. The Japanese stepped up and said we will sell you rice. Japan had a surplus of rice left over from prior years. There was a lot of heartburn in the U.S. because U.S. rice producers wanted the Koreans to buy from them. So we had lengthy negotiations over Japanese rice exports. The internal price for rice in Japan was extremely high, maybe eight or ten times what American consumers of rice were paying. The Japanese were used to the high prices. To export they had to sell for much less, hurting the market for every other potential supplier.

Q: Also this was designed to protect the rice growers, and these were people sitting on prime real estate.

PIEZ: Sometimes. More important, they tended to vote in a block for LDP candidates.

Q: Well it in a way was like what was happening in Europe.

PIEZ: And in many districts it was critical to the election of LDP members to the diet. Very sensitive politically.

Q: Well did you turn rice negotiations, orange juice negotiations, these were taken pretty much on the trade negotiators.

PIEZ: Yeah with the Department of Agriculture big players, and USDA kind of torn because they valued the market for grain and soybeans, but they also wanted the market for these specialty products.

Q: And also we didn't want too many TVs going in so there was an awful lot of trading back and forth I guess. Were there concerns, you were on the country team weren't you?

PIEZ: Yes.

Q: Was this a period of say pretty stable relations?

PIEZ: On the whole, yes. We might have specific problems on trade issues or on quotas, our quotas and their quotas, but as I say they were reasonably well managed without a whole lot of damage to effective and profitable trade relations in many sectors between the two countries.

Q: Well this is a period I remember reading reports coming out, people trying to sell in Japan, that there were all sorts of obstacles put in their way and their being able to sell this and that. But the basic thing was that it was pretty much quid pro quo wasn't it?

PIEZ: Well yes, we would work out those issues, or some of them anyway. The American business community in Japan was extremely active. It was growing during the years I was there. Through the American Chamber of Commerce in Tokyo, they took an extremely active interest in all the topics under negotiation. If the U.S. Trade Representative came to Japan, his appearance at an event given by the American Chamber of Commerce was a matter of routine. So we had those people as well as traveling company representatives as a continuing presence in the background whenever anything came up. Whether it was a Treasury negotiation over financial issues or anything else.

Q: Were relations with Japan and North Korea and all a subject of concern to us?

PIEZ: I don't think so, no. The issue of North Korean abductions of Japanese hadn't developed at the time I was there. There was a faction of Koreans in Japan's Korean community that was oriented towards North Korea.

Q: It has always been there. It has always seemed to me to be sort of remarkable.

PIEZ: Yeah, and somewhat similar to the fact Japan has a communist party. The communists would elect maybe ten percent of the Diet, but they were really of very minor significance. There was practically nothing they could do except what members of our Congress would call client services. It was important to them to get re-elected. That was about it.

Q: There was a period, I guess in the 80's, maybe I am wrong, maybe it started before, where the Japanese were riding pretty high as regarding income and all that and they were investing and buying Rockefeller Center and Movie companies.

PIEZ: Oh yeah and some people feared that they are going to own all of American farm land. They bought one farm. It caused a press panic.

Q: Was this going on in your time?

PIEZ: Oh yes. I think half facetiously an officer in MITI that I knew once said, "Well we have this huge accumulation of treasury bills and bonds and this huge trade surplus, so why don't you sell us California?" Our response, even more facetiously, was, "Do you really want it?" But there was a time when at least nominally all the land in Japan was worth more than all the land in the United States. And all the land in Tokyo was worth more than all the land in California. But there was a huge bubble of land prices in Japan and in '91, when their recession began, the major part of it was the popping of that bubble. Land in Japan was way over valued.

Q: Was it more or less apparent to everyone that it was more or less over valued?

PIEZ: I think so .We would report this to Washington along the line that of course you guys already know this. And they did. It was published data often reported in the press.

Q: There was not much you could do about it.

PIEZ: What we might have done was to report formally someday this is going to burst and it is going to cause a recession. But it was one of those things that was considered common knowledge. The Japanese certainly knew it, but the banks continued to accept the land at these high assessed values as collateral for lending.

Q: How did you find the banking system?

PIEZ: Well it was a powerful private banking system and very closely tied to the large Japanese corporations, the trading companies and the manufacturers. There were some variations. Toyota was so profitable that they had practically no borrowed capital and was itself practically a bank. But that was exceptional. The trading companies operated quite steadily on credit from their related banks.

Q: How was life for you and your family? You had a son.

PIEZ: I had a son and two daughters. It was a very comfortable place to live. During the time we were there, the housing was convenient and of good quality. We had short commutes that was a big benefit and very much in the government's interest too because it meant practically all of the professional embassy staff was really on call. In Bangkok, for example, our officers often have a long and difficult commute, and that is a hardship. But we had no pressure of that sort in Japan. There were no problems of supply. You could get anything you wanted. It was not a country where you could employ household staff. It was just completely priced out of reach. So people had to be quite self sufficient on that end. But Americans are used to that. That is how we live here after all.

Q: Absolutely. What about social life? Were you finding a change, were the Japanese at the professional level more open to contact or not?

PIEZ: It is difficult for the Japanese to entertain at home, so typically they would entertain in restaurants or hotels. Often times they would have an allowance to facilitate that so you got invited to events on someone's expense account. They would often relate their entertaining to visitors from out of town or some seasonal event. New Years was a big holiday time and after New Years they would catch up on their social obligations. We could entertain at home. The Japanese were glad to come to those things. And always quite curious to see how Americans lived.

ALBERT L. SELIGMANN
Political Counselor
Tokyo (1976-1980)

Albert Seligmann was born and raised in New York City where he also attended Columbia University's School of International Affairs. He entered the Foreign Service in 1955 after serving in the US Army during World War II. His career included posts in Japan, Thailand, and Germany. He was interviewed by Charles Stuart Kennedy in 2000.

Q: Today is April 11, 2000. Al, we are back 1976 to 1980, is that right?

SELIGMANN: That's correct.

Q: You are off to Tokyo as political counselor. Who was the ambassador when you were there?

SELIGMANN: When I arrived it was Jim Hodgson, former Secretary of Labor, for about a year and then Mike Mansfield.

Q: How was Hodgson as ambassador?

SELIGMANN: He was very easy to get along with. He didn't engage deeply in the operations of the embassy, but more or less let it run itself. It was a fairly relaxed time. Hodgson used to refer to the period as "windless days." I got to know him better later on when he was a member of the U.S.-Japan Advisory Commission, and I was executive director. When we met again, I remarked, "Jim, the wind is blowing strongly now." He, of course, agreed. He enjoyed a relatively calm period in our relationship shortly before trade issues whipped up a storm.

Q: You were political counselor. Could you describe the political section and what you were concerned with at that particular time? Let's start in 1976 and if any changes came, we can...

SELIGMANN: The section was divided into three branches: external affairs, headed by my deputy, with particular emphasis on China, Korea and the Asian region; an internal affairs section which covered internal politics and internal developments within Japan; and a political military section dealing with an endless stream of issues related to our military presence as well as a number of new developments that soon took center stage on the political side of the house. The section also had responsibility for the Translations Services Staff that turned out daily press summaries and monthly magazine summaries, as well as ad hoc translations. I had talented people working with me.

Q: Who were they?

SELIGMANN: Most have gone on to be ambassadors. Nick Platt for a year was my deputy followed by Dave Lambertson, both of whom got their own posts. Tom Hubbard in external affairs. Bill Breer, Howard McElroy and Don Keyser in political-military affairs, Mark Minton, Craig Dunkerly, Chuck Kartman...

Q. Chuck Kartman?

SELIGMANN: Yes. Now handling the talks with North Korea. Bill Breer was later DCM in Tokyo and is now the Japan chair at CSIS.

Q: Yes, I have interviewed him.

SELIGMANN: I have probably left a few out. Talented people, which made my life easy. Within a week of arrival, we all faced the chore of moving from temporary offices into a brand new chancery. Fortunately, all the details had been worked out in advance by Nick Platt, so I was spared any space planning. Many of us who had worked in the old chancery regarded the new building as an architectural monstrosity - clearly we needed a much larger building, but we could have done better. Before I began to settle in, I was informed the day after I arrived that labor-cost-sharing negotiations were to start the following week, and I would be heading up the US negotiating team. That was interesting, inasmuch as I hadn't heard a word about it in Washington.

Q: What did that involve? What was that?

SELIGMANN: For years we had been having a great deal of friction with the local Japanese employees of our armed forces in Japan. It was customary in Japan for government as well as non-government employers to negotiate annual year-end bonuses, as well as pay increases in this period of prosperity. It was a period when wages were high, there was full employment, and the exchange rate was not working in our favor. Our budget being what it always is for such matters, this had become a nasty business, where we held the line, making concessions only after USFJ (United States Forces Japan) employees went out on strike, with resultant bad feeling all around. We argued with the Japanese government that our forces were there to help defend Japan and they should assume some of these labor costs. The Japanese pointed to our status of forces agreement (SOFA), which stated all too clearly that the Japanese would provide facilities, bases for our forces, and we would pay all the operating costs, specifically including labor costs. Nonetheless, partly reflecting a different attitude toward contractual arrangements than ours, i.e., if conditions change, renegotiation may be in order, the Japanese had agreed to talk about this. When the Japanese agree to talk about something, it usually means they are prepared to do something, although we didn't know what that something was when we started out. I am no lawyer, but it was pretty clear we had no solid legal base to go on, even though I thought we had a fairly good political case. The best thing going was the trade deficit, which was beginning to cause a great deal of economic friction between Japan and the United States. I am sure we would never have gotten to first base otherwise.

Q: In a way was it, I mean we could plead poor mouth.

SELIGMANN: We could plead poor mouth, which didn't sound so good, but that isn't exactly the way we went about it. I think the Japanese saw it, whether we did or not - I did at least - that being forthcoming in matters like this, which contributed to the U.S. presence in the Pacific, could help with Congress and the public by demonstrating that this was a true alliance, a true partnership - the word "alliance" was still taboo at that time. I had a little leeway to put our act together, inasmuch as the first meeting was a pro forma organizational session chaired by the DCM and the Director General of the North America Affairs Bureau; my counterpart was

Hiroshi Kitamura, the latter's deputy, later ambassador to Canada and London I immediately got together at the embassy the USFJ J-5 and labor officer and the three labor officers of each of the services from Yokota (air), Zama (army) and Yokosuka (navy). To preempt a fight over priorities and provide an opportunity to get all demands on the table, I asked for wish lists of what they would like to see covered. I consolidated these in a single initial negotiating brief to which no one on the U.S. side could possibly object, including a host of items: special allowances, health insurance, overtime, administrative costs - just about everything except basic pay. The underlying argument I used was my own invention: even though the status of forces agreement obligated the United States to pay all these costs, there was nothing in the SOFA that said Japan could not pay them if it wished. This got laughed out of court initially, but with the passage of time came to prevail. In effect that is the way it came out over the course of time. There were other issues coming up. but I might as well pursue this one.

Q: Do this one.

SELIGMANN: We started off, as usual in that kind of negotiation, getting nowhere for a long time, listening to each other's respective positions. In the interim, the Foreign Ministry had work to do to coordinate its position with the Defense Agency and, more importantly, with the Finance Ministry. Gradually, the Japanese began to find that certain costs could be described as other than "labor costs," e.g., "health and welfare costs," or "administrative costs." In the end they came up with a package that amounted to some 30-odd million dollars a year, not a huge amount of money, but a start. In return, however, they wanted the United States to make a commitment that there would be no further demands in this area. Also they wanted the U. S. to agree to a period of labor peace for two or three years, during which there would be no prolonged haggling over bonuses and the like. We were prepared to go along with the second request from the start; indeed, it was an objective for us as well. We always came through to some extent in the end anyway, as in most labor-union negotiations, but we always made it difficult. We could not, however, agree that this was the limit. We appeared to have reached a stalemate, and also had to overcome strong feeling in the Pentagon that the amount offered was insufficient. We were approaching the point where we were going to have another round of bitter labor negotiations if we didn't get something done. In regard to the amount, Yukio Sato, head of the Security Division of the North American Affairs Bureau, now Ambassador to the United Nations, took me aside and said something that I understood, although it was hard to sell back home, "Listen to the background music." I took this to mean, "Accept what we are offering now and there will be more in the future," i.e., this was an opening wedge. Maybe you have to live and work in Japan to read it that way, but the Pentagon was another matter. I pulled out every stop I could think of to try to bring the Pentagon around through high- level messages from the ambassador and the like, and I made the pilgrimage myself a couple of times to Yokota to try to persuade the Commander USFJ and his chief of staff, who fortunately were understanding and sympathetic.

We remained at loggerheads, however, in regard to Japanese insistence on writing into the agreement a clause that stated this was the limit possible under the SOFA. Thereupon I drew a leaf from my Berlin experience, drawing on a gambit we had used once or twice with the Russians, even though I was not personally involved. In a tête-à-tête, I suggested to Kitamura that when the agreement was initialed in the Joint Committee, the body that met every other week to administer the nitty-gritty of the SOFA and other matters related to our military

presence, he state for the record that this was the maximum Japan could provide under the terms of the SOFA, and that we in turn state for the record that we did not agree. He took the proposal under advisement, and the next day agreed. With that in hand, Washington gave us the go-ahead and we had an agreement.. The short-term postscript was that whereas we understood matters would slide for at least a couple of years, the next year, without any prompting on our part, the Japanese volunteered to take on further costs, approximately doubling the amount to over \$60 million a year. Over the years additional cost-sharing agreements have been concluded whereby the Japanese have assumed virtually all our support costs, including utilities, and all local pay; the figure varies depending on budgets and the exchange rate, but the last I heard it came to \$85,000 per U.S. serviceman or about \$4 billion a year. I think it is an interesting lesson on how one deals with Japan. They are not a litigious society. Much is based on faith, handshakes, personal relations and confidence in and respect for each other. If you show that respect and you show that you have the confidence and leave it up to them, they will often come through in unbelievably generous ways. This has happened again and again although they rarely get any credit for it.

Q: You were mentioning that the Pentagon was very difficult to deal with. What about the Japanese military establishment? Are these decisions made at the political level so you are not up against a Japanese defense apparatus?

SELIGMANN: It is a good question. It comes up in regard to another issue we will talk about. At this stage, the Foreign Ministry felt strongly that they ran the show on all political-military matters. They would listen to the Japan Defense Agency (JDA), which while headed by a Director General who was a Cabinet member, had less than ministry status, but the Foreign Ministry felt it should make all final decisions with political ramifications. This was born out of the post-war scheme of things, civilian control over the military being an important concept, which of course had not been accepted before World War II. The foreign ministry was and is run by people of a liberal bent in the best sense of the term, meaning they were wary of giving too much influence to their own military. This was resented by the self defense forces, who sometimes were made to feel they were second-class citizens in the bureaucracy. I made it a matter of high priority in my own dealings to maintain direct relations with the JDA without going through the foreign ministry where that was appropriate. I certainly wouldn't go around the back of the foreign ministry on something they should be aware of, but wanted both the JDA civilian leadership, which tended to come out of other agencies such as the Finance Ministry and Police Agency, as well as the military leadership to feel that we understood their problems. Generally, of course, I dealt with the civilian side of the house. In regard to issues themselves, what few differences we had were usually limited to matters where the JDA and USFJ were in accord. My contacts with the JDA paid off. On one occasion, the day the Director General (Minister), an old political contact, was to depart for a visit to Washington and some European capitals, I received a last-minute call from his office suggesting I might wish to pay a farewell call. This was rather unusual and when I scurried over, I noticed a waiting room full of Japanese officials and one or two foreign ambassadors. I was immediately ushered in a side door to his office, however, to find him quite relaxed, reading a newspaper; he wanted to clue me in on some significant commitment he intended to make, the details of which I have forgotten.

Q: Now, did those self defense forces have sort of professional ties within the military, in other

words going beyond dealing in Japan? You know, so often particularly you think of the Israelis and all, but others who have good military contacts and they come back to the United States and they hit the Pentagon before they go anywhere else. Was this at all going on with the Japanese?

SELIGMANN: We were and are Japan's only ally. Apart from the heritage of the occupation and the initial post-occupation period when we helped build up the Self Defense Forces, we have traditionally maintained close military-to-military ties. Nonetheless, a number of developments had gradually taken place to alter the picture. Whereas for years almost all of Japan's military leaders spoke pretty good English, this was no longer the case. For our part, we had drastically reduced our military presence, and partly in response to Japanese pressure for base consolidation and the return to Japan of facilities sitting on much desired land, had concentrated them at a few major installations. The SDF, in turn, tended for tactical and other reasons to be stationed in areas such as Hokkaido or Kyushu, where there was little opportunity for frequent contact with our military. We still were collocated or were next-door neighbors at a few facilities, especially true of the navy and some of the air force, but the top military leaders on both sides, with some exceptions, were no longer on the first-name basis they had been for many postwar years. The navy and air force routinely conducted joint exercises, but because of budget constraints and geographic separation, this was less and less true of the Ground Self Defense Forces (GSDF or army), which accounted for perhaps two-thirds of the Japanese forces. We were not growing apart in the sense of thinking separately or acting separately, but we were not seeing that much of each other and the opportunities to go to service schools and the like were more limited than they had ever been, partly because of the extraordinarily high costs we charged - eventually, State, working with the Pentagon managed to get Japan so-called "NATO treatment" or discounted tuition. I could see a burgeoning or nascent problem, because, I felt that if there is any one place in Japan where the seeds of nationalism might take root, historically, traditionally it might be with the military. If you read this morning's New York Times, you know what I am talking about.

Q: No, I didn't.

SELIGMANN: The governor of Tokyo, while not an extreme rightist, has a reputation as an outspoken nationalist; he is the man who wrote "The Japan That Can Say No [to the United States]" that caused such a fuss a few years ago. Speaking to the Self Defense Forces, he apparently mouthed some blatantly nationalist sentiments that could cause political problems. I don't for one moment suggest that his audience lapped all this up - that was not my experience with the SDF people I dealt with - but he was playing to what he assumed was a receptive audience for his ideas.

Q: Apart from the labor-cost negotiations, what other things were you involved with?

SELIGMANN: Another major item on the political-military side was negotiation of what became known as Guidelines for Defense Cooperation. Our military staff and the Japanese military staff had been working together on contingency planning, which from the U.S. point of view was an altogether natural thing to do with an ally. We do it with all our allies, and anyone in this town is aware that the basement of the Pentagon is full of plans. We have plans for every contingency under the sun. In the case of Japan you would plan for a Korean contingency or a

Taiwan straits contingency or whatever. It doesn't mean that you expect that to happen, but you plan for it. When something does happen, it never happens the way you planned anyway, but the planning process has facilitated how you react. However, in Japan, you had all the baggage of the pre-war and wartime military, which made this an extraordinarily sensitive area. Some time before my arrival, one of the magazines or newspapers had come up with the "revelation" that there was an exercise known as "Three Arrows," in which United States and Japanese military were planning for a contingency, I think on the Korean peninsula. The idea that such planning had been going on in secret became a political scandal, so it ground to a halt. After that, the Japanese were unwilling to engage in further joint planning. The question was how do you work with your military friends in this situation. The solution agreed to either in the Security Consultative Committee or the Security Subcommittee was to have a public set of guidelines for defense cooperation that would permit planning to go on and would spell out the planning parameters. Sometime in 1977 or 1978 we began negotiation of these first guidelines. I was the embassy representative on the U.S. negotiating team, but the negotiations themselves were left pretty much to the U.S. and Japanese military staffs. The Japanese approach was to obtain as explicit a commitment from the United States as possible to just what forces would be committed in just what contingency. Our military were not unwilling to go along with this kind of thing. On the other hand, I felt that even though the guidelines required nothing more than departmental approval in Washington, they were to be approved at the cabinet level in Japan. We were not negotiating a treaty and could not sign an agreement that went beyond the scope of the security treaty itself; to do so would probably be unconstitutional. That issue was never raised by anybody but myself as far as I know; I did flag it at one point in a message to Washington which met with no disagreement. We were all agreed on fundamentals, still stated in the guidelines, that if Japan was subject to attack, the Japanese would in the first instance respond with their own resources, and if that did not work, then the U.S. will come to their assistance. And of course without specifying it, the nuclear umbrella was still in place. The two military staffs, however, wanted specific commitments, e.g., in X circumstances, the 24th division will be flown in from Hawaii, etc. I held that this sort of thing belonged in a plan, not an intergovernmental agreement that lacked the status of a treaty. In the end we worked out more general language along lines I drafted. The guidelines, made public and approved by the Japanese cabinet, permitted planning to resume and have remained in effect. By direction they were confined to measures to defend against an attack on Japan, but they were expanded two years ago by a new set of far more extensive guidelines on ways in which our armed forces would cooperate in meeting contingencies outside of Japan.

Q: Meaning Korea.

SELIGMANN: Not just Korea. It could mean the Taiwan Straits, although the security treaty deliberately fudges the definition of what is the Far East. But the new guidelines now provide a framework for cooperation short of participation in direct combat for contingencies other than an attack on Japan proper,

Q: Were you feeling in the 1976 to 1980 period, just after we got out of Vietnam that the Japanese felt that the Americans seemed to have become undependable now. We can't be assured what they might do and they wanted to nail this down more than had been the case before.

SELIGMANN: I think there was a period of great uneasiness after Nixon announced the Guam doctrine and right after the end of the Vietnam war, but by the time I got to Tokyo, I think we had weathered most of the storm. No doubt, however, some of that feeling was behind the desire to get the guidelines pinned down.

Q: But 1976 was an election year and Carter was making noises saying he was going to withdraw troops of the 2nd division from Korea.

SELIGMANN: All remaining combat troops.

Q: One division had already gone. So the 2nd. division was the only one left there. I know because I was in it. I arrived right in July in Korea at the time. This was supposed to have sent shock waves, the fact when he was elected was very disturbing to the Asian powers. How did you find this?

SELIGMANN: The Japanese government all but panicked Prime Minister Fukuda either came to Washington himself or sent a special envoy to plead with Carter not to do so. Carter seemed to feel almost simplistically that he had to keep a campaign promise, even though there did not seem to be that much pressure for him to do so. Eventually he backed down, limiting withdrawals to 3,000-4,000 men, but it was a very bad period. It was perhaps more worrisome to Korea but the Japanese were just about equally upset.

Q. Well, Carter did not come through as a very sound person, did he, on foreign affairs in the Far East early on?

SELIGMANN: No. I think the Japanese liked him as a person. It was almost the opposite of the Nixon situation, where they approved of much of his foreign policy, e.g., China, and could not understand why we had problems with him. They felt American presidents had responsibilities for the rest of the world, read "us," and domestic US politics should take second place.

Q: Well, these plans that we made public, well, not the plans but the framework, did they look pretty good? I mean were they sort of innocuous?

SELIGMANN: From a U.S. point of view they were both innocuous and unnecessary. They met a Japanese need, however, and worked out fine, permitting the kind of planning the Japanese and ourselves wanted to do to go ahead without roiling any waters.

Q: Were there any other we have sort of had the labor costs, the plans, anything else you got involved in during this time you were there major things?

SELIGMANN: I served as the deputy US representative of the Joint Committee, chaired on the US side by the Chief of Staff USFJ and on the Japanese side by the Director General of the Foreign Ministry's North American Affairs Bureau. Apart from the management of incidents and the usual flow of minor problems, the major agenda item was base consolidation, contingent in many instances on the Japanese constructing alternative facilities, e.g., housing, hospitals. Most

of this was worked out by the military and our PolMil officers - I would only get involved if they thought I should. During this time we created still another consultative mechanism, the SCG (Security Consultative Group), chaired by the DCM and the Director General of the North American Affairs Bureau. This was designed to permit mid-level decisions without bringing in participants from Washington, where a binational imprimatur was needed. It served for example as a body to set up the modalities for negotiating the Guidelines and formally to approve them.

The domestic political situation was in a state of turmoil in the wake of the Lockheed scandal that had toppled the government of Prime Minister Tanaka, an otherwise popular leader, now under investigation. Just before the December 1976 general election, a number of younger LDP Diet members defected to form a new party, the New Liberal Club, that did exceptionally well, to the point that the LDP lost its majority for the first time since 1955 and was forced to govern in coalition with the defectors. This resulted in a heavy load of domestic political reporting in the light of foreign media speculation that the end of conservative rule was in sight.

We had the usual never-ending stream of third-country and UN related issues, including toward the end of my tour, the hostage situation.

Q. You are talking about hostages in Iran.

SELIGMANN: Yes. On most international issue, including the USSR and China, we saw eye to eye with the Japanese, but in the Middle East, we were not always in synch. The Japanese were more dependent on Middle East oil than we were, although oil is fungible - if someone doesn't get oil, everybody hurts. For example when you had the oil crisis in 1976...

Q: 1976-1977: Carter was in by that time.

SELIGMANN: Yes. Prime Minister Miki immediately went over to Iran and other countries and was just delighted to be designated a "friendly country" by Iran, a designation they did not hand out lightly. That influenced getting their oil to flow again, and Miki is said to have exulted on the plane on the way back to Tokyo. This was not in the best of taste and did not sit well in the United States.

Q: Were we leaning on them to be unfriendly?

SELIGMANN: No, because we understood their problem, but we felt he was a bit obsequious, playing up to the Iranians. It wasn't a serious difference in the overall scheme of things. As I might have mentioned earlier, on my watch we took a more explicit position than we had hitherto on the question of the northern territories, which prevented Japan and continues today to prevent Japan from having a peace treaty with the Russia. I think that helped us in our general relationship with Japan.

Q: Well, I would think there would be always a subliminal delight in the fact that the Soviets were hanging on to these things. In other words diplomatically it protected our flank up there. I mean we didn't have to do anything about it.

SELIGMANN: That's true. Moreover, there is a long-standing historical distaste or distrust for Russians in Japan. One incident while I was there which I think we all kind of relished was the landing of a MIG fighter, which was flown into Hokkaido under the Japanese radar by a defecting Soviet pilot.

Q: It was state of the art at that time.

SELIGMANN: Yes. I was having a relaxed Sunday afternoon when I got a frantic call from our defense attaché. He was so cryptic and careful on the telephone that I really did not catch on to what he was trying to tell me. He said something like, "One of those aircraft landed up at Hakodate in Hokkaido." I thought he was referring to a U-2, which flew on missions from Kadena, that occasionally had to make emergency landings as a result of weather conditions or for other reasons. This was something that had to be informed to the Japanese but did not strike me as anything to get excited about - it was no big deal. Once the message got through, of course, all kinds of things started to happen. First of all, the intelligence powers in Washington were sure that the Japanese were going to let the Soviets take the aircraft back home, and we would never have a crack at it. It never occurred to us in the Embassy that there would be any problem.

Q: Were you all trying to get to them and say, "Don't worry; leave it alone?"

SELIGMANN: Yes. But, you know, they were nervous as could be and weren't listening. This went on for a couple of days, and then a colonel, I think stationed at Misawa, sent a direct message back to the Pentagon without clearance with the embassy, saying that the Japanese were going to turn the MIG back and we had better turn the heat on them. We were furious from the ambassador on down, and in the end the colonel got reamed. It was enough, however, for the embassy to receive an instruction to make a high-level representation to get assurances that we would have a chance to look at the plane. I accompanied Tom Shoesmith, the DCM to the Foreign Ministry's guest house, where the Vice Minister was hosting an evening reception. He came out and after Tom made a brief pitch about how important this was, etc., simply replied, "Don't worry." For our purposes, that was all the assurance we needed, although, needless to say, our military continued to worry. What happened after that was all fun and games. The Soviets naturally were screaming that the plane and the pilot should be returned without delay. As an immediate pretext for not complying, the Japanese charged the pilot with entering Japan without clearing immigration and further complained that the plane had been brought in without going through customs. They permitted us to take the plane completely apart, and when we were finished, packed it up in crates and sent it back.

Q: This is tape 7 side 1 with Al Seligmann.

SELIGMANN: The Soviets sent them a bill for damages, which the Japanese countered with a bill for shipping charges. That was the end of the incident. Also in the category of cold-war incidents, we had a very high level KGB operative defect.

Q: How did that work out?

SELIGMANN: This was in the middle of the night, and was handled properly. The duty officer came over and knocked on my door, not using the telephone, which was the way to do this, and told me what was going on. I went into the embassy in the wee hours, and had to face the station chief and his colleagues, all of them wanted to get this guy on a plane from a U. S. base to the States within an hour. I said that this could not be done under any circumstance without notifying the GOJ and deferring to their wishes; they would have to wake up the ambassador if they wanted to go ahead. There was a lot of fuming and storming, but in the end again, it worked out fine. With elaborate security precautions in place, he went out legally in effect, not surreptitiously. To have acted otherwise would have been a slap at Japanese sovereignty. All of these incidents illustrate the need to have a little faith in your allies and friends, respect their desires, and prevent others who are over- eager from trampling all over them.

Q: Well, also, there is a track record isn't there? I mean the Japanese produced well. I mean I had some experience earlier on in Greece. If that sort of thing had happened in Greece, My feeling would be get them the hell out. Get somebody out; don't give a damn because the Greeks weren't going to be cooperative at all, mainly trying to get out of the line of fire.

SELIGMANN: I would agree. What you do in one country does not necessarily apply anywhere else. I would be only speaking about Japan although you would probably say the same thing about West Germany.

Q: And then there is Greece. Mike Mansfield came in, and he was a grand old man of the Senate and all, and he stayed there, you were there for the beginning. He was there for about what, 12 years.

SELIGMANN: Twelve years. I went away and came back six years later and he was still there.

Q: Yes. How did he take on, this was his first time as ambassador. Early on, how did he grab hold?

SELIGMANN: The Japanese have sometimes had trouble with our appointments as ambassador, even though they almost always work out in the end. From the start, they were very flattered to have a man of Mansfield's stature and reputation named as ambassador to Japan. There may have been a bit of concern because of the Mansfield amendment...

Q: Would you mind explaining what the Mansfield amendment was?

SELIGMANN: The Mansfield amendment, directed not so much at Asia as at Europe, called for a substantial withdrawal of U.S. forces from Europe. That happened without real adverse consequences, but some Japanese thought he might advocate a similar drawdown in East Asia, especially in the light of Carter's pronouncements on Korea. Apart from that possibility, which never materialized, they were extraordinarily pleased at what they saw as an indication of the importance of Japan to the U.S. that his appointment represented. He had a knack of saying, doing just the right thing. I remember his very first press conference, maybe the first week after he arrived. The embassy auditorium was packed, with mostly Japanese reporters but also all the foreign press in Tokyo. They expected a long introductory statement, but he got up and said,

"I'm the new boy on the block, shoot!" That threw the Japanese into a panic, few of them having any notion how to translate these colloquial phrases. They learned early on that he was not a man to waste words. From the start, he announced unequivocally, "The United States-Japan relationship is the most important bilateral relationship in the world." Before long, this was slightly embellished with the additional phrase, "bar none." This sentence was repeated in just about every public statement he made while in Japan and became established as a trademark to the point that his audiences waited for it. As a politician he understood how effective that could be. We in the embassy in time came to refer to ourselves as the "bar none ranch."

Q: How did you deal as political counselor?

SELIGMANN: He pretty much let the embassy run itself, and dealt through the DCM. I rarely took an issue to him directly, except when I was acting DCM, and can recall no instance when any substantive or non-substantive difference arose. He ran the weekly large staff meetings, which provided a good opportunity to get endorsement or take a sounding on a matter. On the other hand, he didn't take kindly to small talk, and I always felt sorry for section heads who felt compelled to come in with an agenda whether anyone wanted to listen to it or not. So we worked principally through the DCM, who would sign off on most matters.

Q: Tom Shoesmith.

SELIGMANN: It was Tom Shoesmith and then Bill Sherman.

Q: How did you find the people you were dealing with on the Japanese side? You know, you have been in and out of there a number of times. In this 1976-1980 period, had there been any evolution, were they seeing things differently, or was it pretty much operating the same way it had before?

SELIGMANN: Our relationship had emerged from what has sometimes been called the "big brother, little brother" period that followed the Occupation for some years. The revision of the security treaty marked the beginning of the end of that stage, and Okinawa reversion could be seen as marking the end. We had moved into a partnership relationship, with mutual recognition that our two economies combined accounted for 30%-40% of world productivity. That brought with it an increasing amount of trade friction and on all fronts a natural tendency for Japan to speak for itself. Sometimes this was interpreted by commentators and businessmen as "arrogance," but I saw no significant sign of that during this tour. Japan remained highly dependent on the U.S. military presence in the Pacific and while a major donor of foreign economic assistance, was still hesitant to assert political leadership; most of its initiatives were confined to Asia. On the political front we saw eye to eye on most issues, which made for easy-going relations with the Foreign Ministry. At the same time, the Japanese began to react less kindly to preaching on our part. I recall sitting in on a meeting with Foreign Minister Sonoda and a prominent visitor (Secretary of Defense Brown?). Without waiting for anything specific on the agenda to come up - I think this was while we were negotiating cost-sharing - Sonoda departed from script and surprised his own side by saying, in effect, "Don't tell us what to do; tell us what you need." Sonoda was known for being blunt, but to make sure I understood (his Japanese was not that clear and the interpreter had bungled a bit), the head of the Security Division phoned me

later to make sure we had it straight. We had, but the incident was indicative of nascent shifts in the Japanese approach which we needed to take into account.

Some changes had taken place on an operating level, in that rank was more significant in determining access to government officials, political leaders, business leaders, etc. The United States was still primus inter pares, however, and our language officers enjoyed a considerable advantage in being able to see almost any politician short of the very top levels. I also profited from friendships and connections established earlier in my career, and was often able to deal at a higher level than I would have been able to coming in cold. This was also true on the political scene, where junior politicians I had known were rising in the ranks. The embassy, incidentally, tried to get me the title of minister - we had an economic minister - in consideration of these factors and the tendency of other large embassies to have a multiplicity of ministers, but was turned down by the Department, a position that was sensibly reversed after I left.

Q: Did you feel that the foreign ministry was getting a good reading of what was happening in Washington? One of the things that sometimes happens in the Foreign Service, you can almost get a better reading from what is going on in Washington, particularly Congress and all by listening to your host foreign affairs establishment because they are working the field which we don't work. In other words they are looking at the White House and they are hitting the Congress and all, and you know we sort of hear it kind of the way it should be rather than the way it actually is. Were you getting any of that?

SELIGMANN: That is a good point. Going back to the time I was in S/PC, it had been customary during our policy planning talks with the Japanese to have one informal evening over drinks, during which we discussed out respective domestic political situations. These became unproductive and boring, however, particularly because the Japanese were far more circumspect than we were in talking about their own politics. In preparing for one session, I suggested that as an experiment, we make the initial presentation on Japanese politics and that they start off on U.S. politics. This turned out to be more insightful and lively, so we kept it that way. When I was back in Washington, after this Tokyo assignment, I thought the Japanese embassy was doing a pretty good job covering the field. While it has varied some, depending in part on facility in English, they have generally assigned their most able diplomats, not only as ambassador, but down the line, and have been able to establish good personal contacts with top officials and members of Congress, as well as working-level officials in all key agencies and Congressional staffers. Togo, who had been the point man for renegotiating the security treaty, was ambassador in the late 1970s, and the first to occupy a magnificent new residence that was an asset in representation. So, to answer your question, they were well clued in on the Washington scene. Above all else, Japanese who talked to him had a great asset in Mike Mansfield who was about as well informed on the Washington scene as anyone.

Q: Did Okinawa play much of a role at this time?

SELIGMANN: The major issue of reversion was behind us. We had to contend with occasional off-base incidents involving our military personnel, more often than not young Marines, and we were still under considerable pressure to reduce our presence. Artillery practice that called for the periodic closing of a major highway on the island, demands for the return of land in and near

downtown Naha, and the call for reduction of our extensive maneuver areas were all thorny issues, and twenty years later we are still trying to work out base reductions without jeopardizing military requirements. Considering the disproportionate weight of our presence in relation to population and usable land, it is important that we stay ahead of the game. The Okinawans themselves have always been torn between the boost our presence gives a poor economy and the feeling that they are being called on to make sacrifices beyond those of the rest of Japan.

Q: Was there concern during this time about the Soviet Union because you had the Soviet attack in Afghanistan that would be sort of unprovoked, and then the Soviets, this is December 1979. But also I think around this time or earlier on the Soviets were making noises about using Cam Ranh Bay as a major base.

SELIGMANN: There was also a sizable buildup of Soviet Forces in the Soviet Far East, including the northern territories. They had not had much in a military presence there before, but now they put a division, I believe, into the southern Kuriles.

Q: What was the thinking then, I mean from our own thinking and what you were getting from the Japanese about this?

SELIGMANN: There was not much feeling that the threat to Japan had increased substantially, but it reinforced the feeling that the Soviets were the enemy. Japan's fringe extreme rightists made the most of the Soviet stance with their noisy sound trucks, and the police maintained tight security around the Soviet embassy, but overall the major effect was to reinforce our partnership, our alliance.

Q: How about China?

SELIGMANN: With Nixon's visit to China, we had come to see things about the same way. The Japanese had felt for a long time that we should be more forthcoming in establishing relations with mainland China. When we did so, of course, we administered one of what came to be called the "Nixon shocks," by failing to consult or inform Japan in advance. The Japanese still had visions of quick profits through massive trade and investment - dreams some entrepreneurs harbored for Siberia as well - but realism was setting in on both fronts.

Q: Korea?

SELIGMANN: Japan has always seen and probably always will see Korea as a dagger aimed at the heart of Japan. Whatever happens there can have severe effects in Japan. A Korean contingency had become perhaps the major rationale for maintaining our bases in Japan, more so than the defense of Japan proper, and a Japanese nightmare, which persists, is the thought of tens or hundreds of thousands of Korean refugees flooding into Japan if stability is not maintained on the peninsula.

Q: Were we doing any pushing on the Japanese to, say, be nicer to the Koreans or were they pretty nice? It has never been an easy relationship.

SELIGMANN: It has never been easy, and I don't think they have been terribly nice. This was not one of the periods where we were in the middle, however, as we were at times in the 1950's and 1960's. Discrimination against Koreans, failure to grant Japanese citizenship to second- and third-generation Koreans born in Japan, textbook euphemisms about Japan's colonial record in Korea, etc., remain questions that have to be resolved by the Japanese by themselves or bilaterally.

Q: Well, on nuclear matters, how did that play during this period? Any problems or just sort of status quo?

SELIGMANN: You always have had the problem of what we agreed or didn't agree about port entry of naval vessels and whether they did they or did not have nuclear weapons aboard. I can't remember the timing, but at some point the mayor of Kobe decided to take a New Zealand type approach, demanding assurances there were none on our vessels calling there, so we just stopped calling at Kobe. I am not sure where we stand with that today. Japan had its own internal problems in developing nuclear power. Everybody wanted cheap electric power or electric power from sources other than fossil fuels, hydropower being almost fully developed, but nobody wanted a reactor near them. There was a question of what to do with their one nuclear powered merchant vessel that never really worked out commercially - the GOJ was ready to give it up, but no port would take it in, so it was an orphan for awhile. I am not sure whether it was then or later on when reprocessing became a major issue, especially the security in-transit of used fuel sent for processing to Europe. These were not, however, what I would put in the category of major issues.

Q: Well, is there anything else we should discuss do you think?

SELIGMANN: Endless visits, presidential on down. One that I won't forget was a transit stop by former President Nixon. He came through Narita airport en route to a triumphant return visit to China, but Ambassador Mansfield could not go to the airport because of a long-standing commitment to address the faction of former Prime Minister Miki at their annual meeting several hours from Tokyo. In the absence of the DCM, I went to Narita to greet Nixon bearing a letter from the Ambassador regretting that he was not there. All this had been discussed with the Secret Service in advance, so that there would be no surprises. When Nixon arrived, I was shoved out of the way by his ex-Marine aide, while they commandeered my car to take him but not me to the nearby (c. 50 yards away) Air France lounge, which had been reserved for his use during his layover. After about thirty minutes, I said I would like to deliver the Ambassador's letter, and was told to proceed at my own risk. I knocked on the door, Nixon told me to come in, looked up from the pad where he was apparently working on a text, took the letter, threw it unopened into his despatch case and quizzed me on why the Ambassador was not there, how far away his meeting was, etc. Then he went back to work without a word, thereby dismissing me. Nice man. The Secret Service agent-in-charge apologized for what had transpired. When I told all this to Mansfield, he was upset and asked his old friend, Leonard Woodcock, ambassador in Beijing to keep him posted. As I recall, he reported back that Nixon had made no remarks about his reception at Narita, and Mansfield did see Nixon off when he came through Narita on his way back.

Q: Yes. I mean, a lot of things were happening. Were you getting any reaction from the Japanese about President Carter, kind of wondering who is this guy and what is he doing? Were they uncomfortable with him?

SELIGMANN: Initially they were, but that wore off when it became clear we were not going to pull out the bulk of our remaining ground forces in Korea. He paid a visit to Japan, which went smoothly enough, but I recall one episode that was disappointing. The embassy staff had assembled in the chancery forecourt on the assumption that he was going to talk to them as scheduled but he decided not to do so. Finally Roslyn came down from the residence and filled in nobly. This was more important for our Japanese local employees than for the Americans, but it was kind of funny that he would do that. I don't think the Japanese felt very strongly about him one way or another. In the end he was hostage to the hostage issue, immobilized by it.

HARRY HAVEN KENDALL
Program Officer, USIS
Japan (1977-1978)

Harry Haven Kendall grew up on a Louisiana farm and entered USIS in 1950. His career included assignments in Venezuela, Japan, Spain, Panama, Chile, Vietnam, and Thailand. Mr. Kendall was interviewed by G. Lewis Schmidt on December 27, 1988.

KENDALL: Then after two years at it, I took over as Japan Program Officer and Field Supervisor for the six American Centers in Japan and became a "*Shinkansen* cowboy," riding the bullet train up and down the Japanese archipelago, looking after the needs of our centers in Sapporo, Tokyo, Nagoya, Kyoto, Osaka, and Fukuoka. It was a rewarding and important job.

Special experiences grew out of my role as Regional Programs Officer and Field Supervisor for Japan. I met a lot of very interesting people, particularly the scholars visiting Japan. Ezra Vogel of Harvard, who was then researching for his book Japan As Number One, was one of them. Bob Scalapino came on various occasions, as did Larry Krause, one of America's leading economists who is now on the faculty at U.C. San Diego. There were many others.

One of the more interesting individuals, practically my first recruit, was an expert on waste disposal. Waste disposal is not usually considered a prime concern of USIA, but he was an American expert in a field of increasing concern to many cities in Asia, and our posts were hungry for good speakers. I offered him, expecting to get one or two responses, but practically every post asked for him. He did very well, hiking around the garbage dumps of Southeast Asia, telling the local authorities how to better manage their waste disposal problems.

Another individual, more interesting in terms of our programs, was a specialist in American literature named Charles Anderson, professor emeritus from Johns Hopkins University and a superb lecturer.

Q: Did you schedule them primarily in the universities?

KENDALL: The posts did the scheduling in the universities and in our own cultural centers, such as the Tokyo American Center. Anderson came with high recommendations, and he seemed to get better with each post report, so everybody wanted him, from Australia to Korea and then on into India and Europe. He was perhaps the single most popular lecturer on the USIS circuit that I've ever known. I feel rather proud for having found him. We are still in contact, he's still writing, lecturing vigorously, even at age eighty-five. Marvelous guy, delightful sense of humor, and a real joy to know.

Those were some of my activities in Japan. I got out into the hinterland there, too, but spent most of my time in the cities where we had our branch posts.

ROBERT GOLDBERG
Spouse of Foreign Service Officer
Tokyo (1977-1980)

Mr. Goldberg was born and raised in Baltimore, Maryland and educated at Gettysburg College and the University of Chicago. He accompanied his Foreign Service wife on her assignment to Tokyo before entering the Foreign Service in 1983 as Foreign Service Officer. A Chinese language specialist, Mr. Goldberg served both in the State Department of State in Washington, D.C. and abroad dealing primarily with Economic and Chinese affairs. His overseas posts include Tokyo (as spouse), New Delhi, Hong Kong, Guangzhou and Beijing, where he served twice, once as Deputy Chief of Mission. Mr. Goldberg was interviewed by David Reuther in 2011.

Q: So let's see, the Carter administration comes in 1977 and you are off to Tokyo.

GOLDBERG: We were off to Tokyo. It was a great three years. I studied Japanese. I worked at Simul International, which was at that time run by the guy who used to refer to himself as Japan's foremost simultaneous interpreter, Masumi Morimatsu. They were very nice to me. I was their English language re-writer. They had a group of Aussies and New Zealanders and one or two Brits who did the translations of a lot of Japanese language material. Then I came in and polished it up re-writing it. Most of my battles were with my fellow foreign nationals who thought my rewrites did not adequately capture the sense of the Japanese.

Q: So that is what you were doing.

GOLDBERG: I was also teaching at the University of Maryland extension school in Yokouska and that reenergized my interest in teaching.

Q: Where were you living at the time?

GOLDBERG: We had a house off of the compound, in Asaksa off of Aoyama Dori near the Emperor's palace. It was very close to the TBS tower and around the corner was the Embassy of North Korea. So this was 1977-1980. We used to watch the North Koreans meander through the streets. My older son always used to say there was a Black Guy coming down the street. What he meant was a guy in a black suit, who was North Korean. I was always tempted to walk over to the Embassy but never quite got up the nerve to do so. Probably not a career-enhancing move.

Q: What was it like living in Tokyo in those days?

GOLDBERG: It was a great experience. We had a full time housekeeper. I could study Japanese. I could go off to work. My wife really enjoyed her job. She was in the political section. At that time Tom Hubbard, future Ambassador to Korea and the Philippines, was a relatively junior Foreign Service officer. We knew the Hubbards quite well. I don't know if you knew Tom Bleha. He was there. Bill Sherman was the DCM [Deputy Chief of Mission] at the time. A couple of future ambassadors like Chris LaFleur, future DCMS like Dick Christenson. Obviously Mike Mansfield [served from June 1977 to December 1988] was at the beginning of his incredibly long run. I didn't have that much to do with the mission per se. A fellow who just recently passed away, Bob Immerman became a very good friend. We had known Bob in New York when he was there at U.S. UN. We renewed our acquaintance with him in Tokyo.

Q: Now 1979 was a big year on the Sino-American front, Washington extended diplomatic recognition to Beijing. How did that go over in Japan?

GOLDBERG: Frankly I think the Japanese were expecting it; it was eventually going to happen. Of course, just springing it on them is what was unexpected. The Japanese in the office in which I was working just commented that "It is about time." There seemed to be a lot of navel gazing going on the part of official Japan, like what do we do now, what about Taiwan, but I don't think it was all that much of a "shocku" to use the Japanese term. I had already gone to China for the first time in 1978 with Bob Immerman and my wife Sally. We started off in Hong Kong and went in through Shenzhen, which if you recall at that time was really just a checkpoint. When I became consul general in Guangzhou many years later I used to tell the story of my first trip to China and note that Shenzhen was just a little fishing village of less than ten thousand people – and now was a city of over seven, eight million.

From Shenzhen, we went to Guangzhou, Guilin, Hangzhou, Shanghai, Nanjing and then on up to Beijing. We knew Charlie Sylvester who was the political counselor at that time and we stayed with him and his wife Evie in Beijing. It was a wonderful trip of a little more than two weeks. I guess as with most people who traveled in those early years you were basically seduced by what you are seeing. This country had been closed for so long and you were finally there. It was clear that something was happening, change was around the corner, that sort of thing, but little had happened yet.

Q: The facilities in Beijing were pretty basic still at that time.

GOLDBERG: They were. The Sylvesters were in the Jianguo menwai diplomatic compound where Americans had some apartments. There were a lot of people who were still spending six-

to-nine months in a hotel before apartments became available. As the political counselor. Charlie was at the front of the cue for housing. We did the tourist routine, riding away on flying pigeon bikes. My recollection of getting from the Sylvester's to Tiananmen Square is of the barrenness in between – there was, in fact, nothing in between. And people didn't talk to you. In Guangzhou, you were drawn to the English language corners in the park and were immediately surrounded by people. When was the first time you were in China?

Q: I finally got there in 1987.

GOLDBERG: 1987, was more open and I suspect you didn't have the sense that people were very wary of talking to you. When I got back and was working at Simul, there was lots of talk, as I say, about the normalization but it was mostly it was a good move and what now.

MARK E. MOHR
Political Officer
Tokyo (1977-1980)

Mr. Mohr was born in New York and raised in New York and New Jersey. He was educated at the University of Rochester and Harvard University, where he studied the Chinese language. After service in Korea with the Peace Corps, he joined the Foreign Service in 1969, and served abroad in Taipei, Taichung, Hong Kong, Tokyo, Beijing and Brisbane. In his service at the State Department in Washington, Mr. Mohr dealt primarily with Far East Affairs. After his retirement he worked at the Department of Energy on Nuclear energy matters. In 1997 he was recalled to the State Department, where he worked as Korean desk officer. Mr. Mohr was interviewed by Charles Stuart Kennedy in 2009.

Q: Well you went to Tokyo when?

MOHR: I was there from the summer of 1977 to the summer of 1980. So I spent three years in Taiwan, two years as a vice consul and one as a language student, three years in Hong Kong as a junior political officer, and three years in Tokyo as a somewhat less junior political officer. I missed the 1970s in the U.S. I was overseas.

Q: OK, so we are now in 1977.

MOHR: Yes, in Tokyo.

Q: Who was the ambassador?

MOHR: Former Senate majority leader Mike Mansfield. This was the first three years in what turned out to be a 12-year tour for Ambassador Mansfield. He was first appointed by President Carter, and then reappointed by President Reagan. So I was there in the early Mansfield years. I was lucky, because Mansfield was greatly interested in China, and I was the only China

specialist at the Embassy.

Q: Yes, he had been a marine in China.

MOHR: Correct, guarding the Beijing-Tianjin railroad in the early 1920s. I think Mansfield was a bit disappointed initially that he didn't get the Beijing job, but after a while you could tell that he realized how important Japan was to the United States, and he grew to really love his job in Tokyo.

Q: Yeah well it was a far more important job at that particular time.

MOHR: Oh yes, and he understood that. He coined a memorable phrase, "The most important U.S. bilateral relationship—bar none."

Q: Well you were the China watcher.

MOHR: Correct. I was the China watcher. There were approximately 12 people in the political section. 11 were fluent in Japanese, and then there was me.

Q: OK, so what did you feel like? You were in the Chrysanthemum club, the club for Japanese specialists, but you were a China hand. Did you feel like a fish out of water?

MOHR: Well, I wasn't in the Chrysanthemum club, composed of Japanese language officers. I was more like an observer. But I soon grew to be interested in Japan and Japanese society. So I asked my colleagues a lot of questions, and as is normal with human nature, when they realized I was interested in what they were doing, they grew to accept me as a sort of honorary member of the Chrysanthemum club. About halfway through the tour, the deputy chief of mission called me into his office and offered me the opportunity of Japanese language training. It was a great honor, but after thinking it over for several days, I declined. I thought that if I learned Japanese, when I was in China, I would feel guilty and anxious because I wasn't doing enough to keep up my Japanese, and when I was in Japan, I would be worrying about losing my Chinese language skills. So, I declined. Some foreign service officers have been able to do both, but I knew I was not one of them.

Q: What was your job at the Embassy?

MOHR: Well, my job was in the external section, to report on Japanese foreign policy in various areas, especially of course China. My other areas of responsibility included the Korean Peninsula, the Soviet Union, and the United Nations. I would go to the Gaimusho (the Japanese foreign ministry) several times a week, and usually call on the deputy director of the relevant office, because the deputy director was my equal in rank at the time. The members of the Japanese foreign ministry all spoke good English, even those for whom English was their second foreign language.

Q: What was the Japanese attitude or approach to China during this time?

MOHR: A very good question. Their basic overall attitude was a bit critical. They felt we were too carried away with China, that we were too emotional. Of course one major concern was that our preoccupation with China would translate into ignoring Japanese interests.

Q: China does this. People are falling in love with China over and over again.

MOHR: Yes, the Chinese are very good at manipulation. One example was long-time conservative columnist Joe Alsop. He was a friend of Taiwan, and a critic of China, for many decades. Then, sometime in the 1970s I believe, China invited him for a visit and he went. His column afterwards was incredible. He basically said something like, after going to China, he understood that they were communist, but underneath it all, they were still Chinese! Since they were still Chinese, they were basically good. An incredible flip-flop. The Chinese are good at this, and the Japanese are not. The Japanese spend great sums of money on public relations, invite Congressmen and their staffs to Japan, and still most Americans have a warmer feeling towards China. The Chinese have this amazing ability to beguile foreigners that very few other foreign countries have. The Japanese are particularly bad at this, and so are the Koreans.

Q: The Koreans are in your face.

MOHR: Yes.

Q: Which I find a pleasant habit in a way. It depends on...

MOHR: Your mood and on the circumstances. Whereas the Chinese know how to make you feel welcome, and important. They are very good listeners, and rarely spend time trying to impress you. But if you are observant, you notice they rarely talk about themselves, and never gossip.

Q: The Chinese come across as being almost obsequious.

MOHR: Not quite. Underneath it all, the Chinese are not obsessed with wanting to be liked. They are very comfortable in their own skins. If they want something from you, they focus on their objective. They do not waste any time on trying to impress you, but on trying to influence you. But they do this in such a pleasant way, that you don't feel manipulated. I think most Americans want to be liked, and the Chinese can sense this and use it to their advantage.

Q: Did you find the ambassador and the staff called upon you to find out what is going on in China very much?

MOHR: Yes, Mansfield would, on occasion. But most of the time, he would simply read my reporting. As was well known, the Ambassador was a man of few words.

Q: He was known as probably the most laconic man who has ever been in the Senate.

MOHR: Yes, this reminds me of a good story. The first time I was invited to the residence for a social event, I noticed the Ambassador remained in the receiving area. All evening, Mansfield remained in the foyer. I was puzzled as to why he wasn't mixing, so I went up to him and asked

if anything was wrong. I think this got him a bit irritated. He just replied that he was fine, and that I should go back and mix. I shouldn't have bothered him, and afterwards, I learned my lesson. The Ambassador didn't like small talk, and he didn't like to socialize. At receptions, he would stay in the foyer, and never mix. Another time, Ambassador Woodcock was in town from Beijing, and I was informed that Ambassador Mansfield wanted me to accompany him in taking Woodcock back to the airport. Now Narita airport is a good two and a half hour ride from Tokyo. Woodcock also didn't talk much. I sat in the back between them, and I counted how many words they said to each other during that time: nine. The atmosphere however was pleasant. They were good friends. But neither talked much. I like to talk, so I went a little crazy, since I couldn't talk unless spoken to. And they did not feel the need to speak to me.

After saying goodbye at the airport to Woodcock, I did not look forward to the ride home. Finally, I asked the Ambassador if it would be all right to put on the radio and listen to the U.S. armed forces network. He agreed. It was the hour for the news. All of a sudden, there was a commentary tearing into Senators from the oil patch, claiming they were basically bought and did not represent the interests of the country, but only the interests of the oil industry. After the program was over, I asked the Ambassador if he would care to comment. He puffed once on his pipe, then said: "Yup. He's right." I was so stunned, I was at a loss for words.

Another advantage of having Mansfield as your ambassador was that you had nothing to fear from visiting Congressional delegations. Usually, you don't know how critical they might be, including to the Ambassador. But with Mansfield there, all Congressmen, and especially Senators, were downright reverential. Usually, the Senators continued to address him as Mr. Leader.

Q: When did you leave?

MOHR: I left Tokyo in 1980. Having been overseas since 1971, it was time to go back to the United States. My family had doubled. I now had a daughter and a son. My daughter Jennifer was born on Taiwan in 1972, my son Adam was born in Hong Kong in 1975.

CLIFF FORSTER
Public Affairs Officer, USIS
Tokyo (1977-1981)

Cliff Forster was born in 1924. His career with USIS included assignments in Japan, Burma, Israel, and Washington, DC. He was interviewed by G. Lew Schmidt on May 29, 1990.

FORSTER: In 1977, Mike Mansfield became our Ambassador to Japan, and I received my assignment to be his Public Affairs Officer in Tokyo.

Q: Did you replace Al Carter?

FORSTER: No, I replaced Bill Miller, who came in after Carter. In mid-77, I was asked to come up to USIA Director Jim Keogh's office with Gene Kopp and Bill Payeff to meet our new Ambassador to Japan, Mike Mansfield.

I've always been a great admirer of Senator Mansfield, and it was a real pleasure to meet him for the first time. I must say the next four years with the Ambassador, like the earlier Kennedy period with Ed Murrow, were very special years. He was a marvelous man to work for, and he was always so interested in USIS and our role there. He knew how important we could be to what he was trying to achieve, and we worked with him on his whole effort to try and de-escalate some of the economic issues and tensions that were just beginning to build up over the trade imbalance.

Most of that period, I would say, we were involved primarily with our trade relations with Japan, and since there was so much rhetoric on both sides, we had an important job to do. The Ambassador went to every prefecture, relying on USIS officers who accompanied him around on all these trips. He recognized the value of what we were doing there, and when Simul International, a prominent Japanese firm, wanted to publish a collection of his speeches in Japan, we worked with them on that project with the Ambassador's approval. That book is a real seller now, a very popular book.

Q: Was it translated into Japanese?

FORSTER: Yes, into Japanese.

Q: Was it our program that did it?

FORSTER: No, it was Simul, and we talked it over with Mr. Muramatsu and Mr. Tamura, the publisher. They had expressed interest in doing something really big on the Ambassador, and we decided that the speeches would be the main content -- all using the wireless file copy. For each speech, Simul had a commentary that went along with it by a well-known Japanese. It was extremely well done, and the Ambassador was very pleased about that, and so were we. Of course, Simul was overjoyed. They were able to get that book all around the country.

Ambassador Mansfield, in my view, played a very important role during that critical time. He used to have an expression, Lew, when he would meet with the press, and his press conferences were always on the record. At the end of each session, he would say, "Well, boys, tap 'er light." Of course, he smokes this pipe, you know. So the first one to come and ask me about this was the *New York Times* correspondent. "When the Ambassador says 'tap 'er light,' I assume it's his pipe," he commented.

"Yes, I guess it is," I replied. I just assumed that myself. But the *Times* bureau chief said he'd like to know. Shortly after that, at a Japanese press conference, the Ambassador said the same thing. "Tap 'er light." Several Japanese journalists came up.

"What is tap 'er right?" they asked.

So I went up to the Ambassador and had one of the longest conversations I experienced with him. He said, "Well, Cliff, when I was a young fellow, I used to work in the copper mines in eastern Montana. As you pound that stick of dynamite into the shaft walls, you'd holler down the line, 'Tap 'er light. Tap 'er light' and that's what we've got to do here in Japan. We've got to keep these economic issues from becoming political issues by tapping 'er light. We don't want to tap her too strong. Let's see if we can't do it without raising the decibel count."

And he really worked at that. We all did, I think, but particularly the Ambassador. Bill Sherman was his DCM, whom you know, and we coordinated our public affairs effort on this issue with him.

It was a combined effort to try to keep the dialogue going, working with congressional people coming through to try and avoid emotional diatribes. And with the Japanese, to try and make them aware of what they were up against with American public opinions and up on the Hill, if they didn't just open up on the trade side. The problem was really on both sides. You could see it coming.

When I left Japan in 1981, it was beginning to escalate fast. It was a very challenging time for both Americans and Japanese in avoiding emotional clashes. I'll just end on this. There are many things to talk about during that period and just about the time we left, we had that big budget crunch. I guess you and I, over the years, went through these cutbacks and RIFs, as we called them, which involved the closure of several USIS centers. But that 1980-81 budget cut was a very difficult business for all of us, and we had to cut back, although I did my best to hold on to the remaining centers. You know how strongly I feel about the center program, which are on the front line of our program.

Q: How many centers did you have at that time?

FORSTER: At that time, we had six. From twenty-three in our earlier period, we were down in 1981 to only six -- Sapporo, Tokyo, Nagoya, Osaka, Kyoto and Fukuoka. I just couldn't see another center going, and these were the core centers, in my view. So we had the usual wrestling match with Washington, which kept asserting that we had to cut some centers to meet the requirements.

WILLIAM C. SHERMAN
Deputy Chief of Mission
Tokyo (1977-1981)

Ambassador William C. Sherman was born in 1923 and raised in Kentucky. In addition to serving in Japan, Mr. Sherman served in Korea, Italy, and Washington, DC. He was interviewed by Thomas Stern on October 27, 1993.

Q: In June, 1977 you transferred to Tokyo as the Deputy Chief of Mission. How did that come

about?

SHERMAN: Mike Mansfield had been selected to become our new Ambassador to Japan. I don't know exactly how the selection was made. I had known Mansfield, although not well. During my first Foreign Service Officer assignment, I worked with Congressman Mansfield when he was part of the US Delegation to the UN General Assembly. Later, while I was assigned to Rome, he came for the coronation of Paul VI and as I explained earlier, I was the control officer for that delegation. I escorted him and Maureen Mansfield around at the time for three or four days, along with Earl Warren, Rabbi Lewis Finkelstein, Charles Englehardt and others.

Of course in 1976, there was an election in the US won by Jimmy Carter. Within ten days of his inauguration, Carter sent Mondale to Tokyo for discussions with the Japanese.

In the meantime, Dick Holbrooke had been named as Assistant Secretary of State for Far Eastern Affairs. So Japan was high on the foreign policy agenda of the new administration and that kept us hopping during the first half of 1977. In the Spring of that year, the new Ambassador had been selected and the DCM selection process begun. I was due for an overseas assignment in any case and Holbrooke was in the process of restructuring the whole Bureau to meet his own needs and desires. I was of course hoping that I would be selected by Mansfield to be his DCM and I was very glad that he did so. Before he made his selection, I escorted him around in all of his meetings around Washington. I arranged all the meetings and went with him. So I got to know Mansfield relatively well during his indoctrination period.

Mansfield had traveled widely and therefore was familiar with the role of a U.S. Ambassador. Hodgson had left Tokyo in February, 1977 so that the post had been run by a Chargé Tom Shoesmith for several months. When Mansfield's appointment became public, Hodgson flew to Washington to brief the Mansfields. on his experiences. As far as Mansfield was concerned, he did what he had always done: consider the question carefully, reach a decision on what was right and then do it. He never had a problem engaging the Japanese; he was just a very skilled leader who knew how to approach issues and get them resolved if he could. Mansfield did not see himself as a manager of a US establishment; he viewed himself as a symbol of the American presence in Japan. He was the President's personal representative and felt responsible for the image of America in Japan. He was at first very reluctant to be a highly visible Ambassador; he wanted to limit his public appearances to no more than two or three per annum. His initial inclination was to view his assignment as a semi-retirement. That of course, changed rapidly once he became ensconced in Tokyo. He communicated frequently with the media, both American and Japanese. He did like to meet with individuals, often early in the morning. He was always polite and attended even routine ceremonial functions because he was the Ambassador, even when he personally would have preferred to do something else. He became famous for his ability to walk in the front door of a National Day reception, shake a few hands, often have his picture taken and be gone in a few minutes. He moved into an active role very slowly and somewhat reluctantly. He acted very much like David Bruce did in London. Bruce met with the Queen and the Prime Minister and perhaps a few key Cabinet officers, but never with lower officials. Of course, the way Mansfield decided to be an ambassador was very much a function of his own personality. I don't think the role he defined was done consciously, but he molded the Ambassadorial role to fit his own style and behavior.

Mansfield very rapidly established close ties to the Prime Minister and the Foreign Minister. The Japanese held him in awe; he was by far the most important American politician who had ever been appointed as Ambassador. They were overjoyed by the appointment because it signified to them that the new US administration held Japan in highest regards. While in Tokyo, Mansfield tried very hard to maintain his contacts with the US Congress. He always said that he had no ambition to return to Congress after his stint as Ambassador except perhaps to escort a foreign Prime Minister. He used to say that he had enjoyed his years in Congress, but that he would not return to serve. He did so when he came back to Washington go to Congress just to discuss the "good old days", but, as I said, he would escort the Prime Minister or Foreign Minister whenever they visited Washington. He was always right there whenever these key Japanese would meet the Foreign Relations Committee or Senators or Congressmen. That was always very helpful to the Japanese because Mansfield would be the "gate opener" and would lend his prestige to their discussions with members of Congress.

He would always host any Congressional members who might be in Tokyo. He would personally brief them and would exchange views with them. He was always well informed on trade statistics, for example. He could tell each Congressman exactly what the trade between his or her State, in some cases even district, with Japan was at the time. He never forgot a statistic. He always knew what was important to these members of Congress; he had never forgotten the lessons he had learned as Majority Leader. He was very skilled in handling Members of Congress. He never used these occasions to ask for any Congressional action or favor. He would present the case as he saw it and would then leave to his audience to take whatever action it considered appropriate. I think that on a couple of occasions, Dick Holbrooke asked Mansfield to take on a couple of political assignments -- lobbying. The issues had nothing to do with US-Japan relations. Mansfield refused; he didn't even do any political work for the Administration in his home state of Montana. After having left Congress, he never used his ties or connections to do any political work of any kind.

He never demanded that he be kept abreast of anything, except perhaps occasionally on economic statistics. He may have asked the IRS representative to help him with his income taxes, but he never demanded anything. He expected the staff to let him know what it considered important. I made certain that he saw every important substantive cable from the Embassy. He was always the first in the office. The Marine Guard would give him the key to his office suite. He would start the day by reading the newspapers. Because of his careful readings, he was extraordinarily well informed on both American and Japanese current events. I would get to the office around 7:30 a.m. and start my day by having a cup of coffee with the Ambassador. Some days that session would last a few minutes; some days it lasted two hours. Sometimes, he would reminisce about his political life; sometimes he would want to discuss a Japanese political issue or about mutual security affairs or about events of the day or the week or about internal Embassy matters. I was never quite sure what the subject of the day's conversation might be, although I always had an agenda that I wanted to cover with him. Sometimes he would suggest some form of communication to be sent to the Department -- and he would usually say: "Make it strong, Bill". Sometimes he would ask for a personal message to the President or the Secretary to be drafted for his signature. That insured that his views were always well known in Washington on the major issues. As far as I remember, he never called the President; he didn't feel he had to and

in any case, he hated telephones. He would see the President whenever he was in Washington, almost every time. Same with Secretary of State; he rarely called Vance from Tokyo. Holbrooke would call him from Washington and Mansfield would talk to him, although very reluctantly. Sometimes, he would refuse to take the call; I would then get on the phone and tell Holbrooke that the Ambassador didn't want to talk to him. Holbrooke could barely believe his ears. I remember one day, while I was back in Washington for consultation, Holbrooke called Mansfield because some private group -- it may have been the Council for Foreign Relations or something like that -- were visiting Tokyo and had not been invited for any kind of social occasion by anyone in the Embassy. The members of this private group had expressed some dismay to Holbrooke. Dick thought that Mansfield should make some kind of effort. He was about to call the Ambassador when I intervened and suggested that he would be wasting his time. Fortunately, Holbrooke thought better of it and didn't call. He would not have received a very cordial reply from Tokyo! In addition to his personal reluctance to host large receptions, you must remember that both Ambassador and Mrs. Mansfield were children of the depression. They barely scraped through their youths. Spending money came hard to them, particularly for what appeared to be frivolous matters. We had a very hard time convincing Maureen to spend money for representational purposes, even if were not her own. She was a little more relaxed about spending the government's money, but there was always a struggle about the size of a guest list for any function at the residence. I tried to stay as far away from issues of that kind as I possibly could. Some of Mansfield's predecessors -- particularly Jim Hodgson, who was a business man -- had made the Residence available for what were social functions sponsored either by Department of Commerce or Agriculture trade teams or even American private business groups. These groups would either pay the costs directly or reimburse the Embassy. Soon after the Mansfields' arrival, someone called Mrs. Mansfield and told her that there would be a social occasion at the Residence that evening and wanted to make sure that there would be sufficient sustenance for the guests. Maureen was outraged by the call; after that, I issued instructions that the Residence would not be available for that kind of activity. I added that only the Ambassador could determine what events would take place there, that he would be the sole host and that all costs would be paid by the State Department's representational funds. If a commercially oriented reception took place, it was because the Embassy deemed it to be important, not because a company or trade group wanted to use the Embassy property...

I did a lot of drafting; sometimes I would assign the task to others. The messages would be shown to the concerned principals in the Embassy so that we would all be saying the same thing to the public. Mansfield almost never wrote anything himself; he would approve our drafts or ask for certain changes to be made. He of course saw all "first person" messages; sometimes I would show him other messages that were being proposed by Embassy officers when I thought they were important enough to have the Ambassador's approval. I was determined that he would never be caught unaware on any major substantive issue. I was equally determined that I would not play any games with him, as some other DCMs may have done with their Ambassadors. I was not going to pursue any personal agenda and present Mansfield with a *fait accompli*. The Embassy was his Mission and not mine. I was there to help him and to marshall the resources of the Embassy to support him. I think we made a good team. I think he was satisfied with my performance and I was certainly delighted to work for him.

My main task as DCM was to run the Embassy -- in my fashion -- and be its principal point of

contact with the Department in Washington. I was also responsible for the operations of our other establishments in Japan whose Principal Officers reported to me. We didn't have a Supervisory Consul General as was the case in other countries. We had a Consul General in Tokyo, but he was only responsible for the consular operations at the Embassy. Each Principal Officer submitted a monthly report to me on their activities. I used to contact them by phone when some one special would visit their district or when we needed something done. I did a modest amount of traveling throughout Japan. I took a couple of trips to Southeast Asia to compare notes with my counterparts there. Whenever there were major changes in the Cabinet -- a new Prime Minister or a new Foreign Minister -- you could always expect the newcomer to visit Washington sooner, rather than later. The Ambassador always accompanied the Prime Ministers and I usually accompanied a new Foreign Minister. I would represent the Embassy during the course of his meetings with various Washington officials.

We had our usual battles with Washington on the staffing of the Embassy. We had more than 300 Americans representing all agencies. Of that number, only 100 or so were from the State Department. There were 33 or 34 different agencies represented in Tokyo, including such as the Bonneville Power Administration which was buying generators in Japan. The Ambassador always felt that there were too many official Americans in Tokyo; our presence was just too large. During one of the many efforts to reduce overseas employment (called MODE this time), which begun just as I arrived in Tokyo, the Embassy was certain it could do something about reducing the American presence. That view was held despite the failure of many similar previous efforts. This time, the Ambassador was determined to do something.

He was particularly upset by the Office of Naval Research which had a small staff in Tokyo. No one was quite sure what they were doing; it something to do with cooperative efforts with Japanese scientists. One member of the staff had taken an official trip to China without any Embassy clearance or even notification. In the late '70s our relationships with China were still sufficiently delicate that we did not allow many US government officials to travel there for fear that it might be misunderstood by the Chinese or that they might take some P.R. advantage from such a trip. So Mansfield targeted the ONR office and was convinced that it should be disbanded. That was the office that he would eliminate. That got us into a battle royal with Washington. It took us two years of constant cable traffic, arguing back and forth about these three or four people. We enlisted the assistance of the Department, which, in matters of this kind, was and is just useless. We had high ranking Navy officials coming to Tokyo to review the situation. We took the issue up whenever we were in Washington. In part, the bitterness of this issue was the consequence of a major bureaucratic battle we had had with Foreign Office made several years earlier during the Okinawa reversion period and the security treaty days when the ONR office was opened. The Japanese viewed the office as an intelligence collection operation and were very reluctant to allow it to open. ONR was an open liaison operation and in the final analysis, the Japanese government gave us permission to open it. But the scars were still showing in the late '70s. After two years, ONR closed shop in the Embassy. It just moved to a military command doing the same thing under a different sponsor. It was ridiculous! The Embassy wasted a lot of time and effort and accomplished nothing.

I might at this time mention my fight with the Inspection Corps. Within a month of my arrival, a team of Inspectors came to take a look at our operations. The chief inspector was Terry Arnold,

an old Philippine hand. Sheldon Kryns was his deputy for this inspection. The confrontation between the Inspectors and the Embassy started almost immediately. The team had gone to some constituent posts first. In Sapporo, the Consulate had hired a local, but before he could report for duty, the Inspection team recommended that his position be abolished. It was much too late; all the paperwork had been done and the person was ready to report for duty. The team had behaved in a very high-handed fashion and had left a lot of bruised feelings in Sapporo. On their first day in Tokyo, Lea Anderson, our Administrative Counselor, took the team on a tour of the Embassy. After that, the team came to me and said that the Embassy was too big. I suggested that they might wish to hold that comment until they were finished with the inspection instead of starting with a conclusion. Their comment was not addressed to me because I had just arrived and had had nothing to do with the size of the Embassy. Nevertheless, the team kept coming back to this issue every time we met; we were not entirely unsympathetic with the general view because the Ambassador himself had reached the same conclusion. But we were irritated by the team's knee-jerk reaction. Mansfield met with the team a couple of times in very formal settings, like their first courtesy call and their final call during which he listened to their oral report without comment. He didn't entertain them or have a discussion with them.

In any case, every time the team and I met, we had a disagreement about one thing or another. For example, the team took exception to the long standing practice of the Commissary selling to other foreign diplomats. It was a practice that had been approved by the Japanese Foreign Office many, many years earlier. It was a useful practice not only to develop good will in the diplomatic corps, but also to generate funds for the Commissary and other non-governmental expenses. Part of our profits from the commissary went into a world-wide pool used to assist commissaries at smaller posts that needed financial support. Arnold and his group took exception to the practice. That gave rise to a major dispute and debate. I still remember discussing the subject with Arnold at the Marine Ball toward the end of the inspection trying to shout over the blare of the band. I found the whole inspection a total waste of time and money. The major recommendation was about the size of the Embassy and the desirability of it being reduced by 10%. The team wanted us to volunteer a reduction of our personnel ceiling by that percentage. Of course, the team did not suggest where the reduction should take place; that was to be left to us. Then their report recommended that we cease commissary services to other foreign diplomats in Tokyo. I really took umbrage at the whole inspection effort in our written response to the report. Our response was so harsh that the Inspector General was upset and felt offended. I thought it was a lousy inspection which wasted everybody's time and lots of money. The Inspector General's office refereed the issue of sales to the Legal Advisor who ruled that it was illegal for US commissaries to sell to non-US diplomats. So, much to our embarrassment, we ceased that practice. But we refused to accept the general recommendation on personnel reductions on the grounds that no specific suggestions were put forward by the inspectors; we couldn't do anything with a recommendation that just said that the Embassy was too big. Months of back and forth with Washington left a lot of ill feeling on both sides. Mansfield supported my positions, but didn't get involved in the bickering. I am generally pro-inspection, if the team takes the attitude that it is at a post to try to help to improve efficiency. But when the team sees itself as an adversary, then an inspection is worthless and maybe even worst. The end of this story was that the whole inspection report was buried and considered null and void.

Q: What about the quality of your staff?

SHERMAN: Tokyo had and has always had a first class staff. Being such an important post, all agencies try to send their best people. The senior staff were all very good. The language capability was adequate, certainly as far as the Foreign Service Officers were concerned. The Economic Section could have used more Japanese language officers, but to find people conversant both in economics and in Japanese is very difficult. The Department has always had difficulties recruiting first class economists and then couldn't really spare the ones it did hire for language training, particularly hard languages. I got along very well with the Station Chiefs, first Bill Wells, then Horace Feldman and Bill Grimsley. That has always not been true for some of my successors. A lot of Foreign Service Officers are just psychologically opposed to CIA and therefore have difficulties relating to intelligence personnel. I had the full cooperation of the Station which was helpful many times.

The Embassy, traditionally, had been close to the American military contingents. The Military Attachés, as is often true in countries where the Defense Department has troops or ships, did not play a significant role. We had an American Military Defense Assistance Organization which was basically a sales force for American weapon systems. It did not conduct any training functions. The MDAO was part of the Embassy and the Chief reported to the Ambassador, but his reporting channels were through CINCPAC in Hawaii. He had very limited contacts with the other American military commands in Japan. Years earlier, when we had a MAAG in Japan, there was some confusion about command relationships because that group saw itself as a staff section of the US military command, while the Embassy thought it to be an integral part of its operations.

The Embassy had had a Politico-Military section with close ties to the Japanese Defense Forces. By the time I arrived in Tokyo, that section had been abolished and the work was being done in the Political Section by a politico-military officer. The Political Counselor and his staff worked with the American military stationed in Fuchu and provided the Embassy a day-to-day liaison. Of course, the military could have contacted me at any time and the CINC could have called the Ambassador at any time. But that rarely happened because the Ambassador only became involved in large public issues and seldom, if ever, became involved in operational matters. One that Mansfield was very active in was when an American submarine rammed into a Japanese merchant ship and then submerged and didn't stick around to see whether any assistance was required. Most of the issues that required Embassy-Command contacts dealt with host nation support and sometimes status of forces. The issue of Japanese financial support for American forces was in part dealt by the Politico-Military section of the American desk office of the Foreign Ministry and in part by the Self-Defense Agency. For the American side, much of the work was done by the Embassy's Political Counselor supported by US military representatives. The US military related primarily to the Japanese on a service-to-service basis and with the Self-Defense Agency. If they had a reason to contact the Foreign Ministry, they would go with the Political Counselor or a member of the Political Section. Sometimes, the Counselor or a member of his staff went to the Self-Defense Agency accompanying a US military officer. The routine was well established and there were no bureaucratic frictions between the US military and the Embassy. The Air Force Chief of Staff at Fuchu was the primary American military representative who dealt with the Japanese. He used to be in the Embassy almost on a daily basis and was certainly in touch telephonically with us every day -- either with me or the Political

Counselor. Whether I would be involved depended on the nature of the issue and its importance and whatever level of the Embassy had to carry on the discussion with the Japanese. For example, if a meeting of a Security Subcommittee was required, then I would get involved. If an agreement had to be signed, that would involve me. If senior Defense Department officials were visiting Tokyo, that would also require my involvement. Those visits were not unusual; the Secretary of Defense would come out at least once a year.

Q: Let me ask you about trade issues in the '77-'81 period. Where the tensions already running high?

SHERMAN: Trade issues were beginning to become sticky. Bob Strauss, then the Special Trade Representative, had been given the mandate to do something about the automobile trade imbalance as well as color TVs and some agricultural issues. He was in Tokyo frequently, often with a very high P.R. profile. He and Mr. Ushiba, former Japanese Ambassador to Washington and one of Japan's foremost "American handlers" were the authors of one of the early trade agreements. That was done in a two-three days "three ring circus" atmosphere. I participated in the day and night long marathon meetings which took place mostly in the Ambassador's Residence. Periodically, Strauss would pause and say that he would have to call the President; he used to say that he had promised the President by a certain time and that would always leave only a few minutes to wrap up one issue or another. That would focus the Japanese mind once again and the bargaining would resume. Those were wild meetings! There were simultaneous meetings of a number of groups focusing on one matter or another. Dick Rivers, the USTR's General Counsel and Allan Wolfe, one of the Deputy Trade Representatives would be in different rooms meeting with their Japanese counterparts. During these separate negotiations, Strauss would hide out somewhere, meeting in secret with somebody theoretically unbeknown to anyone else. At one stage, Strauss came to the Embassy where he was confronted with a draft agreement that Rivers and Bill Piez of the Embassy had negotiated out with the Japanese. Strauss didn't want to look at it; he kept saying that he was too tired to look at anything. Dick Holbrooke kept after him -- during critical meetings, Holbrooke and Erland Heginbotham, his economic expert and other EA staff members, would be present in Tokyo. Finally Strauss looked at it and exploded. He wanted to know whether Rivers had really worked on it. When he was assured that he had, he said that he would fire him immediately, if not sooner. He had a number of less-printable expressions that he used periodically and he would let them loose in a red hot string at moments like this. Perennially, we had large meetings of this kind, with what seemed as if half of Washington were in Tokyo.

Then there was a Congressional trio who took a keen interest in US-Japan trade matters. Jim Jones, the Congressman from Oklahoma, a Lyndon Johnson White House staffer and now our Ambassador to Mexico, Sam Gibbons, a Congressman from Florida and Bill Frenzel, from Minnesota would visit Tokyo from time to time to pressure the Japanese on one trade issue or another. Mansfield always saw them and worked with them. Jack Button, then the Embassy's Economic Minister, worked with this Congressional delegation, which played a very helpful role in focusing Japanese attention on the seriousness of trade issues

Then there was a period during which Frank Weil, the Commerce Department's Assistant Secretary responsible for trade issues, used to visit Tokyo frequently. He was interested in

increasing Japanese imports of American consumer products. The Japanese offered the use of their trade ship; that is the ship which they used to promote their own goods by sailing it around the world as sort of a mobile trade fair. The Japanese offered the use of the ship to us so that we could take our wares to various Japanese sea ports. In the final analysis, that ship ended up being a combination of military surplus wares and a novelty shop. No serious American exporters were going to use a gimmick like that. The ship did carry some American clothing, some furniture, some novelty items, but it was not really a serious trade promotion effort. But the preparations for the ship's sailing took up a lot of the Embassy's time and effort.

We made other efforts. The US-Japanese trade advisory council was very active during the late '70s. There were lots of committees formed, some by the American Chamber of Commerce in Japan and some formed by other groups. There was a constant series of meetings and other public and semi-public events. The trade issues did not lack attention, but the tensions kept rising. The American Chamber had Mansfield's full attention; he was very active in that forum. The Chamber met monthly with the Ambassador. We would brief the officers of the Chamber, with Mansfield presiding over the meeting. He would listen to the Chamber's views. He of course knew all the leadership of the Chamber as well as many of its members because he devoted a lot of attention to that group. He thought that an American Ambassador had an obligation to listen to and represent whenever appropriate the views of American business in a foreign country. He also thought that his relationship to the Chamber was useful in the management of the trade issues. The Chamber did conduct a number of studies that were useful to understanding the issues more clearly. You have to understand that at this time there were probably 25,000 Americans in Tokyo, most of whom were involved in trade issues of one kind or another. The Chamber was very active under good leadership, which was assisted by a good professional staff. So the Chamber had adequate financial and human resources to really represent the American business community. The leadership would return to Washington for annual meetings; during this period, it would visit important people in the Legislative and Executive branches. They developed this routine in concert with us. So the Chamber was an influential group on trade matters.

Q: Let's finish our discussion of your tour as DCM in Tokyo with an account of the President Carter's visit in 1979. What do you recollect from that?

SHERMAN: President Carter did come to Tokyo in 1979 and again in 1980 for the funeral of former Prime Minister Ohira. The 1979 visit served two purposes: a) Carter attended a G-7 summit -- the Energy Summit -- and b) a State visit. There was the usual Presidential hoopla: large teams from Washington some of them arriving three months before the event. More would come as the visit time neared and the planning became more concrete. There were at least three hundred staffers and press visitors during the President's visit. Secret Service had a 24 hour watch, with twenty men on each shift. The Presidential communication requirements are massive. There were two plane loads of press. There were all the experts needed for the summit.

Having been through a number of such Presidential visits, I think I had the Embassy pretty well prepared and organized. David Lambertson, now our Ambassador to Thailand and then the deputy Political Counselor, was in charge of the day-to-day Embassy support activities. He was assisted by a young officer who is now the DCM in Seoul, Chuck Kartman. The Embassy

worked well with the Secret Service, the White House Communications staff as well as the White House trip planners. The White House political staff was primarily interested in showcasing the President. Since Carter had a reputation for having started "town meetings", I suggested that we have one in Japan in the little town of Shimoda. That was the port town that was visited by Commander Perry and his black ships and where the first Consul General Townsend Harris had established his residence and office. The Japanese were not at all happy with that suggestions because they felt that the country "bumpkins" of Shimoda would ask all the wrong questions and embarrass the whole country. The Japanese preferred that Carter chat with a group of intellectuals -- University professors, writers, etc. -- in Tokyo. In the end, atmospherics prevailed and the town meeting was held in Shimoda. It was a warm and human session and the President and the citizens of Shimoda communicated easily and smoothly. They asked human questions, not very sophisticated, but much more meaningful to ordinary people both in Japan and in the United States.

When an Embassy is first told that a Presidential visit is being contemplated, its first reaction is panic. The first question is whether the Embassy has enough resources to plan and support a Presidential visit. The second question concerns the routine work-load: can the Embassy both support a Presidential visit and do its regular work? In fact, an Embassy stops doing its normal work and concentrates entirely on the visit. After that, a list of issues is developed; most of them concern logistics which are the responsibility of the administrative section. Slowly, an outline of a schedule is developed; the routes that the President is to travel are mapped out; stops and photo opportunities are planned. Plans are developed for a communications system which will get material to the President wherever he may be. That raises the major issue of where the President stays. Carter stayed at the Ambassador's Residence; that required the Mansfields to move all their personal belonging out of their bedroom suite into another bedroom in the house, which, for ten days, was almost the only room they were permitted to use. When Kennedy came to Rome, Ambassador Reinhardt was ill and in fact was in the military hospital in Wiesbaden, Germany. Mrs. Reinhardt was in the Residence by herself, but the White House staff told her she would have to vacate the premises and suggested she fly back to Virginia for a week while the Kennedys occupied the Residence. When Johnson went to Bonn, it was the Hillenbrands -- he was then the DCM -- who had to vacate their home. The Shermans were lucky; the White House advance team looked at our house to see whether it wouldn't be easier to move us out, but fortunately our residence was a little far away from the center of activities and more difficult to secure. Of course, the Secret Service had to secure the house which meant thorough sweeps and surveillance. Then come questions about the feeding and taking care of the media; that is usually a USIS function. Then of course an Embassy becomes somewhat of a translator between the White House and the Foreign Office trying to explain the position of one to the other. The White House believes that the President's schedule is their business; the host government feels that it is in charge. Accommodations always have to be reached, but they can sometimes take days and days. Tempers flare, feelings get hurt. There are always major turf battles over who can attend what meetings or social functions. I had a huge fight with Dick Holbrooke the night of the Imperial banquet. The Palace rules are that the Ambassador and the Ministers of an Embassy are invited to Imperial functions. Invitations were restricted to those few from the Embassy plus certain people from the delegation of the visiting dignitary. Of course, the number of people who would like to attend an Imperial function are always many more than the Palace will invite. In our Embassy, there were two Ministers: myself and Jack Button, our Minister for Economic

Affairs. We received our invitations. Holbrooke was incensed; he wanted to know why Jack Button had been invited. He had a member of the EA Bureau with him -- Alan Romberg -- who he thought should have received priority over Button. He stormed in his usual fashion and I tried to explain the Japanese protocol to him. I told him that the Japanese had their protocol and we were not in a position to tell them how they wanted to run their business. He finally accepted that fact, but he surely was upset.

Once the visit is contemplated, then it is the sole issue of the day, day after day, week after week and sometimes month after month. Japanese were and are almost paranoid about security, partly as the result of the embarrassment they felt when the Eisenhower visit had to be canceled because of demonstrations over the Security Treaty. They have always tried to recoup from that failure. So when an American President visits Japan, security is almost overwhelming and certainly suffocating. For blocks around where a President stays, the police form a cordon keeping all possible attackers far, far away. They had police snipers on the roofs around the Chancery; I could see them every day from my office as far as my eye could see. In the four or five weeks preceding the President's arrival, the police and the military conducted massive operations. Carter wanted to have a feel for Japan and the Japanese people. He wanted to jog around the Imperial Palace, which is the preferred route for all Tokyo joggers. Then we suggested using the Akasaka Palace -- the formal reception building where State dinners and other formal functions were held. No way! The Japanese authorities just wouldn't even consider it. Finally, Carter settled for jogging around the Ambassador's Residence where he was staying. Even that, barely passed Japanese muster because someone could have taken a shot at the President from one of the near-by roof tops. We did challenge the tight security that the Japanese imposed; we constantly argued with the Japanese authorities about that. But the Japanese insisted that security was their responsibility and that they would be held accountable of anything had happened. That was of course true. The Secret Service never complained about the tight security; they were happy with it. But the White House political team and the Embassy did because the security was limiting us in how we could present the President.

On a couple of occasions, the President did manage to escape the security net. He had visited Tokyo before as a member of the Trilateral Commission and therefore had a favorite *yakitori* restaurant. One evening, the Carter family slipped out and went to the restaurant, escorted by their own Secret Service, but not by the overwhelming Japanese security forces. They stayed there for an hour or so; you can still see a picture of the Carters eating there.

The only serious glitch that occurred during the State Dinner that the Japanese hosted. They didn't say anything while Carter was in town, but expressed their great displeasure to us after everybody had left town. To this day, I am not sure how the unfortunate incident took place nor at whose direction. The dinner was at the Imperial Palace. Somehow or other, Cornelius Iida, the US official translator, appeared on the scene and took a chair right behind Carter. That is never done!. Emperor Hirohito had one translator, Ambassador Masaki, who always handled all translation chores for the Emperor. He was the only one permitted to translate for the Emperor and that was the way protocol had always been conducted. All of a sudden the Americans produced their own translator; I don't know how he got into the Palace or the dining hall. In any case, the Japanese considered this a serious breach of protocol. I was as surprised as anyone else, although there must have been people in the American delegation or staff who arranged Iida's

presence. In any case, after the President left the country, I was summoned by the Chief of Protocol and told in no uncertain terms that Iida's presence had been a major breach of protocol and that it would never happen again. It had never happened before and the Japanese would never permit another such serious breach of protocol. I forwarded the Japanese protest to our Chief of Protocol, Kit Dobelle. I assume that she had some knowledge of the affair, but I never heard another word about it.

In general, I would say that the visit went smoothly. As I said, we had a large staff in the Embassy; most of them had been involved in the visit one way or another. Many had worked long hours for weeks before the visit. One would assume that sometime during the ten days that Carter was in Japan, he could have found time to talk to the staff. But we were informed that he would not have time, but that Mrs Carter would address the staff. So on the day set for this appearance, I went to pick up Mrs. Carter. She said that she didn't understand why the President had not found the time to meet the staff; she said that she wished he could because she understood that everybody had worked so hard to make their visit a success. She was very polite; she met the staff and apologized for the President's inability to attend. That was alright. I was told by someone in the entourage that Carter just didn't make appearances of that kind. But at the end of the visit, as he was about to leave the Residence for his flight to Seoul, he mentioned to Mansfield that the Tokyo visit was about the best organized one that he had ever been involved in. He wanted to express his personal pleasure to the staff. Mansfield immediately called me to assemble the troops so that Carter could meet as many as he could. I went to work immediately, of course, but we couldn't even find the lights in the main auditorium. I didn't know where they were nor did anyone else right at hand; they were hidden in some control room. Our Administrative Counselor got into an elevator and stopped at each floor, yelling out of the door for all who could hear to come to the auditorium to meet the President. It was quite a flurry. Carter had to wait for a few minutes until we could get the lights turned on. When we finally assembled as many as we could, Carter spoke for about ten minutes very graciously thanking everybody for their fine performance. People were grateful that he had done that.

In all Presidential visits that I had ever been involved in, the White House staff brings with them sackfuls of tie clips, cufflinks, pens and other mementoes with the Presidential seal on them. Sometimes, it would be an autographed picture of the President. These were given to those who had worked especially hard on a visit. For that Tokyo visit, there was nothing. Absolutely nothing. It meant that people like Lambertson, who really spent untold hours on the visit, had no souvenir at all. When it came time to exchange gifts with the Emperor, we presented a bunch of Norman Rockwell plates left over from the bicentennial celebration. Who ever ran the Presidential gifts operations -- I think it was one of Carter's cousins -- did it on the cheap, making the White House appear like a country store. It did not make the U.S. look very good! When Lea Anderson and I raised a question about the gift to the Emperor with some of the White House staff, we were told to mind our own business in no uncertain terms and never to mention the subject again. The White House did not handle the gifts and souvenirs very well.

The visit in 1980 was essentially unnecessary. Washington felt that there had been a close personal relationship between Carter and Ohira. In fact, it was more a public relations friendship than a real one. In any case, Washington felt that it would be appropriate if Carter attended the funeral. Unfortunately, the Japanese have a different attitude toward funerals. They don't usually

have State funerals for a deceased Prime Minister. Those funerals are much more modest and no head of state is invited. Prime Ministers come and go with some frequency; the Japanese plan relatively modest funerals for their political leaders. For Emperors, it is a different story.

So for Ohira's funeral, the Japanese were not soliciting high level foreign attendance. I told Washington what the Japanese were planning and why. It didn't pay any attention to our advice; Washington had made up its mind to do it its way. The moment the Japanese were told that Carter was considering coming, their plans changed; they invited a lot of other senior foreign dignitaries. In the end, however, it was Carter and a few minor European royalty that showed up. Other countries sent their resident Ambassadors or Cabinet officers. Carter's attendance forced the Japanese to have a much larger funeral than they had expected; it did show a close relationship between the Carter administration and the Japanese, but overall, it made the U.S. look a little over eager. We didn't have much time to plan since the funeral took place about ten days after Ohira's death. As a matter of fact, I was in Hawaii when he died. I was attending a SSC meeting. I had leave that abruptly and return to Tokyo to supervise the arrangements for Carter's funeral visit. Given the brief period between the death and the funeral, the Embassy wasn't out-of-business for nearly as long as the previous year. Furthermore, funerals have an entirely different meaning than State visits; they are therefore much less complicated to arrange and to support a Presidential visit.

DAVID L. HOBBS
Consular Section Chief
Osaka-Kobe (1978-1981)

David L. Hobbs was born in Iowa in 1940. After serving in the US Army from 1960-1963 he received his bachelor's degree from University of California at Berkeley. His career included positions in Germany, Brazil, England, Japan, Colombia, and an ambassadorship to Guyana. Ambassador Hobbs was interviewed by Charles Stuart Kennedy in March 1997.

Q: What was your job in Japan?

HOBBS: I was the chief of the consular section in Osaka-Kobe. It was a very small section but had the third highest volume of visas in the world, after Tokyo and London.

There is so much travel by the Japanese to the United States and we still had this requirement that they all have visas. We were just grinding out these visas by the hundreds of thousands.

Q: I assume they arrived with shopping baskets full of passports.

HOBBS: Right. We hardly saw any of the individual Japanese. The travel agents brought the passports over in bags and boxes.

I had one little interesting skirmish with the Japanese staff there. They were actually very good

and worked very hard, but had their own little points of view. One of them was that Koreans were not worthy of having long term visas. They would decide pretty much whether or not the visa should be issued and for how long. We would only spot check and ask them to bring all the problem cases to us. During spot checks I began to notice that Koreans were getting three month one and three visas even though they were people born in Japan and lived there all their lives and had jobs in Japan. I called them together and thought it was not a good idea to do that. We kept giving these people visas over and over again. The staff resisted but I insisted and in the end they crumbled and did what I told them, although I'm sure on the day I left they went back doing what they always used to do.

But, I always remember this one woman to whom I said, "Look, somebody who was born here, lives here, wears the same clothes, speaks the same language, you can't really tell the difference, so why are you making a big fuss about this?" She said, "We can too." "How can you tell the difference?" She said, "Because Koreans are always standing in front of pachinko parlors wearing white shoes and swinging a little chain." I said that I would not accept that and therefore do it our way.

Some months later I was walking towards a place where there was a little art show and I went in front of a pachinko [pinball] parlor. I suddenly noticed a man standing in front of the pachinko parlor with white shoes and swinging a little chain. I said to my wife, "Look, there is a Korean." She looked at me and said, "What do you mean?" I explained what this woman had told me. She said that was crazy. But it was amazing that the stereotype was so strong in Japan about the Koreans. As a matter of fact, he probably was a Korean, the owner perhaps.

There was another thing we had going on there that was very difficult. The Japanese had a great number of investments in the United States and there was a lot of effort by the Americans to attract more Japanese investments. We had dinner with the then Governor Clinton of Arkansas when he came over once to try to interest the Japanese in making investments in Arkansas. And they did make some. There were a lot of companies who would send a lot of Japanese to the United States to run their investments on treaty visas. But, we caught on that there was a enormous number going over and it looked like they were staffing these companies almost entirely with their own nationals, which was going quite a bit beyond what the treaty visas were intended to do, take care of the visas for the managers and technical experts. We did a lot of inquiring and asking around and found out that they were indeed staffing entire offices with their own nationals, down to the most menial tasks. So, we decided we would governor this a bit and put more attention to the issue and ask a lot more questions. Inadvertently we created quite an uproar in Japan. It was front page news. Why were we inquiring more thoroughly into these visa requests? We had a meeting once where several thousand Japanese business people showed up for a meeting on treaty visas where we tried to explain the qualifications. Got a lot of press.

I was on the train with my children, who were going to school, going to the consulate one morning and I said something to my daughter about leaving Japan. This man who was standing next to me hanging on to a strap got off the train with me and said, "When are you leaving?" I looked at him surprised, not knowing who he was. He said, "You are the American consul?" I said, "Yes, I am." He said, "When are you leaving?" I said that I didn't know when. Later I heard through the community that there was a buzz going on about the consul leaving and maybe there

wouldn't be any trouble anymore about getting treaty visas.

When I got back to the States there was a conference on treaty visas which one of the immigration associations had arranged. Again it was held in a large room and it was filled with almost entirely Japanese business people who were very much concerned about the treaty visa and wanting it very badly. I remember asking one of them why it was so important to have a treaty visa when they could just go over on a regular visa and do a little business if they wanted to. His answer was that in case of another war they wanted to be covered by a treaty. I found this quite interesting that they would worry about the possibility of another war with the United States. In some ways it is a very difficult culture to figure out and quite, quite challenging. There was quite a bit of trickery going on among the companies trying to get the visas.

Q: Were they also staffing their offices abroad with Japanese because they were easier to work with?

HOBBS: Yes, top to bottom, because it is easier to work with someone in your own culture and the communication is better with native speakers. But, they were comfortable not only with having Japanese native speaking managers but felt more comfortable, I guess, with having the entire staff of their own nationals and just manufacture as much as possible and sell it to the Americans. It was working quite well until we started to look into it a little more carefully.

Q: Did you have any problems with the embassy, because this was causing a stir within Japan?

HOBBS: Yes, it got front page news. It even made it into the *New York Times*, the fact that there was a bit of controversy in Japan over treaty visas and the embassy was uncomfortable with it. The DCM told me once that as long as you didn't get in the papers you were okay but once you did you were in trouble. He was quite uncomfortable with the situation.

Q: Who was the DCM?

HOBBS: Bill Clark. And, it was true of course, it is nice not to get into the newspaper. It was the one problem we really had and we still haven't sorted it out. The Japanese were working very hard to promote their own exports, which was fine, but their markets were quite closed then. From my personal experience I could see how difficult it was. For example, one man there who was a commercial officer who spent most of his career in Japan, made it his personal crusade to get Louisville slugger baseball bats approved for use in Japan. They didn't meet Japanese standards so couldn't be imported to Japan, yet they were shipping bats by the tons to the United States. This man spent five years of his career beating on this one issue until in fact we wore them down and Louisville bats were approved for sale in Japan, but no one bought them. The distributor would not order them. So, it is an example of it not always being the obvious trade barriers that make it difficult for us to sell in that market, but the sort of non-tariff barriers, the cultural proclivity to support one's own. I know Japanese businessmen who would tell me how embarrassed they were that there was an American computer in their office and not a Japanese one.

Our victory in the baseball bats was not much of a victory. There was a kind of little struggle we

went through constantly.

There is a great reputation that the Japanese have for being above board and very honest in their dealings with people, and that is basically true. But, I remember once Mitsubishi Ship Yards was trying to send an engineer of some sort over to Norfolk, Virginia to work on a broken down ship that they had built for an American company. The American consul looked it up and told them if the person has special expertise that is not available in the United States then he comes in on a B1 visa instead of a temporary worker visa in this emergency situation. Mitsubishi was told to get a statement from the Norfolk ship yards that this is an emergency situation and there is no American technician to deal with this ship problem. The next morning we had a telegram that was supposedly from Norfolk but was obviously written by a Japanese. We were pretty sure it had come from the Mitsubishi Ship Yards in Kobe. I called over there and asked them point blank from which office the telegram had come. They finally connected me to the office realizing they had been caught red handed.

The Sony Corporation wanted to open a factory in Mexico on the border under that program we had for *Free zone*. Mkiadori business they call it. A tariff free zone. Things that are brought into Mexico to have value added to them can be shipped back to the United States without any tariff. So, Sony decided to open a factory in Mexico to make televisions for sale in the United States. They asked for treaty visas to live in the United States. I said, "Well, since your factory is in Mexico, you should be getting a visa from Mexico to live in Mexico to run your company. You don't have a business in the United States." They didn't want to accept that, so I told them I would send an advisory opinion to Washington to see if it was okay to run an office in Mexico but live in the United States. The answer came back after a month or two that if they ran an office in the United States they could have a treaty visa for the United States, but otherwise they had to get a visa from Mexico. So, I called the Sony people to come talk about it and they came with their attorney. I told them Washington's response and they conferred among themselves a bit and finally turned to me and said they wanted to see the cable that I had sent requesting an opinion. I showed it to them. They read it carefully. Then one said to another, "It looks like he is telling us the truth, so we will have to go along with the decision." They were very adversarial.

Another example of the cultural differences that made it so incredibly challenging. I got a call one day from Washington wanting to know what in the devil I was doing to make trouble for a tooth company that was trying to get some people in to open a factory in Arkansas. Senator Bumpers was very upset. I had never heard of this and said I would check into it. I called the company, which supposedly we were giving trouble to, to ask them if they had applied for visas and if so, when, who applied and what happened. They knew nothing about it but called me back a little later and said they actually hadn't applied yet. I asked them to explain why there was a problem in Washington. They said they would get back to me. They called me back in a day or so and said they had figured it out. What happened was they had a lobbyist in Washington, a Japanese citizen who had been living in the United States for many years, who had met Senator Bumpers and had talked about this great thing the company was planning to do and had made some comment about hoping there wouldn't be any problems with the visa. The Senator must have misunderstood and assumed that they said there was a problem and that was how it all got started. I told them to send over their applications and they would be taken care of. They came over, visas were issued and everyone went away happy.

When the company opened its operations in Arkansas a delegation came out from Arkansas to thank them for the big investment and I was invited to the big party, which was held in a very nice estate outside of Kobe. It was amazing fun. As I walked in everybody I saw from that company was bowing as far as they could bow and apologizing to me for all the trouble they had caused the honorable consul. I caught on that somebody at the top had ordered that everybody should grovel to this consul because he had been hassled for no reason. At one point I was talking to the president and the vice president of the company and I told them it was okay, they didn't have to be so upset, I wasn't really upset about it. Mistakes happen. Then the vice president turned to me and said, "But, you know, you have to understand how this happened. The lobbyist in Washington has been in the United States too long and acts like an American." I said, "I think that was an apology, thank you very much." Japan was quite an interesting place to work.

Q: During this 1978-81 period, did you get any feel for the politics of Japan, particularly in Japan-American relations?

HOBBS: The Japanese were beginning to feel that they had been a little too long under the tutelage of the Americans, I think, and were trying to be a little more on their own. They didn't like to have a very high profile on any political issues in the world, but they also seemed to resent more and more assumptions Americans would make about where they would stand on issues and what approaches they would take. I had one man who had been living there for about 40 years who was part Japanese and part American. He had a ship chandler's service in Kobe harbor for many years. He had been watching how Japan had been progressing for years. He spoke good Japanese. He said he saw definite generational change. Those who were born after the occupation and had become adults and had no recollection or remembrance of anything the Americans had done at that time to be of assistance to Japan in a very difficult time, had a very different attitude towards Americans. He called it an arrogance. Perhaps there was a little of that for a while, but it probably dissipated a lot after the late eighties when the economic bubble burst taking some wind out of their sails. I haven't been back to Japan since then, so I don't know.

One incident happened while I was there which was very unfortunate. The Americans were having some military exercises off Japan where submarines were trying to evade aircraft which were trying to spot submarines. In this little game they were playing, one of them surfaced and came right up underneath a Japanese fishing ship. The ship was badly damaged. The submarine waited a little bit above the water, appeared to be checking out what was going on with the ship as it was sinking, and then submerged and went away. Two people, the captain and one other person, died and many others were plucked out of the sea having been pretty well exposed to the cold water and pretty upset. I had to conduct the hearings in Japan to try to determine the reason for this action. There was a terrible uproar about this incident. A lot of anti-American sentiment being expressed for a few days, and then it all went away again. But, they were very upset that this American warship had killed somebody.

Q: Well, it really does sound like bad judgment on the part of a naval commander.

HOBBS: That was exactly what was determined in the end. I had to take the statements of the

Japanese members for the navy. Then the navy took the statements and included them in a broader hearing that took place, I think, in Tokyo. In the end the captain was found not to have acted properly. Once it was obvious the ship was sinking, he should have abandoned the game and rescued them. That decision helped, but there was still the question of paying damages to the families of the dead captain and crew member. The head of the US navy in Japan personally went to the home of the captain's wife and apologized, as did Ambassador Mansfield. Those kind of things help a little bit.

Q: Did you get any feel for Ambassador Mansfield and how he worked in Japan?

HOBBS: I was there his first couple of years. He was very well received. He didn't speak Japanese, although had some history background in Asian affairs and knew something about Asia. He had been in the Senate all those years and obviously was a very prominent American, and that helps in Japan a lot. They like to have somebody who has a high profile in the United States assigned to Japan. It doesn't matter to them whether he is truly a diplomat or not. So, Mansfield had great entree, was highly revered and his words meant a great deal to the Japanese. They paid a lot of attention to him. So, I thought he was doing a very, very good job.

MARILYN A. MEYERS
Japan Desk Officer (Economic)
Washington, DC (1978-1980)

Japanese Language Training
Yokohama (1980-1981)

Principal Officer
Fukuoka (1981-1983)

Ms. Meyers was born in Virginia and obtained degrees from Southwestern University and Johns Hopkins School of Advanced International Studies. A Japanese and Burmese language officer, she served tours in Tokyo, Yokohama and Fukuoka in Japan and as Principal Officer (Chargé d'Affaires) in Rangoon. Other assignments include Johannesburg, Canberra and Washington, where she dealt primarily with economic matters. Ms. Meyers was interviewed by Thomas Dunnigan in 2005.

Q: You were brought back to the Japanese desk.

MEYERS: Oh, yes. Which I asked for.

Q: And there you were again doing economic work. How many of you were handling economics?

MEYERS: There were two of us. Two out of six officers.

Q: What problems were you faced with there?

MEYERS: One of the major things that I was working on was energy, a continuing problem. We'd been through a second oil crisis by the late Seventies. We were trying to work with the Japanese to develop and fund research on alternative sources of energy. And there was a sense that the Japanese owed this to us because they were running such huge surpluses in trade. So let's take a bit of that money and plow it back into development of alternative fuels. I coordinated those efforts with our own Energy Department and the Japanese Embassy, of course, working back to Tokyo. I can't think of any specific problems in this area. I guess the major surprise of my tenure was Secretary Vance's resignation over the botched hostage rescue attempt in Iran. I heard it first when a Japanese reporter I knew called, seeking my reaction. And I said "What?" And he said "Yes, I'm over here at the White House and they're handing us Xerox copies of the Secretary's resignation letter. And I said "Well, Imai-san, I know nothing about it and furthermore I have nothing to say about it." And then hung up the phone and shouted, "Does anybody know that Secretary Vance has resigned?"

Q: Were we trying to get the Japanese to assume more international responsibility? Remember, we said "You're now big boys and you ought to do more?" Or did that come within your portfolio?

MEYERS: We were beginning to push the Japanese to do more in international aid and assistance. By the time I got back to Tokyo years later we were holding formal discussions to better coordinate our aid programs.

Q: Did you have to deal much with criticism of the Japanese from American sources, from the Congress or anything?

MEYERS: No, answering occasional letters. Maybe later on, but not for the two years in Washington.

Q: Well, after two interesting years on the Japan desk you went to Yokohama. That was for language training, I gather.

MEYERS: That was for language training. Actually, I had made up my mind as I left Tokyo in 1978 to come back to the Japan desk. The only way I could drag myself onto the plane at Narita was to say "Okay, you're going to go back. You're on the Japan desk; that's great. And you're going to start working on getting back to Yokohama so you can finish the language training. Because, yes, you want to be a Japan hand." So, fortunately the assignment to Yokohama came through. I didn't want the full course back in '75. I wanted the one year so I could come to the Embassy, work, and see if I really wanted to be in Japan as much as I thought I did. And I found I did want to make it my specialty. So, yes, I got back to Yokohama and had a very good study year there. Because, first of all, the teachers just knocked themselves out, the Japanese language instructors. And the classes were small. I mean, two of you and the instructor sitting there; there was no escape. There was nowhere to run and there was nowhere to hide. So it was pretty intensive but therefore very good. And that's where we really got into the reading, as well as the speaking. Reading selected newspaper articles and listening to radio news and television until

you understood what they were talking about. Embassy Tokyo also offered supplemental language courses. But Yokohama was fulltime and I achieved a 3+,3 rating. I could always talk better than I could read.

Q: Well, at the end of that you were sent to Fukuoka, where you expected to go for your first tour.

MEYERS: Yes, I was very happy to go. Because I'd worked hard on my Japanese in Yokohama and I knew if I went to Fukuoka, it would stay the same or maybe even improve – since I would use it more -- and I wouldn't slip backwards, which is what I feared would happen in Tokyo.

Q: And you were in charge of the Consulate? How large was the post?

MEYERS: Well, if you counted everyone – Americans and Japanese -- maybe twenty five, thirty. Not many Americans – only four. The Admin was run by a Japanese, the admin section. We had one American heading up the consular, one American heading up econ/commercial and a branch public affairs officer (BPAO) and myself. The Japanese staff totaled about twenty, twenty three or so. And a wonderful, tight knit, cooperative bunch. I mean they were just super.

Q: What were your problems you faced?

MEYERS: I guess the major issue that came up had to do with our political/military relationship. I had two U.S. military bases within my consular district. One was the Iwakuni Marine air base on the main island of Honshu and the other was the Sasebo naval base over in Nagasaki prefecture. The U.S. carrier *Enterprise* and its battle group were planning a port call to Sasebo. And it was the first in years because the last time the *Enterprise* came, we were still in Vietnam and huge anti-Vietnam demonstrations occurred in Sasebo. The sailors came ashore but they were never allowed off the base because it wasn't safe. There were actually a couple of Japanese killed in the demonstrations. So there was a lot of tension. Everyone thought all would probably be fine; Vietnam's long past. We had also developed a much more cooperative military relationship over the years. I went from the Consulate to report on the visit as did the pol/mil officer from Embassy Tokyo. All went quite well. That visit, was one highlight of my tour.

Q: And Nagasaki was in your district, as you mentioned, apparently. Any residual feeling there about Americans?

MEYERS: Little. August 9th is still remembered each year. And there were a few hardcore demonstrators, Communists and so on. One other event I recall about Kyushu as being really memorable was a visit by a Congressional delegation (CODEL) from the House Subcommittee on Ways and Means. It was led by Sam Gibbons from Florida, who was a prince of a man. Anyway, his CODEL of Republicans and Democrats, and wives and staffers, outnumbered the Consulate staff almost two to one. And at first I thought "How are we ever going to handle this?" But we did. Almost every member of the subcommittee would go to Tokyo each year for trade discussions to emphasize the importance of trade being a two way street. And each year the CODEL would also make a study tour outside Tokyo. So they came to Kyushu when I was there. We arranged a very busy schedule. They toured a Nissan plant in eastern Kyushu and a

semiconductor facility operated by Texas Instruments. We traveled a fair amount through the countryside. I remember one day being on a bus driving from somewhere to somewhere. Two members were talking and looking at the rugged Kyushu hills and remarked, "Good thing we didn't have to come ashore here back in '45. This would have been rough going." All in all their visit went extremely well. They worked hard but they also had a good time.

ULRICH A. STRAUS
Consul General
Okinawa (1978-1982)

Ulrich A. Straus was born in Germany in 1926 and, after some time in Japan, his parents settled in the United States. He served in the U.S. Army and attended the University of Michigan. Mr. Straus joined the Foreign Service in 1957 and served in Japan, Germany, and Washington, DC. He was interviewed by Charles Stuart Kennedy in 1992.

STRAUS: A job in Okinawa opened up.

Q: *This was 1978-82.*

STRAUS: Right.

Q: *I assumed you jumped at this chance?*

STRAUS: I did.

Q: *The position was...*

STRAUS: As Consul General. This was six years after reversion and Okinawa by that time was a regular part of Japan. The thing that makes Okinawa unusual and why we have a consulate there in the first place is the fact that we have somewhere between two-thirds and three-quarters of our total military forces in Japan on Okinawa. The time that I was there that meant about 50,000 Americans, including dependents, which translates to five percent of the population.

Q: *It is not a heavily populated island then.*

STRAUS: Well, a million people. Part of the area is jungle. Of course, the potential of problems are manifold. On my way to Japan I stopped off in Tokyo and had a memorable first encounter with Ambassador Mansfield. He was so gracious. He asked me if I wanted a cup of coffee, and I said, "yes." He goes out into the little vestibule next to his office and makes the coffee. I also, of course, talked to Bill Sherman, an old friend, who was DCM at the time. Bill in effect told me to do my thing down there. He didn't want to hear from me. We don't want any of the problems in Okinawa to escalate into US-Japan issues. And I think I was successful to the extent that during my time there I think I succeeded in doing that.

I think that having good luck is an essential part of effective diplomacy. And I was very fortunate. I was fortunate in the type of military officers I dealt with for the most part on Okinawa. I was also most fortunate in the Okinawan authorities that I dealt with. Within a couple of weeks of my arrival in Okinawa, the Governor of Okinawa, who was a member of the left, was stricken by a stroke, which forced him out of office within two or three months, and led to his untimely death. He was succeeded by the candidate of the Liberal Democratic Party, the center right in Japan, and he took a much more cooperative view of the American military presence in Japan than his predecessor had. It was a period of conservative resurgence. It was believed by the Okinawans that it was the left wing that had set the stage and effected the reversion of Okinawa. But now that they were part of Japan, it was more beneficial to have a member of the same party that was running the rest of Japan as governor. But it wasn't just the governor, it was a lot of other local jobs that went to the conservative party.

As I said, I found the military, particularly some of the Marines...in Okinawa it should be noted that there was a rather unusual situation. It is the only place abroad where it is the Marines that are the dominant military force. So the senior military commander was a Marine. You have about seven or eight general Marine officers. The next largest force is the Air Force, because of the huge Kadena Airfield there. Then the Army and Naval are minuscule, which is rather strange.

I guess my job was really to keep the peace. I had generally pretty good cooperation from the military. I never had to go up to Tokyo to ask them for anything. I had very good relations with the Japanese government authorities, as well as with the Okinawa authorities. We got constant harping in the Okinawan press, which plays a major role in Okinawa. We had frequent protest groups that came to the Consulate. We encouraged them to come to us rather than to the military because we felt we could probably deal with them better than the military could. We were fortunate that there were no really major incidents. I'm glad to say that during my time there was no murder on the part of our troops. All the really nasty stuff the military do in Japan really goes on in Okinawa. The nasty stuff involves live fire exercises which the Marines have to do to practice. Your typical Marine is a 19-year-old. The Air Force is very different. It is generally a 35 year old married mechanic who is the typical Air Force guy. If anybody is going to get in trouble off base it is generally a Marine. But most of the problems were not that type. There were ricocheting bullets, which hit a rock and would fly out of the maneuver area. Then there were accidents involving the Air Force like fuel spills and that sort of thing. Then the Air Force also, of course, were very noisy. They had these U2 type aircraft.

Q: These were high flying photograph type planes.

STRAUS: Yes, remarkable things. They had the most modern fighter jets at Kadena Airfield, one of the largest military bases in the world. Active 24 hours around the clock.

I used to tell the Marines and Air Force when they would complain about lack of Japanese cooperation, "What do you think an American mayor or governor would do in similar circumstances?" They were generally understanding. Particularly the Marines. Perhaps they lived close to the ground and had a particular understanding for the political problems. I also had that feeling with the Army, a much smaller group.

So it was a very interesting experience for me. There was nothing like running your own post. I did a lot of reporting on incidents and I think the way I reported them had an effect on perhaps decreasing the number of these incidents, making sure the military took all reasonable precautions.

Q: Did you work with the military to get them to adjust their operations to avoid problems?

STRAUS: Yes, exactly.

Q: It wasn't, "Well, get the damn civilians out of the way that is their problem"?

STRAUS: No, no. As I said, I found them generally quite accommodating and it was always a matter of individuals. You can't expect all of them to be that way. I think if they felt that you understood their problem ... When I got there in 1978, their problem in part was that the average Marine was a guy who was perhaps out of reform school who decided it would be better to go into the Marines then anywhere else at this point in his life. Many of them didn't have a high school diploma. By the time I left in 1982, that had changed. The quality of the people they were getting was much better. But we were still in the post-Vietnam period when I arrived. I had sympathy for them and I expressed that. I thought they were doing a remarkable job really of educating these young men and women.

I counted this as some of the happiest time I spent. I wasn't overworked, but on the other hand I had plenty to do and I thought I was very usefully employed.

Q: How did you find the Okinawans? They had now adjusted to being part of Japan, but did you find they were a breed apart and would sort of use you to find out what was happening on the mainland?

STRAUS: No not that, but I had the feeling that there were three actors, three players in Okinawa, whereas in Japan you only had two. You had the Okinawans who were sort of the landlords, the Japanese who were the treasurers, and then there was us. And any two were sort of playing off against the third and often badmouthing the third. But I think it was a well-understood game. And, as I said, largely thanks to the kindness and understanding of the Governor, who I thought was a very shrewd and effective politician and was there almost the entire time I was there, things suddenly worked a lot better in Okinawa and I was able to take the credit for it.

Q: What was your feeling about the Japanese officials or others who were down there?

STRAUS: Well, I think the Japanese were usually more sensitive to the situation in Okinawa than they are usually given credit for. The Okinawans, while they were under the Americans had a great deal of independence, and now they were just another prefecture. Not only that, they were a prefecture that was historically the poorest of the lot. In a sense they didn't like that. They liked to be more important. So they screamed and did a lot of yelling which resulted in the Japanese pouring a lot of money down there.

There were a lot of guilt feelings involved on the part of the Japanese because, of course, the only land battles fought on Japanese soil was in Okinawa. They were told that was necessary in order to defend the homeland. Well, it turned out the homeland then decided to throw in the sponge. The whole thing is, of course, an irony. Everybody, of course, knows about Hiroshima and Nagasaki, but the prefecture that took the heaviest hits in World War II, was none of those two, it was Okinawa. A quarter of the population of the prefecture died. No place in the world had that kind of catastrophe. It was staggering. Historically they had been very pacifist. Then the irony is that they now host the largest concentration of American forces in Japan. So the Okinawan feeling is that you Japanese are getting the benefits of the American presence, but we have the Americans, thank you very much! So the Japanese say, "Yeah, but look what we are doing. We are subsidizing this and that." And they are doing that. And they were careful, at least during the period I was there, to restrain their business and not rush pell-mell down there and drive out less efficient Okinawan businesses. So there were no Japanese banks down there or department stores or construction companies. Okinawa really has no industry as such. Whether this has changed in the meantime, I don't know. But at that time I thought they showed commendable restraint and sensitivity. At the same time that they still tended to look down on the Okinawans as being under-educated, under-disciplined. Okinawans tend to be sort of southern people...a little slow, more relaxed...and that is not the Japanese. There is a difference.

But we appreciated the Okinawan culture. It is a different culture and it is remarkable what that little group of islands accomplished in history.

KENNETH YATES
Policy Officer
Tokyo (1978-1982)

Kenneth Yates was born in Connecticut in 1940. He served overseas in the U.S. Army from 1969-1962 and received a BA from the University of Pennsylvania in 1967. After entering USIA in 1967, he was posted abroad in Seoul, Kabul, Tokyo, Reykjavik and Beijing. Mr. Yates was interviewed by Charles Stuart Kennedy in 1997.

Q: Let's move to Japan where you were from 1978-82. What was your job there?

YATES: In Japan I was Policy Officer.

Q: What does that mean?

YATES: I was charged with overseeing the theory and operation of the Japan program. At the time, Japan had five branches—Sapporo, Nagoya, Osaka, Fukuoka—and Tokyo. My job was the Country Plan; I made the initial draft of it each year. I handled all the public opinion and other research done by the post and also handled the growing use of computers. In Japan at the time, we were just getting into the computer age. While I was there, I installed a WANG VS-100

computer; it was state-of-the-art at that time. Because space in the Tokyo embassy was at a high premium, we had to locate the major works of the computer, the central processor and the large disk drives, in a converted closet along one hallway. At the time, the hard disks each occupied a device of its own and had interchangeable disk packs with a stack of “platters,” each about a foot and a half in diameter and stacked about eight high like pancakes. It was not as powerful as a main frame of the time, but it was not too much different. It was a serious computer and permitted a large number of terminals.

In Tokyo, USIA was going to be the “lead agency,” as it was termed, for all computers for the different sections in the embassy. The chief reason for that arrangement was that USIS had the initial interest and me, who had some experience in computers. So we got the original assignment to provide services for all. The Wang VS-100 we installed was to provide such service for the entire mission. The embassy was a ten story building in downtown Tokyo with about 20 different U.S. government agencies, such as the FBI, IRS, State, Defense, USIA, etc. All of us were going to work on the same computer. That was at least the theory in the beginning. So I wired the whole building, including communications.

After we got this thing running, I thought it would be a good idea if we could hook up with communications directly and thus be able to send cables from my desk as it were. I was told that could not be done. “Why?” was my question. “Because we have a classified system.” The classified system was housed on the top floor of the embassy and was inside a vault like installation to provide maximum security. All that was needed was to connect my VS-100 through the wall of the vault and I could then fully wire communications for the embassy. Such an arrangement ran into difficulty, however, for I was told, “no, you can’t connect a black line to a red box.” The red box is classified and the black line, unclassified. I argued that it should work fine and that, technically, there was no problem at all. We would only use an unclassified circuit, we would have unclassified control, and there shouldn’t be any problem. “No, it is technically not possible,” came the response. I thought that was funny, because we used to have a thing called USINFO, an unclassified channel that used old teletype equipment in USIA. That system was stand-alone, but we were able to receive messages in the normal telegraphic traffic. It was mixed in with all the classified traffic.

USINFO was the original USIA network which was devoted to press materials, post advisories, and other unclassified items. It was slow but serviceable, a sort of bridge between the real “wireless” file that used to be broadcast from VOA relay stations around the world and the later computer-to-computer transmission that is now used. USIA posts around the world still used USINFO to receive longer messages such as press stories, long articles for placement or translation, and the usual internal messages such as transfers, admin messages, and the like. USINFO was handy to keep bulkier traffic away from the usual telegraphic channels.

We used to get USINFO messages regularly, and a dependable flow was important. Many posts without alternate technical means would receive USINFO traffic via the usual telegraphic channel. Knowing that was possible, I stood my ground and maintained that the “red” and “black” channels could coexist. I said, “You CAN connect a classified network with an unclassified one, and I can demonstrate that to you.” The communications technicians were adamant, “No, you can’t. That is completely out of the question.” Asking them to just wait a bit,

I said I would send a message to myself now and come back to the 10th floor to pick it up. They thought I was crazy.

I then went downstairs to the basement where we had a USINFO terminal and punched in a message to myself. Since our traffic contained a large number of USINFO messages in the telegraphic flow, it was easy to pick up an example with the appropriate addresses. After I had completed my keyboard work at the aging terminal, I returned to the 10th floor and asked for my message. Humoring me, they checked the received traffic, and sure enough, there was an unclassified message amid the classified incoming. I now had demonstrated proof of the mixing of the "red" and the "black." Once more, I asked that the connection between my computer and the communications panel be made, so that I might enable telegraphic transmission and receipt directly from each desk.

While surprised, the communications people refused to budge but were curious about how such an unbelievable mixing was possible. The story was a bit convoluted but simple. The USINFO terminal is in the basement of the embassy. The connecting line was an old U.S. Army 75 baud circuit which ran to the old Sanno Hotel down the street. The Sanno Hotel was a U.S. military R&R facility and it, in turn, was connected to Camp Zama. Of course, from Camp Zama via Hawaii, communications were connected to the Pentagon which maintained a bridge to the State Department's communication system, and - voila - all the U.S. embassies around the world including Tokyo. That is how the simple typed message I sent from the basement arrived instantly on the 10th floor.

Q: Camp Zama was the American army headquarters in Japan.

YATES: Right. We later found that if we could get an address in the large worldwide cable system, we would be able to use that simple USINFO terminal as the basis for connections world-wide. That would permit me to connect my computer on the second floor of the embassy with the worldwide cable system. I discovered that the Department of Agriculture had an extra address it was not using and I could get it. Yet I ran afoul of a technicality, because the speed of the USINFO line was too slow at 75 baud to be able to match up with the rest of the network. The minimum speed to be acceptable on the network was 300 baud, and the U.S. Army would have to upgrade its circuit to the embassy from 75 baud to 300 baud. This involved the purchase of a \$200 modem. They were not willing to do this for our benefit since such older lines were being phased out wherever possible. I was never able to get the connection.

In reality, the Department of State really did not want to see such direct communication enabled, because someone would be able to sit at his desk and send messages directly by computer, transmitting them to any embassy in the world over the State Department network. While the whole e-mail system was technically feasible at that time, the problem was internal controls. Who would see what I said? Who would clear what I had to say? This promising project floundered. The technical people rejected it in the beginning, saying it wasn't possible. When I showed them that it could be done, they got very bureaucratic about it, and the promise of convenient and instantaneous communications, the stuff of e-mail today, never had a chance. I thought this was too bad, because I thought at that time we could really do something interesting in an unclassified environment which would allow us communication with our other posts all

around the world. This was in 1978.

Q: I was just across the pond in Korea about this time, and we were just experimenting with a WANG computer there. It was pretty primitive.

YATES: That time was very interesting. One of the other things I had to do, because of my computer connection, was oversight responsibility for our mail system, addressing, which in USIA is called “DRS,” the Distribution Record System. I had control of that in Tokyo. One of the problems with our DRS was addressing. In Tokyo, we had to use Chinese characters (Kanji) that are commonly used in Japanese addresses, particularly for names. People would use the phonetic syllabary, “kana” in combination with Kanji for everyday Japanese text, but because of the large number of homonyms in the Japanese language, the kana system is used primarily for inflections on verbs and simple connectives. For such things as names and addresses, you need Kanji, which are based on ideograms, and therefore carries a much more complex meaning than the kana. At that time, Kanji-based language was beyond the relatively simple machinery of the Wang VS-100, at least in addressing programs, and therefore made it necessary to contract our address system out. We had no Kanji printing capability in the embassy itself. I discovered, though, that computers were starting to come into their own, and there were some programs available back in the U.S. that might be able to handle our printing needs from there.

In particular, I found a connection to a GE node in Beltsville, Maryland that was being operated by the Japanese advertising firm, Dentsu, and they had a multiplexed connection to Tokyo working 24 hours a day. What we would have been able to do was to dial up a local number in Tokyo and get access to the GE computer in Maryland. This would have been much like the Internet operates today. In turn, they would connect us with our USIA headquarters here in Washington, and we would be able to exchange data plus use the large variety of programs that were online in Beltsville. They had a Kanji printing program that Dentsu was already using.

The basis of my concept was to do the processing in Beltsville and then, download a print file to us in Tokyo where our address labels would be produced. The advantage of this was economic, since the Japanese contractor was rather expensive and through this process we would have full control in the embassy in Tokyo. International computer connections were a relatively new phenomena, and the Dentsu network was not being used that much. The whole process promised to be a lot cheaper than the contracted services then in use, and we would have the added benefit of all of the software that was otherwise not available to us in Tokyo. As it turned out, we ran into all kinds of problems.

This seems silly now, in light of the vast amount of personal data that is available on the Internet, but at the time, we were worried about transborder flow of information on individuals. We had a name list that, at the time, included what we were sending them, when those materials were sent, plus a record of when a given person attended a program with us. This enabled us to maintain contact with our audience and have a better grasp about our effectiveness. The target audience in Japan, at the time, was broken down into different pieces. At the center, was a small group of about 300 whom we spent a lot of time working with. These were key people in the media, economic institutions, and the government that we wanted to talk with about U.S. policy or simply to mail background material to them.

Beyond that, we had a much larger group of individuals that we would invite to programs and send materials to but would not devote much personalized time to. These included junior professors, younger reporters, people who were coming up but had not yet arrived. They were not members of our “core audience” but were important to us, nonetheless, and certainly were a part of the audience we had to maintain contact with. So we included them on name and address lists. Altogether, we had about 15,000 in the data base for those sorts of individuals throughout Japan.

The operation of the DRS systems always was a controversial topic. Our local staff members helped but were sometimes suspicious, believing that we probably were feeding data collected about individuals back to Washington where it would be used in intelligence or other conspiratorial needs. Of course, nothing of the sort was done, but the more efficient the system and the more productive it was for guidance, the higher the level of local suspicion and anxiety. Some felt uncomfortable with the possibility that personal data on Japanese was possibly being passed outside the country. For most, it was generally all right to keep such information in Tokyo where our local employees had their hands on most of the processes. Efficiencies, such as those offered by the Dentsu arrangement, were understood, but the discomfort was palpable. Technically, it was feasible, and essentially, we had it all set up. All we had to do was sign the contracts to implement a system which, in a limited fashion, would have looked like the Internet does today. Of course, few show much concern about trans-national flows of information today, but at that time, it was a serious problem.

Q: This time in Japan, 1978-82, from your polling what were your particular concerns? Whither the Japanese public vis-a-vis the United States?

YATES: That was an interesting question. There were a number of Japanese polls, the largest being the Jiji poll which had been done for many years. There is what’s called trend data available through the Jiji poll, because they have had the same kinds of questions asked over very many years.

Q: This is a Japanese firm?

YATES: Yes, it is. We would do contracts with the office of research, because I had been in the office of research before and my policy job in Tokyo included research responsibilities. On occasion, I would contract for questions in Japanese polls. For example, “What do you think of the American policy?” “What do you think about the US-Japan-Security Treaty?” The interesting thing was that we could take the results of these published polls and with the new Wang computer, do some reprocessing for results that were important to us. Most important was trend data, looking at similar questions over a longer period of time. The Jiji poll was particularly useful. Mainichi Shimbun and the Yomiuri Shimbun ran similar polls, as did most major Japanese news organizations.

In the aggregate, the poll data on US-Japan relations over the years revealed the basic trends in Japanese thinking on the relations between the two countries. By analyzing data using a technique called regression analysis, you can condense a variety of information into a single

graphic representation and reduce uncontrollable variation to reveal the fundamental change in the data over time.

A good example of this was Japanese impressions of America and its relations with the power that had defeated it in the Second World War. For some data, if you looked at it in the short period, you found dramatic rises and falls. This related directly to the events of the day and the nature of the newspaper headlines at the time of the poll. However, if the same data were combined with that from other polls and the data were examined over a longer period of time through the technique of regression, then in a period of about 10 or 15 years, you found a gradual increase in the favorable attitude of the general population. There was a lot of press commentary saying Japanese-American relations were going down the tube or was at one extreme or another. The revealed truth in longer period analysis was that the Japanese view of America was fairly stable and positive.

Yet every time there was an incident, such as when a U.S. submarine hit a Japanese trawler, our poll numbers went down sharply. That was in reaction to individual events. When you plotted significant international events in Japanese-American relations, you found they very closely correlated with the mood swings of the Japanese public. But if you did a regression analysis over a longer period of time, it turns out there wasn't much change at all. That was an interesting lesson for those who watch polls here in this country, the famous one being the Dewey/Truman election. They looked at the spikes and didn't look at the trends.

Q: Did you find yourself almost odd man out? Here you were playing with computers in an era when they were just beginning.

YATES: In USIA, computers for some were bad words, as it was throughout the government. I think USIA probably was more receptive to most of this new stuff. Yet for an ambitious Foreign Service Officer, a connection with computers probably had a negative effect on his career. While I believe that the effect of using computers to assist in communication programs had an enormous impact over the years, I don't think I got much credit for it. It was considered out of the mainstream of what a traditional Foreign Service Officer was concerned with. So I tended to get odd jobs. I built the first audience record system in Korea that was based on computer principles. That was in 1968, when I first entered the Foreign Service. I had previously had a lot of computer experience while working my way through university, so the development was a natural one.

Q: At the bank?

YATES: Yes. So I had a base of operational knowledge to work from. When I arrived in Korea, they were struggling with organizing data about the audience and programs. Every officer would have a Rolodex on his desk or at least a business card file, and it was on that basis that contacts were developed and managed. The Deputy PAO at the time was Mort Smith, and he had within his responsibilities managing this audience. I suggested we do something with punched cards. We didn't have a computer and could not afford one - but punched cards were available. I told them we could do a "key sort" system, which is based on very primitive physical computer principles.

I drew up plans for a key sort device on a piece of paper and got a local vendor - literally on the street - to build it out of wood. It involved a box into which we put cards which rested on a trap door on the bottom. Also on the street, we located an umbrella repair man and bought umbrella staves from him. We used these as the needles for the key sort system and designed a card that had holes around all the sides. We got a company to drill the cards. You put the person's name and something about them, what kind of audience, academic, government, media, etc.. We coded the area, their interests, etc. We would then use a mechanical punch to cut through from the drilled hole to the edge of the card. Each card could then be coded with notches which opened the hole to the edge. If you put the pin-like staves through the holes pertaining to what you wanted to find out, those which had a punched out notch in the appropriate location would fall from the rest of the cards when the trap door was opened. This was a primitive card sorter. We then would put the selected cards in a mimeograph-based printing machine and printed the name and address onto a piece of paper which you could use to wrap materials to be sent to the audience. Then you put the cards back in the box. Next time you would pick a different group of holes.

Q: My recollection is of an outfit called Royal Mcbee...

YATES: That's right.

Q: It was a knitting needle system and I think it started in 1870. We used it in personnel in the mid-to-late sixties.

YATES: It was old at the time, but it was good enough to get us off the ground with a machine based system without any real cost. The interesting thing was, in order to make this work, we had to get the information and the names and addresses. That was quite a problem in USIS at the time, because people on the staff were not organized for information with that in mind. We had a Cultural Affairs Officer who was very distinguished and who had very warm and close contacts with some important members of the Korean audience. When the call went out from the Deputy PAO, Mort Smith's office, to give their names and addresses to me for my "machine," this particular Cultural Affairs Officer resisted the concept. He considered his contacts his own and was very reluctant to have them shared with anyone else.

There was a real row in the post about that. He was ordered to give his list to me, and it turned out after all the fuss, he had only about seven names. Whether it was out of indignation over the order to turn over his private set of contacts to the general staff or masking his embarrassment that he had so few genuine contacts, I never was sure, although I did suspect the latter.

The key sort system was a precursor which had become outdated, as you pointed out, and it did not last very long. There were physical problems. First off, there was the problem of transferring the addresses from the cards to paper. Sometimes, not all the cards would drop out; you really had to shake the box hard. The mimeo-based system was clumsy and new cards had to be re-done after only a few uses, because the chemical deposit on the surface of the card wore down to the point that it no longer gave an image adequate for the postal authorities to read.

I heard that the U.S. Army declared some card sorters surplus at Camp Zama in Japan. Under the U.S. procurement system, if any element of the federal system has equipment that is declared surplus, any government agency can lay claim to it before it is put up for sale. So we got the army to agree to give us a card sorter. We had to modify it, because Japan ran on an electric current of 100 volts and 50 Hz. That conversion accomplished, we brought it to the office. We then had to punch cards with a key punch which we got locally. We could then prepare standard IBM punch cards, and it then became a real system. We could process a much larger number of audience members and could sort cards quickly to meet desired criteria. One disadvantage to a key sort system is, you can select but you can't sort; you have to do it mechanically unless you do it through a series of selections and then it is all screwed up and you can't put it back in order again. The old IBM card system was much faster. We got it installed, and although it still used a mimeographic address transfer system to prepare selected address lists, it ran for many years after I left.

Q: Back to Japan. In policy planning, besides the more technical side which we have already discussed, were there any other aspects to your work?

YATES: I ran the research part, which was important, because we used the information we developed to govern the use of our resources. Even then in the late seventies, resources available to USIS were declining. There was a question of how many cuts we could take and where to focus our resources. We stepped back and took a look at the physical facilities we had in Japan. How could we best use these facilities to reach a maximum number of people with the greatest amount of information that was going to have the direct utility to them? Questions raised concerned personal contact versus direct mail, versus invitations, versus radio (such as the Voice of America), versus libraries.

The problem of libraries was one of the biggest questions. A book was quite a large investment, and you are never certain anyone is going to read it. However, you are fairly certain people will read direct mail and can often make an assessment based on direct feedback. So we had to make such relative decisions.

A controversial one was how many people could be effectively addressed with this multimillion dollar program in Japan? We did the math backwards. We went back to individual officers, asking how many hours a day an officer could spend with people, given the usual office mix of administration, meetings, and the other mechanics of operating in a large organization. Put in a different way, how many people within their assigned duties would they be able to know well? The level of personal intimacy was important. Could you possibly know something about a contact's kids or his wife, and be almost on a first name basis (which you don't do in Japan)? Could you be on a level of friendship with a person, so they would trust you when you went to them with something that was important, an issue they were concerned about? How many could you accommodate on that level? We looked at this really hard, did a lot of talking. We came up with a number, about 30 people that, on average, could be handled at the defined level of closeness. This would be 30 people they could really get to know, to be functional with.

If you multiply that 30 by the number of American officers we had in Tokyo, you came up to something like 300 people. That became a very problematic figure. The 30 individuals for each

program person thereby defined the “core group” in the DRS. For our bean counting critics, the charge might be, “You mean you are spending \$5 million a year (or whatever we were spending at the time) on 300 people?” This would be leveled by congressional staffers who looked at our program in Japan. “You can’t do that. You have this big operation and you are only talking to 300 people? That is outrageous.” On the other hand, if those were the right 300 people in Japan, it would be worth putting all of our resources onto them. But that, of course, is not the way people look at things in Washington. The earlier PPBS (Program Planning and Budgeting System) was tried in earnest, but was not in place so very long. Neither was “Zero-Based Budgeting.”

Real or imagined questions soon got out of hand for each of these systems. Some asked to assess the value of the operation, based on how many people saw your movie, or attended programs, or visited the library. Under PPBS, I remember during my time in Korea we would show movies to assembled audiences containing all sorts of people. For example, we might show three movies to 50 people in one sitting. What was our contact? The total reported under PPBS was 150, but I only had 50 people attending. The formula we were requested to apply asked for a count for each screening. One film shown to 50 people counted 50, but three films shown to 50 at one time counted 150. How this could quickly get out of hand seemed obvious, and there was no assessment of the quality of either the audience or of the impact those films had on their viewers.

Q: When the Carter administration came in, there was a great deal of emphasis on the zero-based budget, too. This was the buzz word of the time.

YATES: That’s right. This was not the first time and downsizing (although we didn’t have that word then) was very much alive in Japan in the late ‘70s. We were talking about cutting branches and reducing the budget by 15-20 percent. One of the things I had to do was to look at the program and make suggestions for where we might cut at various funding levels. If we got a 5 percent cut, where would the axe fall? If we got a 10 percent cut, what would be eliminated? Twenty percent cuts were unimaginable, but we were forced to consider the possibility. From one year to the next, we never knew what we were going to have in the next budget. It was a silly way to run a railroad, and much of the time spent in such sterile exercises would have been much better spent in developing contacts or better programs.

One of the most strongly attacked parts of the system was the libraries, because collections of books absorb an enormous amount of resources in staff, plant, and investment - you had to keep your libraries current. Technology was changing libraries a lot even then. Microfiche was a buzz word. It is probably gone now, replaced by computers, but at that time microfiche was a big fad in library science. So the question was, do we buy a lot of microfiche materials for our libraries? If so, how do we reduce our book collection in order to offset the cost of the new materials and the associated readers? We had a library in every one of our centers, absorbing about a third of our budget. The question was, were they paying off with a third of the return?

The simple answer was “no”. The complicated answer was “maybe”. The presence of the library in a community gave an institutional face to the whole operation. It would be difficult to justify in local terms having a government operative in their midst going to universities, if he is a propagandist passing out U.S. government brochures. But if he is the director of the library, that

is good, because that is passive and something people want to have, a resource for the community. Few wish to strike up close relations with someone whose only justification is to sell a point of view.

However, if you are the head of a library, a source for learning and students, you are accepted, even welcomed. So as cachet, a way of defining ourselves in the interest of the communities, the library is very valuable. But that is hard to convince somebody who runs a budget. The libraries cost x number of dollars. How many people use them? We had to keep statistics on how many people walked through the doors, but that didn't indicate what they read. Even those who came to our programs held in the library were counted. It was a real game. Unfortunately, at that time we were examining our navel on this one without looking at the larger questions and understanding them and being able to articulate them to those making the decisions in Washington. We just did the numbers and aggregated the numbers worldwide. Later, Charlie Wick's "billions of people watching TV in Europe on Worldnet," was the illogical result of what was supposed to be a scientific approach to the problem. The logic and its science were flawed and led to a flawed conclusion. Instead of looking at the context, they were looking at the volume and that wasn't very useful.

While I was in Japan, we did another thing with our new computer. One of my duties there was to help people apply new technology to make our traditional programs stronger. We knew the library system needed a shot in the arm. First, on our new WANG VS-100 we created an interlibrary loan system, so that all of our library holdings could be accounted for centrally. If someone in Fukuoka wanted something on a particular topic, foreign relations in the U.S. or the Korean war, he could ask the librarian in Fukuoka what was available here in Tokyo, as well as all the other branches in Japan. That meant we could reduce our holdings countrywide. Maybe Osaka would be a center for trade, Sapporo, the center for American history, etc. We could specialize our libraries, and we would then have to buy only one copy of a "must have" title. This would save us some money. I did that in COBOL at the time.

Q: COBOL being?

YATES: Common Business Oriented Language. That is the old fashioned stuff that has for the most part disappeared or has been transformed into the "C" or "C++" programming language and now has returned to being so much in vogue because we are trying to get the year 2000 (Y2K) problem straightened out. I programmed the new inter-library loan system with something like 5000 strings of code to provide reports and other data for the different branches. We would periodically update them.

At the same time, we had another problem with our libraries: to get people to use them. If you are going to survive in a period of cuts, you must keep attendance numbers up. We devised a direct mail "outreach" system, a way of making the target audience aware of what we had available. In the traditional approach, you make up a list of materials and send it out to your library patrons. That wasn't good enough, because we didn't have enough library patrons who were members of the all important "core group." That group was generally too occupied with business or government to have time to visit our libraries, so were not members.

Therefore, we created an outreach system where, instead of sending out a list on American history, for example, to all on the library patron list, we chose instead to approach only those we thought most interested in the subject. Our full country audience was about 15,000, but obviously, not all would be interested in American history. Maybe 50 or 100 at best. American History is a narrow field, particularly in Japan. On the other hand, we may have had 4000 in our target audience who would have a special interest in the discipline of economics.

Since our DRS was categorized by topical areas, we were able to ask the libraries to make up a list of recently received materials (no more than 15 or 20) in a certain subject area. They would decide what good materials they had in that area—new books, new magazines, etc. We then used our WANG VS-100 to find out how many people in our audience had an interest in the selected topic. Once we had a workable number of individuals to “target” for the selected materials, we would send the instructions to a contractor who, with the specially prepared form, would list the selected materials and mail the announcement to those names topically selected.

The recipient would then look over the listed materials, select up to an allowed four, and return a tear-off portion of the form to the nearest USIS branch for them to respond with the indicated items. The return reply form was postage paid and, once torn off from the listing, would fold up into a format that was acceptable to the Japanese mails. On the reverse side of the completed return form was the original mailing address, so the only part the recipient would have to complete would be the check-off blocks indicating which of the items he or she desired. Completing the form by the recipient was designed to be fairly quick and easy, so as to minimize the effort needed to complete the process. Within four or five days, they would get an envelope back with the ordered materials.

For example, suppose we wanted to do something on our trade imbalance with Japan. Once a topic was decided, within 14 days we would have completed an entire cycle, including the target group selection, addressing, mailing the outreach announcement, the response by the recipient, and the return of the ordered materials. Of course, once the topic and materials were selected and the contractor put to work to mail out the announcement, we would reproduce the listed materials in sufficient numbers to cover the anticipated response and send those copies out to the branches, depending on their proportion of the target audience. We were able to use drivers and other people who were not working on immediate tasks to receive the responses and assemble the orders.

Thus, the materials would get to the target audience in the shortest time possible. The assumption was that if we could respond in a rapid fashion, the person ordering the materials would still remember his or her request and therefore have a better chance of actually reading the materials than one to whom the materials were sent blindly.

We got an average response about 15 percent for each of our mailings and sometimes it was as high as 20-30 percent on economics. But that was very high. It meant that we were getting primary material that we had selected into the hands of people that we had selected. This is a fairly high average rate for unsolicited materials, but because we had carefully selected the target group as one which we knew to be particularly interested in the materials, our high success rate could be explained.

We did not bother people with materials they did not want. Ideally, each time the recipients found the outreach flyer in their mail, they would be conditioned to recognize it as something they would be interested in. If they were not interested in American history, they would not get anything on American history. If they were not interested in the environment, they would not have to read that. But if they were interested in economics, they got the economics material.

The whole outreach process revealed a couple of other things. It quickly showed that our libraries were not always up to speed in those areas with the highest priority in our country plan. The country plan now applied to the libraries. We were beginning to get the pieces of the program to fit together under this single outreach, or “alert,” as we called it in Japan. I don’t know if it is still running, but it did run for a good number of years. It was very easy to do. It didn’t involve very many people. It involved one librarian, at least, who would develop a list of materials. It involved writing up those materials in a summarized form, typing them into the computer, and sending them over to the contractor with the characteristics of the audience wanted; the contractor did everything else. They even mailed the alert.

A blank form, which was the frame for all “alerts,” was pre-printed and on hand with the contractor. Only the printing of the selected names and addresses and the special list of materials was necessary before it could go in the mail. Then, all we did was to reproduce all the materials and make sure the branches had enough, so that they could then distribute them directly to the audience when they mailed in their requests. The mail cycle of addressing and mailing gave us enough time to reproduce and distribute on the first cut. The stuffing of envelopes was done in each branch and mailed directly to the audience in its area. After the order was received, the clerk who stuffed the envelopes would separate the order form into two parts, that with the actual order and the part with the return address of the person who did the ordering. The original target’s address did double duty. It was used with spray-on adhesive to address the package of materials, so we could avoid the additional work needed to address the envelope to the target member. The remaining piece of the original order form had printed on it the membership number of the target recipient and the actual order form on which the ordered materials were selected, so we had a full record of the transaction to keep a running tally of our effort.

Q: What were the principal problems USIA found in dealing with the Japanese where we wanted to try to get them to understand our position?

YATES: Among a variety of trade problems were the major items of beef and oranges. We had a citrus problem in Japan. The Japanese grew their own citrus, called “mikan” - a small, very sweet tangerine, and prohibited or prevented, through tariff and non-tariff barriers, the importation of American citrus products. American beef was not imported into Japan. While beef was an important U.S. agricultural product, the Japanese would not buy American beef, because they had their own beef industry. Japanese “Kobe” beef was very expensive, and they didn’t want to have competition from the grass-fed American beef, because it tasted better and was a heck of a lot cheaper. The Australians were selling flank steak to the Japanese, which also was much cheaper than Kobe beef that was raised on imported grain and sometimes hand massaged to increase the fat content. So we had those two major trade problems.

We also had the automotive imbalance, of course. At that time, Japanese cars were getting hot in the US, and they were making enormous strides in sales of automobiles, while we were doing nothing in Japan, mainly because of what were non-tariff barriers. For example, a shipment of General Motors cars came to Yokohama but were all impounded at the dock and could not be released for sale. The reason was the amount of light in the rear lights that leaked between the area of light that was the brake light and the area of the light that was not the brake light. Under Japanese law as interpreted by the customs officials, that was not allowed. The problem had nothing to do with the safety of the car, its reliability or its value. It was purely a non-tariff barrier which the Japanese customs people could use at the port of entry.

The folks at GM had no idea such a law existed but had to retro-fit all the imported cars with a special gasket in the taillight to prevent light from leaking from one chamber to the other. This example is indicative of the kinds of things that we were up against. A similar kind of tempest in a teapot also occurred regarding “medfly” on U.S. apples going to Japan.

In addition, we had a military problem. About 32,000 American GI’s were resident in Japan, principally in Okinawa. There was a constant battle over the presence of those GI’s and their tendency to get into trouble in the social life that tends to swirl around military bases. We had a training site on the side of Mt. Fuji which was always a sensitive issue, because Mt. Fuji was considered to be a Japanese national symbol and we were shooting artillery shells into the mountain. That, of course, raised sensitive feelings, particularly on the part of the Japanese who were uncomfortable with our presence.

And then there was the problem of noise generated by military aircraft. This was a special problem at those bases where carrier aircraft were moved when a carrier was in port at Yokosuka. Since those large ships could not conduct operations while in port, pilots would have to maintain flight status and keep up training schedules from alternate sites. Of special concern was night flying. Military emergencies may occur at any time, day or night, and the pilots needed night flying experience. However, the people who were aroused at 2:00 am by the roar of the jets taking off and landing at Yokosuka Air Base or other military bases could not be expected to be sympathetic to the military need. American military aircraft don’t have the noise abatement fittings that commercial aircraft do. As housing developments pressed closer and closer to U.S. military installations, the problems increased.

If that was not enough, there were nuclear problems as well. Over the past several decades, nuclear power became increasingly prevalent in major American ships. The Japanese had a nuclear phobia and were unhappy with American nuclear powered vessels showing up in their ports. The Japanese’ three no’s - no production, no holding, and no use of nuclear weapons - were a symptom of this particular nuclear phobia. They would give us a lot of trouble on that, and there was always a question of whether American warships that visited Yokosuka were carrying nuclear weapons. The Japanese had the right to ask, but chose not to, thus most times successfully avoiding the problem. But those were serious questions.

Perhaps you remember the soybean incident during the presidency of Jimmy Carter, when he cut off the supply of soybeans to Japan? The soybean and its various products represent an important staple in the Japanese diet. Tofu, for example, is made from soy, and everybody uses soy sauce

in Japanese cooking. Some Buddhists and other vegetarians eat practically nothing but tofu. When Japan is not self-sufficient in soybean products, and when, during the Carter years, it was decided to stop supplying Japan because of official pique over trade difficulties, the Japanese went into shock. They realized how dependent they were on outside sources for something that was very, very important to their diet and did not like the feeling of insecurity.

A related issue is rice. American rice is very good - as a matter of fact, in the opinion of some, better than Japanese rice in terms of taste and quality. However, in Japan with arable land at a premium and rapidly diminishing because of the pressures for housing or other more profitable uses for open land, rice production sharply declined. Perhaps in part because of the shock of the soybean crisis, the Japanese attitude toward self-sufficiency in rice became much more rigid. They clearly felt that something so vital for national survival should be fully supplied from domestic production. That led to very high price supports for rice farmers and an astronomical cost of rice in the market. U.S. rice was much cheaper, but the Japanese felt deeply enough about the problem to continue to pay a very high premium for their rice simply to avoid a situation where they would be beholden to foreigners for the supply of such an important staple. The import of rice was completely banned.

The extremes to which this particular paranoia could be taken can be found in the prohibition of the import of wild rice. While a grain, wild rice is not rice but a completely different product that the Japanese do not grow. Still, since it contained the term “rice” in its description, it was fully banned as an import into Japan. For a long time, the prohibition against the importation of rice has cost the Japanese taxpayer dearly. Politically, however, the Japanese voter accepted the burden as the cost of retaining “food independence” and to avoid the national embarrassment that the soybean shock had created.

Those were the principal issues that faced the bilateral relationship during my tenure in Tokyo. From time to time, other minor things would come and go as immediate issues. Nonetheless, we had definite public affairs problems, all of which were to be addressed through the methods I have described—the outreach, the alert system mailings, the DRS to design the audience around these issues, so we could target the Japanese press and media.

Not all of the problems in Tokyo were of a bilateral nature. One special kind of experience occurred when a CODEL (congressional delegation) came into town. CODELs came and went through Tokyo all the time, and they were always playing to their home audiences while they were in Tokyo. A congressman from the mid-west would come and have no interest in what the Japanese were thinking, but only in what impression his constituents might receive while he was in the news from overseas. Ostensibly addressing the international press on international questions, he would actually be speaking, not to the press in Japan, but to his constituents back home. That always led the Japanese to great seizures of angst about “what are the Americans saying now? Is this a trial balloon? What are they trying to tell us?” We would explain to Japanese journalists that we were trying to tell them nothing. This was simply a Congressman on a junket in Japan but talking to his or her folks back home. So don’t worry about what he says, and particularly do not take what he said as indicative of the attitude of the American government. The Japanese didn’t understand this and always felt they were missing something.

One time, Steve Solarz from New York came into town. We got a call from the embassy political section one afternoon, saying that Congressman Solarz was in town staying at the Okura Hotel and wanted to see me, because he understood that I had poll data on Japanese opinions. I asked what information he was interested in, and he said he wanted to see the data. I responded that I could pull together all the information on a specific subject and save time for him, but he insisted he wanted to see all the data in its raw form. I had about six large, bound books of data, so I picked them up and took them to the Congressman's room at the Okura Hotel. I sat for a couple of hours in Solarz's hotel room while he went through the books page by page. I was dumbfounded. Once in a while he would ask a question. He was an intelligent, careful observer of this information and was actually reading the data with an analyst's eye. For me, this was a revelation, because I had never expected a member of the American Congress to be interested or capable of absorbing information at that level. Whether or not this was the best use of his time was a bit beside the point. He evidently wanted to see the raw data unedited and undigested by others.

Q: I am interviewing Steve Solarz now, mainly on Africa. His way of operating was to go to a place, have people lined up for him, and then he would also talk to other people. He would vacuum up everything. During the period I am interviewing him for now, he was chairman of the subcommittee on Africa; then he went to the subcommittee on the Far East. But he could talk with tremendous knowledge, because he talked to everybody and did the things you are saying. So he was able to draw on real data and real contact. Sometimes he could be a pain in the ass, because he wanted to be everywhere, but I think he was also respected, because he did what you are saying.

YATES: Although I spent a lot of time in the Foreign Service, I had only the slightest contact with American Congressmen. Solarz, with his evident hunger for straight data, was an exception. Of course, the reason was that I had the data he was interested in. I did have respect for Solarz, although there were a number of CODELs that I had no respect for.

One such instance occurred while I was in Afghanistan. Lester Wolf from New York came to Kabul. An interesting man. My recollection is that he was only there about six hours. He was interested in drugs, illicit narcotics. The embassy had made several discoveries in the area of interdicting narcotics and had come to an arrangement with the Afghan government on the means to handle such investigations. They held announcement of the new arrangements off, to wait for his arrival so that he could attend a show and tell about the progress that was being made. At the news conference, he said, "I came to Afghanistan, and despite all these bureaucrats, I broke the log-jam in the narcotics problems here in Afghanistan." Such a grab for the glory that was based on the hard work of others did not endear him to the hearts of the people who had done so much to make it possible for him to be a part of the final success while he was in town.

That kind of offhand treatment of Foreign Service and other officials working abroad is something that happened very, very often. I saw congressmen and even their staffers coming through, using embassy resources and then spitting on the people who had done so much to help them and made sure their visit was successful. Following an overseas visit where every effort was made to make their visit productive and comfortable, members of the Congress would turn around and criticize imagined standards of living abroad or such things as the "booze budget,"

the funding needed to provide receptions and food to visitors on such occasions as the Fourth of July. They simply were feeding stereotypes at home to make it appear that they were champions of stringent budgetary guidelines, but the cost of one CODEL far exceeded representational events where real governmental business was transacted to the benefit of American business or the taxpayer.

Of course, there were people in the government who were not like that. In the Carter administration, there was Jodie Powell, whom I had some association with while he was at the G-7 in Tokyo. Normally, when a presidential visit would occur, we would have to supply materials, and everybody in the embassy would take a different part of responsibility. In USIS, one of our responsibilities was to prepare Wireless File materials, a news service we provided to the mission. Included in the Wireless File were summaries of public opinion in the host country and of world events in other areas. The basic service was to keep the presidential party abreast of what was going on and what the local press was saying about the visit. Naturally, USIS would also handle incoming foreign press and briefings and interviews.

Powell was particularly good, because he was accessible. Each day, I would put together the local media reaction plus wireless file materials and get it over to his office. He worked in the basement of the Okura Hotel, which was a hotel next to the U.S. Embassy, so it was easy for us to access. He had a windowless office in the basement, about 7 feet by 8 feet. A very small office, it had just enough room for a desk and a chair. He was always in this office reading. The rest of his people often were pushy and insufferable. But he was smart, capable, knew what he was talking about, didn't waste time, and was always respectful of people who were trying to help him. That was very important for those of us who were grinding out the information.

On the other hand, some of the advance people, in particular, were not very smart. Political advance teams that come out, even for presidential visits, are not always the best and brightest. They were often campaign workers who were given an overseas trip as a reward for their campaign work. I recall one member of the advance team for the Carter visit to Japan that was supposed to be at the airport at a certain time; embassy officials couldn't find him. They were supposed to go to the airport, bring him in, brief him, and get him set up for his work. He had disappeared in Tokyo. After an exasperated search, they finally discovered him in Tokyo.

The story was he had gotten to Narita, gotten off the airplane with his backpack, and went into the terminal to find transportation into the city. Not knowing that he would be met, and evidently not appearing to be of presidential advance team caliber to those who were tasked with meeting him, he checked the cost of a taxi to Tokyo, which was astronomical, and the fare for the airport bus, which was evidently too much as well. So he hitchhiked along the expressway back into Tokyo. He put out his thumb out and got a ride. The great amount of effort spent to track him down because of his ignorance of how things are done created much frustration, a quick spreading story, and did little to encourage respect for the incoming presidential advance team.

There was another incident with the Carter advance team at the time of that visit. As usual with such trips, the President had one schedule and Rosalyn Carter had another. One of the things she was going to do was visit Kyoto and one of the gardens there; I believe it was Ryoanji. The young lady responsible for that part of the trip traveled to Kyoto to set up the visit. She took one

look at the stone garden and said this would not do. She wanted carpeting put on the rocks, so that when Rosalyn came and walked out into the garden, she wouldn't slip on the rocks. It took a lot of tall talking to get the advance team to understand that this would not be something that would be possible, because of Japanese sensitivity to the aesthetics of the location. The advance team fought long and hard on that principal, but finally relented when it became evident that the Japanese and the embassy, would not budge.

During the visit, Carter was to make a major speech on economics. Somebody in the bowels of the White House wrote the speech. I don't know who it was, but he or she knew nothing about Japan, its culture or its sensitivities. Luckily, we got an advance copy, took one look, and knew it wouldn't fly. In the last hours before the speech was given, we had to literally rip the whole thing apart and rewrite from sentence one, because it was so crudely written. One wonders how the government manages to keep things connected at home. On the road, it is evident that things fall apart quickly.

When we have had important officials abroad, more than a few times the saving grace has been some poor guy sitting out in the brush who knew the situation and could say, "No, no, don't do this. You are going to screw it up." As we downsize and shut facilities, as we remove people, there are fewer and fewer experienced people to do this, and the logic would be that we are going to make more and more mistakes, as, I guess we did, on the recent trip to China.

Q: Carter got hit by the press at least twice. Once was in Poland and another time was making a remark about Montezuma's revenge in Mexico City. Neither went down very well.

YATES: You have to have somebody with local ears, local eyes, and local feelings to be able to say "Don't say that," or "I think, Mr. President, that isn't quite what you mean," and correct it on the spot. If you wait for three days, you are lost. You do a lot of damage and negate a lot of the effort that has gone on and millions of dollars that were spent to try to get people to understand American policy and attitudes. And, more importantly, to understand that the American people have respect for people in that country. A presidential slip, a gaffe by one who is speaking for the American people, can undercut a lot of good will that has been established. Maintaining goodwill sells American products, which means American jobs back home, and builds our own reputation abroad as an important place in the world. So as we are shutting down, we are losing this currency.

Q: How did you find living in Japan as, say, compared to Korea?

YATES: The physical aspects of living in Japan?

Q: Just operating within Japan.

YATES: Japan is different, light years away from Korea. During my time in Japan, I went over to Seoul on consultation only once. Since I had been in Japan for some time and other places before that, I had lost my sense of the Korean environment. When I stepped off the plane, it was immediately apparent. You could just feel the difference, a sense that the air is different. The reason, I believe, is in the attitude of the people. The Japanese don't feel comfortable with

physical contact. They aren't comfortable with a relationship that gets you too close to their personal lives. It is all right to have an official relationship, and they are very happy with that and are wonderful friends, but if you get too close on the personal side, they are uncomfortable, because you don't fit into the Japanese scheme of things. For example, there have been many, many books written on the difference between the Japanese and other culture's business practices, and these are best sellers in Japan so that their readers may feel more comfortable when traveling abroad.

Koreans, on the other hand, are physical. They are in your face. They are much more open and you can joke and carry on - to a point - with a more relaxed feeling than you could in Japan. On a Seoul street, you get bumped into and no one will say, "I am sorry." In Tokyo, it is a great crisis. If they bump you on the street, they bow and are very apologetic. A Japanese friend and I had formed an international club, the International House. We brought in speakers from different embassies and had a cultural exchange. He was a very quiet and personable man and has since died of a heart attack.

Before I left Japan, he invited me to lunch to say goodbye. It was a nice, pleasant restaurant at one of the smaller hotels in Tokyo on a side street. We were sitting eating, when all of a sudden I crunched down on a piece of glass in my rice. I put it on the side of my plate and ate the other things. My friend asked, "What is the matter with the rice?" I replied, "I think there is glass in it." "We probably should say something or someone else may be hurt eating the same rice." So he called the waiter over, and he asked what was the matter. "My friend here found glass in his rice," he said. The poor waiter almost fainted on the spot. He picked up my plate and rushed off to the kitchen and bedlam ensued. The chef, the restaurant manager, the hotel manager, waitresses - everybody on the staff - suddenly appeared, bowing and almost knocking their heads on the floor saying, "This is unacceptable. We run a good restaurant and are deeply sorry."

In fact, my friend got away with a complete free meal, because when we left, there was no charge. The whole staff turned out to say goodbye in the parking lot and once again apologize. There was a great intensity in everyone's apologies. In a good American restaurant, the waiter might say, "I'm sorry, I will bring you a fresh dish and you will not be charged," and you might even receive an apology from the manager. I would not expect the entire staff to turn out in a display of contrition. But in Japan, there was an extreme sense of embarrassment. My friend said if we had not been cordially treated, we could have simply picked up the phone and called the health officials in Tokyo, and they would have come and closed the restaurant, because an infraction of that type could cause a serious health problem if left unaddressed. A much less dramatic but similar situation can be seen if you buy something in a Japanese store. The clerks spend minutes wrapping up a relatively cheap purchase. The Japanese do things with a different sense of aesthetics and responsibility, which I think is sometimes surprising to westerners who are accustomed to a more casual approach to service. But the Japanese consider it important and necessary.

Q: How did you wife feel about being Korean in Japan? Was this a problem?

YATES: Yes. One of the dark sides of Japan is that they are not as racially tolerant as most of rest of the world. This is true for much of Asia. We had a problem when I was in Kwangju with

the black GI's. In the late '60s, American blacks felt they were deeply wronged in the US, and if they could only get outside of this country, things would be okay. We had black GI's at the air base in Kwangju who would go off base, thinking they had finally gotten away from this racist society and run right smack into a racial antagonism which was far deeper than anything they had encountered in the US. It caused severe psychological problems for the black GI's in Kwangju and the military brought in a psychiatrist to handle them. The military were very uncomfortable, since at one time, they had a policy of not sending any black GI's to Korea because of the racial tension, but that was no longer an acceptable course of action. Korea had not changed, however, and the problem persisted.

A similar effect could be seen in Japan. The Japanese are more sophisticated, perhaps, because there is a basic cultural attitude not to confront people or things directly. This leads to the image that all is fine. But under the surface, there are powerful feelings that have deep cultural roots. The Japanese do not like Koreans, and the feeling is passionately reciprocated. Up until very recently, they fingerprinted all ethnic Koreans resident in Japan, even though they have never been in Korea and don't speak Korean and may be a second- or third-generation Japanese citizen. They were still considered "gaijin" (foreigners) and had to have an alien registration card. So how did this basic animosity affect us?

The first reaction of Japanese who are not internationally experienced when seeing an Asian woman with an American man is to assume that they are an American GI and a Japanese bar girl. That is a hard image to get over. Once they discovered I am not a GI and she is not a bar girl, it was all right, but she is still Korean. From a distance, my wife would appear Japanese to most people in Japan. It is only when she comes closer that they will recognize that she is Korean. Americans probably wouldn't notice the differences. There are differences in cheek bone, in the color of the hair, and in the length of the thigh bone, due to the respective national diets. In Korea, there is much more calcium in the usual diet, as well as a larger quantity of vegetables and less salt.

When my wife went into a shop, if they weren't paying attention, the sales people were very warm and treated her like just another Japanese customer, but if they recognized her as a Korean, they became very cool. That caused some problems, although I think my wife was usually comfortable there because, generally speaking, the Japanese don't make a point of differences unless they are forced to confront you directly. If you are in an environment with them, they are oblivious to you, even as they are oblivious to other Japanese. Their houses are enclosed by walls, and they keep a very intensely private area. Japanese architecture and the shape of a Japanese garden focus internally. You don't buy a Japanese house for the view, you buy it for the garden and focus internally.

They do this in their personal relations, which made her tense. Westerners, the round-eye, long-nose type of person, are treated more like children: cute in their own way and distant from intimate Japanese concerns. A Westerner who speaks a little Japanese is adored. It is a wonderful feeling, you are coddled, they fawn over you...to a point. The point comes when the foreigner's Japanese gets good enough that it is no longer a barrier to communication. No longer cute, a foreigner who speaks Japanese well must be made to fit into the social fabric, even to allow discourse to proceed. Of course, that is virtually impossible without a long residence and

acquaintance with the Japanese person encountered.

A good friend of mine who has been a professor of Japanese language and literature for a number of years and whom I served with in Hokkaido when I was in the army, married a Japanese girl, whom I also knew. A very fine woman. They went back to the United States, and he studied Japanese and became very proficient. They returned to Japan where he studied in Kyoto as a researcher in the Japanese language. He told me that he found the Japan he returned to very, very different from the Japan he had left as a GI. The reason was that his Japanese had improved to the point where it was no longer something that separated him from Japanese society. The problem in Kyoto was that the Japanese now were cold and distant. At the point that he no longer had a barrier in communication with them, he had to be categorized within their system. He could never become Japanese. Sort of like those Hawaiians who become sumo wrestlers. They are wrestlers, but they are always gaijin. Some become Japanese citizens, but they are always gaijin.

The problem for my Japanese speaking friend was that he found his experience in Japan not so much distasteful but much, much harder, because the Japanese he met did not know where to classify him. The Japanese carry business cards which give a lot more information than we probably would have on our business cards. But this is because you must be placed in the system, so people will know how to talk to you, how to relate to you, and what kind of a relationship they should maintain with you. When you are a cute, stumbling gaijin, it is easy. If you are a Japanese person, you don't let your daughter talk to those male foreigners, but it is all right to socialize in a remote sort of way. You invite them out, entertain them, give them gifts. Everything is fine. It is much as it would be with foreign visitors here. But when you become closer, the relationship changes. Maybe it is true for immigrants here who, after living in an American town for a while, become one of the people but are still seen as different. It then becomes harder for them, since they feel at home but not really comfortable.

Q: What was your impression of the embassy?

YATES: The ambassador during my whole tour in Japan was Mike Mansfield. He was there for more than ten years. Mansfield was a phenomenon. He had more energy than almost anyone else in the office. As I mentioned before, USIS was on the second floor and had big windows that stretched across the entrance. I could walk down the hall and see Mike coming and going. He had a spry step, getting into and out of the car. I guess he must have been about 80 at the time. An amazing man.

When I installed the Wang VS-100 computer at the post, we were very proud of the accomplishment and wanted the ambassador to come and officially begin its operation. We arranged for a photographer, and I had a special terminal set up in my office for him to use. He was going to go to it and touch a key and it would say "Welcome Mr. Ambassador." So we brought him to the second floor. I still have a picture of him sitting at the terminal, holding up his hand and saying, "What now?" That was because he had pressed the key and the screen went blank. We had tested this repeatedly before, and it always had been fine. My guess is, when he sat down at the terminal, he leaned on the table or something like that, and the cable at the back had come loose. But Mike was a great guy and never lost his cool. He always called me "Ted,"

although I can't think why.

He also had great influence among the Japanese. First of all, they knew he was very well connected in the Democratic Party and Washington. He was very credible in interpreting the mood of Congress to the Japanese. But he would also do things differently. In his office, for instance, he was famous. When he would invite a guest in, he would say, "Would you like some coffee?" Of course, the Japanese always had coffee and would say, "Sure." He would say, "If you will just wait a moment, please." He would walk into a little small Pullman kitchen on the side of his office there, and he would make the coffee and serve it. To a Japanese bureaucrat or an official who is waited on by flocks of young office girls, coffee or tea comes automatically; you don't ask. The fact that the Ambassador got up and made and served the coffee became sort of a social bit of cachet in Tokyo—those who had coffee made for them by the American ambassador. He used little things like that to great effect. He obviously knew what he was doing. It was a nice touch.

We had a particularly difficult incident in which Mansfield was especially effective. It was on the occasion when a Japanese trawler went down. We had a roaring time with the press; they were taking us apart.

Q: Just for the record a submarine surfaced...

YATES: The submarine was coming up, and the conning tower hit the bottom of a trawler and it sank. The submarine crew did not realize they had hit the small trawler. Three Japanese crewmen lost their lives in that incident.

We were getting roasted by the Japanese press on it. Ambassador Mansfield singlehandedly turned the entire incident off. The way he did that was to get his picture taken by the press with one of the surviving families. In the picture, he was standing before the family bowing and apologizing for the incident. The whole episode instantly vanished as an issue. It was no longer relevant. He had the sensitivity to understand that one single act was what was needed. By making the apology, the matter was concluded. Sort of like my friend's ear in Afghanistan. It was over, and the Japanese got back to business again. An interesting bit of sensitivity exhibited by the grizzled old coal miner.

Mansfield was an interesting ambassador to work for. I didn't work for him directly, although I had opportunities to go sit in on the country team meetings. In the morning, he would come into the meeting briskly, once everyone was in place. Everyone soon learned not to be late for one of his meetings, for they never lasted very long. He would brook no shuffling of feet or mumbling or carrying on. He would come in and say, "What's up?" If everyone said everything was okay, he would say, "It sounds good," and get up and leave. When there was discussion and you indicated you had something to say, hesitation would cost you the chance and he would go on to the next person. As a result, Mansfield's country team meetings rarely went longer than 15 - 20 minutes. His philosophy was, if you have something to say, say it; if not, shut up and let us get on with other business. He also had an enormous capacity for statistics and numbers. At a briefing, he could spill out trade numbers and problems at a level of detail that would knock the socks off the press people. An amazing person and a very, very good ambassador, I think.

When the administration changed, the mainly Republican business community in Tokyo was fully of the opinion that they wanted Mansfield to stay. Which important Republican politician wanted to come to Tokyo was immaterial, because Mansfield was so good in maintaining contacts with the Japanese and keeping everything on an even keel, that they didn't want to lose that capability. He remained there for many years.

EDWARD M. FEATHERSTONE
Political/Military Officer
Tokyo (1978-1982)

Consul General
Okinawa (1982-1986)

Mr. Featherstone was born in New York City and raised there and in Japan. After graduating from the University of Pennsylvania and serving in the US Army, in 1961 he entered the Foreign Service. As a Japanese language and area specialist Mr. Featherstone served primarily in Japanese posts, including Kobe-Osaka, Yokohama, Niigata, Okinawa (Consul General) and Tokyo. He also served in Barbados and in Washington. Mr. Featherstone was interviewed by Thomas Dunnigan in 1999.

Q: *Well, in 1978, they found an assignment for you, I gather, in Tokyo?*

FEATHERSTONE: Yes. We were in Tokyo in 1978. I was a political-military officer again. We had bought our house in Arlington, Virginia not too long before that, in 1976, which is the house we are in now. My daughters were, at that time, in high school. Anyway, we had a good situation with my kids.

Q: *They were able to accompany you to Japan?*

FEATHERSTONE: They accompanied us to Japan, that is right, until they graduated from college, of course. I mean, until they entered college.

Q: *Who was the ambassador at the time? Was it Mike Mansfield?*

FEATHERSTONE: Yes, it was Mike Mansfield.

Q: *Since you weren't doing a full new job, how large was the political-military unit in the embassy?*

FEATHERSTONE: It wasn't very large. As a matter of fact, it was three people, counting myself.

Q: *To whom did you report?*

FEATHERSTONE: I reported to the political counselor.

Q: *Depending on the problem.*

FEATHERSTONE: Depending on the problem, yes.

Q: *Did you have American military officers assigned to your office?*

FEATHERSTONE: No. We dealt regularly with the military, but there was no officer assigned to our office.

Q: *What were the major problems you had to deal with in those years?*

FEATHERSTONE: These were the Carter years. It was mostly getting used to the style and to the stipulations of the Carter administration. There were some ups and downs, of course. I didn't have all that many serious problems facing me, in terms of political-military or economics, at that time. It took a long time to get used to the Carter's people way of doing things. I think I said before, they changed USIS a lot, which made USIS people quite unhappy. It was a situation of getting our feet on the ground, after the Carter people came in.

Q: *You had been away from Japan for about 10 years when you went back. How did the country change, or did you notice many significant changes?*

FEATHERSTONE: It had changed a lot. There was a lot more growth. When I first saw Japan in the late 1940s, it was in ruins. Later on, things became better. Then, they became better than ever before. Now, Japan was rich. It's like a John Updike thing: rabbit was rich. We finally got to the stage where Japan was rich, and they were outstripping us, in terms of finery. You saw it in the buildings. They had these fancy buildings going up, and all sorts of things. We didn't have the money anymore to compete on that scale, which was putting big projects up that would impress people, that sort of thing. Not that we didn't do it for that reason. Japan began to feel its power, I guess. The fact that they had so much money, they had a great deal of influence. It was somewhat more difficult to deal with them because they thought we ought to confide in them more or do things their way more often. This is quite natural. That is the state of the world.

Q: *Political-military... Did you get involved in the sales of our airplanes to Japan?*

FEATHERSTONE: No, I didn't really. Mostly, the military people did that. We had a military affairs' office. There was, I think, a Army colonel and all the military aircraft sales were in his purview. They kept me advised and used to come to me with various ideas on who would be a good fellow to approach or something like that. I would help them out. In that sense, I was involved, but I wasn't the one who made decisions on that course.

Q: *Well, while you were in Tokyo, there were several visits from the Defense Secretary, Brown. Were you involved in those?*

FEATHERSTONE: I was, indeed. I was the control officer for Brown. In fact, he sent me a nice note one time. There was a friend of mine who was a colonel in the United States Air Force. He was actually the control officer of Brown, I think. I was there as a State Department political-military officer. If I recall this correctly, the Japanese interpreter was supposed to be there, but he wasn't there. So, here they were with Brown. So, they dragged me in, and I did the interpreting for Brown for about a two-hour session. Somebody wrote a nice letter to me from him; I think it was Dave Lohman. He was an Air Force colonel who was a good friend of mine.

Q: I think President Carter also visited Japan during the time you were there.

FEATHERSTONE: He did. I went to one of the cocktail parties. I was not involved in the visits, myself. I did go to the reception, though. I remember being there. The Carter people were unusual. They had a laid back, southern style, quite different from what I was used to.

Q: Could you see Japan emerging as a military power or partner for us in the Far East?

FEATHERSTONE: I think it is unlikely. Although memories are now fading, the defeat was very traumatic. Everything was leveled. I remember being in Japan when I was a kid in 1947. There was nothing standing. It was a complete devastation. I remember that pretty vividly. I can't see getting in the military. There is sort of a psyche resistance to military stuff with the Japanese. They have a terrible time recruiting people. People won't join. It is very difficult. I just don't see Japan getting into the major military business.

Q: What about the scandal, I guess you would call it, of the bribery of Japanese officials by American companies such as Lockheed, McDonnell Douglas, and others?

FEATHERSTONE: Well, you know, this happens. It has happened with probably every nation. I recall, I guess it was the Germans who had something with Siemens in the early 1900s. It happens all the time. I am not condoning it. This is not something that is out of the blue. Of course, one ought to take measures to prevent this sort of thing, and of course, punish those who are obviously overstepping their bounds. Corruption in Japan, like in the United States, is nothing new. They have a lot of stuff, a lot of payoffs on things. Lockheed was one of the big ones. I think former Prime Minister Tanaka was involved in that. I met Tanaka several times. He was from Niigata. Of course, I had been assigned there. I met him several times in Niigata. He knew that I was a Foreign Service officer. I always used to chat with him when I saw him. He was a tough guy. He was nobody to fool with. He came to an unfortunate end, I think. He could have done good things for Japan, and in some ways, he did. He could have been much more effective if he hadn't rubbed so many people the wrong way, and gotten involved with others who were corrupt. I don't think he was a bad person himself, but I think he was always in bad company.

Q: This can happen. Were you involved in forcing Japan to increase its military spending?

FEATHERSTONE: That was always something that was on the table for us. It was an objective that we always had in mind. We were always congratulating Japan or encouraging Japan in

things that they did that would increase our readiness and theirs, of course. There is a limit as to how much you can push. Of course, when you are dealing with a nation that was controlled by military authorities for about 1,000 years, you don't want to push too heavily. We didn't press them. We certainly complimented them and tried to show our appreciation, which we thought was the right thing.

Q: Can you tell us a little bit about the problems we had with our nuclear arms ships trying to come in, the Midway and others?

FEATHERSTONE: Yes. Japan has a terrible, what they call a "nuclear allergy," being the only nation that suffered two A-bombs. They were really traumatized by this. My own feeling is that the A-bombs saved Japan, because if we ever had to invade Japan, it would have been house-to-house fighting. Everything would have been destroyed, just like all the places in Europe. It would have been rubble. I don't know whether you are aware of this, but we never bombed most of Japan. We bombed some of the military area.

Q: In Tokyo.

FEATHERSTONE: We heavily fire bombed Tokyo. In fact, the fire bombs in Tokyo killed more people than the A-bomb did, far more. We never bombed a lot of stuff, including the largest dry dock in the world, which we are still using.

Q: You made the point. They may have had something in mind.

FEATHERSTONE: There is a lot of stuff in Japan like that. We reserved and saved, and Japan was able to recover all that much faster. They had all their power plants. That would not have been the case if we had bombed them to smithereens.

Q: It wasn't the case in Germany.

FEATHERSTONE: They had all the railroads too. Japan has a massive railroad network. That was all there, and still is. All you had to do was start it up. Everything was going again. That is one of the reasons Japan was able to recover so quickly. The Japanese people, of course, are hardworking and all that. Without that, it would have been 20, 30 more years.

Q: Were you involved in many demonstrations?

FEATHERSTONE: Yes. We had quite a few. As the Vietnam War heated up, there were more and more of them. As I say, they were never violent. I don't think we ever had any kind of violence. But, there was chanting, and they would wave banners and flags. People would approach you and say, "Get out of Vietnam," even if that was the only English they could manage.

Q: Were you there for Secretary Weinberger's visit?

FEATHERSTONE: Yes, several of Weinberger's visits. He made more than one. Of all the

people that I dealt with, he was by far the most pleasant and easiest. I also think he was one of the smartest. I received a nice letter from him too. Weinberger was a very fine fellow.

Q: *Well, after these four years in Tokyo, you went to Okinawa.*

FEATHERSTONE: Yes, I went as consul general this time.

Q: *The island had been reverted to Japan.*

FEATHERSTONE: The island was reverted to Japan in 1972. I was the consul general. Of course we had, and always had, a large military establishment there. I think we had the biggest air base in the world, in terms of runways.

Q: *That is what consuls general pride themselves on, I think.*

FEATHERSTONE: I am a big scuba diver. Some of the best scuba diving in the world is off Okinawa. I spent almost every spare minute that I could, scuba diving. I was diving all the time, except when the weather wouldn't permit it, of course. A bunch of the Air Force fellows and the Marines were with me on this. We used to hire a boat and put about 40 people on. You could probably get 60 people on board, but we didn't have that many. We would go out every weekend, weather permitting, on this boat. We would go to other offshore islands, and anchor the boat, and go diving. It was one of the best times in my life, honest to God.

Q: *How large was your staff?*

FEATHERSTONE: I had about six or seven people. Some of them are still around, up in Tokyo now.

Q: *Oh, it doesn't matter.*

FEATHERSTONE: I had a number of associates and friends at the time. It was one of the best times of my life. I wrote regular reports on local events, conditions, people, etc. and sent these to the DCM, who was my boss at that time. I don't know whether that information was of much use to anyone, but my Okinawa sojourn was certainly one of the happiest times of my life.

Q: *Did the ambassador visit you very often?*

FEATHERSTONE: The Ambassador came down once or twice.

Q: *Who was it at the time?*

FEATHERSTONE: Ambassador Mike Mansfield (Big Mike).

Q: *What was the attitude of the Okinawans?*

FEATHERSTONE: The Okinawans have always liked Americans. We came there after the war.

Everything was obliterated, because of the war. We came there and helped people. We saved the lives of many people with sulphuric drugs, medicines and so forth. They have always liked Americans. They hate the Japanese.

Q: That is interesting. I never heard this before.

FEATHERSTONE: The Okinawans came under Japanese control in 1609 when the Japanese took Okinawa. It was a terrible, harsh rule and the Okinawans had a miserable time of it. Everything was the death penalty. The Japanese were really tough guys. There is no question. They were massively brutal.

Q: Cruel?

FEATHERSTONE: Very cruel. Anyway, the Okinawans always liked us. We were their saviors when we came in after World War II, because we helped them. Even with all the demonstrations and everything we had, they were always tempered... They never called us names. They were never spiteful toward us.

Q: What were your relations as consul general with the American military?

FEATHERSTONE: Very good. I spent some time in the military myself, so I was simpatico with a lot of them. They were all conservatives, which I am.

Q: You also didn't have the big problem of reversion, which you had your first tour out there.

FEATHERSTONE: That's right. It was all over with. It was a great thing. For years, the U.S. military thought reversion would be terrible, because they would lose all their influence, because they wouldn't be able to fly all these missions. But, they were able to do all that and more. In fact, the Japanese paid for a lot of this stuff, actually. It was cheaper having been reverted. It turned out to be much better for the U.S. and much better for Japan.

Q: Did you have any visitors from this country, out to Okinawa?

FEATHERSTONE: Yes. We always had whoever the ambassador was, or the chief guy involved in Military Affairs, would come out. They would make regular visits.

Q: I have only been at the airport. When we landed there, they had us pull down the curtains on our plane, so we couldn't see anything. This was back in the 1950s.

FEATHERSTONE: It's just beautiful. The people are very nice, too.

Q: Did you at the consulate have to deal with this problem of crimes by the U.S. military out there?

FEATHERSTONE: Yes. You probably have read about, more recently, the rape of two 12-year-olds by a Marine and a sailor. When I was there, a taxi driver was killed for four bucks, or

something like that. How can somebody do something like that? Killing somebody for four bucks. Killing somebody anyway is awful, but I mean, for four bucks. I remember having to go to the funeral for this guy and a woman broke down and said bad things to me about the United States. That was unpleasant.

Q: I imagine that was an unpleasant duty. Did we still have a problem with atomic weapons out there?

FEATHERSTONE: Not too much. We took most of the nukes out of there by that time. We took the poison gas out. There wasn't too much there except 21,000 Marines and all their tanks, and all that stuff. The Navy didn't have very much there. The Navy used to send ships in every now and then, but I don't think there was a presence there. There was one naval officer, a senior officer, on the staff.

Q: As you were leaving there, what was your view of Okinawa's future? Do you think it will continue as a happy base for us?

FEATHERSTONE: Well, yes, I think it will continue. Okinawa is a very poor area. It hasn't anything to recommend it except tourism. It has wonderful beaches, but they don't make anything there and there are no resources, such as oil. There are no natural resources. The only thing they have is tourism, a beautiful island, and some wonderful places to snorkel dive, swim. The economic prospects aren't very good. I think most likely the Japanese will continue to support them in various ways, financially.

Q: Subsidized. Yes.

FEATHERSTONE: Subsidize things by providing money for power plants and that sort of thing. I don't think anything is going to happen that will disturb that because the Okinawans certainly don't want that to happen, and I don't think we do either. I think if it is going to continue, then okay. They will never love having American bases there, but they put up with it. Of course, they reap a lot of economic benefits from the bases, by way of selling things. So, it is not altogether bad. I don't anticipate that there will be any great problems in Okinawa.

JOHN E. KELLEY
Labor Officer
Tokyo 1979-1980

Deputy Chief, Political Section
Tokyo (1980-1982)

John E. Kelley was born in California in 1936 and raised in Washington, DC. In addition to serving in Japan, Mr. Kelley served in Korea, Portugal, and Australia. He was interviewed by Charles Stuart Kennedy on May 21, 1996.

Q: *You left Congressional Relations in 1979, where did you go then?*

KELLEY: Back to Japan.

Q: *When were you in Japan?*

KELLEY: From 1979 to 1982.

Q: *What was your job in Japan?*

KELLEY: Again, I had two jobs in Japan. I went back with the understanding that I would have succession of jobs, I went back to the Labor Counselor for a year and then switched over to become the Deputy Chief of the Political Section for the last two years that I was there.

Q: *Who was the Ambassador when you were in the 1979 - 1981 period.*

KELLEY: Mike Mansfield.

Q: *What was your impression of how he operated?*

KELLEY: Mansfield focused on creating the impression among the Japanese that the United States had an extremely high regard for Japan. That Japan was, as he used to say, "our most important bilateral relationship, bar none." He had the stature to accomplish that. He did not get himself involved in the minutiae of relations with Japan or in the running of the Embassy, but he was very much in charge of the direction of the policy. He was an excellent representative of the United States because of his personal humility and yet his extremely high stature and with the high regard that he was obviously held in by both the government of the United States and by the Japanese. He also emphasized to a greater degree than any other Ambassador before or since, the role of the Congress in U.S. policy and spent a lot of time personally cultivating all of the people he had known in the Senate and in the House of Representatives, during his long term in the Senate, to build the impression that he already held that the U.S./Japan relationship was the most important bilateral relationship that the United States had. He would spend a lot of time with any Congressional Delegation that came through, personally briefing them on this relationship and what was going on with it, then corresponding with these people to make sure that they understood and appreciated the importance of the relationship.

Q: *You had the labor job for a year. What was the labor situation as you saw it in Japan and what did the Labor Counselor do?*

KELLEY: The Labor Counselor had both a traditional role and then had a role that I thought was more important. The traditional role was to keep the Department of Labor and to a lesser extent the Department of State advised of what was going on in Japan. The role that I thought was more important was to use the labor connection to advance United States interests in the economic relationship between the United States and Japan.

Q: *Let's talk first about the traditional role. As long as you have two "masters" (almost three*

masters really) the Department of Labor, the Department of State, and the AFL CIO, did you feel at this particular stage of things that you had too many "masters"? What roles were they playing?

KELLEY: My feeling was that they didn't have enough "masters". Or at least not enough people who were involved in and concerned about what I was doing. At one point I even thought that it might have been a good idea to switch the Labor attaché functionally, from the political section to the economic section. I never actually pursued that officially, but I pursued it in other ways. I worked much more closely with the economic section than I think anybody had in that job since it was first instituted back in the 1960's. Having different people interested in what I was doing and trying to influence what I was doing was never a problem because ultimately even though different entities have different approaches, if they were interested in the U.S./Japan relationship at all, they were regarded as a plus. It was an opportunity for us, not a burden, to cultivate a perspective of the relationship which was congenial to our own. That was the Ambassador's impression that it was the most important bilateral relationship that we had. So we did that. The more people that were involved and interested, the better. So when I would receive delegations out from the AFL CIO, for example, it was a great opportunity to go out and expose them to the nature of what the Japanese were doing and let them know what the competition was like, and what we had to do to deal with it -- give them a dose of reality.

Q: How did you view the Japanese labor situation? Where do they fit into the Japanese scene, at the time that you were there?

KELLEY: The Japanese labor movement was split in two, the larger portion was aligned through the labor confederation with the Socialist party, with strong communist influence. The other was aligned with the democratic socialist party and was less political really, and more congenial to the American approach to labor relations, industrial relations, although they were historically much more company unions, enterprise unions, if you will, than our own unions were. Politically, we wanted to moderate the attitudes of those in the socialist labor movement to get them to be more accepting of what we were trying to accomplish in Japan: what the United States and Japan were trying to accomplish together in the region. What we were doing and what our security treaty was all about and what it was trying to accomplish. Because Domei had a relationship with the AFL CIO, and Sohyo's relationship was more with the communist trade unions, we had a strong interest in strengthening that relationship that Domei had with AFL CIO, and strengthening Domei's influence in helping to encourage to the degree that we could without actually interfering, was the consolidation of a labor movement, unification of the Japanese labor movement, but along democratic principals so that Domei would be the dominating influence.

Q: How did the Japanese labor leaders and people you dealt with respond to what we were trying to do?

KELLEY: Sohyo almost predictably thought we were trying to dominate the labor movement and undermine their efforts and advance our own political agenda. Domei wanted to keep us at arms length because too close of an embrace would taint them. But they appreciated the assistance we gave them and they knew that we would invite them over to the United States, provide them with grants of various kinds, to see how the U.S. labor movement operated for

example. We helped them promote contacts with the free labor movement and helped them to get wider recognition around the world through these contacts. So they encouraged a quiet, cooperative relationship. They tried not to be too openly engulfed in our embrace. They were congenial to our views about the security treaty for example, and other political issues and were quietly supportive.

Q: Did you find the delegations of the AFL CIO that came over to understand the need not to be too exuberant in the dealings with Domei?

KELLEY: Well, it wasn't a problem for them so much, because they were union to union. If the government got involved with the union then that was suspect. That tainted the union if it became too blatant. Another union, the AFL CIO union, having contact with a Japanese union or a union movement didn't carry the same weight. The communists within Sohyo tried to paint the AFL CIO as a CIA plant and in fact tried to discredit Domei. But they had to be very careful about that, because they wanted the relationship with the AFL CIO themselves. So it wasn't an approach that was taken by Sohyo, it was only taken by the more extreme elements of Sohyo influenced by the communists. They tried to cultivate a relationship with the AFL CIO and the AFL CIO recognized that they couldn't exclusively relate to the Domei and they also had to have a relationship with Sohyo and they tried to develop it.

Q: At one time we had the Department of Labor and within the AFL CIO had essentially ex communists who were more holly than the Pope as far as being anti communists, and sometimes this outlook did not allow them to see things except in extreme black and white. Was this a problem then?

KELLEY: You had individuals who had this problem, but we didn't see much of that in Japan. More often you would get people from the AFL CIO coming out who recognized that they had to have some kind of contact with Sohyo, to keep it within balance so that Domei wouldn't get bent out of shape, but would try to make overtures to Sohyo. Because in many cases they would be dealing with unions and there would be union to union problems that had to be resolved. We had some international issues for example, we had to work to resolve to the benefit of the American labor movement and we needed the cooperation of a sector which was dominated by Sohyo and we had to work with the Soviet Union. There were even representatives, or people who would be at international conferences who wouldn't have to deal with Sohyo and they would do so. You find the Sohyos logs more often in the area of working with underdeveloped countries than you would working in the industrialized countries.

Q: You said that there was also an economic side to your labor job, what was that?

KELLEY: I thought that the most important part of the economic support of my job was the automobile industry, which was sort of emblematic of the economic side of the job. It's the constant problem of not exporting our jobs to Japan or any other country. We had a problem with the U.S. automobile industry which had not recognized that it had to export and had satisfied itself with the United States market and had allowed the Japanese to export into our market without really competing. It became clear to me early on, as it became clear to the Japanese auto workers union at the same time, that if the Japanese automobile industry continued to export

autos to the United States at the rate it was at the time in the late 1970's and early 1980's that there would be a tremendous reaction in the United States and there would be an effort to shut down trade relationships in automobile exports in Japan and the United States. This would benefit nobody. It could reverberate throughout the U.S. trade area and could wind up with all kinds of restrictions in all kinds of countries on imports. So there had to be some moderation in Japanese exports of automobiles to the United States, or some gesture of some sort that could be accepted by the AFL CIO, and by the U.S. auto workers.

The idea that the Japanese auto workers had was that they should encourage the Japanese automobile producers to do what Honda had already started to do. Honda was a renegade in Japan. Nobody followed Honda's lead. Everybody in Japan thought Honda was nuts. The big automobile producers, Toyota and Nissan, showed no inclination to build automobile production in the United States, and as long as they did not there was a tremendous possibility of explosion.

The Japanese auto workers decided that they would try to convince the Japanese auto manufacturers to open production in the United States, thinking that they could blunt the inevitable American reaction that way and maintain jobs in Japan at the same time that they provided some jobs in the United States. This would benefit the Japanese automobile industry over the long term. When I learned that this movement was afoot, I went to the Ambassador and asked him to take a personal interest in this thing. His immediate reaction was "How"? I suggested to him that he write to Doug Frazier, the President of the UAW, and ask him to accept an invitation that had been extended by the head of the Japanese Auto Workers and to come to Japan and try to negotiate arrangements with the Japan auto industry to produce Japanese cars in the U.S. The Ambassador liked the idea and he asked me to draft a letter. I did and he sent it off. This became the catalyst because Frazier was not about to respond to the head of the Japanese Auto Workers because he thought he would be sandbagged. He thought he would be exposed to the criticism of the United States if he came over and negotiated some kind of deal that turned out to be a bogus deal. He didn't know what to think. He didn't know enough about Japan. When he got the assurance from the Ambassador that this was a good idea, and since Mansfield had such great credibility with the labor movement because of his former position as Majority Leader, this broke through all of the barriers. Frazier came over and negotiated deals with all of the major auto manufacturers, over several visits. That provided the impetus for the creation of all of this industrial automobile production in the United States which is so accepted today. I think that probably avoided a collision which could have damaged not only our relationship but changed the course of our trade policy and converted us to isolationism.

Q: That's fascinating. That shows you that officers in the field can take a look and see opportunities and gain the support of somebody such as the Ambassador and of course you had an Ambassador who could do it. It was almost fortuitous, if you had the normal Ambassador, well thought of and all, but wouldn't be able to reach out to somebody such as the head of the UAW.

KELLEY: I felt that it was perhaps the most significant thing that I had ever gotten involved in and had any influence over in the Foreign Service. I had to take a little flak from the Political Counselor because I had sort of gone out of channels, directly to the Ambassador with this thing because it was really so much economic that I was afraid that it would get too politically colored

by bringing it through the Political Counselor.

Q: Who was the Political Counselor?

KELLEY: Al Seligmann. I didn't deliberately try to offend him. I tried to be conciliatory after the fact. My role was to be the Ambassador's advisor on labor affairs and nothing in my charter said that it was supposed to go through the Political Counselor, for that particular thing. If it was political that was something else. In the end the Ambassador became so enamored of this project that it developed a life of its own with him. He would make speeches on it -- when I switched over to the political section as Deputy of the political section, I continued in the role of a speech writer for the Ambassador and helped him to craft some ideas in his speeches that dealt with this particular issue. We continued to work very closely on this thing throughout. It was a tremendously important episode in the U.S.-Japan relationship -- I think it was the seminal event in the economic relationship between Japan and the United States during Mansfield's tenure.

Q: It really lanced the boil, didn't it?

KELLEY: I think it did. The unfortunate thing is the UAW ultimately didn't recognize the significance of what its own President had done. When Frazier was replaced as President, and then the succession of UAW Presidents tended to focus on what was wrong with the relationship, what was wrong with the agreement, the way it was implemented and so forth. They didn't recognize that this was an agreement that had to be applied with some flexibility. They focused on the way the Japanese continued to subcontract parts production with Japan, they continued to bring in partially constructed vehicles, frames, etc., and assembled them in the United States. They thought all of this work should have been done in America. Well it should have been. But there was a tremendous breakthrough there none the less. The rest of the problems could be worked on and were worked on and resolved over time. Not to recognize the seminal importance of the breakthrough, I think, was churlish on the part of Frazier's successors and some of the lesser elements of the UAW.

Q: When you moved to this other job in 1980 or 1981, what were the main things that you were dealing with then in the political section?

KELLEY: For the first year the job was external relations, during the second year I moved into the internal. It was also sort of executive officer in many ways, for the Embassy and I would do things like coordinate Presidential visits under the direction of the DCM. I would really be his exec in effect, he would be the overall coordinator.

Q: Did you have a Presidential visit or visits?

KELLEY: We did, Carter came out for Ohira's funeral. I dealt with that, coordinated that.

Q: How did it go?

KELLEY: It went extremely well, given that it was such short notice. In fact that may have made it a little better, there wasn't enough time for anybody to come in and screw it up. We had to put

together a number of side consultations with the Japanese and a number of other countries. We had to give the Japanese plenty of political mileage out of the visit, give the President some exposure to the new Japanese leadership and at the same time give him a chance to reassure the Japanese about a lot of the things that we were doing out in Asia. All together I thought it was a great success. They certainly thought so, they had come to us early in the piece as soon as they discovered that U.S. citizens were here and they thought that it was very important to recognize that this was to take place at the highest level. It took me a while to convince -- I didn't have the wit unfortunately to make sure that they understood that what I understood to be the highest level was the President. I just assumed that they knew that the President was the highest level and I think that they assumed that I knew that as well. Unfortunately the Political Counselor didn't accept that. He wouldn't let me go back and clarify it with them, so I had to persuade him and in turn that is what they meant. Meanwhile we spun our wheels for awhile while I tried to get him to agree to that was what they meant. Once we got past that it went pretty well.

Q: During this 1980-1981 period basically the Carter Administration, Japan's external relations I take it that the Northern problem with the Soviet Union remained a delightful obstacle for any opening up to the Soviet's, didn't it?

KELLEY: The Soviet's were our best friends during that period. They were all over themselves, stepping on their own crank constantly during that period. Doing things that just alarmed the Japanese. Of course the Japanese were deliberately taking advantage of every gap, of every flight by a Russian Bear aircraft, or anything else that these fools might do, to exacerbate the problems in the relationship and build up the Northern defenses. So for us it was wonderful [laughter] we would just sit back and watch this and watch the Russians stumble over themselves refusing to give up the Northern territories, or even talk about it. We'd watch the Japanese get madder and madder and madder.

Q: Was there anything happening with China in that particular period? This was during the Carter Administration where we formalized relations with China. Did you see much movement?

KELLEY: The Japanese were always concerned that they would be out ahead of us, but not too far ahead. Trying to fine tune that posture was their particular concern. They were particularly concerned with not being hit with anymore surprises about China, the way they were with the Nixon visit and Kissinger's visits and we obliged it. We didn't hit them with any surprises regarding China and they were always a little bit ahead of us in developing their relationship with China.

Q: How about the new nations in the Pacific Islands, any Japanese more interested in those than we were?

KELLEY: Our problems in that area were largely that the Japanese had a much better image out there than in the areas they formally had control of during World War II and before, than we did. The island areas were very anxious for Japanese economic assistance and our primary concern was that the Japanese economic assistance not be so overwhelming that ours was dwarfed by comparison and we were made to look foolish. This was a constant problem because there was no money available, or very little money. As always has been the case since after the Korean

War with our assistance for that part of the world. I don't recall any particular difficulties in that area.

Q: Are there any other areas, problem areas, during this period?

KELLEY: There was one other problem area and that was that former Ambassador Reischauer used the occasion of a visit that he made to Japan to make a pronouncement about how nuclear weapons had been handled in the U.S./Japan relationship. He referred to the "introduction" of weapons into Japan. Given the Japanese allergy to nuclear weapons, anything that was said on the subject at all which introduced an element of uncertainty about whether we had or had not introduced nuclear weapons into Japan was a matter of intense alarm. Politically this was probably the most explosive issue during the time that I was there.

Q: Reischauer had been Ambassador, among other things, was this a gratuitous remark or was there a purpose behind it?

KELLEY: I didn't have a chance to talk to Reischauer and he never really explained himself, that I recall, I'm sure he did at some point. My assumption is that he was just having pangs of conscience, that he thought that perhaps he had not been as forthright and honest and his reputation was somehow stained -- not as forthright as he might have been. He was a little bit uneasy about the requirements of diplomatic life with regard to how you dealt with very delicate issues and having a policy which were not totally clear, frank, etc., about what you were doing in areas as important and as explosive as the nuclear weapon policy. It was sometimes that he may have had a lot of trouble dealing with. I think that he felt that he needed to ease his conscience somehow with his new academic colleagues -- after he went back he became more vocal about our policy in Vietnam, and I think he felt uneasy about anything he might have done that dealt with this very sensitive Japanese issue.

Q: It was very obvious to anybody who was even not privy to secrets -- obviously we were carrying nuclear weapons in somewhat major ships that we put in there. If we sort of said "We're not saying" it was sort of a fig leaf, but once you say it all of a sudden then it becomes a reality. How did you all deal with this?

KELLEY: With great trepidation. [laughter] We knew what the reality was and we knew that the Japanese at the highest levels of government knew what the reality was. We had to craft language that would make the reality palatable, without rubbing the Japanese public's nose in the reality. That's what we went about doing, and ultimately we wound up with a formulation that the Japanese government thought was acceptable to the Japanese public. Fortunately, Reischauer did not feel obliged to push the issue much beyond what he had already done. He could push it to some degree, but he didn't pound on it. It continued to be a festering problem in the relationship up until the time the Navy decided that it would remove its nuclear weapons from its tactical forces.

Q: You left there in 1981, is that right?

KELLEY: It was 1982.

Q: Did the coming of the Reagan administration have any effect on policy with Japan?

KELLEY: The difference was night and day. The Japanese were much more at ease with Reagan, in the political sense, security sense. The Japanese are traditionalists when it comes to diplomacy, they like the tried and true methods. They know how that works. They were brought up on the power politics of the turn of the century, that's when they were introduced to diplomacy, generally. When Reagan came in this was great power, diplomacy again. They knew how that worked -- or at least they thought they did. They got it wrong when they were first introduced to it at the turn of the century, but at least they thought they knew what was going on. This was the America that they had dealt with before. The one that knew what its role was, it was confident that they could do it against the communists, that valued its alliances and put them first, and didn't go around beating up on people about human rights. To the point that it seemed to not be taking into account cultural differences, which was always the great preoccupation in Asia. They could understand a certain emphasis on human rights but what they got bent out of shape about was when we seemed to be telling people how to behave culturally. So they were relaxed about Reagan. The left didn't like him very much, but the left didn't run Japan.

CRAIG DUNKERLEY
Principal Officer
Fukuoka (1979-1981)

Ambassador Dunkerley was born in Wisconsin and raised in several states in the Midwest. He was educated at Amherst College and the Fletcher School of Law and Diplomacy. In 1970 he entered the Foreign Service, serving abroad in Da Nang, Tokyo, Yokohama, Fukuoka, Brussels and Vienna. During his career Mr. Dunkerley became a specialist in NATO and International Security, Disarmament and Arms Control matters, and served as Special Envoy for Conventional Forces in Europe from 1997 to 2001 with the personal rank of Ambassador. He also had several tours of duty at the State Department in Washington, DC. Ambassador Dunkerley was interviewed by Charles Stuart Kennedy in 2004.

Q: You then went down to Fukuoka?

DUNKERLEY: It was my great good fortune to be assigned as Consul – the Principal Officer – at our Consulate in Fukuoka from mid 1979 to mid 1981. It was a delightful experience – one that I still remember with fondness. It was an assignment to a very pleasant part of Japan, the consular district essentially covering the island Kyushu, which in turn was exceptionally rich in Japanese history and tradition, in the arts and traditional culture. For the most part, there was not at that time a pervasive Western presence, let alone numbers of Americans, in Fukuoka or Kyushu – at least as compared to Tokyo or the Osaka-Kobe area. This was both an advantage and an attraction to being posted there: if you wished, it was an opportunity to access and immerse one's self in things Japanese in a way not readily available in Tokyo.

Much of the Consulate's activity was related, in addition to the usual sorts of consular work, to very active trade promotion and to extensive public affairs outreach. It was also a useful perch from which to gain a sense of domestic politics at the local level in that part of Japan – Western Japan – and so we provided considerable analysis and reporting during several national elections during that period. Given its location and past history, this was also a part of Japan with special and long-standing ties with both Korea and China. While the basic direction of Japanese relations with those countries was set at the national level, there were interesting regional aspects to those relationships. For example, Japanese investment and industrial projects with China were picking up then – this was the late 70's – and so the Consulate also followed several ground-breaking Kyushu-Shanghai projects of the period.

So in all of this, as Principal Officer I ended up doing a great deal of time traveling throughout Kyushu and its different prefectures, with the opportunity to meet not just local officials, business leaders, and journalists – but also various artists, craftsmen, actors and the like. From a personal perspective, it was a great time.

There were, of course, also occasional but quite serious problems to deal with. Early on there was a tragic fire in one of the consulate residences in which an American officer perished along with his visiting mother.

And there was a major political incident of an American submarine – the George Washington – sinking a Japanese freighter in, as I recall, early 1981 (Perhaps a recurring theme in U.S.-Japanese relations has been that of accidental submarine collisions). The accident was serious enough by itself, resulting in several deaths. The immediate aftermath was a casebook example of the problems and tensions arising out differences in culture: in this case, the divergence between an understandable but unfortunate reluctance on the part of some U.S. authorities to say too much prematurely, following our own legal standards and practices, and the need, seemingly hardwired into Japanese perceptions of what constitutes proper behavior in such situations, for prompt, sincere, and even emotionally evocative apologies. As much of this played out in Kyushu waters, and the Japanese casualties came from Kyushu. I ended up playing a certain role in the management of that problem.

My two years there went fast. At the end of that period, I was awarded a Fellowship – as an International Affairs Fellow – at the Council on Foreign Relations in New York. After a year at the Council, I returned to the Department in Washington, working from mid 1982 to 1986 I was in the Bureau of European affairs – first in the Office of Soviet Affairs dealing with strategic arms control and then in the Office of NATO Affairs continuing this focus on negotiations with the Russians.

Q: I'd like to go back to Fukuoka. Was the political atmosphere different there than in Tokyo? Newspapers, political control and all that?

DUNKERLEY: Yes and no. There was, of course, a noticeable difference between being out in the provinces and being in the central metropolis. One could say that it was a slightly slower pace out in Western Japan, though I wouldn't carry that too far. It was certainly not more insular. But as you know from your own experience out in that part of the world, Tokyo was and remains

very much the center of Japan's political affairs, and its national media out of Tokyo similarly shaped much of the broad coverage of politics by regional and local outlets.

Q: How was the influence of U.S. military?

DUNKERLEY: Within Western Japan, you had a US Navy presence at Sasebo naval base not too far from Nagasaki. There was also a Marine Corps air station at Iwakuni in Yamaguchi Prefecture, on the Honshu mainland but also part of the Kyushu consular district. Inevitably there were periodic civil-military problems with aircraft noise and the like.

But it was my good fortune when I was there not to have the sort of problems that had been seen there more recently, for instance in connection with our presence in Okinawa. There was a qualitative difference. Just looking at the numbers involved, the ratio of American military presence in Okinawa was much, much higher in a relatively small area than what we are talking about in Kyushu at the time I was there.

Q: Without overstating it, there is a difference almost in quality and outlook between an infantry and people maintaining airplanes. What happened during the incident between the George Washington and the freighter?

DUNKERLEY: The SSBN George Washington was running exercises. There was bad, foggy weather and low visibility. It surfaced and abruptly collided with a small Japanese freighter. It submerged and the freighter sank. Several of the crew drowned. Again, there was a question of responsibility for the initial act and then an apparent failing to respond.

Unfortunately, in the George Washington incident, it took 24 or 36 hours before we were able to say authoritatively through the U.S. Navy that in fact it had been an American submarine involved. During that time there was a certain amount of confusion on the Japanese side. That length of delay was unfortunate. Part of the problem that followed relates to the inevitable disconnect between a culture such as ours – where we are acutely aware of legal procedures, determining guilt and responsibility through a formal process – as opposed to a Japanese cultural situation where there is much more weight assigned to an immediate and profound expression of regret. It took a certain amount of time to work out – just as in the more recent incident off Hawaii of a few years ago.

Q: Off Hawaii where we sank a Japanese research and school vessel.

DUNKERLEY: Yes.

Q: What did you do? Did you have to wait?

DUNKERLEY: No, I had to get involved since it was in my consular district and all of the crew who were lost came from a small town in the southern part of my district – in Kagoshima prefecture. I had to get to the scene rather quickly and represent the U.S. in expressing at least our initial apologies to the grieving families. I had to make a variety of public statements to try to tamp things down even as the U.S. Navy was grinding through its own procedures to determine

responsibility. I had to convey that sense of regret.

Q: Did you have the Navy trying to keep you from over apologizing?

DUNKERLEY: No, but I was the one who had to be out front on the local scene in those first few days.

Anyhow, enough of those days....

ROBERT W. GARRITY
Deputy Public Affairs Officer, USIS
Tokyo (1979-1983)

Robert W. Garrity was born and raised in Boston, Massachusetts. He graduated from Boston College in 1957. In addition to serving in Japan, Mr. Garrity served in Germany and Iceland. He was interviewed by Hans N. Tuch on June 5, 1990.

GARRITY: I think the interest was probably common to my wife and me. Comparing notes, it started back in childhood, reading and so forth. It really hit us en route to our first assignment in Southeast Asia, because our first stop outside the United States was a 24-hour layover in 1965, with our three small children, in Tokyo. I remember my wife saying at that time, "Some day you've got to get assigned here." We just never forgot Japan. Of course, in those days it was still under construction. They had had their 1964 Olympics and did very well. Tokyo, in 1965, compared with when we went back in 1979 they were two totally different cities.

Q: I was there for two weeks in 1955.

GARRITY: When there wasn't much city at all!

Q: That was the only time I've been there.

GARRITY: So I guess you get a feeling about, and an attraction to, a place, and the contrast. I think we returned to Japan on the way back from Vietnam, and my wife was posted in Bangkok with the children. Of course, the contrast between Japan and Southeast Asia is quite extraordinary.

Q: Yes. The reason I am so interested in this is that in all our dealings with Japan, both governmentally and non-governmentally, it appears to me that we have often thought in terms of dealing with Japan as our Secretaries of State -- Kissinger comes to mind, specifically -- deal with the Europeans. However, it appears to me that you are really dealing with an entirely different culture, with a different world, and that one has to take that into consideration if you are ever going to do any good -- let's put it that way -- in Japan for your own country.

What do you think is the essence of how we should approach our relationship with Japan?

GARRITY: I think there's a danger in being overly mystified by Japan. The Japanese themselves, over many, many years, contributed to the feeling that they're very difficult to understand -- really, for foreigners, impossible to understand.

Q: They convinced me. (Laughter)

GARRITY: Their language is "impossible for anyone to master." It's a very difficult language. It's difficult for the Japanese. I'm not saying that as one who mastered it. I was shortchanged on the language training and only got the half of it, and that was the lesser half in Washington.

But I think that compared to Americans and American society, Japanese culture and society is more easily available and more easily understood than our own. We are much more complex as a society. On the other hand, I think there is a tendency to think of Japan as just one big homogenized mass of people. That's not true, either. My experience in Japan, because of having supervision of our Cultural Centers -- which we don't call Cultural Centers anymore; we call them American Centers, whatever that means -- I think the contrast in the different parts of Japan can be very marked, to me. The rich historical tradition in Kyushu, the outward-looking and very different kind of attitude among the people in Hokkaido, which is more recently settled, sort of the California or the last frontier of Japan.

It's an exciting country to experience. Obviously, understanding the culture is essential to dealing with Japan. There are a lot of Americans who do understand that. There's a tremendous amount of expertise, not as much as we would like to have, but more than we realize we have. Nevertheless, coming to Japan later in a career rather than at the beginning, as most Japan hands usually do, I made it my point to see Japan and try to accept it as it is today, rather than being burdened by what it was like way back then. And this incredible economic miracle, it's all done. I think we have to deal with Japan as it is now, not agog over what they've accomplished compared to what they were forty years ago.

Q: In our relationship with Japan, do the Japanese have an easier time understanding us, dealing with us, than we with them?

GARRITY: I don't think so. I think that they learn to deal with certain patterns and traits of Americans, but I think there are very few Japanese who really understand the United States.

Q: But superficially -- just superficially -- we have a relatively small number of Japanese-language officers both in the State Department and USIA, who can deal with the Japanese and Japan in their native language. I don't think that there is a Japanese salesman, whether they sell computer chips or Toyotas, who would think in terms of dealing with Americans in this country without speaking fluent English.

GARRITY: That's right.

Q: I mean, isn't this one shortcoming that we have as a society, in that we are reluctant? Maybe we realize it now more than we did in the past, but that we shortchange ourselves in not dealing

with, say, the buyer of our products on his own terms and in his own language. We expect them to speak English and deal with them in our terms rather than their terms. Do you have any comment on that?

GARRITY: I think that's been a tradition. We were not traditionally an export country. We sold what was left over from the American market. Quite a contrast between that and other nations' approach, where they actually research the foreign market and manufacture to suit that market. We are learning how to do that, but it certainly has not been a tradition in the United States.

Q: From your point of view and from your experience, how, in the area of public diplomacy, that we were involved in, what do you think we have done wrong? What do you think we have done right? And how do you think we ought to approach the future?

GARRITY: Our public diplomacy, as practiced with Japan, has really been driven by policy. We are supporters of policy. Our job is to explain policy, as well as explaining what makes Americans tick, as we do everywhere. Policy isn't necessarily made by people who know anything about Japan. As a result, the pattern over many years in our dealings with Japan is an intense kind of focus on very small issues. So we've really dealt microcosmically with Japan, where the Reischauers and the Ezra Vogels of the world see a macrocosmic view of Japan and know all the issues as well. The official policy has never really come to grips with the macro view of Japan. So as a result, we have concentrated so heavily on whether there is access in the Japanese market to particular American manufactured goods --

I think I found it very useful to come to Japan when I did. I suppose it was kind of a quirk. The assignment, I believe, was made purposely by John Reinhardt, the director at the time, to actually bring in someone who hadn't been there before on assignment and, in a sense, bring a stranger into the club.

Q: You were there before David Hitchcock?

GARRITY: David was there for the last two years of my stay, and the first two years, Cliff Forster was PAO.

Q: Both Japan hands, so to speak.

GARRITY: Yes, long assignments in Japan and fluent in the language.

Q: Is David fluent?

GARRITY: Oh, yes, and very, very good on the culture, very strong understanding of Japan.

Q: David has written quite a bit about Japan. As a matter of fact, I am going to try to interview him, also, although he is not yet a retired person, but anticipating his retirement.

GARRITY: I would say that the people assigned by the Agency in Japan, particularly the American Center directors -- maybe I'm just judging from my own experience there -- having

division of labor with the PAO during my time; I had charge of the Information Division and in the Information Centers, plus just the overall concern for the post -- the Center directors, in my experience, were some of the most outstanding Foreign Service officers I've come across, without exception, very, very able in the language.

Q: That seems to parallel my experience in Germany, when the Amerika Haus directors, in my view, were sort of the engines that drove the program in Germany.

What was the major thrust during your period in Japan, which was the four years between 1979 and 1983? Mike Mansfield was the ambassador during the entire period.

GARRITY: Yes.

Q: What was the main thrust of the USIS program in Japan at that time?

GARRITY: Let me preface that by saying, working as an Amerika Haus director in Munich gives you a very special connection to anyone else who has ever been an Amerika Haus director or an Information Center director. It's probably -- going back over everything -- the best job they've ever had. It's the most fun.

Q: Exactly! The most fun. (Laughter)

GARRITY: The most fun. It's twenty-five hours a day and you never regret a minute of it.

Q: But you do think that's what you would normally do for recreation. (Laughter)

GARRITY: Right. (Laughter) The contrast, of course -- and I think it's probably a contrast with the program in Germany today -- we had a program in Munich which was markedly cultural. We covered all the issues, but we had a very rich cultural program, as well. That was less true, I think, in Japan, although we did have cultural presentations, visiting artists. Certainly the heavy concentration was on the issues that were driving the bilateral relationship.

Q: In other words, you were involved in really supporting the economic, the political, the security issues which were in the forefront through programs that you did in your centers or through exchanges.

GARRITY: That's right. I particularly did a lot of work with the Japanese media around lunches that I would have at my home. We had a steady stream of government officials who I would try to get together with the appropriate Japanese media.

Q: Was it easy or difficult to deal with the Japanese media? Were they receptive to your approaches?

GARRITY: Oh, yes. Very much so.

Q: I noticed in Germany, no self-respecting German editor would ever use a piece of wireless file material in his or her newspaper, whereas in Brazil, even in the most respected newspapers,

even under the absence of censorship, would take a wireless file and slap their own correspondent's name on it and publish it as though it were their New York or Washington correspondent. Did the Japanese, for instance, use the wireless file?

GARRITY: They certainly understood what we were doing with the wireless file, and it was not an object of suspicion in that sense. They found it most valuable as a record of policy statements.

Q: Source material.

GARRITY: Source material, texts for speeches, presidential speeches, and so forth.

Q: In other words, they used it, say, to write editorials, because the wireless file was the one resource that provided full text, which the AP or other wire services, if a president gave a speech or a secretary gave a press conference, would provide a story, not the authoritative text.

GARRITY: They have several of their own international wire services and their own correspondents, plus, of course, access to AP, Reuters, UPI, Tass, you name it. I mention Tass, which has become a little more respectable now than it used to be. Nevertheless, the value that the wireless file offered -- and it was invaluable -- it's a full text that you just wouldn't get from any other source that quickly. That's what we really tried to stress with Washington, to keep those texts coming, keep the policy statements coming.

Q: Talking about the wireless file and the importance of the centers and your program in the centers, what were some of the other things that were particularly effective? Exchanges or the Fulbright program?

GARRITY: The whole exchange apparatus is gold, as far as I'm concerned. When I first went to Japan, I approached our cultural attaché, who was a fine man by the name of Sidney Hamolsky, who is now retired in southern California.

Q: We served together in Brazil, where he was the cultural attaché.

GARRITY: Very, very devoted. In my naivete, I said, "Sid, could I have a list of all of the exchange programs between Japan and the United States?" Not just ours. (Laughter) He laughed and said, "Anyone would give their life, practically, to get such a list, because there are so many exchanges on so many levels, that nobody has ever compiled one."

Q: Did the government program of exchanges, whether it's the Fulbright program or youth exchanges, did it make an impact? Was it important, what with all the other exchanges going on?

GARRITY: I would say so. It certainly had a lot of visibility. The prestige that's attached to being a Fulbright exchange scholar, for instance, is just enormous. During my time in Japan, a national organization, an Association of Fulbright Alumni, was formed.

Q: In Japan?

GARRITY: In Japan. The alumni had met together in various regions around Japan, but it became a full-fledged national organization and a fund-raiser. There was a very sizable grant that started all this off, by a man named Yoshida, who was the head of YKK, the foremost fastener company in Japan, maybe in the world. We always called him the Zipper King. He was the first man to set up a plant in a place called Georgia, when a man named Jimmy Carter was governor. They established a friendship, and really, in honor of President Carter, he donated \$500,000 to the Fulbright Commission. You may not know, but in Japan, such donations are not tax deductible. Not only that, they are taxed. So he probably had to pay an additional \$50,000 on his donation. But it really got things going.

There was a thirtieth anniversary of the Fulbright program. Senator Fulbright came to Japan for the occasion, and I would say that the attention paid to the Fulbright program and the organization of the alumni and the fund-raising that went into it got a lot of publicity.

Q: That should have been an interesting occasion, because Mansfield and Fulbright saw eye to eye on most issues, didn't they, when they were in the Senate? Were they friends?

GARRITY: I would say that Ambassador Mansfield considered himself, and was considered, a first-class colleague by all of the incumbents and former members of the Congress. Just a remarkable rapport. We had so many visitors actually serving in Congress or having had congressional service, who came through Tokyo. Without exception, in my memory, anyway, they had apparently a warm feeling with Mansfield.

Q: You and I both had the good fortune of serving with non-career ambassadors, politically appointed ambassadors in our respective last posts, you with Senator Mansfield, I with Arthur Burns. They really, as far as I was concerned, were inspiring and really made, in my case, the last few years in the Foreign Service a particularly interesting and satisfying experience to be with people like that.

GARRITY: That's true. I think in the case of Ambassador Mansfield, he prided himself on coming into the Congress first as a representative, then as a senator, from the academic world. This was a very important distinction for him. He was a professor at the University of Montana.

Q: So was Fulbright.

GARRITY: Right. So this gave him a natural feeling about the Fulbright program or the exchange programs. Certainly he was a very strong supporter of the YFU exchange programs, and particularly got involved with the Senate-Diet exchange program.

By way of explanation, that was a program where the Japanese Government invited each senator to nominate one youngster from his or her state to spend three months in the summer in Japan under the auspices of Youth For Understanding, and in turn, then, the US Government decided to reciprocate by inviting a number of Japanese youngsters between fifteen and eighteen from each prefecture in Japan. That was called the US Senate-Japanese Prefecture program, which, unfortunately, at the present time is coming on hard times.

Q: So I hear.

GARRITY: Yes, because both governments are reluctant in their funding of this program, and I think it's so valuable. Ambassador Mansfield made it a practice to say "sayonara" to the Japanese as they went off to the US, and to greet the American exchange students as they arrived in Japan. There was no question that he considered this a very, very important program. The caliber of the students was just overwhelming, and the impact that they made in their communities was quite profound.

Q: What programs didn't work?

GARRITY: What didn't work? You know, we have a funny situation in Japan. The American companies who do business in Japan successfully don't really like to talk too much about why they're successful, because they don't want any of their competitors to get their secrets. But the companies who fail sort of steal away in the night and they don't want to talk about it at all. (Laughter) So programs that don't do well, they tend to disappear and be forgotten.

Q: One of the reasons I'm asking the question is because during my time at the Voice of America, there were those, including the then director, who really wanted us to broadcast the Voice of America in Japanese, because he felt that the Voice of America was a global radio network and we had to broadcast in all the major world languages. He felt that way also about German and Italian and French.

I always opposed that, because I felt that spending resources -- and they would have had to be considerable resources -- on starting again to broadcast in Japan, it's a media-saturated society, I felt, especially by radio. Secondly, it is a free society where people have access to all kinds of views and news and information not supplied to them only by the government. Thirdly, I felt that it would take us so much time and effort and money to build an audience in this media-saturated society, that I thought it would be a waste of resources to broadcast in Japanese, and instead, we should spend our resources on programs which would be much more effective in the cultural communications process.

As long as I was there, and I think even now, I mean, my view prevailed, but it was a sore point with some people that we were not broadcasting in Japan.

GARRITY: I think clearly a Japanese-language broadcast would have been, in any case, unnecessary and certainly not worth the cost. There were maybe half a million Japanese listening regularly to Worldwide English on VOA. There are aficionados of shortwave radio all over the world, and Japan has their percentage.

Q: But these were not the target audiences.

GARRITY: Not necessarily. No, I think these are people who are just interested in tuning in around the world and getting BBC or whatever. There's no question that Japan has access to worldwide information, either directly from their own representatives around the world or

subscribing to other news services. Building an audience for a Japanese-language broadcast by VOA would have been unnecessary -- unnecessary completely.

Q: How about television?

GARRITY: I think television, as we gained expertise in the two-way satellite operation, for specific events, was useful. For instance, the first program that we put together, working with Washington on a satellite broadcast, was with the Secretary of Defense [Caspar] Weinberger. I remember this vividly. I'm not sure it's something I should talk about. (Laughter) The cable came from Washington saying, "How would you like to have the Secretary of Defense?"

"Sure!"

They were willing to put money into up-leg and down-leg. It was kind of one of the first programs and they wanted it to work. Well, I got together with our press attaché at the time, who was Bill Moyers, who is in personnel right now. You might go to Bill Moyers and check whether I remember everything correctly. But we got ourselves over to NHK, which is the big non-commercial network, somewhat the equivalent of BBC and much, much bigger than our own PBS. I didn't bring money up at all. I mean, I would have killed the deal if I had raised the subject of money. NHK has so much money, they don't know what to do with it. When they heard "Secretary of Defense," they said, "Great!" They had a program already on the schedule, where they could just tie him right in. In fact, the first thing they wanted to do was just carry it live. We subsequently did record it and then put time into a really good translation. Simultaneous translation can be a risky business, a high-wire act. So eventually that's the way it did work.

NHK picked up the entire tab for their end, and I must say there was kind of a begrudging attitude on the Washington end, in that they didn't get to spend all the money that they had in mind. (Laughter) Rather than thanking us for saving them money!

Q: Worldnet, which it finally developed into, was its purpose as Charlie Wick envisaged it initially, as a news maker? Was its value as a news maker or was its value more in the way that it provided an opportunity for people who could not come in person and go around and talk to a lot of people or to communicate as sort of a specialist in a subject and thereby provide the information and the contact that they could not provide in person? Which one?

GARRITY: In my view, the latter, certainly. News makers, that's covered by commercial, already existing communication lines and networks. The real value, to me, of the technology was not this daily program, which is just sort of a poor imitation of the "Today Show." The real value was in getting the counterpart to the Japanese expert on the other end of the tube and giving them a chance to really talk. I think that it gave an immediacy that you just couldn't get otherwise. We've done the same thing on telephone lines, which may seem primitive, but in its own way could be very, very effective.

Q: It works.

GARRITY: It works. I mean, there are very successful talk shows in town today that don't have

television and yet work beautifully. So I think whatever means electronically you have to bring our people together with Japan and wherever, fine. Television adds to it, but I think the real value is not the regular scheduled program, but the event-by-event --

Q: In dealing with the Japanese, in your programming with the Japanese, was the factor of language a major element? In other words, did you really have to do things in Japanese?

GARRITY: I would say most of the time we did things in Japanese. That doesn't mean all our American speakers were able to come over and speak in Japanese. But we put a lot of effort into translation and interpreting.

Q: How about publications? Did you publish anything?

GARRITY: First of all, we had an outstanding magazine which somehow managed to continue to exist during an era when the Agency was considering one-world materials, which seemed to me to be the ultimate in nonsense, to consider that one piece of material is suited to every audience in the world. [See interview of Stanton Barnett in this series on this subject. The idea was sometimes called "the Global Village" concept, that all intellectuals worldwide have similar interests and reactions to the same idea.] (Laughter) How an agency with so much knowledge could ever come to such a conclusion was beyond my understanding.

The magazine Trends was geared to a Japanese audience, primarily reprints of appropriate American articles, but also there were articles commissioned for the magazine with American writers.

Q: In Japanese?

GARRITY: They would be written in English.

Q: I mean the magazine, Trends, was a Japanese-language magazine.

GARRITY: Yes. In fact, it won several awards for design, which were richly deserved. We were very fortunate to have a succession of American officers, publication officers, who were immensely talented and devoted to keeping the magazine up to high standards, and a very devoted Japanese staff working on getting the magazine out, and some awfully good translators who were able to get these articles and re-rewrite them. I don't really like the word "translate," because you can't translate -- maybe in some languages it works, but in Japanese you can't just translate from English to Japanese. You have to take English and put it into Japanese to make any sense. I think that Trends was an outstanding example of a successful magazine that really communicated and went to a very, very important opinion-making audience.

Q: Before we go on to the other subject of concentration this morning, is there anything else you would like to mention?

GARRITY: Yes, I'd like to make one more comment on my experience in Japan. You asked were there any programs that didn't work. I would say that although there's a need, as we all

know, to keep track of your audience and be sure you're communicating with the people you are supposed to be communicating with, the intensity with which we were expected to work with our audience records, the DRS, distribution record system, vastly outweighed the return.

WILLIAM PIEZ
Director, East Asia Bureau
Washington, DC (1980-1982)

Mr. Piez was born and raised in Rhode Island and educated at the University of Rhode Island and the Fletcher School. After service in the US Armed Forces, he joined the Foreign Service and was posted to Frankfurt, Kabul and Manila as Economic Officer. During his career Mr. Piez dealt primarily with economic matters of East Asian countries, particularly Japan, where he served first as Economic Counselor and, from 1983 to 1985, as Economic Minister. In the Department in Washington, Mr. Piez was Deputy Assistant Secretary of East African Economic Affairs, and from 1989-1991, Deputy Assistant US Trade Representative. Mr. Piez was interviewed by Charles Stuart Kennedy in 2009.

Q: Well you left there when?

PIEZ: Well I left there in 1980 to come back to the East Asia Bureau to the Economic Policy Office. I was the office director.

Q: You were there from when to when?

PIEZ: I was there for about two years. In 1983 I left that job. Transferred again.

Q: Well what was this '80 to '83 period. We have been talking about economic difficulties. How stood Asia at this point?

PIEZ: Well at that time it was the region of the economic miracles. You have got Korea, Taiwan, Singapore, Malaysia not too far behind. Vietnam was settling down. We were dealing with some of the political issues like the POW/MIAs. We had an extensive structure of regional organizations in Asia. We had ASEAN (Association of Southeast Asian Nations). We had the Asia Pacific Economic Council (APEC). It included Australia and New Zealand. The American Chambers of Commerce in the different countries had their organizations in the region and they met every year dealing with various questions of their business interests in the Asian countries.

Q: From your perspective when you got there in 1980 what were sort of our economic concerns?

PIEZ: Well there were still trade issues, and we still had a number of questions relating to encouraging our exports, and the increasing importance of China as an economic power was certainly of interest. A lot was going on there.

Q: Well how did we feel about China? Did we see China as a potential market? All this oil for the lamps of China idea that this is a great market, at the same time if this thing starts going it will flood us.

PIEZ: Occasionally you would have someone say if every Chinese lengthened his gown by one inch there would be a market for 80 million square yards of cotton. Well Ok. I was not too impressed with that sort of thinking. We didn't see China developing as a threat in particular, but certainly Chinese economic development was very much to be desired. China as a poor country was not something that would be to our interests at all.

Q: Was India included in your bailiwick or not?

PIEZ: When I was in the bureau, No. That was part of South Asia and still the NEA bureau. We went as far as Burma and after Burma that was it.

Q: During the time you were there, two years or so, did the investments in Thailand and Indonesia were they beginning to go sour? Were their economies in pretty good shape?

PIEZ: On the whole they were. Indonesia had some pretty forward thinking industrial and economic leaders. I think it was pretty well known the system was highly corrupt. To get into the category of economic or industrial operations in Indonesia you had to have connections. But on the whole the country seemed politically stable, and economically developing at a reasonable rate. There were continuing problems in the Philippines. Thailand was doing well. The East Asian financial crisis occurred only after I had retired.

Q: The Marcos regime was beginning to come apart right while you were doing that.

PIEZ: It was during the Carter Administration that the Marcos regime collapsed. Richard Holbrooke was our Assistant Secretary and he was concerned that Marcos be replaced, but in an orderly fashion and without violence. That was how it worked out, essentially, although economic advancement in the Philippines was still slow and sporadic.

Q: This was the Reagan administration, at least after you were there Reagan came in. You know, Reagan being a Californian and all, also his people were from California, so they must have been a little more oriented...

PIEZ: More oriented toward East Asia. The Reagan Administration came in while I was in Washington. I recall that, during the Air Traffic Controllers strike, I was on night duty for a time. Because of the time difference a lot of the traffic on related issues came in at night. Our concern was to keep flights from and to East Asia operating safely as much as we could.

Q: Did you feel that you were getting your due share of attention in the State Department.

PIEZ: Oh yes. Ambassador Mansfield, one of his repeated expressions was the U.S.- Japan relationship was the most important bilateral relationship in the world, bar none. He could make that case. One might choose to argue, but he had a pretty strong case. President Reagan kept him

on as ambassador, a wise decision.

Q: But also to the point where you take a look at the situation you have differences. If you look at say Europe. You have a whole bunch of countries, but they are all rather cohesive. But when you look at Asia you have only really got Japan.

PIEZ: Well Japan was clearly by far the second largest economy in the world.

Q: China, you didn't know where it was going. Korea was in the middle of a dictatorship. Park Chung Hee had been killed...

PIEZ: The harsh realities of dictatorship.

Q: You mentioned the Philippines dragging behind. What was the problem? How did we perceive it?

PIEZ: Well Marcos and his cronies stole everything they could get their hands on. If they saw a sector of the economy that was doing Ok on exports they might seek a way to milk it. The prime example was cocoon production and exports of copra. Marcos and his cronies literally took over the business. And the actual growers of cocoanuts and copra were really reduced to subsistence levels. The cronies tried to control and time the exports in order to maximize the prices. That doesn't really work too well when you have a lot of competition from other countries like Indonesia and Malaysia. But they thought they could do it. They did certainly make a lot of money out of it. The bad thing was the Filipinos who were getting all these profits tended to stash them abroad in the United States or in Hong Kong, or put them into showcase mansions that did not add much value to the economy. As I mentioned before a country could tolerate some corruption if the people who make the gains from corruption invest it wisely in their own country. In the Philippines they weren't doing that. They would send the money out.

ALOYSIUS M. O'NEILL
Staff Aide to Ambassador
Tokyo (1980-1981)

Japanese Language Training
Yokohama (1981-1982)

Political Officer
Tokyo (1982-1984)

Mr. O'Neil was born in South Carolina and raised there and in other states in the U.S. He was educated at the University of Delaware and Heidelberg University. After serving in the US Army in Vietnam, Mr. O'Neill joined the Foreign Service in 1976 and was posted to Korea. He subsequently served three tours in Japan as student of Japanese and Consular and Political Officer. He also served in Burma,

Korea and the Philippines as well as in Washington, where he dealt primarily with East Asian and Pacific Affairs. Mr. O'Neill was interviewed by Charles Stuart Kennedy in 2008.

Q: You were there from 1980 until when?

O'NEILL: To 1984. The first year was in Tokyo as ambassador's aide, the second year — from 1981 to '82 — was the second year of Japanese language training at FSI Yokohama. From 1982 to '84, I was back in the embassy in the external branch of the political section dealing with Japanese Asia policy.

Q: Before we get to working for Ambassador Mansfield, what was your impression? First, a little compare and contrast Japan and Korea in your eye, Seoul and Tokyo and all. Was this quite a change or not?

O'NEILL: It was in certain respects. Both were huge metropolises, of course. The biggest obvious difference between Korea and Japan was the absence of a North Korean-style military threat to Japan. The military threat the Japanese were concerned with was the Soviet Union, not North Korea. Even though there were large U.S. military forces in Japan their principal mission was first the Soviet Union and secondly North Korea. The Japanese were in those days certainly happy to hide behind the American force presence including the nuclear umbrella.

The level of development between the two countries was still very widely different. Korea was on the very upward path to where it is now. Japan had already been there, and it was a gigantic economy and one that was years away from the economic doldrums that it's mostly been in since the mid-1990s. It was a real powerhouse. You'd start seeing these American books about Japan as number one, and Japan was being touted as the model for American businesses, etc.

In the U.S., nobody was thinking of Korea in those terms. Tokyo was a more glitzy city, a more developed city. Obviously, there was a great deal of construction going on in Seoul at the time, replacing these buildings that were post-war construction with better and more modern apartments, office buildings, etc. So there were a lot of physical differences. It was also a lot easier to get around Japan. We could walk out of our apartment in the embassy housing compound and get on a subway line to one of the major railroad stations in Tokyo and go by rail to anywhere in Japan except Okinawa or Hokkaido. The rail network in Japan was extraordinary particularly compared to Korea at that time. It was also a much bigger country with a much larger population.

Just one example of the difference was in the way that the respective embassies dealt with the military relationship. As I mentioned earlier, in Korea it was normal once a week for the ambassador and the top American four-star to have breakfast once a week when they were in the country. In Japan, the number of U.S. military total was larger than in Korea perhaps by 10,000, counting people on ships based in Japan. The main periodic connection between the embassy and U.S. Forces Japan (USFJ) Headquarters at Yokota Air Base outside the city was usually a lunch between the DCM and the Marine major general who was the deputy commander and chief of staff, USFJ. It was a lower level relationship. The ambassador and the commander could

certainly talk when they needed to, but the routine connection was somewhat lower and less close than it was in Korea. No surprise, really.

Q: Let's talk about Mike Mansfield, your impression of Mike Mansfield as a person, and then what you were doing with the embassy and with Japan.

O'NEILL: It was a fascinating year. I never expected to be working for somebody who was a real historic figure in American political terms. Mansfield had been born to Irish immigrant parents in New York on the day before St. Patrick's Day in 1903, March 16, 1903. The family moved to Montana when Mansfield was very young. As you may know, Mansfield had a military background. In 1917, during WWI, he had dropped out of school and enlisted in the Navy. He was kicked out when they found out he was only 14. He was living proof that a fraudulent enlistment was not always a bar to future success.

Mansfield then went into the Army for a year or two and then right after World War I he joined the Marine Corps. As a Marine private, he was sent both to the Philippines and China. He was very proud of having been in the Marines. In Tokyo, if he wasn't wearing a U.S. Marine Corps tie, he wore a Marine Corps tie bar, with the Marine eagle, globe and anchor on it. The only inscription on his tombstone at Arlington is his name, his dates (1903-2001) and "Private, U.S. Marine Corps. There's nothing about being the longest-serving Senate majority leader or the longest-serving U.S. ambassador to Japan.

Mansfield used to tell Japanese visitors that he first saw Japan in 1922, often long before some of those visitors were born. When the ship was taking him back from China to be discharged, it stopped in Nagasaki for coal. He said — of course, the Marines weren't allowed off the ship — he could look out and see lines and lines of Japanese women with baskets full of coal on their heads. They'd dump the coal into the chutes of the coal bunkers on the ship. That was his first view of Japan.

After he had got out of the military service he began teaching at the University of Montana. He was elected to the House of Representatives I think in 1942, anyway during World War II. Then he was elected to the Senate in 1952. I heard him tell Lady Bird Johnson, who was visiting Tokyo, that that was the year Lyndon Johnson, John F. Kennedy, and Prescott Bush all entered the Senate. At the time that he was appointed ambassador in 1977 he had been the Senate majority leader longer than anybody else.

Mansfield was quite an extraordinary character. When I got there in summer 1980, of course, we were heading towards the election in which Carter was running against Reagan. Lots of people were telling me that I'd have an exciting time as the ambassador's aide because there'd be a new ambassador after the election. They were saying it would be fascinating dealing with the Imperial Household Agency over ceremonies involving the emperor and helping the new ambassador get adjusted to Japan.

Mansfield was very much like a Liberal Democratic Party politician of Japan in some ways. One is that he had spent his entire political career in the legislature which most Japanese politicians do in their parliamentary system. The other is that he was somewhat older than the average

American ambassador even at that time. He also was pretty soberly dressed all the time.

In contrast to lots of ambassadors he didn't necessarily want his staff aide to be in his office as early as he got in. He tended to get in around 7:30 and he wanted the time to read all the newspapers in English and press translations that had been provided. Then I would come in and go through all the cable traffic to select the small amount that he really needed to see. Mansfield had a tremendous ability in his 70s to absorb what he was reading and put it to use in meetings or in instructions to people in the embassy. He was a courtly gentleman who also had an enormous appetite for information.

One of the many fascinating things about him was the range of his correspondence and the range of contacts he had. He had spent a lot of his career in Congress focusing on Asian affairs and had many contacts among very senior Asians including Prince Sihanouk of Cambodia. In his correspondence file, you'd find letters from him to and from everybody ranging from Kirk Douglas to Sihanouk and just about everybody in between. People were constantly coming to see him and pay their respects and ask his advice, etc. There was one time that Melvin Laird was then meeting with the ambassador.

Q: The secretary of defense.

O'NEILL: The former secretary of defense. The meeting with Laird was going long. The next person he was supposed to meet was Harold Stassen, the former "boy governor" of Minnesota who had run for president certainly four or five times. Stassen was out in the waiting room, and I kept going out and saying to him, "Sorry, Governor, but things are running a little late. The ambassador will be with you soon." After one of those trips to look in on Stassen, my phone rings, and it's John Kenneth Galbraith, wanting to "say hi to Mike." He was just passing through Tokyo. I said he had this line of visitors; Galbraith said, "Just let Mike know I called," which I did. This was just one moment in a Mansfield day. It wasn't always that way, but it illustrates the kind of person that he was and the kind of people who sought his advice. They all wanted to say they'd been talking to Mike Mansfield about Japan.

That was a tough time in U.S.-Japan relations because of huge discord over trade, particularly automobiles, exports from Japan in the United States, and the fact that when it came to automobile imports from the U.S. to Japan, there were two big factors, two barriers. One was Japanese non-tariff barriers to trade including a lot of their hyper-attentive inspection routines. The other thing was that the American automakers resolutely refused to make cars for the Japanese market, and nonetheless demanded that Japanese consumers buy them anyway. So you had the American Big Three, furious that the Japanese were not buying huge American cars with the steering wheel on the left hand (wrong) side and cars that were, because of their size, real gas guzzlers in a time when gasoline in Japan was many times higher than it was in the United States. Had they been to Japan, the Big Three's executives might have noticed that the streets were narrower than LA's too. Managing that issue was a big problem during that year.

As it happened, these thoughts about my getting to deal with the arrival of a new ambassador were put on hold by President Reagan. Mansfield's reappointment was as far as I know Reagan's first ambassadorial nomination. In the springtime the often rocky U.S.-Japan relationship got

rocky, indeed, because of a series of incidents. One happened in April 1981 when *George Washington* which was originally built as a Polaris missile submarine was running submerged near Japan in international waters. It struck and sank a small Japanese freighter, the *Nissho Maru* with the loss of the captain and the first mate. This accident caused a huge uproar in Japan. To help cope with the outcry, the ambassador made a formal call on Foreign Minister Abe, the father of the recent Prime Minister Abe, and was photographed bowing deeply before Abe. This didn't sit too well with some in the U.S., but it certainly did in Japan to have this distinguished and broadly admired figure doing what Japanese would have done in the same circumstances. His bowing publicly to the foreign minister did help contain the uproar over the accident.

Not long thereafter Prime Minister Zenko Suzuki made an official visit to the U.S. to meet with Reagan. Either in the course of that meeting or right after it, Suzuki, who was as bland a politician as has ever been prime minister, stated that Japan would defend its sea lanes out to 1,000 nautical miles. Also, PM Suzuki used the word "alliance" to describe the Japanese relationship with the U.S., which as far as I can recall was the first time that a Japanese prime minister had done so. This was 21 years after the revised Mutual Security Treaty had gone into effect but Suzuki's statement also caused quite a stir in Japan. (The American public of course, thought that was the relationship with Japan all along.) Responding to Suzuki's statement about defense of the sea lanes, Foreign Minister Ito promptly resigned on the grounds that this whole question and public announcement had not been vetted with the foreign ministry. The White House quickly issued a statement saying that this had been the most successful U.S.-Japan summit meeting in history, which probably did little to repair the damage.

Then a third thing happened in that eventful spring of 1981. I went to the office one morning, and Bill Sherman, the superb DCM, a Japan hand of the deepest hue, and just a consummate FSO, was looking at one of the newspapers. The big story was former Ambassador Reischauer who had been Kennedy's ambassador at Japan, upon his retirement from Harvard took it upon himself to announce to a Japanese reporter that of course we had brought nuclear weapons into Japan over and over again, and the Japanese knew it. Bill Sherman was never rattled by anything. He always knew what to do; he always had the right answer. I had never seen him so unhappy. His face was just white, and he was furious. In the aftermath of the *George Washington-Nissho Maru* accident and the flap over the Suzuki visit, now this, Bill Sherman said, "*What else can go wrong?*" Bill said some uncomplimentary things about Reischauer that morning. There was a good bit of fancy stepping to put that particular genie back in the bottle, and eventually the Japanese wandered on to other subjects.

Q: It was one of these unspoken things, that Reischauer had spoken, wasn't it?

O'NEILL: He did it for no good reason at all. Whether he felt on his retirement he had to get one more headline, I don't know. I never met Reischauer. I knew of him as a great scholar of Japan and, presumably, a successful ambassador. But, yes, what he raised in public was one of those things was never spoken of. The U.S. press guidance was always very fixed and very bland. Both sides always wanted the issue to go away.

Q: How important was the emperor, the court, the court protocol, and all that, from your perspective?

O'NEILL: In the Japanese constitution the emperor's not even described as the chief of state. He's called "the symbol of the state and the unity of the people." So his constitutional role was to be very ceremonial, indeed. When there was a presidential visit, there would be ritualized meetings with the emperor, and the emperor would welcome the president. Ambassadors presented their credentials to the emperor in great ceremony.

There was an annual cycle of events for the diplomatic corps hosted by the emperor, including the emperor's garden party. There was even an annual trek for the luminaries of the ambassadorial corps out to the imperial pig farm, and there were other events like concerts of an extremely traditional form of music called *gagaku* at the music hall of the imperial palace to which the diplomatic corps was always invited. But the emperor played no role in politics. He would have a nominal role in opening parliament and giving a rather stilted speech on those occasions, and the emperor's birthday on April 29 was a holiday, the anchor holiday of the so-called "Golden Week" but he was not a political figure. Had he tried to be so, it would have been quite disturbing in Japan.

Q: As the ambassador's aide, did you get any feel for the relationship between Mansfield and Reagan and Alexander Haig when you were doing that?

O'NEILL: I'm trying to think. Haig was Reagan's first Secretary of State. I don't know how much contact that Reagan had ever had with Mansfield before Mansfield was nominated as ambassador. The communication that I remember most between senior Washington figures and Ambassador Mansfield was with trade officials — commerce, the U.S. Trade Representative, etc. — over autos, steel, and all the other major issues in trade relations. Haig didn't visit during that year. In that year, I don't recall that we had any cabinet visits except, perhaps, on the trade side. I don't think the treasury secretary did.

Q: It's interesting. Here's a major ally.

O'NEILL: Just let me add some atmospheric about Ambassador Mansfield who was a very fine gentleman of the old school. If he would be coming to an elevator at the same time as one of the female Foreign Service Nationals, one of the Japanese employees, Mansfield would always step back and try to usher her onto the elevator. Of course, this would paralyze the FSN because there was this towering figure to whom she was supposed to be bowing deeply, trying to let her on the elevator ahead of him.

One of the well-known things that he did to help put visitors at ease was his ritual, particularly with Japanese visitors, of making instant coffee for them. This was in total contrast to the Japanese way of doing things which was to have OLs or office ladies serve tea to everybody. Of course, in Japan the great person himself who was hosting the meeting would never think of doing such a thing. But Mansfield did this, trying in his way to put people at ease.

Another thing, in his office on the bookshelf next to where he would meet visitors, he had photographs of the Republican and Democratic congressional leaders. He would almost invariably point these out, particularly to the Japanese politicians and also business leaders. His advice was, "When you're looking at Washington, don't think only of the executive branch

which is obviously very important, but these people are very important to you, too.”

Q: When you were his aide, did he go down to Okinawa, which was “Marine territory?”

O’NEILL: “Marineland of the Pacific.” He didn’t go to Okinawa that year at all. He had been I’m sure. I went with him and Mrs. Mansfield on a long trip to three of the prefectures on the Japan Sea coast of Honshu. He made quite a number of trips to the U.S. during that period, and I always went out to Narita Airport with him and Mrs. Mansfield to see them off and to welcome them back.

Q: How about Mrs. Mansfield? Ambassadors’ wives run the gamut. How would you describe her?

O’NEILL: She was a lovely person. She was really wonderful. Ambassador Mansfield was absolutely devoted to her all his life. She was in frailer health than he was overall but she was fascinated by Japan, really enjoyed learning about Japan. Aside from visiting places and meeting people, she did a lot of reading on Japan. She was a lovely lady, a fine hostess, and absolutely essential to him because he was so devoted to her.

Q: How did he run the embassy?

O’NEILL: The DCM ran the embassy. The ambassador knew the embassy officers whom he dealt with, but he didn’t go around the embassy shaking hands and that kind of thing. In that respect he was different from an FSO ambassador who would have been more likely to spend more time just on a periodic basis going around the various sections. Those in the embassy who didn’t normally come in contact with him in their work weren’t necessarily happy with that fact.

But he always had very strong, capable DCMs who were real Japan hands. The one I first dealt with was Bill Sherman who as I recall had gotten a start in language training at the end of WWII. He was one of the people the Navy trained in Japanese. I’m not sure if he was overseas during the war, but he was thoroughly involved in Japan thereafter. That was the way Mansfield wanted it. He wanted to be able to deal with senior Japanese and have the DCM run the embassy and give him good advice.

Q: We’ll move into a different sphere in a minute, but from your staff aide’s viewpoint. I would think Japan would be hard to deal with because you have a Diet that doesn’t seem to be a functional legislature. One party that’s been in forever and...

O’NEILL: Of course, in that era, the Liberal Democratic Party or LDP always had the majority in both houses in the Diet, the upper house and more crucial lower house, and always picked the prime minister. An interesting factor in Japan, though, was that even when the LDP had an absolute majority, and therefore could pass any law, there was a compulsion because of cultural strictures to get, for example, votes from the Japan Socialist Party the main opposition party and, perhaps, some of the smaller parties, too, to at least give the...not even the illusion of consensus but a certain amount of consensus. That was the practice. The LDP would make concessions that would be unheard of in the U.S. Congress. If the Republicans or the Democrats had the absolute

majority, they would pass whatever they want and devil take the hindmost. Japanese tended to be more conciliatory, but the factional infighting among the LDP tended to produce prime ministers prized for their timidity and for their lack of willingness to take bold initiatives. This has been an interesting phenomenon all along with few exceptions like Prime Minister Koizumi early this century.

The other thing that marked Japanese politics was the jockeying for the prime ministership among faction leaders in the LDP. They were usually vying for cabinet positions that would position them later for a run for the top job. This produced a certain amount of turmoil and turnover in the cabinets, more than you might want, and also some cases where cabinet members who had decided a career path to move from one ministry to another were not all well versed in their portfolios. The bureaucrats, the permanent bureaucracy which started at the vice ministerial level in all these ministries, were determined to control their ministers and make sure the ministers did what they wanted. Bills that went to the Diet were normally drafted by the bureaucracy and presented to be passed with as little discussion as the bureaucracy and the PM's office could manage.

There was and still is the opportunity to vent opinions in the Diet, however. Every year in the springtime, March and early April, the diet budget committee sessions were televised. Despite the name, these budget committee hearings were a concentrated form of the "question time" that you would see at the House of Commons in London. It was an opportunity for all members of the Diet to — and certainly all opposition parties at least — to throw rhetorical rocks at the prime minister and various other ministers about anything that came to their minds.

The bureaucrats, during the budget committee hearings, usually camped out in their ministries because they were up all hours of the night writing Qs & As, questions and answers, for their ministers or the prime minister, and otherwise sat in their offices all night playing *mah jongg*, waiting for some new question to come in. They were prisoners of their ministries during the budget committee hearings. It was an opportunity for the general public to see the ministers and prime minister be baited with leading questions and having to respond, and measuring their quality as government officials based on this.

Q: You moved after a year to the political section?

O'NEILL: In Tokyo, the staff aide's job was a one year assignment. During that year, the DCM decided I should get the second year of language training in FSI Yokohama and after that go to the political section's external branch, which dealt with Japanese foreign policy. I was slated to be cover Asian affairs, which was to my mind the best job in the political section for a mid-level officer.

Q: How did you find the second year of Japanese?

O'NEILL: In some ways it was easier than the first. But it necessitated moving down to Yokohama which was only about 30 miles away, and living in a house "on the economy" as the military says, rented for that period of time from a Japanese realtor. It was a wrench in that we had already moved twice in Tokyo because of the reconstruction of the embassy housing

compound. We moved to Yokohama knowing that 11 months later we were going to move back up to Tokyo into the newly rebuilt embassy housing compound.

I found that during the year I was staff aide, my formal Japanese had fallen off alarmingly, because mostly I was dealing with senior Japanese officials who all spoke exceptionally good English. During that year most of my Japanese language practice came in running around to little towns sightseeing or going around in Tokyo. So I had a certain re-learning curve at the beginning, but it was excellent instruction.

The teachers were all experienced, and both male and female in contrast to the situation at FSI Washington. That was very helpful in and of itself. The program was more elaborate. We had field trips at different times during the year of two different types. Sometimes the entire group of students would go with teachers off to some place, usually of historic importance, to spend several days in a Japanese environment. There were two or three times at least where you'd go out for a couple of days at a time on a program that you designed yourself to see a particular part of Japan, etc., and then you'd report on it. There was a lot more active use of the language during the course of the year than there could have been at FSI Washington. It was quite good instruction and I wound up with three-plus in both speaking and reading at the end of that year, which is above average.

We moved back after that to Tokyo, after home leave in the U.S. to the new embassy compound which was built on the site of the old one. This was in September of '82, and I worked in the political section for two years.

Q: Before we move to that, how was your wife adjusting to this? She's Korean, and the Japanese... I mean, both sides aren't very nice to each other in normal.

O'NEILL: She was quite good about it. She adapted extremely well to the whole business of being in the Foreign Service, and she adapted very well to Japan. In the first year when we were in Tokyo, Jin spoke no Japanese, and I had had a year. When we'd go into a shop, I would speak in Japanese and the person would invariably answer my wife who had not said a word, and because she looked like she ought to be saying something in Japanese. But I can't think of any instance of overt prejudice against her.

When we were at FSI Yokohama, spouses could take Japanese on a space available basis. There were sufficient teachers that this was possible, so Jin took Japanese full time, the whole 11 months. Of course, she knew essentially the same Chinese characters that the Japanese use. Koreans and Japanese don't exactly use these characters in precisely the same way, but she knew them from her schooling. Korean and Japanese are grammatically very similar; so Jin had a built-in leg-up. By the end of the course, she actually had a four-four which was full proficiency in both speaking and reading Japanese. The official score she got was a three-plus, three-plus because the person who was then the head of FSI Yokohama — a Korean whom she'd known when she was teaching Korean for Peace Corps — explained to her that it would be damaging to the morale of the diplomats who were studying Japanese for a second year if she got as high as a four-four after one year. So he gave her a "very strong three-plus, three-plus."

As an aside, in contrast to FSI Washington, FSI Yokohama also trained Canadian, Australian, and New Zealand diplomats. Those governments paid. We had some Australian military officers in FSI Yokohama, who were great fun to be with but not necessarily deep scholars of the Japanese language. All of them usually did two full years back to back at FSI Yokohama, which would have really sent me around the bend. As it was, by the end of that second year of Japanese, I had spent three of my first six years in the Foreign Service in hard language training, which was not something I'd recommend to anyone else. It was fine with me though.

Q: I'm looking at the time and maybe this would be a good place to stop. We can pick this up in '82 when you're coming out of the language thing. We've got quite a bit to talk about in your time dealing with external affairs.

O'NEILL: Yes, a time including among other things the KAL007 shoot-down and the Rangoon bombing of the Korean cabinet and other...

Q: And also the Soviet attitude toward Japan's Northern Territories.

O'NEILL: One of the things we'll want to talk about in that time period is Prime Minister Nakasone's rather surprising trip to Korea to meet with Chun Doo Hwan. It was early in '83, I think, but I'll double check on that. Nakasone who eventually developed a great relationship with Reagan broke tradition, which was that the first overseas trip for a new Japanese prime minister was always to Washington.

Q: Today is the 12th of September 2008. Continuing with Al O'Neill. Al, we left it when you were just getting out of Japanese language school in '82 was it?

O'NEILL: Yes, summer of '82.

Q: Summer of '82. We've got a lot of things to talk about Japan including Nakasone going to Korea, the shutdown of KAL 007, the Soviet-Japanese relationship, the Rangoon bombing and all this. You were in, external affairs?

O'NEILL: Yes. The political section in Tokyo was divided into three branches. One was external which dealt with Japanese foreign policy. The second was internal which dealt with the Japanese political parties, the Diet and domestic politics in general. The third was the political-military branch which focused on the U.S.-Japan security relationship, Japan being a treaty ally of the U.S. In fact, we were their only treaty ally. There was a branch chief and at least a couple of officers in each of these branches.

As far as I was concerned, I had the best job which was Asian affairs. Normally that dealt Japan's relationship with the countries which were under the State Department's East Asian bureau although depending on staff shortages, I sometimes covered everything from Pakistan to the Trust Territories of the Pacific Islands. It was a very interesting time.

Q: I would think that whoever or those who had the portfolio for internal political affairs must have been very bored, something like reporting on politics in Switzerland. The ministers changed

and the prime ministers changed, but nothing happened.

O'NEILL: That was why I was glad I was in external. In the internal branch, unfortunately the main thing that they had to watch was which LDP faction leader was going to become prime minister next.

In the political military branch, there was a lot of work because there was usually a good bit going on in the U.S.-Japan defense relationship. Sometimes it got pretty difficult. A big theme during that period 1982-84 in the political military realm was what was known as the Kanto Plain Consolidation. The Kanto Plain is the area that includes Tokyo, Kawasaki, Yokohama, Yokosuka, and into Chiba Prefecture on the coast to Narita Airport, one of the most densely populated areas in the world and one of few relatively flat areas in Japan. The U.S. military was consolidating a lot of bases that had been held since the occupation and, indeed, had occupation era buildings in most cases, largely vacating Yokohama and then consolidating into Yokosuka Naval Base and into a much smaller area of Yokohama. Other consolidation was going on among U.S. Army and Navy facilities elsewhere in the Kanto Plain. There wasn't to my recollection much change in the Air Force structure in the area.

In the external branch, that period 1982 to '84 was pretty busy, particularly 1983, in which there was one major event after another in Asia. By late 1982, Yasuhiro Nakasone had become the prime minister. He was very conservative which was not unusual for LDP prime ministers, but he was a more energetic person than, for example, his immediate predecessor, Zenko Suzuki. Nakasone put his stamp on things from the very beginning. Let me mention that at the end of World War II he had been a junior officer in the Imperial Japanese Navy, which was a little unusual for the LDP politicians at the time.

The tradition was that the first overseas trip for every prime minister was to Washington, to meet the president and senior U.S. officials and show the people back home that he was getting the approval of the U.S. government. Nakasone decided to make his first trip to Seoul to meet Chun Doo-Hwan, the former general who had taken over the Korean government in a more-or-less bloodless coup that then led to the very bloody Kwangju uprising of May 1980.

Not only was Nakasone doing this very precedent-breaking thing but he's obviously been preparing for it a good while because he had learned a few Korean pop songs to be able to sing at drinking parties with Chun. He had also given strict instructions not only to the staff of the *Kantei*, the prime minister's residence and office, but also to the Foreign Ministry that they were not to tell the U.S. about the visit in advance and after the announcement only to say what he was going to let them say. When this little bombshell dropped on us, the political counselor at the time was just beside himself.

Q: Who was that?

O'NEILL: Bob Immerman. He and Rust Deming, the external branch chief, and I were frantically calling our contacts in the Foreign Ministry to get more information. They were telling us that they were under instructions not to say anything, which was not the happiest situation for us. Ambassador Mansfield himself, that very revered figure, called the vice minister

of foreign affairs who was the senior professional Japanese diplomat. The vice minister told Ambassador Mansfield that he was under instructions from the prime minister's office not to say anything more than that the visit had been announced.

Q: I would think that particularly you being a Korean hand would say, "This visit is a good idea."

O'NEILL: Yes, in my "personal capacity" as they say in Japan, but in my official capacity in the political section, I wanted to at least find out the basics. If the prime minister wanted to break precedent, that was a remarkable point to begin with, but we wanted to find out what was going to happen, what they were going to discuss, what kind of aid or loan packages the Japanese had in mind, etc. From the workaday professional standpoint, this was not a happy moment. As I recall, before the visit we did get more information. It was just a two or three day embargo.

I think that the visit went very well. Nakasone did, indeed, party with Chun Doo-Hwan who was a pretty nasty character, but it was important for Japan to have a good relations with Korea and, indeed, it was important for us for the two to have good relations, too, since they were both our treaty allies. The fact that Nakasone made a good impression on the Koreans was good for the three countries.

Let me think of other things that happened during that year. Well, the next big event of 1983 took place on September 1. I happened to be on leave in my apartment, when the first word came out that a Korean Airlines 747 was missing on a flight that was to take it from Anchorage to Seoul across the Pacific. This happened to be the 60th anniversary of the Kanto earthquake which had devastated Tokyo and Yokohama on September 1, 1923.

Q: That was when Frank Lloyd Wright's Imperial Hotel was about the only building to remain standing.

O'NEILL: Exactly. A devastating earthquake that not only flattened and burned Tokyo, Kawasaki, and Yokohama with a huge death toll but also as an offshoot produced a number of anti-Korean riots and the killing of Koreans based on rumors that in the aftermath they were poisoning wells and that kind of thing, another unhappy moment in Japanese-Korean relations.

First, the flight was supposedly just overdue. Then there was a report that it had been forced down in the Soviet Union, and then as more and more details came out it was clear the Soviets had shot the plane down. Ronald Reagan was president, George Shultz was secretary of state; Casper Weinberger was secretary of defense. It was a time, anyway, of rather significant tension in U.S.-Soviet relations, and this was just an outrage. I said before that it was in April 1979 that the Soviets shot down the first Korean Airlines airliner, Flight 902. It was actually April of '78; I was off by a year. In that case the pilot managed to land a very badly damaged airplane on a frozen lake in the Kola Peninsula near Murmansk. In this case the aircraft was destroyed, and it crashed with loss of, I think the total number of people on board was 269.

Q: Including an American congressman.

O'NEILL: Congressman Larry McDonald who was if not the head of the ultra right John Birch Society was one of its high level officials. There were other American victims, just ordinary Americans. The high school age daughter of one of the senior people in the American Chamber of Commerce in Japan was on that flight and she was killed. There were just people of lots of different nationalities, mostly Korean.

The Soviets first denied any knowledge of the whole thing. Then one of our embassy officers who was a Soviet expert and Russian language officer was given the audio tapes from the Japanese Air Self Defense Force listening station at Wakkanai on the northern edge of Hokkaido. That was the transcript of the radio transmissions between the Soviet air defense ground control with the Sukhoi-15 interceptors that were tracking the plane.

The plane was way off course from Anchorage, starting with a tiny angle of deviation from the intended course. The farther along you go, of course the wider the deviation actually gets. The tiny little navigational error that was somehow built-in in Anchorage got bigger and bigger. Instead of going south of Kamchatka and Sakhalin over Hokkaido and down to Seoul, it was actually going over these very sensitive parts of the Soviet Far East where they had missile installations, submarine pens, and large fighter interceptor bases to protect against American bomber attacks just as we had similar bases in Alaska and radar stations. It developed that the plane was shot down. It was clear that the plane was being tracked by the Soviets. They lost it two or three times, and there was no evidence at all that the KAL pilot or crew knew anything was going wrong.

I knew a Pan Am 747 pilot at the time, who had been a Navy pilot. In the aftermath of this terrible business, he said several things. One is that every 747 has three inertial navigation systems on it — INSs — which are supposed to guide you even if you're flying over the polar area where there is a lot of magnetic distortion. He told me that according to the instructions each of these INSs is supposed to be set by the crew individually before the flight, zeroed to the precise location to where you are on the runway, say in Anchorage. But he said nobody does that; everyone "gangs" them and programs all three INSs at once. Thus any error that's put into one of them is going to be in all three of them. Once you start these little mini-computers putting in the positions, if the ground crew happens to move the aircraft even a small amount, that's all you need for an eventually major navigational error.

He also talked about the Soviet claim that they had fired warning shots from one of the interceptors behind the 747, which would normally include tracer rounds that should be visible at night. Most SU-15s didn't normally have guns. They were armed with air-to-air missiles although some of them did have external gun packs, so maybe the Soviet pilot did actually fire warning shots. My friend said it wouldn't matter. You're at night in a brightly lighted cockpit. You couldn't see tracer rounds no matter what. He was speaking not only as a Pan Am pilot but as a Navy fighter pilot as well.

This turned into a huge row in U.S.-Soviet relations. We were obviously supporting the Koreans and their attempts to recover whatever remains, etc., could be found. The Japanese were weighing in on our and the Korean side and were providing support, as I said, from the SDF radar installation. It was a huge incident.

My boss, the external branch chief Rust Deming, and the Director of the Foreign Ministry's Soviet division, Minoru Tamba, had the lead role in Tokyo on dealing with the incident, along with a senior Korean diplomat whose name I can't remember. Tamba was quite a character, who eventually rose very high in the Japanese foreign ministry. I think he became a deputy foreign minister eventually. He had been born on Sakhalin, when it was still Japanese held. Tamba, Rust Deming and the Korean diplomat eventually got permission to go to Sakhalin to deal with the Soviets, mostly military people, on this shoot down and the attempts to recover remains, etc.

The Soviets they were dealing with were obviously under very tight control as to what they could say, and I was told that in one of the rooms they were working in was a little glass booth with a man in it watching and listening to all the meetings. You can bet he wasn't from the Soviet Red Cross. Even after the Soviets admitted that they shot the plane down they were saying it was an intruder, and began hinting it was on an intelligence mission. The "usual suspects" in the West and even some in Japan took up that conspiracy line and ran with it. It was all nonsense; the real story was simply that for the second time in five years a KAL flight crew had made a terrible navigational error and this time it cost the lives of all on board. Sadly, I'm sure the botched Soviet attempt to destroy KAL 902 in April 1978, which was a huge embarrassment to the Soviet air defense, caused them to be even more ruthless and unforgiving in 1983.

The Soviets in Sakhalin were under extreme pressure to not give out any information. And also meanwhile U.S. and Japanese vessels were searching the straits north of Hokkaido to try to find remains and the so-called black boxes from the aircraft. While they were doing this they were dodging Soviet destroyers which were out not only to find the black boxes first but also to harass our vessels as well. That was a big event that had fairly long lasting negative effects on U.S.-Soviet relations.

One of the other things that happened in that same period was the assassination of Benigno Aquino as he was coming back to Manila from U.S. exile in August 1983. He was murdered on the steps of his airplane by two men from the Philippine Aviation Security Command. That murder lit the fuse of resistance to the Marcos dictatorship that eventually caused Marcos's ouster by his widow Corazon Aquino's People Power movement in 1986.

While the uproar over the KAL shoot-down was still in full spate, Chun Doo-Hwan was making a state visit to Rangoon, Burma in October. While he was there three North Korean army officers set a bomb in the open roof of the mausoleum where Aung San was buried. He was the Burmese national hero whose daughter Aung San Suu Kyi has been under house arrest in Burma since about 1990.

That mausoleum was analogous to the National Cemetery in Seoul or Arlington Cemetery here. A state guest would go there and pay his respects to the national founding hero; so the North Koreans knew Chun Doo-Hwan was going to do that. Chun apparently got held up in traffic en route to the mausoleum. It appears that the North Koreans mistook the Korean ambassador, who I'm told resembled Chun to a degree, for Chun. Because Chun's retinue was largely there, the bomb was detonated killing the ambassador, the much respected Foreign Minister, Lee Bum-Suk, and most of the senior Blue House staff including Hahm Pyong Choon, a presidential aide

who had been ambassador to Washington, and a number of the senior ROK military people. A number of other people, Koreans and Burmese were gravely wounded.

We were watching this from afar in Tokyo, but we were also interested in getting the Japanese to do whatever they could to support the ROK. It was pretty obvious that the North Koreans were the only ones who would have done something as atrocious as this particularly in a country whose people are as superstitious as the Burmese. No Burmese whether he was a Kachin, Karen, Burman, Chin or from any other ethnic group would ever blow up a grave because they're so concerned about spirits. As an aside, when I was in one of my language stints at FSI, the senior Burmese language teacher had originally come to the U.S. as a diplomat when Burma became independent in the late '40s. He said one of the Burmese diplomats died while at the embassy in Washington. Because of the fear among some of the embassy staff of this man's ghost continuing to linger at the embassy, they asked the Ministry of Foreign Affairs to cut orders transferring him back to Rangoon posthumously, which was their way of getting rid of the ghost.

From that and stories that my father told from his World War II service in Burma, I knew that no Burmese group, even anti-government groups, were going to get involved in blowing up a tomb. Particularly Aung San's because he was one of the rare Burmans who actually had gained the trust of most if not all of the minority groups who were usually being oppressed by the Burman majority.

One fear that we had and I think the South Koreans also had was with Burma's long history of neutrality they would say we're just getting rid of both, breaking relations with both North and South Korea. We didn't want that kind of outcome which would have muddied the situation and let the North Koreans off the hook to a degree. That was a big fear. We were trying to encourage the Japanese to do what they could to get Ne Win, the dictator of Burma, to come down against the North Koreans. (Ne Win had been trained by the Japanese in WWII – Aung San, too, for that matter.)

In fact, the Ne Win government actually managed to capture two of the North Korean officers. One was badly injured by a grenade that he set off, another was killed by his own grenade, and the third man, a major, was captured unharmed. The two living North Koreans were put on trial by the Burmese army and convicted of the murders and of the assassination attempt on Chun.

In the end, we needn't have worried about a muddled outcome. Ne Win not only broke relations with the DPRK and expelled their diplomatic mission but also withdrew recognition of the existence of the North Korean state, a serendipitous twist that I don't think anybody had done in diplomacy before. But it was clear. By the way, this assassination attempt enraged the Chinese as well. They published, I'm told, the Burmese account and the North Korean denial in The Peoples' Daily using exactly the same number of Chinese characters. That symbolized Chinese anger at this crime. When you think about it, not every state, even a pretty nasty one, would go to the length of blowing up the tomb of a friendly state's national hero in order to get at one of their enemies who was on a state visit. Fortunately the Burmese were as outraged as they should have been.

Our last big project of 1983 was on Veterans' Day weekend when President Reagan made a state

visit. This was my second presidential visit having done the Carter visit to Seoul in '79 as we discussed earlier. Once we knew that this was going to take place, I immediately volunteered for all of the events having to do with the emperor. I wanted to have the experience of dealing with the Imperial Household Agency which is known as the *Kunaicho* in Japanese. It's the group of extremely traditional gentlemen who basically control everything that has to do with the emperor or the imperial family and the outside world's dealings with the imperial family.

Q: They had quite a reputation along with the Hapsburg emperor's court.

O'NEILL: Right. But in terms of longevity, the Hapsburgs were Johnny-come-latelies in comparison with the imperial family which they say goes back to descent from the Sun Goddess about 2300 years ago. Reagan was visiting for quite a number of reasons. It was natural for the president to visit one of our top Asian allies, one of our top trading partners with which we had difficulties, particularly over auto exports from Japan to the U.S. and the balance of trade in general.

On the positive side, obviously, we wanted to affirm the relationship with Japan in the military sense and to remind the Japanese, obviously, that we were with them in the face of the Soviet Union which in those days the Japanese saw as their main threat and on which they collaborated with us a great deal in defense planning.

All U.S. presidential visits are an enormous strain on the host government and the embassy. Reagan's visits were no less so than any others. In part it was because every president realizes that these things have to look good on TV back home, and their staffs realize that too. So there is a great deal of searching out the best local color venues and for imbibing the local culture and history, etc., and portraying the president's interest. Again, it's a legitimate purpose both to the U.S. population and also for the host government's population to show that the president is interested in this or that aspect of host country's history and culture. But it's very time consuming because the people from the White House included people like Mike Deaver, who was probably Reagan's longest standing and most important advisor other than Nancy Reagan herself.

Q: And Deaver was extremely close to Nancy Reagan. That was a very powerful combination.

O'NEILL: It was a very powerful combination. What you usually have with the presidential visit to country X, Y, or Z is a series of at least two advance teams. In this case, we had a survey team, a pre-advance team, and then two advance teams before the actual visit. There were two levels of events. One series of events was the ceremonial ones involving the emperor which included welcoming Reagan to the Akasaka state guest house, a courtesy call on the emperor by Reagan and his entourage at the imperial palace, then the state dinner, and then just before the departure there was to be the farewell call by the emperor.

I was assigned to the events at the Akasaka palace, where the Reagans were going to stay during the entire visit. One of the other embassy officers became the event officer for the courtesy call on the emperor and the state dinner. We were both fully occupied. Working with the Imperial Household Agency was very interesting because their idea of precedent was that something had

been done exactly the same way for the last 1200 years.

A particular twist in this visit was the security requirements in the aftermath of the Rangoon bombing, the KAL 007 shoot down and the Aquino assassination. Nancy Reagan was really security conscious and so of course was the Secret Service. Reagan was supposed to have gone to Manila. That leg of the overseas trip was cancelled because of Aquino's assassination, both to show our strong belief that the Marcos government was behind it and also Nancy Reagan's concern for the president's safety made it impossible.

In the event, the very distinguished and able diplomat Mike Armacost who was then our ambassador in the Philippines came to Tokyo to brief Reagan on the Philippine situation.

We had weeks and weeks of more and more White House people. They included people like Mike Deaver and the Secret Service in great profusion because they had to be able to cover all of these various visit sites before and during and were also responsible for flying in the President's limos and helicopters on USAF transports. There was White House Communications Agency or WHCA, a military organization part of the executive office of the President who do all the communication set-ups in every place he's going to be. The White House public relations people also. There were mobs of U.S. officials to start off with, plus there was going to be the news media, too.

When we got the word of the visit dates, the embassy initially reserved 1200 rooms at the Okura Hotel right across the street from the chancery and the ambassador's residence. It was one of the great hotels of the world and one which was very accustomed to American presidential visits over the decades. Eventually I think we only needed about 700 rooms.

One of the principal duties of an embassy is to make sure there's only one visit being planned, not a host country version and a White House version, because if you let the two of them get away from each other, you'll have a real disaster. The host country players, the people from the Imperial Household Agency, the foreign ministry's protocol office, the prime minister's office, the Japanese police, all were working on planning. The White House whether Republican or Democrat has its own ideas as to what the visit is supposed to do for their own domestic and foreign benefit. The host government whether it's Japan or whoever else, has their own imperatives, too, things they want the president to do, things they want him to see, people they want him to see, all that sort of thing.

Q: Did you get any feel for Nancy Reagan and her astrologer?

O'NEILL: This was 1983, so I don't know how long the astrologer had been around. The astrologer was not part of the presidential party. That would have been a minor thing. The biggest thing was security, and it got to a very serious impasse. One of the major sites to be visited by President and Mrs. Reagan was the Meiji Shrine, a huge Shinto shrine in downtown Tokyo, devoted, to the Meiji Emperor, the first emperor of modern Japan and the grandfather of the then emperor, Hirohito, the Showa emperor.

There were two events at the Meiji Shrine: One was to pay respects at the shrine proper, and then

there was also going to be an exhibition of what is called *yabusame* or horseback archery in which men in 12th Century samurai costumes ride down a dirt track and shoot sideways at targets with those great long bows that the samurai used before they got into swords as much. That was to be one of the big televised cultural things on the itinerary.

The Secret Service wanted to bring dogs — and I'm not making this up as Dave Barry says — into the inner sanctum of the central building of the Meiji shrine and go behind the altar to check for bombs. The Japanese were just about overcome. They were really reaching for their smelling salts.

Q: Dogs in Oriental culture are not...

O'NEILL: Yeah. Not a great idea. Not a great public relations gambit to begin with, particularly not in something like this. It would be somewhat similar, to, say, the British prime minister's security staff saying that they wanted to have their dogs up in the private residence of the White House to check things out because the PM is coming for a visit. It would be like that although without the religious character that you've got with a Shinto shrine. At one point, Ambassador Mansfield had to meet with PM Nakasone over security issues — pretty unprecedented in itself — and I'm sure the dog search was on their agenda. Eventually the secret Service had to back down. They couldn't do this. Among other things, they were told by the Japanese that the regular Japanese national police can't even go into that inner sanctum. There's a separate shrine police force who are the only security people allowed into those precincts. Even thereafter, all through the visit there was a lot of tension between our Secret Service and the SPs or Security Police, which is the Japanese equivalent. Of course, they are proud of their ability to protect foreign dignitaries, and their view was when a foreign dignitary, even the president of the U.S., is in Japan, they protect them.

Q: Everything was overlaid with the whole Rangoon business.

O'NEILL: Yes. You had all these major incidents, great tension with the Soviets after KAL 007, the Rangoon bombing, Aquino's assassination, all back to back, all in early fall of 1983.

But in the end, Reagan arrived, over Veterans' Day weekend. It all looked great on television which, I'm afraid, is often the main thing. Behind the scenes it was often more frantic, especially at times at the Akasaka state guest house where the Reagans were staying. It's sort of a miniature samurai Versailles in downtown Tokyo.

The first event was the emperor's welcoming ceremony. Air Force One and the press plane were landing not out at Narita Airport but at Haneda, the downtown airport which was no longer used for international flights. They were to be picked up by Marine helicopters, both Marine One which had been transported from Andrews in a giant C-5 as well as other, larger Marine helicopters from units in Japan. The party would be helicoptered from Haneda to the palace.

The uniform for the Emperor's welcoming ceremony was morning coat, formal striped trousers, etc. We had to outfit Ed Meese, James Baker, the deputy treasury secretary, and all the White House party who were to greet the Emperor. We had gotten their sizes with the help of the White

House advance team, which was extremely professional. They really knew what they were doing. In different rooms in the guest house, we had the formal outfits laid out with nametags. Our job was to run out to the chopper pad next to the palace, find all “our” White House senior staff, who were getting off the helicopters in a swirl of dust, all wearing blazers and polo shirts and chinos because they had just flown across the Pacific, run them up the steps of the palace, into the right rooms, get them dressed, run them back down the steps, and line them up before the emperor got there. The time for this was really short, but we did it!

All along since the summer, a couple of us had been working with the Imperial Household Agency on every detail of the Emperor’s events. Fortunately they had people from the Foreign Ministry on detail, and the senior official we usually dealt with was an ambassador named Yamashita. He was indispensable to making the events with the Emperor go as planned. Aside from the security and press issues, the White House Communications Agency (WHCA) needed to have several vans at the Imperial Palace during the state dinner, which was not the usual Japanese practice for other state visits.

Q: Was somebody keeping an eye out for World War II issues? After all, by many accounts Hirohito could have been considered a war criminal. Were there things that arose on the visit that would have raised the ghost of World War II?

O’NEILL: Certainly not that I can think of on that visit other than we were meeting with the emperor. First of all, a relatively small handful of people in the United States knew or cared that Reagan was going anywhere outside the U.S. Nothing in the visit itself in terms of where they were going, the specific places like the Meiji shrine, etc., would immediately raise in the minds of any Americans, any association with World War II. They weren’t going to Hiroshima or to Iwo Jima or Okinawa.

In terms of what the American people saw on television it was a great visit, smoothly run, great visuals and all that. There were good discussions. Reagan and Nakasone cemented what was known as the “Ron-Yasu relationship,” which was the closest personal relationship to date between an American president and a Japanese prime minister that I can think of. I don’t know that they completely solved any of the top issues between the United States and Japan, but these visits are always the chance to move things forward and make some progress on most of the issues. The Japanese were delighted that the American president was making a state visit.

Earlier, I think I mentioned that I developed a measure of success for presidential visits which is if bilateral relations are no worse after the visit than they were before it was a great success. This one exceeded that cynical standard. I think most of the remainder of my time there, another eight or nine months in Japan, was pretty much the routine stuff of diplomacy between the U.S. and Japan. Fortunately, 1984 in Asia did not match 1983, with the Aquino assassination, KAL 007 and the Rangoon bombing.

Q: Let’s talk a bit before we leave about Japanese attitudes. Let’s start with the Philippines. This was during the Marcos regime. Of course, the Aquino assassination led eventually to Mrs. Corazon Aquino overthrowing Marcos and becoming president.

O'NEILL: Two and a half years later.

Q: Prior to that, how did we view the Japanese relationship with the Philippines?

O'NEILL: To my mind at the time, it was overwhelmingly commercial and aid-related. The Japanese saw big business opportunities in the Philippines and they always had. This was something they have been interested in since before World War II. There were lots of Japanese business concerns in the Philippines when it was still a U.S. Commonwealth before independence in '46. Nothing sticks in my mind of any instance where the Japanese criticized the Marcos regime, as far as his destruction of the Philippine economy, or human rights depredations throughout the country. The Japanese usually kept a very low profile almost everywhere, often to our annoyance because 25 years ago Japan did not attempt to match its economic importance in the world with anything approaching diplomatic and political importance.

Let me mention too the important Soviet relationship with Japan. Even under normal circumstance, even without KAL 007, Japanese relations with the Soviet Union were very bad. Evans Revere, who is now the president of the Korea Society and who served both in Korea and Japan, once commented to me, "Only people who served in Japan during the Soviet era would realize how bad Soviet-Japan relations normally were."

The focus was the Northern Territories, the group of islands just north of Hokkaido that the Soviets took in the immediate aftermath of World War II. After Japan surrendered they moved forces into those northern islands and have never given them back. It was the only issue that united every Japanese political party from the far right fringe to the Communist Party, the Japan Socialist Party and the LDP. Everybody was united on that: Give back the Northern Territories. It was a really neuralgic point.

The animosity toward the Soviets was evident at the Foreign Ministry as well as a matter of policy. When we'd go over to the ministry, we'd just call ahead to the particular office, Southeast Asia I, China, or whatever, talk to the person we wanted to see, and then we'd just go up to his office. It was different for Soviet diplomats. The only office in the Foreign Ministry that they were normally allowed to visit was the Soviet Affairs Division. There was a little doorbell at the front of the door of the Soviet division, and it said *only* in Russian, "Please ring the bell."

The Soviet diplomats would then be taken to a separate room down the hall. Their Japanese interlocutors would be seated in front of a *gigantic* map of the Northern Territories. It was as big as the wall behind you. The Soviets would be facing the map of course. This is known as "oriental subtlety." [laughter] Regardless of what issue the Soviet diplomat came to talk about, that would be the setting.

The Soviets almost never missed a chance to irritate the Japanese whether wittingly or unwittingly. They just had a tremendous knack for doing so. In fact, when something bad would happen in the U.S.-Japan relations, miraculously you could almost count on the Soviets doing something really stupid that would help draw attention from the problem in U.S.-Japan relations and get the Japanese upset about the Soviets. They were wonderful!

They also had a track record of sending as ambassador to Japan whoever happened to be the most recently failed minister of agriculture. He would be dismissed and disgraced because of two or three years of failed harvests, and sure enough he would be appointed as ambassador to Japan. There was one case during that time in which the new Soviet luminary was dismissed from the Party Central Committee of the party *after* arriving as ambassador to Tokyo. It was hard to know if the Party did that to insult the Japanese or for their own obtuse internal reasons but it was easy for the Japanese to feel insulted.

Q: How about China? Let's talk Taiwan first. How sat things during the time you were there?

O'NEILL: Between Japan and Taiwan? It was very interesting. In those days in the Japanese Diet and elsewhere in the Japanese political world, there was a Taiwan Lobby, not quite as virulent as our so-called China lobby in the '40s and '50s, but nonetheless people who were still powerful and protective of the Taiwan relationship. To backtrack: The Japanese opened full diplomatic relations with the PRC, People's Republic of China, shortly after Nixon's visit. That visit is still known as "the Nixon shock" in Japan.

Q: The Nixon shokku?

O'NEILL: "Nix-on shokku." Nixon and Kissinger unfortunately did not tell our Japanese allies about their secret visits to China, so they were absolutely blindsided by Nixon's extraordinary visit. It was a vitally important visit for Japan, but we could hardly have handled it worse. In fairness to Nixon and Kissinger, they probably figured that as leaky as Japan's political world was, advance word would have gotten out. The Japanese press was all over the ministries and all over the prime minister's office and the Diet all the time. There was a certain amount of reason for not telling the Japanese in advance.

The Japanese under Kakuei Tanaka, the famous and eventually disgraced prime minister, a much more activist prime minister than the normal run of the mill, was very quick to open full diplomatic relations with the PRC which meant breaking relations with Taiwan. But, there still was a large body of people in Japan who were linked to Taiwan and wanted to do whatever Japan could do to help Taiwan.

Part of this went back into history because one of the immediate results of the Sino-Japanese War of 1894-95 was that Japan got control of Taiwan (or Formosa) which had largely been neglected for centuries by the central government in Beijing. It was mainly inhabited by two groups of people. One group was aboriginal tribesmen somewhat similar to people of the northern Philippines, who had been there for eons. The other group was ethnic Chinese who were largely from Fujian province across the straits. Those people had been in Taiwan for a long time too. They were sort of left to their own devices more or less to be traders and pirates by the central government of Beijing. Anyway, Japanese had control of Taiwan for half a century. In contrast to the Japanese colonial period in Korea, the rule over Taiwan was relatively benign and beneficial to the people. The Japanese did a good bit of infrastructure development. The people certainly didn't resist the Japanese, at least not like the Koreans did because the circumstances were so different. The Japanese came in and treated them pretty well.

Q: It was also a resort area for the Japanese.

O'NEILL: It became so, yes, in a way that Korea could probably never been for a lot of reasons, including Korean outrage at having been taken over by the Japanese. That control over Taiwan was lost in 1945. But there was still a lot of trade between them, political, educational and personal ties as well.

The Japan-Taiwan relationship was rather protective with many of the Japanese conservative politicians trying to look out for Taiwan. They couldn't do much because again, Japanese foreign policy was just not very assertive. Whatever support they could provide quietly, they would. The catch phrase for Japanese diplomacy in those years and before and afterwards was "omni-directional peaceful diplomacy," *zenpou-i heiwa gaikou* in Japanese. That rather mushy phrase exemplified Japanese diplomacy for some decades. Don't get anybody angry at you, don't ruffle anybody's feathers and just muddle along and hope you get another big commercial contract for Mitsubishi or the like.

Q: From your perspective were we ever going after the Japanese to support something in the UN or in the Japanese moves toward Taiwan during this time?

O'NEILL: Nothing that I could remember. Obviously we were always after the Japanese and many other countries to support us in this or that committee in the UN and this or that General Assembly vote. I don't remember that Japan was on the Security Council as one of the temporary members during the time I was there, but had they been we would certainly have been after them for their vote. The Japanese would normally be with us. They would tend to get uneasy if we were after them, for example, to join us in a vote condemning a dictator in whatever country we happened to be focusing on at the moment. They would not want to do that, and they would tend to want to abstain. Positive things they would get on board with, things they would consider negative or in any way sticking their necks out a way they'd be reluctant.

Q: Al, we're touring the horizon right now. How stood things in the People's Republic of China during this two year period from our perspective from Tokyo?

O'NEILL: I'm trying to think of anything that blew up! [laughter] There was one visit which was good and significant. Hua Guofeng, the Chinese party leader at the time... I recall that this was in the spring of 1984. I'd have to check the dates, but my recollection was it was the spring of '84.

Hua made an official visit to Japan. It had been some while since a Chinese of his rank had visited Japan. He turned out to be a very affable guest. Hua wasn't a cold, aloof type of party apparatchik that you might expect but was quite an outgoing, bubbly sort. He was a big hit in the Japanese news media. I think Hua went to Osaka to see that big commercial hub and I think he made a good impression on the Japanese in general – no gaffes. He helped with the reasonably good relationship that existed then between the Japanese and the Chinese at that moment. The Japanese were trying to encourage the Chinese toward economic reforms which eventually did take off. The reforms were actually on their way because Mao had died in 1976. The Japanese were encouraging the Chinese to continue moving in the same direction.

Q: Was the problem of the Japanese textbooks about World War II alive at the time either vis-a-vis China or Korea? Certainly in Germany this subject is treated in depth in the school books, but in Japan it's almost completely glossed over.

O'NEILL: Yes, I should have mentioned it. There was a blowup about textbooks right before I arrived back in Tokyo to begin my job in the political section. In August of 1982, the Japanese had come with new guidelines for history textbooks. The Ministry of Education does not write the text books, but it puts out guidance for those who do and also this guidance is often used by the prefectural school systems in picking textbooks.

That blowup involved the Republic of Korea and the PRC but that to the best of my recollection, had been smoothed over long before Hua was visiting. If the issue had still been alive, Hua probably would not have come. It's one of those things that's episodic. The larger underlying issue is that the Japanese had not – and have not – come to grips as well with the World War II situation as the Germans. Shame is a serious problem in Japan. If somebody does something that they consider shameful, it really is a disgrace, so many cannot bring themselves to believe that they did anything shameful in World War II. Some do and some don't, but certainly in those days many followed the line in that the Japanese were liberating the Chinese, the Koreans, the Burmese, Filipinos, and those in the Dutch West Indies from western colonial rule. They never quite figured out, "Yeah, we killed several million of them doing that, but they should be grateful anyway."

In those days, when you spoke with Japanese who had served in World War II or were old enough to experience it as teenagers, they tended to speak as if it were a typhoon or an earthquake. It didn't seem to have any human agency at least as you were talking with them about it, it was just like a natural disaster. They certainly were not willing to recognize how they were seen in almost every part of Asia with the possible exceptions of the Burmans, the majority people of Burma.

The Burman majority pretty much welcomed the Japanese invaders, who expelled the British in 1942. Ne Win and Aung San and others who were Burmese independence heroes, the so-called Thirty Comrades, went to be trained during the war on Hainan Island by the Japanese. They got infiltrated back into Burma because they saw the Japanese as the Japanese saw themselves: as the liberators from western colonialism. Elsewhere whether in Hong Kong or Singapore, the Malay Peninsula and certainly the Philippines, the attitude toward the Japanese in World War II was quite a bit different.

Q: How about some of the last ones, unless there is another, unless you want to talk about Southeast Asia? What about the North Koreans? There were two things. One, the relationship with North Korea as a state and also North Koreans in Japan. How was this in your time?

O'NEILL: Any time you see a statistic about the Korean population of Japan, in whatever year from the 1950s through today, it always seems to be 600,000, no matter who's writing about it. It's hard to believe that such a population could be so static, but that's the figure that's always given for, say, for 40-something years.

Most of the ethnic Koreans in Japan originally came from southern Korea or from Cheju-Do, not from the northern half of the peninsula. Some went voluntarily because there was a better economic opportunity even while Japan was the colonial master, and more were either forced into laboring jobs there or perhaps drafted into the armed forces. Anyway, you had this population of ethnic Koreans who were settled in Japan, sometimes for many generations. They were divided politically once the peninsula was divided and two states were set up in 1948. Their allegiances went in different directions.

There was a large group that was called in Japanese *Chosen Soren*, short for the “General Association for Korean Residents in Japan.” That was the pro-North Korean group. The South Korean group went by the abbreviated name “*Mindan*.” They were roughly similar in size, I think. If you were part of *Mindan* or pro-South Korea, you would normally have a Republic of Korea passport, a South Korean passport, and you could travel out of Japan. You’d have to have a visa to come back to Japan or a resident certificate. If you were an adherent of North Korea, a member of *Chosen Soren*, you didn’t have a passport, or at least the Japanese didn’t recognize the North Korean passport. You were more or less stateless residents of Japan because of Japanese antipathy toward the Democratic People’s Republic of Korea, the communist North.

Of course, the Japanese had full diplomatic relations from 1965 with the South and an embassy in Seoul. There was an ROK embassy in Tokyo. There was a good bit of antagonism of course between the two Korean groups although not that I can recall any violence. Also, there was a weird feature of the Japanese political system in that, rather than the Japanese Communist Party, it was the Japan Socialist Party (JSP) that was closest to North Korea and friendliest to their policies.

While I was in Japan the Japanese communist party newspaper which was called Akahata or Red Flag, published an article bitterly attacking North Korea, saying that the worship of the Kim Il Sung personality cult was just like the emperor worship in the Meiji era. Further, the North Koreans really did start the Korean War which was totally contrary to what the North Koreans were saying and certainly an issue on which the Soviets and Chinese at least remained silent. I don’t know what prompted this outburst. The Socialists got a lot of support from the North Korean population of Japan, and a source of revenue for this population was these Pachinko parlors. Pachinko was a Japanese pinball game. The prizes were things like packets of Kleenex or a comb. It wasn’t like you were winning at Las Vegas. Nonetheless, pachinko was a major source of revenue for North Korea and for the Japan Socialist Party.

In fact, in later years when the Japanese government began to cut down on revenue sharing from the North Korean residents’ group to North Korea, it was also cutting into the revenues of the Japan Socialist Party, which may have helped contribute to what I consider its well-deserved demise as a major player in Japan’s politics. But something that became a major issue in Japan relations with North Korea years and still is *the* top issue now is the abductions of Japanese to North Korea.

I was aware that the Japanese National Police Agency strongly believed that a number of the disappearances of Japanese from coastal areas in the ‘70s into the ‘80s were caused by North

Korea. They were quite certain that this was the case, but they were not in a position to make any public declaration about it.

Q: At the time you were dealing with this, was there any rationale for these abductions?

O'NEILL: That's always been one of the major questions. The purpose of bringing them there was to train North Korean intelligence operatives to be seen as Japanese, to be able to speak Japanese without a Korean accent, to be able to understand Japanese customs and culture and all of that well enough that they could pass, at least, in a third country as Japanese with fake passports.

The question always arises, why didn't the North Koreans use this large community of several hundred thousand ethnic Koreans? Most spoke at least a good bit of Japanese, and some of them spoke Japanese as their first language and Korean as their second language which they were learning in *Chosen Soren* schools. Part of my answer is the North Koreans are so suspicious of everybody that they would even be suspicious of these pro-North Korean people as being not quite loyal. There's a reason for my thinking this, and I'll get into that in a second. Also, being outsiders in Japan in the final analysis, they might not be able to pass for "real Japanese." But if you grabbed real Japanese who spoke nothing but Japanese, who know no other customs than Japan's customs; you were really getting the genuine article.

Bizarre as this whole thing is, kidnapping people from another country to bring them to your country to train your intelligence operatives, it's what they did, including to train the two people who blew up KAL 858 near Burma in November of 1987. That's pretty weird, and yet that's what was done. The North Koreans may also have been wary because of the unhappy history of a lot of Koreans from Japan who went to North Korea starting in the late '50s and early '60s. There's a great book about this called Exodus to North Korea by Tessa Morris-Suzuki.

A lot of those true believers, originally as I say almost all from hometowns in South Korea went to the North expecting to be in a nationalistic Korean paradise in which everyone was going to be equal and they were going to construct socialism, following great leader Kim Il-Sung. Everybody was going to live happily ever after. Many of them got very disenchanted very fast with the realities of North Korea which was then as now a brutal totalitarian state. When those émigrés began making suggestions to North Korean officials about improving economic processes or industrial production, that was not what the central committee was planning. If they kept pushing they got into trouble. In a lot of cases, they and their entire families wound up in the North Korean gulag.

Another book that came out about 2000 or 2001 was called The Aquariums of Pyongyang. It was written by a man who's now in the south who was of such a Japanese-Korean family. His grandfather and grandmother took his family from Japan to North Korea. The entire family wound up for, in his case, 14 years in an incredibly primitive and horrible existence in a prison camp. The writer eventually learned the reason that they went was because the grandfather was criticizing the North Korean system. Off they went, the whole family, even ones who had done nothing like the writer, who was a teenager. After the grandfather died, the problem was removed and they got out of the prison camp and were back, though under great suspicion, in

North Korean society in the provinces. This suspicion about their loyalty of the émigrés, I'm sure, was a key reason why the North Koreans resorted to the bizarre tactic of kidnapping Japanese.

Q: Did you generally find that North Koreans in Japan as being a spy problem or something of that nature?

O'NEILL: They were certainly watched. Sometimes North Korean infiltration vessels would use Japanese waters. In other words, instead of trying to go down the coast to infiltrate South Korea, they'd come over to Japan. Sometimes they'd both land and pick up agents and information, etc., in Japan, but also as a sort of ruse went to infiltrate South Korea. Instead of the South Korean coast guard or navy seeing a vessel coming down the coast from North Korea, they'd see what might be a large fishing boat coming from Japan, so it would help fuzz things up especially at night. The Japanese knew this, and they just couldn't bring themselves to make an issue about it because I guess in some cases there was a limit to what they could do about it.

Q: Did you pick out from your Japanese contacts any concern that all of a sudden North Korea might invade South Korea? I mean, Japan would then have to be heavily involved.

O'NEILL: No. Not really. Had there been a major clash that, let's say, prompted a North Korean invasion, the Japanese would have been very upset on a number of levels, one of which was just the fear of how far it could spread. The involvement of all the U.S. forces in Japan in the Korean contingency would have been not only immediate but also sustained during the entire conflict. All the forces in Japan would have headed for the Korean peninsula right away, plus there would have been huge air, naval and ground forces coming through these same Japanese bases, particularly air and navy, flowing through to sustain the defense of the south and the defeat of North Korea. That would have been pretty alarming to the Japanese.

Q: Did you and your wife have any contacts with South Korean diplomats?

O'NEILL: Oh, yes.

Q: What was your impression of their attitude toward serving there?

O'NEILL: I think most of them were Japanese speakers; largely they had good Japanese language skills. I think they liked Tokyo; they liked Japan, and we knew quite a few of them. We had good close relations with the Korean embassy people, the political section mainly because that was who I normally got in touch with. I think they were under the same kinds of strains dealing with the Japanese government as Japanese diplomats were in their embassy in Seoul. It's generally a relatively good though touchy relationship, but there were times things were pretty strained. The Japanese relationship was second only to the U.S. for Korean diplomats certainly at that time and they wouldn't have been assigned to Tokyo had they not wanted to be.

Q: Okay. Today is the 17th of September 2008. This is an interview with Al O'Neill. Al, I think we were talking about 1985 or '84?

O'NEILL: Yes. I left Tokyo in summer 1984 and went back to my first State Department assignment that summer. I was assigned to the political-military bureau in what was then called the Office of Strategic Technology Affairs. It was the office that dealt with COCOM, which was the Coordinating Committee for Strategic Technology Controls, based in Paris. That was a multinational organization aimed at preventing the Soviet Union and its allies and the PRC and others from getting what was called "dual use technology," cutting edge technology that had both military and civilian applications, the purpose being to restrict their ability to increase their military technological level.

The office was quite small. It had only five officers: an office director and four other officers, one of whom was an Air Force captain. The rest of us were Foreign Service officers. At the time the political-military bureau was, as I put it, under the command of Lieutenant General John T. Chain, Jr., USAF, who later got a fourth star and became commanding general of Strategic Air Command. We had quite a large number of responsibilities for such a small office in addition to having a leading role in COCOM for the State Department, a mission that we shared with the Office of East-West Trade in the economic and business affairs bureau or EB.

We also had the U.S. government lead on what later became the Missile Technology Control Regime to try to restrict both the payload and ranges of ballistic missiles worldwide. When SDI — the Strategic Defense Initiative — of the Reagan administration became internationalized, we helped negotiate agreements on SDI cooperation. That was when the U.S. government decided that they wanted to have international partners like Japan, the Republic of Korea, and Israel. We played a role in those negotiations with those countries trying to reach agreements with them on their cooperation with the SDI operation itself. Largely this was going to be in the realm of technological research in those countries that might ultimately benefit the entire SDI project which was, of course, an anti-ballistic missile project, popularly known as Star Wars.

WILLIAM CLARK, JR.
Director, Japanese Affairs
Washington, DC (1980-1981)

Deputy Chief of Mission
Tokyo (1981-1985)

Ambassador William Clark, Jr. was born in California in 1930. He graduated from San Jose State College with a B.A. degree in 1955. He served in the U.S. Navy intermittently from 1949 to 1953. In 1957, he joined the State Department, serving in Sierra Leone, Japan, South Korea, Egypt, India, and Washington, DC. He was interviewed by Thomas Stern in 1994.

Q: Bill, tell us how your next assignment was arranged?

CLARK: My work in Seoul became known to Richard Holbrooke, the Assistant Secretary for the Far East. For one of the few times in my career, I didn't have a clear idea what my next

assignment would be. Holbrooke had suggested that I return to Washington, but did not mention a specific assignment. Two possibilities appeared: either Director of the Office of Japanese Affairs or Director of the Office of Korean Affairs. As it turned out, Holbrooke was not able to find an onward assignment for Bob Rich, then the Korean Office Director, and extended his tour on that job for a year. Therefore, I became Director for Japanese Affairs, which turned out to be a very useful assignment for my career. I would have gladly taken either assignment. I should note that during my tour in Seoul, I received an inquiry on whether I might be interested in a direct transfer to Tokyo as Political Counselor. The question came from a friend who thought that such an assignment could be approved if I were interested. I gave that idea considerable consideration, but finally decided against it because it would have been essentially a lateral transfer. In fact, there was more action in Seoul at the time than there was in Tokyo. In retrospect, it was one of the best decisions I have ever made.

So I returned to Washington to immerse myself in Japanese affairs after a six year absence since 1974. However, I had been close enough to Japan not to have missed the major themes and trends. Copies of messages between Washington and Tokyo on major issues were often sent to Seoul which permitted me to stay current. I may have been somewhat surprised by the degree of concern exhibited in Washington over the automotive trade issue. As you will recall, my last assignment in the Department before Korea was in the special trade office. So I knew something about the issue and the debate over Japanese protectionist policies. In the mid-70s, the issue was specialty steels. But I was startled in 1980 by the level of the tensions over US-Japan trade. The first debate that I became involved in was whether the Prime Minister of Japan should be invited to the United States and if he did come, whether the President would receive him. The problem was that if a meeting would be held, the President would have to take a very hard line on the automotive trade issue. That view in Washington appeared to me to have come from a sharply increased level of concern for trade issues from even four years earlier. There was no question that in that period, the trade tension between the US and Japan had increased measurably. The automotive issue was the principal one, but there were other commodity problems as well. We were upset, to put it mildly, by the ever increasing Japanese penetration of the American car market.

I spent a lot of time on this issue with the USTR, Treasury and Commerce Departments. I saw some people on the Hill, although the Department's Congressional Relations staff did its best to keep Departmental officers as far away from Congress as possible. Most of the Congressional liaison work is done at the assistant secretary level; country directors could join in seminars or talk to people on the Hill with whom they were acquainted. I saw some industry representatives, but that was minimal.

As I said, Holbrooke was the Assistant Secretary. Tom Shoesmith was the first Deputy Assistant Secretary for Northeast Asia I worked for and he was followed by Mike Armacost, after Reagan succeeded Carter. Both of these officers gave me considerable latitude in the management of Japanese affairs, except on trade issues. There, because the issue was of interest to the President and the Secretary, many others more senior to me became involved. This was particularly true in 1980 as Presidential elections loomed, even though trade did not become a focus of attention. After that political event, top level interest waned a little. In early 1981, the first Japanese "voluntary restraint" regime went into effect. That of course is a euphemism, but it has been used

since then and has become part of the lexicon. The Japanese never filled their quota, but their "restraint" stood them in good political stead. I became involved to a small degree in the negotiations of these "restraints", but since the levels agreed upon were based on history of imports, there wasn't much of a debate within the US government or with the Japanese. This is not to suggest that the Department was marginalized in trade negotiations in the early 1980s. In fact, it was much more involved then than it is today. State officials spent a lot more time with the USTR then, in part because USTR was then a much smaller organization which relied on State and other agencies for analysis and support. Today, that organization works much more independently, much, I believe, to the detriment of the US effort on trade issues. In the early 1980s, the USTR was a coordinating agency, which led US efforts, but worked cooperatively with other departments and agencies. It made other agencies compete within the US government, which produced considerable creativity. Then the departments and agencies were deeply involved in the implementation of USTR and Presidential decisions. So I and my State colleagues felt part of the US team.

In the brief ten months period that I was the Office Director, there were a couple of other major issues that engaged my attention. One concerned a Navy nuclear submarine that sank a Japanese freighter after having rammed it right off the coast of Japan. The submarine did not believe that it had caused any major damage and therefore left the scene. Unfortunately, that was a bad call. It took us a long time to convince the Navy that apologies were in order. Being a litigious society, the Navy was concerned that admission of error might prove to be a costly policy. But we were clearly at fault. The Japanese Prime Minister at the time was an unlikely choice, Suzuki Zenko. The headline in one Japanese newspaper when he became Prime Minister was "Zenko Who?" -- a take off on an earlier American headline. That situation in Tokyo made matters somewhat easier. In any case, eventually we squeezed an interim report out of the Navy which Ambassador Mansfield gave to the Japanese Foreign Minister in New York; I was present for that occasion.

Suzuki came to the United States. He rode around Manhattan Island on a boat owned by Malcolm Forbes, the *Highlander*. At the end of that cruise, Forbes, as was his standard pattern, made a few remarks. He wanted to give a present to Mrs. Suzuki. It was a lamp that she had allegedly admired, which to my tastes, was the ugliest thing I had ever seen. It was made of blow fish skin -- a fish that the Japanese liked to eat. Forbes presented it to Mrs. Suzuki, because, according to him, she had said that the lamp had reminded her of her husband's career when he was the Fishery Minister. When she took the lamp from Forbes, she said that she had been misunderstood. She in fact had said that the lamp had reminded her of her husband -- not his career! During the Suzuki visit, we hammered out a unique communique; for the first time, we got the Japanese to admit in a communique that we were allies. That was a concept that had always been troublesome for the Japanese. But this time, they agreed to have it in an international document, referring to "an alliance between the United States and Japan". Suzuki was criticized by the Japanese press at home for the way the communique was handled. He had come to the US for a two day meeting with a formal dinner at the end of the first day. The second day was reserved for a presentation by Suzuki; the first day had been ours. At the White House dinner, some members of the Japanese delegation came to me asking whether they could release advance copies of the communique to the press before the end of the bilateral talks. I said that that was not acceptable. The Japanese said that that was their normal procedure. I continued to demur. So they left and found someone who worked on the NSC, who told them to go ahead.

Before releasing the draft, these Japanese came back to me and told me that they had NSC approval. I told them that they should not have told me because I would not change my mind and if they were looking to me for the official US government approval, they would not get it. So they gave out advance copies to their press. Naturally, for the first time in my memory, the press violated the embargo which it had always religiously observed and wrote stories about the communique which appeared in the next day's Japanese papers. Of course, the draft included the phrase about "the alliance", even before Suzuki had an opportunity to make his points to the President. That didn't play too well in Japan. The stories really appeared as Suzuki was on his way home. When he landed, he held a press conference in which he said that he didn't know that the text would be released prematurely and in draft and that it was all the fault of the Foreign Ministry officials. That led to the resignation of the Foreign Minister, who in any case was looking for an excuse to leave the government. The Foreign Minister knew all about the process. As a matter of fact, while we were in New York, we were a little late to a meeting because the presentation of the Navy interim report had taken a little longer than anticipated. In going to this meeting in a car were the Foreign Minister, Ambassador Mansfield, the Japanese Deputy Permanent Representative at the UN and myself. The Foreign Minister didn't speak English; Mansfield didn't speak Japanese. So the Deputy Perm Rep and I did the interpreting -- he for the Foreign Minister and I for the Ambassador. During the ride, the Foreign Minister mentioned to Mansfield that I liked the communique; he thought that -- jokingly, I believe -- we all were therefore in difficulties. After translating for Mansfield I told the Foreign Minister that I thought the communique was good for him. Little did I know that three days later he would be forced to resign over that piece of paper. That was an interesting by-play in the communique process. The communique stood untouched with the "alliance" phrase in it.

The other result of the Suzuki meeting was a speech that the Prime Minister made at the press club. In that he declared that the Japanese were responsible for the protection of the sea lanes as far as 1,000 miles from Japanese shores. That had never been said before. So the visit became significant in a number of ways by advancing positions that we had long held.

I should note that between the end of 1980 and early 1981, I experienced my first transition, but not the last one by any means. The last time, just to jump ahead, I was an Assistant Secretary not of their choice and probably not of their point of view either. I have to say that the Carter administration did not quit after November 1980; we continued to receive guidance from the political leadership until it actually left office. Holbrooke continued to be active. I have heard that when he took over four years earlier he told all of the deputy assistant secretaries that he wanted them out of their offices by January 20, 1977. He moved his choices in on that date. He actually began to manage the Bureau even before having been confirmed and sworn in. That I think could not be done today. In those days, that approach was expected; today it would be subject to severe criticism. I think that Holbrooke's approach was the right one; you shouldn't leave a vacuum for as long as it takes now for confirmation. Holbrooke stayed until the last day; his successor did not give the deputies orders to vacate their offices; they all stayed on for a while. That is the way it worked eight years later when Bush succeeded Reagan when I was the principal deputy. Of course, that was an intra-party transfer which is quite different from a change in parties. But in early 1981, we still received guidance from the Department's leadership; Armacost stayed as acting Assistant Secretary. The new leadership had some difficulties in selecting a new Assistant Secretary. Once Holdridge was selected, he was

confirmed rather expeditiously. He had just retired from the Foreign Service, after having served as national intelligence officer. Armacost is a strong personality; he made sure that no vacuum would be created after Holbrooke's departure. Al Haig, the new Secretary, knew Mike and respected him. That helped considerably and we didn't lose any momentum in the transition. For us, at least, it went rather smoothly with no shift in US policy.

During the transition, I spent a lot of time with the transition team. I worked with Ken Adelman, who had been assigned to study Far East issues by Robert Neumann, the head of the transition team. Ken and I spent a lot of time together talking about Japan and our policy towards that country. He told me that he had joined the transition team as a labor of love and that he was not interested in a position in the government. So I was not surprised when he took a job at the UN! I did write a briefing paper for Al Haig, but I never knew what happened to it.

Soon after Haig moved into his office, I met with him to brief him on Japan. The Japanese Foreign Minister was about to visit Washington. I remember that I pulled an old bureaucratic trick, which was not well received by many of my colleagues in the Department. This was a time when the Japanese were pushing for one of their officials -- Mr. Iami -- to become Director of the International Atomic Energy Agency in Vienna. This man was a leading expert on nuclear energy and a physicist. He at the time the Japanese Ambassador to one of the Gulf states to give him the appropriate credentials. I didn't think that he had much support beyond his own country; there were nuclear experts in the US government who didn't like him -- he was very outspoken. Since he was not going to win approval in any case, I thought we could well afford to support him, since it certainly would have had a positive effect on US-Japan relations -- at least it would have kept one more issue off the agenda. So when Haig asked me whether there was any positive steps that the US might take in the relationship, I suggested the support of Iami for the IAEA position. I told him that the Foreign Minister would probably raise the issue and that I thought that a positive response from Haig would be very helpful, without incurring any costs because very few others would follow our lead. So when the Foreign Minister raised the question, Haig promised US support for Iami. The bureaucracy reacted very negatively because they were opposed to Iami, but it never had an opportunity to make its views known to Haig. My advice was the only one that the Secretary received on the subject. In the final analysis, Iami did not get the directorship, but the Japanese were grateful for our support. I got a few negative comments from the US nuclear community, but I survived.

Haig had a particular interest in Japanese matters. He was married in Japan while serving with the occupation forces to the daughter of an American general. He considered himself to be an expert, even if minor, on Japan. So I had good access to him and our discussions quite open. He was willing to listen to both sides of an argument. But I didn't stay on the desk for too long after inauguration. My next assignment developed during one of Mansfield's trips to the US to accompany Suzuki on another visit. While Suzuki was in New York, Reagan held a meeting of his senior advisors in preparation for his meeting with the Prime Minister. Mansfield came to Washington for that. That meeting took a solid three hours discussing all the Japanese issues of importance at the time. I don't think I have ever seen another President take that much time on a single country, but Reagan used to do that. He may have used his 3x5 cards, but his staff made sure that the President was completely prepared for these high level meetings and that all the relevant issues had been thoroughly discussed and that the conclusions were generally acceptable

to all senior members of the administration.

It was during this time that Mansfield was looking for a new DCM. When he returned to the US, I spent all of my time escorting him around. At the end of his visit, as I took him out to National to board a Northwest Airline plane, we were walking to the plane. I was one of two candidates for the DCM job, although technically I was too junior to fill that position. Personnel had sent Mansfield a list of candidates and told me that they made an exception in my case by putting my name on it even though I was not at the right rank. I told him at the airport that, although I had not raised the subject, that he should not interpret that as an indication of lack of interest on my part in the DCM job. He said: Yup!". End of discussion! The day after he returned to Tokyo, he called me and said that he would like me to join him as his DCM. That was all he ever said about it. It was up to me then to inform Personnel and other interested parties of the Ambassador's wishes. There was never any argument; what Mansfield wanted, Mansfield got. I should also note as a footnote that Mansfield always flew Northwest because, I think, it was the only major airline that served Montana; it also always took good care of the Ambassador. I was delighted at the turn of events. Although I enjoyed the Washington job, I had had my eyes on the Tokyo DCM job for a long time.

Mansfield was a unique man; I enjoyed working for him immensely. He was older than most ambassadors and by this time had formed certain views that he held firmly and from which he could not be shaken. He knew what his goals were; he had been in Japan for four years already and was firm in the policy course that he had set. His first DCM had been Tom Shoesmith, very briefly, who was followed by Bill Sherman for almost four years. I stayed four years. I was followed by Anderson for another four years. I refer to myself as Mansfield "middle Minister". Mansfield did not like staff meetings, particularly long ones. He held them; if they lasted for five minutes, that was long. He used just go around the table in the conference room to see if anyone had any comments; it was wise to have something important to report. I saw Mansfield leave the room if the presentation became long winded; he would first fidget and then when he couldn't take any longer, he would just decide that he had more important things to do in his office. So the staff kept its comments very brief as did the Ambassador. He expected the DCM to deal with most of the people in the Embassy. He dealt directly with a few -- the Political Counselor, the Economic Minister -- but for example, he would not hold meetings with the Station Chief, which was very upsetting to that individual, as I am sure it would have any Station Chief at other posts. We had three Station Chiefs during my tour and they all finally came to terms that they could not see the Ambassador, but had to talk to me. I saw everything that he did which was related to his Embassy role. He had a voluminous correspondence network with which he corresponded personally, but that was never seen by anyone. His secretary did make copies of these letters and put them in the file for record purposes, but these letters dealt with matters mostly unrelated to his Ambassadorial job. Mansfield got a lot of mileage out of his hand written notes because people appreciated the time he had taken in writing to them. He also used that personal touch by personally giving his visitors a cup of coffee in his office.

The management of the mission was left entirely up to the DCM. Mansfield seldom got involved. I remember one time that he did get involved. It was a time when we had gap between Administrative Counselors. Sherman suggested that the person who had worked for him return to Tokyo to take up the slack. I thought that was a good idea and agreed. What I didn't realize was

that that person and Mrs. Mansfield had not gotten along very well. Since this I had always been responsible for the administrative support operations of the Embassy and the assignment of the person was to be of short duration, I did not check with Mansfield. That was a big mistake. He let me know that I had made a mistake and that he was still the Ambassador. That was one of the few times that he got involved in the management of the mission, although he did pass on the assignment of every senior officer in the Embassy; that is the people that he would most likely be in contact with.

The Embassy was too big. Even the State Foreign Service contingent could have been smaller had we been better organized. For example, the Department's decision to provide administrative support for all components of the US government stationed in Japan -- which by the way was not fully implemented -- required us to have too many people in the Embassy assigned to the running of the Embassy and the constituent posts. I thought we did not devote enough State resources to finding out what was going on in Japan, in the political, economic and security fields. This is an observation that is not exclusive related to the staffing of the Embassy in Tokyo; there were and are many other posts which suffer from the same imbalance of effort. The Embassy in total consisted of about 280 Americans; approximately one fourth of that staff was State. I not only wanted an overall reduction because we just didn't need all those people to achieve our goals, but perhaps even more importantly I was interested in a realignment of resources to increase the Embassy's ability to handle economic issues. My goal would have required shift of resources among agencies, but that is an impossible task in light of the way the US government was and is organized. Mansfield agreed that there were just too many Americans in the Embassy. He had a firm rule, which I fully supported, that there would be no increase in that level. So if an agency wanted to assign a new position, it had to offer up an off-set. That policy put an end to the increase of staff. We did manage to even shrink the size of the Embassy, although it was rather modest. We kept trying, but could only reach about 10% reduction. It must be remembered that even in the early 1980s, Tokyo was not an inexpensive post. We had 143 families in the Embassy compound and the rest in the village, where the rents were expensive. Mansfield was also very good in supporting the size of the State contingent. We ran into the usual and pervasive problem: the State contingent had always been thin, but when it came time to tackle the size of other agencies' staffs, the answer was always "We would be glad to do so if State is willing to offer up cuts in its own contingent". That was practically impossible because the largest part of the State contingent was devoted to administration which supported all agencies. The Consular staff had a legal mandate to process applications; that meant that any cuts to be made in the State staffing would have to come out of the Political or Economic Sections, which were too small already. A flat cut across the board for all agencies was not a very effective management technique since the basic staffing had never been determined on the basis of policy priorities, but had grown up over years depending primarily on the whim of the various Washington agencies. But it was very hard, if not impossible, to reduce the American presence except through a flat percentage cut across the board.

Our representation outside of Tokyo had been cut before my arrival. I think that in some instances the cut may have been too deep. Sapporo was down to a Consul, a Vice Consul and a branch PAO. Fukuoka was about the same. Osaka was larger primarily because the consular workload was heavier than in the other posts. I think it was the largest visa issuance post in the world before we eliminated the need for non-immigrant visas for Japanese. But Osaka was the

second largest economic hub of Japan and we had only one reporting officer and that was the Consul General, who had many other duties as well. That staff, I thought, was just too small. I think an economic officer should have been assigned to Osaka. In general, all remnants of our occupation-days staffing was long gone. The only exception was Okinawa and that staff could have been reduced, but there was always the argument that the size of that CG was justified by the workload that the American military presence generated, which was certainly true to a major degree.

The US-Japan relations in 1981 were pretty good. Trade tensions were at their usual high level; that was and is a constant in those relationships. The first trade talks between the two countries took place in 1972. Since then, those issues have been a major factor and perhaps even a factor of increasing importance as years passed. In the 22 years since the trade problem was first addressed, there were some years when the issue did not dominate our dialogue, but those were few and far between. Mansfield took a very balanced approach; he thought, not too surprisingly, that Washington might not always be correct either in its analysis or its tactics. The tensions were not always the fault of the Japanese. He used to say periodically that "the mote was in our own eyes". That view was not well received in Washington, both in the Executive and Legislative Branches. But Mansfield was a very principled man; he had spent fifteen years as the Democratic Majority Leader, but when he became an ambassador, he became the President's personal representative, regardless of the President's political views. He used to say that he was somewhat surprised by the role reversals that the political parties had exhibited: the party of protectionism had become the party of free trade and vice-versa. He used that comment frequently. He was also a firm believer in the thesis that "one catches more flies with honey than with vinegar". That maxim is as applicable today as it was over twenty years ago; the debate within the US government, and particularly between the Embassy and Washington, was over tactics, not strategy or goals, although the debate is much more vehement today than it was then. This continuum of tensions is not too surprising given that the issues are only grudgingly settled for a while and that some of the players remain the same. For example, one of the vocal "Japan bashers" is Clyde Prestowitz, now out of government, but working closely with the Clinton administration, but then the Special Advisor for Japanese Affairs to the Secretary of Commerce. He has been advising Republican and Democratic administrations for over twenty-years.

By 1982, I had not lived in Tokyo for seven years. Tokyo has always been a large metropolitan area, but in the intervening years, I noticed a lot of new construction, which has continued to this day. The ten period between 1972 and 1982 was the beginning of the modernization of the city. More subways were built, roads had been widened; it was just an easier city to live in. It was also somewhat more expensive and much more prosperous. That was true for the whole country. The economic boom was clearly visible. The smaller towns were not as rural as they used to be; all cities and towns were becoming more and more alike. Ten years earlier, one would notice thatched roofs on country dwellings; one could see quaint rural scenes. By 1982, such vistas were becoming rare; the country was becoming homogenized.

On the political side, the Liberal Democratic Party was still in power, the Socialists were not a threat, *Komaito* was a factor at times and not at others, the Democratic Socialist Party was small and not growing. The only question was which LDP faction would next rule the country. There was a difference from the 1970s when one could make a pretty good guess on who the next

Prime Minister would be. By the 1980s there was no certainty because the factional alignments had become less predictable. That started in the Tanaka regime. I think in part this new development stemmed from certain LDP reforms such as the membership voting for the Prime Ministerial candidate rather than the back-room process that had been in effect. There were events such as Fukuda while running against Hohira saying that if he were not elected he would not run again. Hohira bought enough LDP votes to deny Fukuda a clear mandate forcing him to resign him from the Prime Ministership to be succeeded by Hohira. Kissinger liked that because Hohira listened to him.

We were aware that money was flowing between business and politicians, but was not up to the level that it became later when it became a scandal. We were never certain about the magnitude of that flow and in the 1980s it was still possible to plausibly defend a system of cash support for politicians because it did cost money to run elections. As far as we knew, the factional leaders did not collect money for themselves; all the contributions were devoted to election process and the operations of the faction. This all fell apart with the discovery of \$50 million in walls with Shinkanimura. Tanaka lived quite well, but it was plausible to believe that his life style was primarily supported by the construction work in which he was involved before entering the government. When he was forced to resign, the family did not seem to have much money, which suggested that he did not profit from his political activities. In fact, most of the factional leaders lived somewhat modestly. They had to entertain frequently, which obviously cost money. But there were no indication of venality or politicians becoming personally rich from the financial support they received from their backers. In the early 1980s, such personal enrichment was not supposed to happen.

The relationship between the politicians and the bureaucracy was pretty much the same as it had been seven years earlier. Different politicians were identified with different ministries. Some had worked in a certain ministry and then had entered politics, but still had close ties to their former colleagues. That was particularly true for the Ministry of Finance and MITI. Those politicians who were known to be allied with one ministry or another were assumed to be following the guidance of the Minister with whom they were allied. Conversely, they also exercised some influence over that Minister. All of the senior bureaucrats had supporters in the Diet or in the LDP. Some bureaucrats had contacts with the Socialists, but that was more for form than for substance. So the politicians and the senior bureaucrats scratched each other's backs. Sometimes the politician played the role of protector; I would assume that the bureaucrat would be expected to be helpful in return, although I personally had no knowledge of such interplay.

This intricate relationship always was a challenge for the Embassy. In the political-military field -- that is security issues -- the Diet played a role, but that was a straightforward public debate and we knew who was interested in such issues. Economic issues were harder to track. This was one of the reasons that I tried to get closer coordination between the Embassy's Political and Economic Sections. I thought it was important to know which Diet members had walnut growers in their districts so that we could make a better judgement on the political impact of our pressures for tariff concessions. In the walnuts case, when the tariff was lifted we quickly found out who in the Diet was interested. Had we known those interests beforehand, we could have done some ground work which might have eased the shock. And that was true for all economic issues. I thought it was important that the Political Section, which had the best relations with the

Diet, be knowledgeable of the economic interests of various politicians. I think we made some progress on this front, but I would have liked even more coordination. On all major economic issues, the Embassy tried to explain its position to both bureaucrats and politicians. That was not as prevalent on international affair issues; most of those were discussed with the bureaucracy only. The Japanese Diet tended to more focused on domestic matters; very few members had a real interest in international affairs. I think there were wide agreement that as far as Japan was concerned, the United States was still the leading power in the world and certainly Japan's closest ally.

We viewed Japan through the prism of a bipolar world, but talked about it in other words. We used to discuss "equality" at great length, but we believed that when necessary, Japan would follow us without question. We viewed Japan as a "stationary aircraft carrier". That phrase came from a Nakasone visit to the US. While in Washington, he portrayed Japan as a "stationary aircraft carrier". His interpreter translated as "unsinkable aircraft carrier". "Unsinkable aircraft carrier" was a phrase that Japanese naval commanders had used during World War II. So the misinterpretation was seen by the Japanese as a Nakasone reversion to right-wing revisionism. If the interpreter had used the word "stationary", it would not have caused the uproar that it did. It was Don Oberdorfer of *The Washington Post* who finally looked at the original text of Nakasone's remarks and noted the error. I later asked Nakasone about the episode and asked him whether he intended to correct the record. He said that he wouldn't because if he raised again, the issue would be debated once again; as it was, the incident had past and had been forgotten. It was that Japanese atmosphere that allowed the interpreter to go unpunished for his grave error. In fact, he was a good interpreter; he had just heard the phrase "unsinkable" so often that the English words almost came out automatically. The phrase has considerable meaning in terms of the Japanese Constitution, which is very much oriented against military matters. I mentioned Suzuki accepting responsibility for the protection of the sea lanes for 1,000 miles from Japanese shores. In fact, if one draws an arc 1,000 miles from Tokyo to the east and 1,000 miles from Osaka to the south, one will find that there are Japanese territories at those distances -- little islands. We were working on other defense concepts. For example, the US Navy were patrolling from Okinawa in the Persian Gulf; that raised a question in the Diet. The Foreign Ministry responded that the US-Japan Security Treaty permitted the US to provide for the defense of Asia and patrolling of the Persian Gulf was consistent with the Treaty because that was the source of oil for Asian countries, including Japan, which was an essential commodity for the defense of Japan and other Asian countries. What was happening, which continues to today, was that the Japanese were broadening their interpretation of their Constitution and their military responsibilities. There were never any large leaps, but gradual creep which I thought showed great skill and imagination. We of course kept up the pressure on Japanese defense posture and particularly the issue of devoting only 1% of their GNP to defense expenditures. This was a constant theme, but there were a number of us that were uncomfortable with our position on this issue. The logical conclusion of our pressure would have forced the Japanese to rearm and would have forced the Japanese defense budget to our levels. But our pressures were not driven by security concerns; in fact, our interest in increasing Japanese defense expenditures was primarily trade-driven on the grounds that the more Japan spent on defense, the less it could devote to increased trade and civilian production, thereby improving the balance of trade between us and Japan. There was some interest in increasing Japanese support for our military presence in Japan, but that was not a continuing issue and could have been accommodated, I believed, within

available resources in the Japanese defense budget. We were asking that Japan pay for 50% of our military expenditures in Japan; the Japanese maintained that was just too high. Now they are at about 70%. The US position was more based on the view that the Japanese were just not spending as much as others on defense which gave them an advantage on trade issues and economic development. The casual relationship between defense expenditures and economic growth is somewhat suspect. South Korea, which had percentage-wise a higher level of defense expenditures than we had, also had a much greater growth in its GDP than we had. But no one ever brought this fact to the discussion. So every once in a while, I would argue against pressuring the Japanese on defense expenditures, but there was solid support for US policy both within the Embassy and the American military establishment in Japan. I did note on those occasions that I had grown up in a world that had a fully armed Japan and that I was not particularly enthusiastic about the consequences of that situation; I didn't think it was wise to return to those days. The question of Japanese expenditures was not a major issue in the early 1980s, but we kept it on our agenda and would periodically raise it. The Japanese would promptly reply that they were doing their best and promptly ignore us. The Japanese contribution to our military expenditures began to climb after the Okinawa reversion which required us to rehabilitate some of the sites that we maintained. Up to that time, the Japanese paid for some relocation costs -- if they wanted a building that we were occupying, they would pay for anew one somewhere else. But they never paid for upgrading our accommodations. After reversion, those guidelines changed and the Japanese paid for infrastructure improvements. That started an ever escalating rise in Japanese support for the US military. The Japanese bureaucracy of course would scream, particularly, as I have mentioned, that the support of US forces came out of the defense budget. That meant less money for Japanese forces. The Self-Defense Force appreciated our presence and was very supportive of our presence, but have preferred that Japanese resources be spent on Japanese forces. There was also a view that once the 50% level was reached and breached, then who could tell where the support would end up. And of course that was correct. The resistance to increasing financial support to the US military was not a public problem; it was primarily a bureaucratic opposition that had to be overcome.

I should note that the American military presence in Japan by the early 1980s was quite slim; it was considerably smaller than that I had encountered six-seven years earlier. The main forces were the Marines on Okinawa and the Air Force at Kaduna and Missau. In general, the relationship between the Embassy and the US military was very good in this period. Mansfield was always very mindful of their presence and was interested in any case in strategic issues. When I arrived, the Commanding General, who is always an Air Force General, attended Embassy staff meetings sporadically; most of the time, he sent his deputy. I wanted to foster closer coordination. One day, after the arrival of a new Commander, Chuck Donnelly, I suggested to Mansfield that he be invited to make a presentation to the senior Embassy staff. Mansfield gave his classic answer: Okay if it wasn't too long. So we proceeded and it was very interesting because Donnelly had just been transferred from Saudi Arabia where he had been the Chief of the MAAG. He gave his version of the Middle East situation, cast somewhat from the Arab point of view. Within minutes after the staff meeting, the PAO, Dave Hitchcock, was in my office demanding that he be given equal time at the next staff meeting to set the record straight. He had just come from tel Aviv and saw the Middle East somewhat differently than Donnelly. I told him that I thought that it would not be appropriate for us to get involved in that issue; we had enough problems of our own. We had asked Donnelly to make the presentation to build

bridges to the military, not to fight the Middle East battles in Tokyo.

We often discussed the nature and extent of US pressure on Japan. There were those of us in the Embassy who considered ourselves knowledgeable on Japan who viewed our efforts as essential because the bureaucrats who would be on the receiving end of the pressure -- except the Foreign Ministry -- all had alliances and allegiances to domestic pressure groups. Our demands would have some negative consequences and no bureaucrat would welcome that, much less initiate such actions. So our pressure enabled the bureaucrat to blame us for new policies because he certainly would not wish to take the onus himself. We understood that outside pressure was needed if the bureaucracy were to move in areas and directions of interest to us. We of course were not the only pressure point; politicians were another as well as Japanese consumers, in some cases. But a pressure had to be applied to the bureaucracy; for many years we were the main pressure group and still today we are one of the major ones. But we also we quite aware that the application of pressure had to be handled with skill and at the right time and within acceptable limits. Our problem was probably that we did not have sufficient focus. My main plea to Washington in this period was not to send us long list of demands. The Japanese would pick those which were of least importance to us and take credit for being responsive. But that plea fell somewhat on deaf ears because the US bureaucracy was also responding to its constituencies and was not willing to favor one over another. So our "wish list" just became too long and did not allow us to focus on the key and major issues; our pressure was diluted because of the range of issues that someone in Washington was concerned about.

I considered perfectly legitimate the general approach of putting pressure on the Japanese bureaucracy although I should note that we did reach agreement on some issues without applying that pressure. For example, the Japanese expanded their defense role and mission without very much urging from us. They did it because they felt it proper and did have a beneficial impact in some respect on the intra-Japan debate on defense issues. The general thesis developed that Japan had primary role in defending Japan and we had the principal role in maintaining stability in Asia. Once that thesis was generally accepted, the Self-Defense Forces had a much easier time acquiring the necessary resources. I think we were right in changing our policy of setting an arbitrary percent of Japanese GDP to be devoted to defense efforts to the concept of establishing agreed upon roles and missions. It was a much more effective way for the Self-Defense Forces to present their requirements and therefore being allocated increasing resources. They could argue that if someone were to invade Hokkaido, for example, the Self-Defense Forces would be able to slow down that effort long enough to enable the US to bring its power to bear on the situation.

Before ending the discussion on my tour as DCM, I should mention the Koreans in Japan. They had always been an issue and remain so to today. Their treatment by the Japanese was always a human rights issue, even before Carter and Clinton made it a center piece of our foreign policy. In the early 1980s, there was a big debate in Japan about fingerprinting "aliens" which in Japanese eyes included the Koreans, although many had been there for decades. We were opposed to that policy as a violation of human rights. On the other hand, some of those Koreans also had strong connections to North Korea. At that time, we were not greatly concerned by that linkage. We were interested in the traffic between Japan and North Korea because we hoped that it would provide us some intelligence on what was going on in that very close society. But I don't think we ever got much out of that traffic. I used to talk to Koreans when they returned to Japan

from North Korea, but I can't say that I gained much insight and I don't think anyone else in the Embassy did either. I don't know whether it was true, but the travelers maintained that they had been sequestered when visiting North Korea and could not observe much. Of course, the Koreans also had constraints because members of their family still lived in North Korea, whom they did not wish to endanger. Furthermore, we were Westerners and therefore not entirely trustworthy. That was particularly true for the supporters of Kim Il Sung.

Q: I would like to finish our conversation about your Tokyo tour with some questions about Ambassador Mansfield, whose name is mentioned in other oral histories. First of all, what was your relationship to him?

CLARK: It was probably not as close as those enjoyed by either my predecessors or my successors. In keeping with Bill Sherman's practices -- he was my immediate predecessor -- at the beginning, Mansfield and I would have coffee in the morning at about 7:30 a.m. But that ritual faded over a period of time and so I would see him in the morning when I needed to and not when I didn't have anything on my agenda. Our relationship was very good. I tend to manage without requiring much supervision and Mansfield left the running of the Embassy entirely up to me. The one time I did get into difficulties I mentioned earlier and that was over the assignment of a temporary administrative officer. That was the only time we differed on anything.

There were times when I would press him on some matters that I knew he was reluctant to address. For example, at one time, the Japanese Foreign Minister was going to visit the US and Mansfield didn't want to accompany him. So I suggested that he might wish to send me instead. That didn't resonate with him but he agreed. But by large, I found the working relationship a very rewarding one. He taught me a lot about how to handle people. When I first arrived in Tokyo, I was struck by Mansfield's complete confidence in his own policy views, even when he would champion an unpopular policy. For example, I had been with him in New York when the interim US Navy report was presented, as I have discussed earlier. A few weeks later, he received the final report and was to take it to the Foreign Minister. I asked him who he wished to have escort him. He said he wanted the Naval Attaché, who was less than thrilled to be involved. But Mansfield knew that the presence of the Naval Attaché was important for symbolic reasons. He also said that when he presented the report, he would bow to the Foreign Minister. I pointed out that if reported that gesture would not be welcomed in Washington. He said he knew that, but that the Japanese, for all of their vaunted literacy, did not necessarily read, but they would be greatly impressed if my picture bowing to the Foreign Minister appears on the front pages. They will understand without having to read the articles that I apologized for the sinking of the freighter and that he said, was the appropriate gesture under the circumstances, Washington notwithstanding. As predicted, everyone in Japan knew that the American Ambassador had apologized for the sinking, which was greatly appreciated, and there was some carping in Washington about Mansfield kowtowing.

This use of symbols came to Mansfield almost naturally. He did consider everything thoroughly. One time, he was scheduled to give a press conference at the Press Center. It was during another debate in the US of troop withdrawal, which had at an earlier period given Mansfield great visibility as the author of the "Mansfield amendment" which called for a reduction of troops in Europe. The debate at this time revolved around our military presence in Korea. I predicted that

he would be asked about that issue. He said he had prepared for it; he had asked the librarian to do some research, which he did not use in his remarks. He was asked about troop withdrawal from Korea; he gave, as customary, a very brief answer to the effect that he had been in error in his previous position. The audience gave an audible gasp. The reporter didn't believe that he had heard correctly and repeated the question. He got the same precise answer again. On the way out of the room, one of Japanese reporters mentioned to Mansfield that he had been surprised by his answer. Mansfield looked at him and said: "Remember that a "foolish consistency is the hobgoblin of little minds". He knew where the quote had come from, but for the following days the buzz word in Tokyo was their version of "hobgoblin". But Mansfield knew exactly what he would say and had a great feel for how it would play. His speeches usually tended to be the same, except for one or two paragraphs which covered his views on the issue of that day. The Japanese soon knew how to read Mansfield's speeches and would target these special paragraphs. The rest of the speech they practically knew by heart, but Mansfield would always slip in a comment or two which was topical on the day he delivered the speech. He was a master of public relations. He may have been a very private man, but his public appearances were always so well prepared and considered that I came to believe that he in fact enjoyed them.

I also learned from him that the worst advice is that which is not sought. People in Washington would ask him to intercede with one of his former Congressional colleagues on one issue or another. They would ask Mansfield to let the Congressman or Senator know where he stood on the issue in light of US-Japan relations. Mansfield answer was invariably the same: if he were asked, he would be happy to give his opinion. He would never volunteer it. He was very careful with his Hill relations which paid great dividends. Washington never seemed to learn that Mansfield would not take the initiative. Dick Holbrooke, then the Assistant Secretary for FE, particularly never learned. I remember one episode particularly which occurred while I was still the Country Director for Japan. When Mansfield left his post, he firmly believed that the Chargé was then responsible. Mansfield did not like being called on Japanese matters once he was not physically in Japan. He felt that if he did not have confidence in his deputy, he never would have left him in charge. So his position was that if an issue had to be decided, the Chargé was the person to do it. I understood his point of view, but others didn't. In any case, on one occasion while he was vacationing in Florida -- in Jane Englehardt's guest house -- Holbrooke wanted to talk to Mansfield. That was a double mistake: a) the Ambassador didn't like to be called when on vacation and b) he didn't like to talk on the phone. But Holbrooke was insistent and asked me to find the telephone number. So I called the Englehardt residence in New Jersey and was given the Florida phone number by the butler. So Richard got in contact with Mansfield; the conversation did not turn out to be very satisfactory. Mansfield suggested that Holbrooke call the Chargé in Tokyo -- Bill Sherman. Holbrooke ended the conversation and told me that the discussion didn't get very far. I reminded him that I had told him that calling Mansfield was not a very good idea.

In addition to establishing the premise that once he was not in Japan issues should be decided by the Chargé, as I said, Mansfield detested telephones. When I was to Tokyo, there was no way to get in touch with the Ambassador if he were caught in traffic, which happens often in Japan. So I suggested that we install car telephones in the Ambassador's and the DCM's cars. Mansfield resisted, even though I promised that I would not let anyone else call him. Mansfield's Japanese guard had a walkie-talkie and Mansfield thought that was enough. I pointed out that that enabled the guard to be in touch with the police or the diplomatic security service, but it was absolutely

useless if I needed to get in touch with him. I thought that Washington would not be please of it called for the Ambassador only to be told by the DCM that he didn't know where he was. This argument went on for six months before finally Mansfield agreed to have a phone installed in his car and we only managed to get that approved by installing the phone in the front seat so that anyone riding in the back could not reach it. We never used it, but I felt better because at least in an emergency, I could be in touch with my Ambassador. Mansfield just didn't like telephones.

The other comment I would make refers to the Mansfield team. Mike was the "front man", but Maureen was a formidable member of the team. It was one of the best political teams that I have even observed. He would seek her counsel on many issues; sometimes he would come back to the Embassy and change his views, obviously after having been counseled by Maureen to do so. If he didn't remember a name, she would. Watching the two working together was both enjoyable and instructive. I was certainly aware of that team operation and I am sure that many of the senior Embassy officers were also aware of it. That doesn't mean that we tried to influence Mrs. Mansfield; that would not have worked and would have been inappropriate. In connection with this discussion, I should note that often Maureen was ill. She was allergic to MSG, as many are; unfortunately MSG is used widely in Japanese foods. When Mansfield accepted an invitation to dine at some fancy Tokyo restaurant, it was not unusual for Maureen to send her regrets at the last moment because she didn't want the risk of eating MSG. The funny part was that restaurants to which they might be invited would not have used MSG under any circumstances, but Maureen was always concerned about the possibility because in fact the use of it was very prevalent in Japan. But these last minute regrets would generate great concern in the community because "poor Maureen was ill again". She also used that excuse to get out of going places when she didn't want to. It didn't take long for all the Japanese hostesses to understand that Maureen didn't tolerate MSG and would make sure that she was never served any food with that additive in it. Sometimes, the Ambassador would do things that Maureen liked such as going to fashion shows. She knew the designers and had good tastes. So often, one would see the Mansfields at the leading Tokyo fashion shows, which was obviously a major boon for the designer and something that she enjoyed doing.

Mansfield was a master in handling Congressional delegations. He is the only ambassador I have ever seen receiving standing ovations after his briefings. It was almost unbelievable. I remember one Congressional delegation that visited Korea. It was not going to stop in Tokyo. So Mansfield flew to Seoul and briefed them there on Japan. Ambassador Bill Gleysteen, who was an excellent briefer himself, didn't stand a chance; there was no one who could make a presentation like Mansfield's. No one ever talked back to Mike Mansfield. He never used notes and could brief for as long as he thought it was necessary -- anything between 10 minutes to an hour. He had absolute command of facts and figures; sometimes he would repeat himself, but that was a rare exception. We would always provide him with updated figures. I then would watch this master at work and learned how to use statistics in a meaningful way; I could never do it as well as Mansfield could. When he was finished with his polished presentation, he would ask : "Any questions?". After the applause, some one in the audience would first thank him for the excellent briefing. Then the questions came, most of them relevant, but none in the same category that other ambassadors received. They were always politely worded!

Mansfield guarded his connections. He used them, but in his own way. He would take advantage

of visitors. He had an extensive correspondence and used that. He used to send hand-written notes to people; that was a big deal for the recipients. He could have dictated them, but he understood how much more appreciated these notes were when they were in his own handwriting. I found people really appreciated that extra effort that a hand written note takes. He did a lot of that and he worked his contacts very well. But he did not take the initiative; he would respond when asked. He worked very hard on his relations with the American business community in Tokyo. All of at the Embassy did that, but he was by far the best contact that we had. Although he didn't like long staff meetings, that didn't apply to his sessions with the American Chamber. He would sit through those regardless of the time involved. He would listen carefully to their presentations and they knew that they could count on a receptive ear. Mansfield held the view that the US needed more and better work by the American business community if we ever hoped to achieve some better trade balance. He was anxious to have more American business in Japan and that made important for him to understand the Chamber's perspectives, which he would factor in his analysis of economic policy. Mansfield was convinced that if the American business community were willing to invest time and money, more US imports could be brought into Japan. He used to say, as I think I already mentioned, that often "The mote was in our own eyes". He was critical of some of our domestic policies, particularly those that tended to increase our budgetary deficits. He also criticized some of the positions of both political parties; after all he had been the Senate Majority Leader for fifteen years. He noted, as I have said, the parties' role reversals on free trade, which often aligned him with the Republicans. In some ways, he had more clout in the Reagan White House than he did in Jimmy Carter's. Some of his critical comments on US domestic policies were not always welcomed; he was criticized for bashing his own country and not the Japanese. He did not buy the thesis, which was being discussed then and is alive and well today, that the way to move the Japanese on trade issues was to publicly berate them. I have never thought that that approach had much success. We in the Embassy fully supported Mansfield in his trade views. I certainly believed that greater American effort would increase US imports into Japan. We made some things easy for the Japanese. For example, on automobile trade, the American companies, until very recently never tried to sell cars with a right hand drive. That is what the Japanese drove and would be hard to expect the Japanese consumer to change just for the sake of driving an American car. In fairness, I should note that I talked to the *Yanase* people about Mercedes sales; that was a very successful import program. They were the original Japanese distributors and it was true that over one half of their sales were left-hand drive Mercedes. I was told that the reasons for that were two fold: a) people drove left hand drives just to show that their car was foreign made and b) the most important consumers of Mercedes were companies' presidents; for them, it was more convenient for the driver to open the left hand back door, which was the curb side, if he drove on the left hand. I was also interested why large European cars sold better in Japan than large American cars. In Washington, I had used a little Audi Fox station Wagon -- really a Volkswagen. We took it to Tokyo, but soon after we arrived I looked around for a Cimeron, which was a Cadillac car. I asked the local representative whether he had one that I could see. He didn't, but he encouraged me to order one. I then asked about spare parts. He thought that would not be a problem because I could always order them through the APO. In the final analysis, if the local representative didn't have one in stock, if there had not been any demand to bring some into Japan and if spare parts were not available in Tokyo, I concluded that it didn't sound like a very attractive deal. As an alternative, the dealer suggested that I buy a Mercedes which he said he could guarantee would not use its full value two years later if I were to trade it in then for the next higher model.

He said that a lot of Embassies were doing that, but he noted that the American Embassy was not taking advantage of that opportunity. I told him that I wasn't about to do that either. This is just an illustration of attitude a dealer of imported cars took on their wares; he was pushing Mercedes in preference to an American car. American business was not doing all it could to push American wares.

Mansfield was a very good customer for statistics. He was also a voracious reader. He read all the time. If some one had access to the list of books that USIS was requested to select for him, one would find undoubtedly a long list tailor made for a person who was an ambassador to Japan. He read as many books on Japan, economics and other important disciplines as he could get a hold of.

Mansfield expected the Embassy to perform up to his expectations. When he thought an officer had failed to meet his standards, he or she rapidly lost access to him. He just wouldn't call on that officer, but seek his information from someone else. As I mentioned earlier, he had an aversion to staff meetings. He held them because I guess some one convinced him that it was good for staff morale. But they were over in a hurry; a five minute staff meeting was a long one. I think I also mentioned that I had seen him walk out on presentations that he considered too verbose which certainly did not delight the officers making them. He would ask me to take the chair and walk out.

Mansfield relationships with other ambassadors was very good. When he arrived in Tokyo, he received and accepted some very good advice from Bill Sherman. He was told that he was the most visible ambassador in Japan not only because he represented the United States, but because he was an important figure in his own right. Sherman told Mansfield that protocol required a new ambassador to call on all of his colleagues. And that is what he did -- every ambassador in Tokyo who was available, in the alphabetical order of country. It is a lesson that I took to heart; I did exactly the same thing when I became Ambassador to India. It took me six months and I was delighted when I got to Yugoslavia! After that initial spade of calls, Mansfield maintained contact with the diplomatic community. He of course saw all the representatives of the major powers, but he also went to a lot of receptions and therefore didn't slight anyone. He attended one reception almost every evening and sometimes two or more. Ambassadors of other countries would come up and talk to him during these events. He did not pretend to remember their names; it was always "Your Excellency". He included members of the diplomatic corps in his dinners which further cemented his relationships. He had certain favorites; he invited the Moroccan Ambassador more than once, for example. Morocco was the first foreign country to recognize the independence of the United States and he liked the Ambassador. He often invited the Mexican and the Philippine Ambassadors in part because he liked both countries. So he reached out beyond the major powers. In fact, I saw more of the Asian ambassadors than the British Ambassador, for example, at the Residence. Mansfield made a point of inviting representatives from smaller countries. He thought that that was appropriate and good politics and also it gave him an opportunity to have different points of views and information. It was a wise policy.

Mansfield was a master in the usage of the media. I mentioned his press conferences, which were not frequent, but perfectly timed -- once a month or every other month. The media loved these press conferences. He always spoke on the record, an approach which I then used later in New

Delhi. He never made any pretense of speaking Japanese, but he would fill a room anytime he wanted. He held the conferences when he thought they were necessary. Sometimes, he would limit attendance to American press only. As far as I know, Mansfield never gave a "backgrounder". He rarely appeared on TV; that had been Reischauer favorite media. Mansfield didn't really like TV, but he would appear from time to time. He made frequent public appearances. He visited every prefecture; by the time I arrived, he had almost completed the circuit of Japan. He traveled less after his initial forays. there were parts of Japan that he liked very much. He loved Kyushu and Sasebo, for example. Sasebo had a Navy guest house on the US base which fronted right on the water; he liked to stay there. When he was there, there was usually another purpose to his visit. One time he visited Nagasaki, which was close by. In his speech there, he said that his first visit to Japan was in the early 1920s aboard a troop ship which was coming from the Philippines on its way to China. The ship stopped in Nagasaki for three days to take on coal, which was brought on board a basket at a time carried up the gangplank. He mentioned the dates he was in town. Later, some of the citizens came back to him telling him that his dates were not quite correct and their records, which had survived an atomic bombing, indicated slightly different dates. He was impressed that the Japanese could reconstruct that little piece of history.

While mentioning Nagasaki, I should comment on Japanese attitude toward their suffering. Over time, they did not show much bitterness. To today, they feel that they are unique because they are the only humans who were subjected to atomic bombings. So when one talks about nuclear war, the Japanese are in a very special position. But there isn't special bitterness. In fact, one old general when asked whether Japan would have used an atomic weapon if it had one, replied without hesitation : "Of course!". That caused a major uproar in Japan because it is really contrary to the national mood, but I think he was probably right; in the mid 1950s, the Japanese Imperial Army would have used the bombs if it had it. This is not say that the Japanese have forgotten their history; if you go to Nagasaki today, you can go to the museum and see some horrific sights resulting from American actions. I think I mentioned previously the Hiroshima Study group, now run by the Japanese, but which originally was a joint effort. It is a continuing study of the victims of atomic bombing. But by the early 1980s, the subject was not really discussed, except for example when the Chinese test one of their weapons, the mayors of Hiroshima and Nagasaki are the first to condemn these efforts to "disrupt world peace". They have assumed a self-manufactured mantle of responsibility for all nuclear issues around the world.

While I was in Tokyo, we had a Presidential visit, as a return for the Suzuki visit, which I described earlier. Reagan came; it was great fun! This was somehow different from others we had suffered through. It started with an advance team headed by Mike Deaver, which came about three to four months before the visit. We visited the sites that the Japanese wanted to use. They were particularly interested in having Reagan to go to Kyoto, which was one of their ancient capitals. In addition, I think the Japanese were anxious to get Reagan out of Tokyo. Deaver and I discussed the Japanese interest; I pointed out that a Presidential visit should not look like a tourist trip. I thought that we had to do some things in Tokyo. Deaver saw the situation the same way and so we got along very well, especially since we were both graduates of San Jose University. But we flew down to Kyoto and looked over the possible sites. We finally told the Japanese that we didn't think Kyoto was such a hot idea; then relations became a little tense.

Finally, we all agree that the visit would take place entirely in Tokyo. I made two contributions to the planning of the visit: 1) when it was suggested that the President do something with the Crown Prince -- the Emperor was getting along in years -- I recommended that we have the two watch a horseback riding and archery exhibit in which the riders would be dressed in old court costumes. Both Reagan and the Crown Prince had an interest in horseback riding. I wanted to have that done in Tokyo, but the Foreign Minister, when consulted, mentioned Kyoto again. I said that that was not possible, so the Foreign Ministry suggested Kamakura, where the Great Buddha statue is located. I said "No" to that as well; I told the Foreign Ministry that shows of the kind we were discussing had been put on in Tokyo. I mentioned that there was a horse park in Tokyo that the father-in-law of the Emperor's second son had participated in developing. So that was a natural location. Then I suggested that a better place yet would be the Maji Shrine. That didn't immediately draw a favorable reaction. I said that the Japanese government had for many years tried to get an American President to the Maji Shrine without success because the missionary community had always objected since that was a Shinto shrine. I suggested that here was an opportunity for the Japanese to have an American President visit a major shrine without giving it a religious connotation which we always found unacceptable. That argument seemed to sway the Foreign Ministry; they were willing to go with us to look at the site. In fact, when we went there, the head man gave us a brochure, which included a section on horseback riding and archery. There was a special field for it which seemed to be news to the Foreign Office types. So President Reagan went to the Shrine with the Crown Prince, didn't enter it, but walked around it to the archery field. The day was somewhat overcast. One of the reporters said : "I hate you, Clark. I don't really want to take these pictures but they are the best shots of the trip".

The second contribution concerned the white tie and tails affair to be hosted by the Emperor. The President had his own which made him look very elegant. For the rest of the delegation and us who resided in Tokyo who had been invited, the challenge was daunting. Trying to rent white tie and tails in Japan is almost impossible; one could find them at *Matsuaki*, an old store. But they looked as if they had been cut thirty years earlier. So we ended up getting them at the Prince Hotel, which had a section devoted to weddings. They all looked fine, except they all had velvet lapels. I refused to take on with velvet and got a regular one -- I didn't want velvet lapels.

Security for the Reagan visit was unbelievable. If anything, it was even more suffocating than that which the Japanese had developed for the Carter visit. The Secret Service had its own advance team which negotiated with their Japanese counterparts. As often happens, the two services argued about whose responsibility the protection of the President it was. One of the points of contention was whether the Secret Service car could be as close to the Presidential limousine as it wanted. The Japanese wanted their protection car immediately following the limousine. The Ambassador was instructed by Washington to call on the Prime Minister to discuss this very "high level" issue and presumably to make sure that the Secret Service car followed immediately after the Presidential limousine. As you can well imagine, Nakasone was not at all pleased with having to deal with matter of this kind; Mansfield was also not very happy with the instructions. So the two of them plus us and the Japanese staff spend half-an-hour or more talking about the order of cars in the motorcade. At one point, Nakasone suggested that the Chief Cabinet Secretary, an old LDP man named Nokota who had been a police officer, and the Embassy's DCM get together with their experts to settle the problem. Mansfield readily accepted. So we continued the meeting in the Chief Cabinet Secretary's house which was right in the Prime

Minister's residence's compound. That meeting took another three hours with my side threatening to walk out on a couple of occasions. In the final analysis, the Secret Service did not get its way, but by that time, they believed that we had been as forceful as we could have been and they awarded me a commendation. Recently, I attended the Emperor's arrival ceremony at the White House and wondered what would have happened if the Japanese had been as obstinate as we had been. The Reagans were staying at the *Akasaka* -- the Japanese version of Versailles with indoor plumbing -- which used to be the Crown Prince's Palace and is now the official guest house. Visitors always reviewed troops in front of that Palace; the Emperor drives over from his Palace for that ceremony which is the official arrival ceremony. The chief of the Secret Service detail insisted that he had to stay with the President at all times. The Japanese would not permit that; no one could be that close to the Emperor. The newsreel of the Reagan arrival ceremony will show an unknown figure in morning coat walking a few paces behind the President. That was the head of the detail who decided to completely ignore the Japanese; fortunately, the Emperor did not accompany Reagan in his review because by this time he was getting along in years and could not walk that far. The head of the Secret Service would not allow anything to come in between him and his President! Fortunately, the Japanese did not react; it could have been a serious problem. Our Presidential visits, wherever they may be, are always subject to controversy and frictions because we insist on so many of our ways of doing things. So security was even more heavy handed for Reagan than it had been for Carter, which as all will remember completely isolated the President from the Japanese people. It is true that the Japanese did not marshal as many troops for the Reagan visit, partly because Reagan was just not that interested in mingling with crowds or holding town meetings. So the visit centered on functions at the *Akasaka*; he went to the Diet to give a speech and to the Imperial Palace for the formal call on the Emperor and the banquet. The motorcades were quick; he did not spend much time in the road eliminating the need for the massive security that the Japanese mounted for Carter.

The visit was more than just ceremonial. Reagan was accompanied by Shultz and Sigur, some of the White House staff and other high ranking US officials. As with all Presidential visits, much work is done on the side especially by those responsible for drafting the communique. In that paper, a lot of substantive issues are resolved. Usually, the initial drafts are prepared before the visit, but the thorny issues, if resolved at all, are hammered out during the visit by senior officials from both delegations. The DCMs, in Presidential visits, are responsible for the smooth progress of the visit, but usually are not involved in policy debates.

As always, the President is accompanied by a large media contingent which travels on its own plane. It occupied two wings of the Okura Hotel. That is always a major workload for an Embassy, particularly the USIS component. Before leaving Tokyo, Reagan met the Embassy staff. In fact, he did something quite unusual at the suggestion of one of the White House staffers. His stay in Tokyo happen to take place on November 10, which is the birthday of the Marine Corps. Because our Marine contingent had to be on duty for the Presidential visit, the Marine Corps ball could not be held. So Reagan invited the Marines to the *Akasaka* to share their birthday cake with him; he had a little party for them and only them. The senior American military men in Japan could not believe it; here were some lowly soldiers invited to a party with the President of the United States and they were not invited! That resentment got back to the White House, which then invited the generals and some of us civilians. It was a very amusing show to watch!

The White House staff was quite easy to work with. I think it helped that I knew them all, having worked with them in Washington in preparation for the Suzuki visit. That staff also had a nice touch. Although Suzuki was the one of the first official visits and the staff was just learning the ropes, it handled the protocol as if they had been at it for years. For the State dinner, there was a guest list, which didn't include low level types like myself. For us, they hosted a smaller dinner in the Garden Room which included most of the people who had spent time on the preparations for the visit. The White House included some people in the Japanese Embassy. After dinner, we were invited to join the formal dinner guests for the entertainment. I thought that this gesture was a great touch and greatly appreciated by all the working stiffs, who usually work endless hours for State visits and receive no recognition at all. So I knew the White House staff that came to Tokyo. Deaver was in charge of the "photo opportunities" settings. As I mentioned earlier, the President addressed the Diet, which meets in a dark wooded chamber -- quite a handsome room. There is a sky-light made of stained glass, which somehow escaped untouched through the war. Unfortunately, teleprompters can not be read with the light coming through the ceiling and shining right on them. Reagan is very good with just a script and that is what he used; in fact, that technique is much more personal and each member of the audience felt that he was talking directly to him or her. It was a superb performance. The Japanese were very pleased with the visit which paid appropriate attention to Japanese sensitivities.

Later Reagan returned to Tokyo for a G-7 meeting. That was easier to handle because he was there as a member of a large group, all hosted by the Japanese.

Before closing this chapter of my career, I should mention that this assignment was my first encounter with the problems of down-sizing US representation overseas. It was by no means the last, but I learned a lot about the process even though we were not very successful in Tokyo, even with the full support of the Ambassador. His unswerving view that US government agencies were assigning too many people to overseas posts; the net result was that there was an unbalance in representation with the State Department contingent under-represented and other agencies over-staffed. Although he didn't manage to reduce the Embassy staffing, in his eight years Mansfield did manage to hold the line; it could have increased substantially had he not taken such a firm stand against it. One just needs to see what happened in Bangkok! Every agency wanted to assign its people to Tokyo; some of the assignments had to be settled at the Secretarial levels in Washington. I recall the FAA case. It wanted to assign fifteen people to Tokyo to work on airline safety to be quartered in the Embassy or downtown Tokyo, although they would be working out at Narita and Nahata. I thought that was insane since the commute between Tokyo and those airports was even then at least two hours each way. I suggested that they be located out at Narita and fly to Nahata when they had to work there. FAA thought that was entirely unacceptable and in the final analysis, never did assign a staff to Japan. FAA of course used the argument that their work was vital to airline safety, but most US government can make a case that their work is of the highest priority.

ROBIN WHITE
Japanese Language Training, FSI

Washington, DC (1980-1981)

**Japanese Language Training, FSI
Yokohama (1981-1982)**

**Economic Officer
Tokyo (1982-1986)**

Ms. White was born and raised in Massachusetts and educated at Georgetown University. After graduation she worked briefly on Capitol Hill before joining the Foreign Service in 1973. A Trained Economist, Ms. White served at a number of foreign posts as Economic and Commercial Officer. In the State Department in Washington, she occupied several senior positions in the trade and economic fields. Ms. White was also a Japan specialist. Ms. White was interviewed by Charles Stuart Kennedy in 2005

Q: Let's talk a bit about language training. How did you find it?

WHITE: I lack the language gene, so it was difficult. I worked very hard at it and I got my 3/3 in Japanese, but it was constant work. I was at the Foreign Service Institute (FSI) at Rosslyn for a year, which was not an attractive place physically. We were in a high rise and in small airless rooms doing fairly stressful work, though I enjoyed the teachers and my fellow classmates. The FSI campus at Arlington Hall is a great improvement and much more pleasant surroundings for students.

Then I went to Yokohama, a pleasant environment. Yokohama is a great city as an introduction to Japan. It is a large city, but seems much more relaxed and green compared to nearby Tokyo. My classmates were interesting because the Foreign Service Institute at that time also had Canadian, Australian and New Zealand officials, which made for a nice mix. It was a good combination of backgrounds there, and gave us a wider circle of friends and contacts when we moved on to Tokyo. We also did field trips and travel, so it was a good year.

Q: As you learned the language was the cultural and social structure part of what you learned?

WHITE: It was. I don't remember specifically what I learned in area studies, which is ironic because I'm now teaching the Japan Area Studies class at FSI, but students imbibed a sense of culture and social structure as they learned the language. Japanese is a very hierarchical language and words and structure reflect the way people interact. Women have a certain way of talking that is very distinct from men's tones and vocabulary. You talk one way to your seniors and one way to your subordinates. That is really the most difficult part of Japanese. You're not learning one language; you have to at least be able to understand quite a range of different manners of speech. We were taught basic, standard speech, such as radio announcers would use, but it was always difficult to understand when listening to TV or movies when people weren't speaking standard Japanese or were talking in what might be considered slang.

Q: It seems that a lot of Japanese women seem to speak in a higher tone than necessary.

WHITE: Yes, it is considered a polite feminine form of speech.

Q: How did they teach foreign women?

WHITE: The FSI teachers are careful to teach the students, male or female, to speak a standard neutral Japanese. All the teachers in Washington were women, so they were very careful not to give the male students certain mannerisms or speech patterns that would be considered feminine. Neutral speech from a foreigner is pretty much what the Japanese would expect. They don't expect most foreigners to make the speech distinctions Japanese do.

Q: How about the writing system? It is like the Chinese, isn't it?

WHITE: There are two different alphabets based on syllables, hiragana and katakana, the latter used for foreign words. There are also thousands of kanji which are the Chinese characters. We were taught to read kanji. It was pure memorization so students focused on their substantive areas and learned the kanji for technical words. I was trained to read economic and trade articles and was able to get a 3/3 reading economic articles, but had I been given an article about missile defense, I wouldn't have been able to read it at all.

Q: When in Yokohama, were you able to use your Japanese?

WHITE: That was the great benefit of living and studying in Japan. From the beginning we were living in Japanese neighborhoods, talking to the families, and shopping in little stores. There were also "conversation ladies," who came as volunteers to chat with the students and get together for tea and casual conversation. The Japanese really appreciate people trying to speak the language and praise any effort. It is a positive atmosphere for learning.

Q: You went to Embassy Tokyo in 1982?

WHITE: Yes, in June 1982, and I stayed four more years in Japan. Former Senate Majority Leader Mike Mansfield was the ambassador, one of our longest serving ambassadors who served under both Republicans and Democrats. He was greatly respected by everyone, a gentleman and a man of great integrity. Don Oberdorfer wrote a good biography of him a few years ago.

I was a mid-level officer in the economic section and I had a double portfolio. The more demanding part was transportation. At that time, Japan's export of automobiles was the major trade problem with the U.S., a very political issue. Aviation negotiations occupied a great deal of my time and we saw a lot of changes in the aviation relationship during that period. I also followed shipping.

The other half of the portfolio was reporting on Japan's relationship with the communist countries. I reported on their trade with China, with the Soviet Union and handled the COCOM issue, which related to controls on the export of strategic materials.

Q. Was Japanese essential for your work?

WHITE: Probably not essential. Most of the people I worked with in the Foreign Ministry and in MITI, the Ministry of International Trade and Industry, spoke English. The Ministry of Transportation people who were my other main contacts were mixed in terms of language. The people in the International Division spoke English but with some of the more technical bureaus we did things in Japanese. My Japanese was adequate, but I must admit that it never reached a level of real fluency where I could feel comfortable doing a negotiation without a Foreign Service National (FSN) to back me up.

Q: I know the feeling. In the early 1980's, how did you find being a woman dealing with the Japanese? Was it a problem or were you just the 800 lb. gorilla representing the United States and it didn't make any difference?

WHITE: I think it didn't make much difference. It was very different from how I would have been treated had I been a Japanese woman. I was an American and therefore dealt with as an American, and also had the advantage of being an American diplomat. I think an American businesswoman or reporter would not have had as easy access as I did, but they had to deal with me on government to government issues. I also think that for some Japanese it was a novelty to be sitting across the table from a woman. Speaking some Japanese helped, too.

Q: On that subject, I don't know how it worked for embassy people, but business people often had to go out drinking in the evenings when the business was really done. Was this the case?

WHITE: Certainly drinking after work hours is a major part of the Japanese business lifestyle and also to a certain extent the government official's lifestyle. It is considered important to cement business ties at a social level. I occasionally went out to dinner with people and went to a lot of receptions but didn't go often to smoky bars. Not too many embassy people did. Those who spoke Japanese very well, particularly those who had lived in Japan earlier as students, went out more with the Japanese. People in the political section, especially those following the political parties, worked to make that sort of social connection. Most people, especially those with families, worked long enough hours and had to go to enough official functions that we limited the bar scene to what was really necessary.

Q: Let's take the issues one at a time. On the transportation side, what was the car situation at that point?

WHITE: That was the time when Japanese exports were really overwhelming GM, Ford and Chrysler. To a certain degree it was a problem of American quality and fuel efficiency. People had noticed that relatively inexpensive Toyotas or Hondas tended to last and, being smaller, get better mileage. To the American automakers' credit, they did restructure and started turning out much better products, but initially the reaction was political. Given the trade deficit, it was easy to generate protectionist Buy America campaigns and Congressional pressure on the Japanese. Congress got involved with threats of legislation and quotas; also the Super 301 amendment to the Trade Act was passed. That was aimed at "unfair" trade practices of any country, but mainly

was aimed at Japan. Because the auto industry is such a major part of the U.S. economy, autos were the prime target.

It was also a problem because very few American autos were exported to Japan. There were a number of reasons for that. One was that U.S. autos tended to be quite big and gas guzzling and weren't practical in a Japanese city. Therefore most of the U.S. automakers hadn't made much of an effort to meet Japan's standards. For example, American steering wheels were on the wrong side for Japanese roads, but American companies didn't make a right hand drive model.

Foreign companies had a very hard time getting into distribution networks. There were also some strange and complicated technical issues on the Japanese side. You had to have fold down mirrors and special headlights. You had to have special shields for catalytic converters. Due to the strict standards, it was very expensive, about \$1000, for every American car that came to Japan to be reconstituted, ostensibly for safety reasons. I worked to get more American cars into Japan. On my home leave I spent a good deal of time in Detroit visiting the testing facilities of the major American companies. I wanted to see the emphasis they put on safety in order to argue authoritatively that the U.S. safety tests should be accepted. The Japanese were saying they needed to be done all over again in Japan. What eventually developed was a program that allowed small quantities, e.g. 1,000 cars, to come in without having to go through all the tests and changes. It was a special exception made for political purposes.

As to exports to the U.S., a "voluntary" restraint agreement (VRA) was put in place in 1981 whereby a set number of cars was to be exported. I believe it was 186,000 cars a year. That left the Japanese government to decide who got the quotas, which meant they looked at past export records. This favored Toyota and Nissan. Honda, which was late in entering the U.S. markets, got a much smaller quota so there was a lot of political concern within Japan about how to allocate the 186,000 among their big three and smaller companies.

The irony is that the VRA gave U.S. companies breathing room to restructure, but it also really strengthened Japanese companies. Protectionist pressure often has such negative results. Extra profit went to the Japanese companies as Toyotas, for example, were in short supply in the U.S. Toyota dealers could ask for premium payments above the list price, so the Japanese ended up shipping their more expensive models because they could only ship a certain number. Profits in the American market gave them large capital reserves.

Q: Were Americans and Japanese looking at building Japanese cars in the United States? My wife has a 2001 Toyota with a sticker saying 60% was built in the United States. Was this a factor?

WHITE: Major Japanese investment in the U.S. developed during that time period. From the mid-1980s there was a migration of auto plants to the U.S. Obviously, since they couldn't ship all the finished cars they could sell, they realized that they could assemble cars in the U.S. and they would be U.S. cars not subject to the VRA. That caused political controversy too and at least initially the critics were right that this was not real U.S. production. Companies were sending over the most expensive, high tech parts like the engines and just having them put into car frames by Americans, which wasn't doing a lot for American employment. Because of the

pressure for more American content, they gradually increased parts production in the U.S. In many cases, however, the parts suppliers were Japanese transplants as well, part of the keiretsu or inter-connected company network. That caused many complaints as well. Still, Americans got more jobs and many states benefited. Local content is now quite high.

Q: Were they talking to you or the embassy on this subject?

WHITE: The U.S. government encouraged foreign investment in the U.S., particularly the Commerce Department and the Commercial Section at the Embassy. The purpose was to increase employment opportunities for Americans. The Embassy was helpful to a lot of state governments that opened trade offices in Tokyo. Those trade offices, which had been to encourage Japanese to purchase their exports, became more active as investment promotion offices. Many states offered good tax benefits to encourage companies to locate there. That worked well for places like Kentucky, Tennessee, and Alabama, though not much investment went to the traditional auto-producing -- and unionized -- states like Michigan and Ohio.

As more Japanese investment went in, and there began to be "buying of America" concerns, the Japanese were clever enough to seek good labor relations, join in community activities, contribute heavily to local charities. Now they are a real presence in the U.S. and that has a political impact. Their employees are voters, and congressmen see the benefits of foreign investment. If someone proposed protectionist action against Toyota, for example, you'd see tens of thousands of Toyota employees in the U.S. objecting. Toyota is a good case of community involvement, as they now have plants in a number of states. One of their good programs is to send high school teachers to Japan for a month each year, at first from the states where they had plants but now from all over, I think. Many of these teachers have never been out of the country before and their students have little international exposure. They come back and talk about Japan to their students and to their communities and it makes a difference.

Q: Was there a cultural movement spurred by industry?

WHITE: It was fairly calculating, e.g. we're going to be facing political pressures for a long time, so let's find a way to be in the U.S. market and develop a countervailing force against protectionism in the Congress. Many excellent exchange programs have been developed, in part due to a political motivation to gain greater American understanding of and sympathy for Japan. Jobs were key, but education and cultural exchanges were and are very valuable whatever the initial motivation.

Q: Did automobile manufacturers and others in Japan understand the American market and the political system or was it a learning process?

WHITE: They got a lot more sophisticated in the 1980s. Japanese corporations put a lot more money into hiring Americans. That led to domestic criticism of K Street lobbyists hired for their political connections. They also hired people to do analysis and publish studies, including economic work, and it was not usually biased in favor of the Japanese. But nonetheless it was an ugly period due to the trade tensions. At one point several congressmen took sledgehammers and destroyed a Japanese automobile on Capitol Hill in full view of the cameras. That was replayed

many times on Japanese TV and Japanese still talk of it today. There was an even uglier incident when some drunken unemployed autoworkers beat to death a Chinese American because they thought he was Japanese.

Q: I remember that. That was just terrible. .

WHITE: That of course brought a lot of memories of the discrimination in World War II when the Japanese Americans were put in interment camps.

Q: And the Japanese exclusion at the turn of the century.

WHITE: That's right. So a lot of Japanese at first felt defensive, then resentful, about why they were hated when they saw themselves as just working hard and making good products. In the U.S. there were articles and books with the theme that we won the war, but the Japanese really won in the long run with their economic dominance.

On a more thoughtful note, writers in the revisionist school of political economy, led by people like James Fallows and Clyde Prestowitz, were writing books saying that Japan could not be treated as a normal nation in terms of trade policy. The theory was that countries like the U.S. and the EU worked within in the GATT rules, but Japan, due to the structure of its business-government relationships, simply operated outside the rules. The answer therefore had to be managed trade in which there would be quotas and arranged markets on both sides. So it was good policy to limit the Japanese to 186,000 cars a year in the U.S. market and require the Japanese to import 10% of semi-conductors from foreign markets. That was a very strong trend throughout the '80s. The pressure diminished in the '90s when it turned out that the Japanese system was not as infallible and ready to take over the world as had been feared; also the Japanese vigorously resisted pressure for more specific numbers.

Another revisionist concern was that that because Japanese companies' source of capital and capital flows were different from ours, the Japanese companies did not have to worry about profits. They could just concentrate on market share. That was true, and it helped them grow for many years, but it wasn't sustainable. In the '90s it turned out that because they hadn't had to worry about profits they made a lot of unprofitable investments that then came home to roost and led to a decade of stagnation.

Q: There was no basic accountability.

WHITE: Yes. Because banks rather than the stock market were the source of capital, and because of close keiretsu ties between banks and corporations, you didn't have a real cost of capital. Therefore there was no outside demand that required it to be used in an efficient way.

Q: During the '80s there were books about how the U.S. should copy the Japanese system. In many ways, we did with better quality control, as in automobiles, which have changed considerably.

WHITE: There was a positive interest in quality control. Also some firms gave workers more responsibility for pointing out areas of concern or for improvement, and the ability to stop the assembly line if something was going wrong. That was a lesson from Japanese factories.

Q: What about your relationship with your Japanese counterparts? This was a very difficult time because of the anti-Japanese feeling fostered by exactly what you were dealing with, particularly the automobile issue. Did you find this reflected in dealing with your Japanese counterparts?

WHITE: On an individual basis there was no hostility. There was a professionalism, a sense that regardless of what our governments or politicians were saying, and certainly regardless of what the press was saying, we had to work together to solve the problems. It helped that Ambassador Mansfield was well respected by the Japanese and was considered very even-handed. That got him into trouble back in the U.S., of course, because any ambassador who seems sympathetic to the host country is considered to have gone over to the enemy. But in fact while trying to explain to Americans where the Japanese were coming from and why they took certain positions, he still pressured them hard for market opening actions.

The economic section handled a lot of delegations, usually led by USTR, sometimes by the Commerce Department and there were long difficult negotiations. But there was no animosity among the people involved. Americans from these other agencies often were fairly new to work with the Japanese, but over the years developed into very savvy negotiators who really understood the system.

Q: I understand from a person from the Commerce Department I interviewed that the Foreign Service National (FSN) Japanese staff was invaluable during negotiations in being able to point out flaws and inaccuracies on the Japanese side.

WHITE: I think most embassies have extraordinary FSNs and benefit greatly from their knowledge. At that time in Embassy Tokyo, there was a transitional period because the first generation that had been hired after the war was retiring. They had started working in the '50s or early '60s and were a great source of advice. As you noted, they played a big role from the back row as they could remember what had happened in previous talks. Short tour Americans were at a disadvantage. The Japanese brought huge delegations into the room. They would have 10 or 12 people at the table and 25 young people behind. The young people were all taking notes as part of their training. This meant that they had very good records and could go back and say something like, "In 1978 the deputy assistant secretary said X, which contradicts what you are saying now." We didn't always know the background because we changed so much. The more senior Japanese staff at the embassy were a big help there; I'm not sure they were always invited to participate, but they should have been in the room. Also, as other agency personnel don't change as much, a strong cadre of American government experts has developed over the last 20 or 30 years.

Q: What about bureaucratic practices designed to stifle imports into Japan?

WHITE: Japanese bureaucrats used the excuse of safety regulations to make things very difficult. That was certainly true in the automobile case. Regulations on things like the size or brightness

of headlights had unnecessarily narrow limits, things were obscure, and the bureaucrats were totally rigid about things. But there were also misunderstandings. There was one possible non-tariff barrier that people thought was an outrage until they found out the whole story. Parking lots were refusing to allow foreign cars into their lots. The assumption was that the Japanese had such deep anti-foreign car feeling that they wouldn't let American cars be parked. It turned out that the yakuza, the Japanese gangsters, were among the biggest consumers of black Cadillacs. That was a sign of gangster prosperity. Not many other people would buy them for that reason. The parking lot attendants said "no foreign cars" because they were terrified that a Cadillac would get scratched and they'd have their kneecaps broken. You do have to look below the surface sometimes.

Q: Did we look at retaliation?

WHITE: We threatened more than we acted. A number of trade cases under Section 301 of the Trade Act were brought. The interagency group considered them, tried to negotiate and drew up a list of items for retaliation, but very few of them got to the retaliation stage. It was actually a failure if we reached the retaliatory stage, for it meant that the U.S. hadn't been able to gain the trade liberalization we sought. It was better to make a deal.

Regarding import procedures, another issue I worked on related to customs procedures. Japan has a terribly inefficient airport, Narita Airport, which serves Tokyo. It was politically controversial from the time it was built because the government highhandedly seized land of farmers to build the airport. It was intimated that some of the land had been bought up by politicians' friends so they ended up making a lot of money. A certain number of farmers refused to move and it became a focus of violent radicalism.

Q: I remember seeing farmers out on the runway and that sort of thing.

WHITE: Yes. Several guards were killed in the early days of fighting. Even today the airport is ringed with heavy security. The bilateral complaints related to the fact that once the airport was built, the continuing conflict meant they couldn't expand it for many years to add a needed second runway, which seriously limited foreign carriers who wanted to expand into a growing market.

Narita also had a very inefficient customs process for goods clearance. Goods had to be trucked to another facility 20 or 30 miles away which wasn't too bad if you weren't dealing with something that was perishable or needed fast clearance. However the U.S. wanted get efficient processing on our exports of agricultural products, especially fruit. Apples, cherries, etc. faced all kinds of phytosanitary requirements but slow customs procedures were equally obstructionist.

It became even more difficult when organizations like FedEx started what was new at the time, an overnight small package delivery service. The shipments would get quickly to Japan, but once on the ground the customs clearance was really a hindrance. The customs officials worked basically 8:00 AM to 4:00 PM so for overnight shipments the timing was all wrong. American flights arrived in the late afternoon in Tokyo. We had constant battles to get the Japanese to hire more people, extend their hours, have more facilities on site at the airport, and get the stuff

through the clearance process. That's the sort of bureaucratic problem that applied on the surface to domestic and foreign interests but had a more negative effect on American operations.

Q: Moving to the other part of the transportation portfolio, what about railroads? Were we doing much with railroad products?

WHITE: It wasn't a question of import/export with railways. We were interested in the technology and occasionally the Embassy would handle visitors coming to look at the Shinkansen, the bullet train, which was at that time the highest speed rail in the world. They were also starting to experiment with a magnetic levitation train in southern Kyushu. So this was an area of cooperation, not conflict.

A different problem in the transportation area related to road transport. One non-tariff barrier that I worked on a good deal was a limit on high cube cargo containers. The major American shipping lines, American President Lines (APL) and Sealand, used a certain container that was the routine size of containers all over the world. However it was about a foot and a half too high according to Japanese regulations, so these companies went to great expense in taking cargo out of the containers that came off the ships and putting it into smaller containers so that they could be shipped on the Japanese roads.

Q: Were they worried about high cube containers hitting low bridges?

WHITE: That's what they said, but as I kept pointing out, the shipping companies would obviously plan and take safe routes. It wasn't in their interest to run into low bridges, after all. The bureaucrats were simply defending the status quo-- which, in this case, was negatively affecting Japanese companies as well.

On this issue, I worked a lot with the National Police Agency, which was one of the more insular agencies, at least on the road transport side (as opposed to cooperation on criminal issues) as they didn't generally deal with international issues. One of the most undiplomatic things I ever did was when a police officer said to me, "We can't have these high cube containers because Japan is a small country." I laughed out loud. Then I tried to recover by pointing out that Hong Kong, which was considerably smaller, had managed to arrange their regulations to accommodate these containers. We finally succeeded in getting them to allow the taller containers. Not surprisingly, that was in part because Japanese companies were switching to these larger size containers and put pressure on as well, probably through political channels. Of course then the containers got even larger and they asked for double container loads and things, but as that was after my time I don't know how it stands now.

Q: Some of these were American problems, but they weren't uniquely American problems. You had Europeans exporting, too. Was there a unified approach or it was everybody for themselves?

WHITE: We didn't usually coordinate on specific actions but we did have contact and share information. I called on my European counterparts and we were close to the British and Canadians in particular. Other countries saw the U.S. as the country with the most leverage. They were helpful and told us what they were doing, but the attitude was more to let us go ahead

while they went in later and supported us. They knew that the Japanese were more likely to listen to us because of the size of the U.S. market.

Q: Were you undercut by countries caving in to the Japanese regulations in order to gain advantage over American exports?

WHITE: I don't remember any specific incidents of that. The Europeans were doing better than we were in exporting automobiles, particularly the Germans. It was because Mercedes had a good reputation and Volkswagens were popular because they were cute and small. Right hand drive and good gas mileage, along with a reputation for quality, were key. But the numbers for imports were nothing like the Japanese exports to Europe. That in turn was far less than exports to the U.S. I believe that the Japanese exports to Europe were limited by EU import restraints, both standards and quotas. They weren't getting the overwhelming market penetration the U.S. was. In fact back in Washington there was a three pronged effort where we tried to get the Europeans to get rid of their protectionist legislation so that some of the flow would be diverted to Europe, taking some of the pressure off the U.S. as the only big open market. The other two prongs were working to get more U.S. cars exported and the Voluntary Restraint Agreement.

Q: On the aviation side you mentioned the airport customs clearance problem. Were there any other aviation issues?

WHITE: This was a major issue and along with autos took most of my time. There had been a treaty in the early '50s that was very rigid, as most bilateral aviation treaties were at that time. Certain airlines were allowed in a market with a set number of flights and prices were controlled. The domestic aviation market had also been heavily regulated, but in the '80s deregulation in the U.S. was well underway and companies wanted more flexibility in international markets.

The American carriers in the market were Pan Am, Northwest, and Flying Tigers. Continental had a small route that went between Japan and Saipan that carried mostly tourists and honeymooners. On the Japanese side the carrier was Japan Air Lines (JAL.) The Japanese felt that they were disadvantaged because they had only one airline in the market. That happened because at the time of the treaty they had only one international airline, which was heavily government financed. There was a lot of pressure on both sides from other airlines that wanted to get into the lucrative trans-Pacific market.

A new round of talks began when the Japanese asked for landing rights for Nippon Cargo Air (NCA), which was a new cargo airline that was a subsidiary of All Nippon Airways (ANA.) ANA is a large domestic airline in Japan while JAL had always been the international carrier. ANA had aspirations to become a bigger player in the international field, but some years before they had been slowed down by the Lockheed scandal which involved Prime Minister Tanaka. It involved kickbacks for buying Lockheed planes for ANA. So for a while they were quiet and made no effort to expand into American markets.

But in the mid-'80s ANA wanted to get involved and asked for landing rights for NCA. They were looking at flying high-tech components as well as finished exports to the American market, with rights to Chicago a major part of their plan. The USG refused, though strictly speaking the

treaty allowed the new rights. But U.S. airlines had been seeking more rights both for existing carriers to increase their flights and for new carriers. They saw no other leverage than to refuse what was in fact a legitimate Japanese request. In the meantime NCA had two huge Boeing jumbo cargo jets sitting on the runway losing a lot of money, so the Japanese were furious and we began a long round of negotiations.

The talks were led by State Department and Department of Transportation (DOT), as was the pattern, but unlike most aviation talks, USTR and Commerce also got involved. American companies opposed to NCA framed the question as example of Japan, Inc. because NCA was associated with ANA and also because we'd had all the other problems with customs clearance, high cube containers, etc. that related to cargo operations. The talks became highly political on both sides.

Q: Using the term Japan, Inc. was a shorthand term of saying both the government and business were very closely entwined.

WHITE: Yes, The argument was that ANA/NCA was a conglomerate that was going to overwhelm the smaller American players like Flying Tigers, the cargo airline. Needless to say Flying Tigers was very eager to keep out another cargo carrier. Pan Am and Northwest were combination carriers, with passengers but also large cargo operations, so they liked the status quo. They had a nice market because it was a protected market share, a pie of a certain size and with all the same players year after year.

This series of talks was interesting because a lot of the negotiation went on among the American side. There was Continental wanting to expand its operations, and United, Delta and American Airlines wanting in the market and the new player Federal Express (now FedEx) all pushing DOT and the State Department and the Congress to negotiate a big package. Northwest, Pan Am and the Flying Tigers were trying to keep the status quo and warning that constituents would lose jobs if all the new players were allowed to come into the market and lower prices. Negotiating with the Japanese was only half the problem for the American team as it was impossible to keep all the American companies happy because there were so many different desires and a lot of political people weighing in on behalf of their local airlines.

It was a long hard negotiation but the two sides ended up with a very big package in about 1985 where the old system was completely broken apart and new players came into the market. ANA soon realized that a big package could finally break JAL's monopoly on the U.S. market and eventually all international passenger flights. So there were countervailing forces on the Japanese side for liberalization. NCA finally got its landing rights. ANA got international flights (which has made a lot of American negotiators happy because you can fly nonstop from Washington to Tokyo on ANA, which now has a code-share with United so you can actually fly it on government travel.) Northwest and Flying Tigers were unhappy, though a few years later Flying Tigers was taken over by FedEx. United went in in a very big way and eventually took over the Pan Am operations.

The new arrangement was not completely open skies, not a completely deregulated system. Conflict continued with the Japanese about the number of slots and the timing of the arrivals at

airports because, as noted earlier, Narita Airport was unable to expand as much as it should. Nonetheless the deal brought a lot more capacity in the market and really helped the consumer. Prices went down and the volume of passenger traffic went up.

Q: Was Ambassador Mansfield called in from time to time to weigh in?

WHITE: Yes, having been a senator he was sensitive to the politics and careful to ensure that all the American companies got a fair hearing. During the many months of the aviation talks he received a lot of the American companies who had very divergent views. Some were very eager to get the market open so that newcomers could come in, while the incumbent carriers were arguing against a deal. It's hard not to take sides in something like that because either you support the ones in the market or you don't. The general inclination of economists is to support a freer market but that can be difficult to say for political reasons.

The Japanese companies also made calls and gave their point of view. Sometimes he pushed them to consider alternative scenarios. I remember one interesting meeting with the NCA officials who were just wringing their hands and practically in tears at that point because they were losing so much money with their planes grounded without landing rights. You've probably already heard about how Mike Mansfield would make coffee for his guests himself. It was instant coffee and he made it in a little alcove and refused help from his staff. That stunned Japanese visitors because they always had a young office lady to do that, but here was Ambassador Mansfield bringing them coffee himself. At this meeting the NCA officials gave a 10 minute explanation about why NCA should be allowed in the market, cited the treaty and said it really wasn't fair. When they finished the ambassador took his pipe out of his mouth and said, "I agree." That's all he said. They didn't know what to say, so they basically repeated their points again. I thought that was classic Mike Mansfield.

Q: Moving to the controls, the Cold War was still going on with China and the Soviet Union. What were some of the issues that you got involved in?

WHITE: There was a lot of concern about dual use items, high tech equipment that could be going to the Soviet Union or other countries for ostensibly legitimate purposes but that could be diverted to military use. The allied nations' Coordinating Committee - COCOM - in Paris kept a specific list of sensitive items. There were constant arguments among the developed Western nations about which items should be on the list and which were legitimate for shipment. Many of the decisions were made on a case by case basis.

Japan got a lot of attention because Japan made computers, high tech ceramics, electronics and other sophisticated components, more so than most countries. Partly because of the general anti-Japan feeling in Washington, many people believed that Japanese companies were unscrupulous and selling items under the table, through third countries, with questionable invoices, etc. There probably was a certain amount of that going on, as other countries' companies did as well. The question was how you found out about it. There were certainly a lot of things being shipped to third countries and then on to the Soviet Union, maybe with the knowledge of originating companies while some may have shipped goods in good faith. We quietly shared information on questionable cases with Japanese government officials.

Q: A case that got a lot of attention involved Toshiba.

WHITE: Yes, there were apparently deliberate shipments of goods that allowed the Soviets to create very quiet submarines. It happened a year or two after I left in 1987 or '88, so didn't deal with that one, but that was a classic case and Americans were justifiably very angry that a Japanese company would put profit over security, especially given that we had our troops defending Japan. I don't remember what the sanctions were, but the Japanese government cracked down harder because of that case. It is still remembered here and still resented.

Q: In many ways it sounds like the economic side was a driving engine in the Japanese American relations during this period.

WHITE: I think it was. It certainly was what got the most attention. Of course at this time there was a strong security relationship and good political ties. This was during the Reagan years and Reagan developed a good rapport with Prime Minister Nakasone. Nakasone was unusual in several ways. First he lasted more than a year or two. A lot of American presidents have mediocre relations with the Japanese prime minister because it's a different one every time they meet. The Ron-Yasu relationship developed into a strong personal bond during the period, so the political ties were quite good. And Nakasone was a strong personality who made an impression on the American public. This is unusual as many Japanese politicians aren't well known here.

Q: Were there the economic summits at the time you were there? They're called the G-8 now.

WHITE: It was the G-7 at that time. One year it was in Tokyo and it very interesting to observe.

Q: From your perspective how effective were the summits? Were they trying to settle some problems or was it just people talking and getting together?

WHITE: For the embassy it was a time for everybody to be involved in one way or another, being a control officer for this site or that site, taking care of the visitors of all levels. In terms of the bilateral economic problems handled by the Embassy, I don't think much was accomplished. There were bilaterals and each side had a laundry list of issues and talking points. A lot more emphasis was put on the Treasury Department's concerns and the multilateral issues.

Q: How did it work with the Department of Commerce which had its own Foreign Service? Were they a player in major negotiations or were they really looking for commercial opportunities? How did you work with them?

WHITE: The Foreign Commercial Service (FCS) people worked on both negotiations and commercial opportunities. The commercial section and economic section were both large sections in the embassy and also each had a number of Foreign Service Nationals. Their main focus was to help specific companies get into the market, but they were also involved, though to a lesser extent than the economic section, in policy questions. Things could have gotten complicated if the personalities in the two sections had clashed, but luckily the two sections saw their roles as complementary so we didn't have problems. In negotiations like automobiles the

commercial officer was part of the delegation. While the economic section focused on policy, the commercial section focused on practical aspects and could bring evidence of specific problems that business people had encountered when they tried to get in the market.

Q: During this time Japan was pretty expensive to live in wasn't it?

WHITE: Yes, when I arrived there in '81 to go to language school I think the yen was about 240 to the dollar, but after the Plaza Accords the rate went up and down so there was a lot of variation. Almost everyone in the embassy lived on a compound, which was newly constructed at that time. It was very convenient because one could walk to work in 10 or 15 minutes. You didn't have housing or utility costs to worry about. There was a small store there that got goods from the commissaries on the military bases, fresh milk once a week, that sort of thing. Basic canned goods, cereal, were available. People with large families or who did a lot of entertaining drove out to Yokota Air Base or Yokosuka Naval Base to do their shopping although I only did that a few times.

Travel was expensive, unfortunately, because people with bigger families couldn't afford to get on the train and go to Kyoto or Hokkaido or other parts of Japan. Train fares were high as was lodging unless you went really low scale. Nonetheless we tried to visit various areas and get out of Tokyo as much as possible. Tokyo is a very concrete city and every three months or so you needed to get out and see some greenery. My daughter's school went on ski trips to the Japan Alps and she and I traveled a good deal by air, train, bus, ferry, etc. We especially enjoyed our trips to Kyushu.

Q: You left there in '86?

WHITE: Yes.

DAVID I. HITCHCOCK, JR.
Public Affairs Officer, USIS
Tokyo (1981-1984)

David I. Hitchcock, Jr. was born in 1928 and raised in New Haven, Connecticut. His career with USIS included foreign posts in Vietnam, Japan, Israel, and Washington, DC. He was interviewed by G. Lewis Schmidt on November 17, 1992.

HITCHCOCK: I would like to turn for a minute to Tokyo as PAO and a few of the things that happened in those years. You mentioned Reagan. One of the things that happened was Ronald Reagan's first, I think, overseas visit to Japan in 1982. This may have been during his trip to Korea as well. One of the first things that happened in the preparations for that -- I think the visit was in November -- was that in the summer -- in July I think it was -- White House Aide Deaver came and sat with the country team. A lot of the talk seemed to be about physical security. He seemed bored. I finally spoke up and said that I felt we needed to spend time talking about what

kind of image we were trying to cast of the President in Japan. What sort of impression did we want to leave, and how would we build that impression? Here is a President who is seen in the Japanese cartoons as a cowboy or a B movie actor with very reactionary views and not much awareness of the rest of the world. How do we overcome this in his speeches and in his public appearances? Deaver perked up, and when the meeting was over, he pulled me aside and said, "I want to work with you and your staff. I can see that you are after what I am after." We developed a very good relationship.

I went with him out to one of the scenes that we were thinking of...the Japanese were thinking of having President Reagan go out to Nakasone's summer cottage, which is close to two hours from Tokyo by car. So we went and looked at it with some other people. It is just a little Japanese cottage on a hill. Deaver got up there, looked at it and said, "Don't change a thing. Don't let them pave the gravel road."

A couple of weeks later I got a call, a faint voice from Washington saying, "This is Misty Church. I am a speech writer in the White House, and I understand that you are in charge of the public affairs side of the Reagan visit, and I want to work with you." Well, that was just great. I couldn't have had a better offer. She was a young researcher, but in charge of doing much of the preparation of the key Presidential speeches, including the Diet speech. We had, by that time, composed a TV interview for Reagan and some remarks at two receptions -- one for Japanese and American businessmen and one for the media. So we started working together.

She didn't have the foggiest idea about...I don't think she knew where Japan was. She started out by saying, "We want to get some kind of quote like '*Ich bin ein Berliner*' in the Diet speech. There must be something where the U.S. and Japan have...When he went to Canada, for example, and the President gave a speech to the Parliament, there wasn't a dry eye in the house because he talked about our comrades in arms. Don't we have something like that in Japan?"

I said, "No, I am sorry, Misty, but we were on opposite sides of that one."

She said, "Well, but what about Korea, we cooperated there didn't we?"

I said, "No, no, that is even worse, we can't use Korea either."

So I had to lead her along the way. But she knew what she wanted. She wanted some references to early Japanese Meiji leaders who had tried to bring a democratic process into Japan, the first Constitution, etc. We looked up Hirobumi Ito, Fukuzawa and gave her some select quotes.

We came up with a slogan finally. It wasn't "*Ich bin ein Berliner*." And it won't go down in history like that. It was: "Japanese American friendship is forever." She said, "Yeah, go ahead and put it into phonetics, and we will see if he will read it." *Nichi-Bei yuko wa eien desu*. We put it in phonetics and checked it out with everybody, the language school and so on.

She said also that they wanted to salute Japanese culture. I think I put that in there that the President should find a way to express his appreciation, respect and awareness of the sophistication of this ancient culture. This would rub off some of the cowboy image that

remained. She said, "Good. Find something literary." I decided I would try to find a haiku that had some social, ever so slight, perhaps, reading that could be made of it -- some haiku that could be interpreted as having some social consequence. My wife, Lee, and I got out all the haiku books we had and borrowed a few and looked through them. I wanted Basho because he was the best known poet in Japan. He is the Shakespeare of Japan. I finally found one. It basically goes something like this: Many blossoms in the field, but each has its own special fragrance, or something like that...quality. It was really "many flowers bloom;" almost Mao's slogan. But we got it into the question of cultural values, shared values and diversity in our societies.

Then, of course, I had been working with...I knew who the interpreters were going to be for the Diet speech. It was this outfit that you are probably familiar with now because it is so well known -- Simul International. The head of that outfit was a friend of mine, and still is. We wrote in Tokyo a good deal of that speech. Not the political side of it necessarily, but all of the themes. We wrote the opening statement for a TV interview -- and they never changed a word of it. We wrote some of the toasts. The historical references, quotes and so on in the Diet speech stayed in.

Then I had a call from Simul, and they wanted, my friend, who was going to be in the glass room up above the Diet, the text of the Diet speech. Well, I wasn't at liberty to give it out at all. And yet, I knew what he was saying: if he didn't have the text in advance, there might be references that he would not be familiar with. So, I just quietly gave it to him.

As it turned out, thank the Lord that I did because President Reagan got up there and the speech went fine, and the Japanese had earphones on so there was no oral translation. He got to "US-Japanese friendship is forever" and mispronounced it. Of course, the interpreter was there ready. He immediately corrected the President's mispronounced "*yuko wa eien desu*," and there was a murmur of approval across the whole Diet hall.

The Basho haiku that Reagan quoted made a bigger hit than anything else in the speech. The Japanese understood that the President was reaching out, that he was tipping his hat, even though somebody on his staff had done this for him. The fact that he took the time to do that was just terrifically important to the Japanese.

I only told that story as an example of something that American political leadership and the State Department forget all too often, and that is: when you are dealing with Asia, it is *how* you do things, the style of how you do things, the symbolism that you project, that is much more important than the substance, and indeed becomes the substance in large measure. Without it, it is a cold fish, a cold visit no matter how much everybody tries to hide it. It has to be there. If we don't take this into account during the President's visits overseas, we are missing a chance, and that is where USIA has a special role to play, I think.

ROBIN BERRINGTON
Director, Tokyo America Center, USIS
Tokyo (1981-1986)

Mr. Berrington was born and raised in Ohio and educated at Wesleyan University and Harvard University. After service with the Peace Corps in Thailand, he joined the Foreign Service (USIA) in 1969. During his Foreign Service career Mr. Berrington served at posts abroad in Thailand, Japan, Ireland and England, variously as Public and Cultural Affairs Officer. He also served several tours at USIA Headquarters in Washington, DC. Mr. Berrington was interviewed by Charles Stuart Kennedy in 2000.

Q: Today is June 27, 2000. Robin, you are off to Japan. You were assigned to the Embassy in Tokyo from when to when?

BERRINGTON: Well, I arrived in June of '81 and left the summer of '86.

Q: Did you write anymore Christmas letters?

BERRINGTON: Well, it was interesting. When I came back as we discussed earlier...I was summoned back. I was told just don't write these things anymore. Of course I did. I didn't change how I wrote these things, and I have kept writing them year after year. In fact I am still doing it even after this year. While I was in Washington, I went through a couple of months of language refresher, because I hadn't used my Japanese for some time. I just kind of laid low and waited for all the dust to settle and trundled off to Tokyo in June of '81.

Q: Was Mansfield the ambassador the whole time you were there?

BERRINGTON: Yes, he was there the whole time I was there. He had been appointed by Jimmy Carter in 1976. Then when Ronald Reagan won the election in 1980, much to some people's surprise, Reagan said, "Mansfield is such a good ambassador, even though he is a Democrat and an appointee of my predecessor, a Democrat, this Republican administration will keep him on." So they asked him to stay on for well as long as he and they wanted. So he was in place for, well he had already been there four years or five years I guess when I arrived. [Editor's Note: Ambassador Mansfield presented his credential on June 19, 1977.]

Q: Well now, your job was Public Affairs Officer?

BERRINGTON: Oh, no. I am afraid I never rose to those heights except in Dublin. I guess they would never let me do it again. No, I was assigned as director of the American center. The American Center was the USIS cultural center, I guess, in other countries. The America House for Germany, the Thomas Jefferson Center for Manila. You know they had various names, but they are all essentially the same kind of thing. In Japan, we had six of these. Five of them were in the leading regional cities starting from the north, Sapporo, then leaping pretty far south, Nagoya, then Osaka, Kyoto, and Fukuoka. The sixth center was in the capital city, Tokyo. Of course, I had been the director of the Fukuoka American Center a number of years previously. This time I was back as the head of the Tokyo American Center. That was considered the flagship of all of them. It had the largest library, the largest staff, the busiest program, the most important audience. It stands to reason that it would be a little bit more equal than other centers.

Q: Okay, well, let's talk about when you arrived there, how would you describe the state of Japanese-American relations? Tell us about what you were doing and the issues.

BERRINGTON: Well, you know, Japanese-American relations are always been on a fairly even keel. The issues over the years have not changed that much. The official, well not just official but the formal as well as informal relationship has usually been an excellent one. There are a lot of reasons for that.

First and foremost I suppose, is that with the exception of a few years after the occupation in the 1950s, the Japanese government has always been under the control of the Liberal Democratic Party, which is a conservative party, despite its name, and is composed of a series of factions centered on the influential leaders of the party. All of these factions and basically the party's control comes from any one of these factions which may be large or small depending on elections and a leader's death or a leader's illness or something like that. Certainly not on any ideological or policy issue grounds. But all of these factions have as a fundamental pillar of their policies, a pro-American policy. So, there was never any real shifting of governmental attitudes about the United States. They were very much behind America and we were almost kind of like, you know some people suggested it wasn't that much different that MacArthur and the occupation. The American embassy, the American ambassador was almost like some kind of pro-consul and the Japanese government was very eager to listen and not very eager to disagree. Now maybe that is not doing complete justice to some of the disagreements we would have, but by and large it was a very friendly, very close relationship between governments. This extended to the people too. Throughout relations at the times I was there, other people had been extremely cordial and friendly. It is very hard for me to remember in all the years I have been in Japan, any overtly hostile or unfriendly acts by anybody. You might bump into a slightly aggressive drunk, but he might be unfriendly to anybody not just Americans. Of course, there was the Japanese Communist party and a few other kind of professional anti-foreign types, but they really were more anti-foreign than strictly anti American.

Another reason why relations were usually pretty good and pretty close was that within East Asia, and of course our policy in Japan was based on a number of regional issues as opposed to only bilateral issues; within East Asia, there was a fairly common concern about China, of course, and North Korea, and although there may have been times when they saw China in slightly different ways than we did, and we'll go into that further later on. Nevertheless, China was regarded as a rather unfriendly power in the area. There was absolutely no question about North Korea. We tended to be in total agreement about that one. By this time, the major strain on the relationship, Vietnam, was long since over. So the regional issues were pretty much not major irritants.

The bilateral issues, well you know, with Japan, it's funny they have been kind of like the bad penny that keeps coming up again and again. It is just a different year on the penny. These bilateral issues that seemed to disturb the relationship, it was always trade. The Japanese were eager to restrict imports of whatever was the issue at hand, and the Americans, of course, were always trying to open up the market so that more whatever it was could be brought in. Over the years this could be anything. I am not making this up as silly as this might sound today, baseball

bats, grapefruits, textiles, and probably the most particularly American part of all, lawyers. These are all things the Japanese wanted to, to the extent they could, keep out of the market for various reasons, most of which had to do with competition with the local product. So whatever we were talking about in the trade issue, the trade area, it was like we could pull out the scripts and the arguments and the factors impinging on all of this and lift out the word baseball and put in the word computers or chips or oranges or whatever. So it was almost like a ritualistic routine that both governments would go through. It was as if they knew what we were going to say and we knew what they were going to say. We both went through the motions, and strangely enough after a number of bargaining sessions, we would reach some kind of compromise which would satisfy both parties. Things would be fine for another year or two until another issue came up, which would be start exactly the same process, what we would call kabuki, where we would read the same lines and go through the same dance and it would get resolved.

Q: What was the role as we saw it and you saw it at that time during the 1980s, early Reagan, of the American centers in your perspective?

BERRINGTON: Well, I had told you earlier about how the American Centers when I was in Fukuoka went through a major not just cosmetic change, changing the name from Cultural Center to American Center, but also went through a much more kind of modernization, I guess you would say where everything from fax machines were introduced. This was back in the 1970s when fax machines were introduced, Our audiences were more carefully identified, and the speakers and the programs we did were clearly fine tuned to the mission's policy concerns. Of course this was not how it was before. You could have had somebody come in and talk about Moby Dick or Nathaniel Hawthorne and nobody would complain. When things changed in the 1970s that kind of programming, unless somebody just kind of did it secretly, just never happened again. Which in my opinion was a very good move. You know it brought them up to date. So by the time the 1980s had gotten around, there had actually been a kind of almost Sisyphean, is that the right adjective, a number of reverses. Alan Carter, the man who was responsible for the modernization, had long since left. A couple of PAO's had come in that were either anti-Alan Carter, didn't like what he was doing. In fact, these were usually people who had been in Japan before Carter and if anything wanted to take the program back to status quo ante.

I mean there wasn't as much demand if you could just fly by the seat of your pants and do whatever you wanted to do. If the PAO happened to like the issue of science, okay, then we did a lot of science. If the next PAO happened to like literature, then everything was on literature. That's no way to run a railroad. That's the sort of mismanaged or disorganized program that Carter was trying to eliminate. So his successors inherited the Carter program, but some of them tried to actually turn the clock back. Of course, they couldn't do it completely. There were too many people who were strongly in favor of the program as it then existed. Even a program as radical and different as Carter's was at the time, after a few years does take on a bureaucratic life of its own. We all know that very well. So despite the efforts of some of these successors to push things back, although they might have caused a little bit of mischief here and there, it really was maybe one step back and two steps forward, and maybe another one step back and then two steps forward as the people changed. Of course, the new program was something that the State Department and other people liked very much too. They were no more eager to see it turned back than the rest of us. Anyway, by the time I got to Tokyo, this was kind of the situation in which

the program was in. All of the communications modernization was still very much in place. We still had very clearly refined audience systems, which by then was computerized. Back then everything had become computerized. We could pull up the audiences; let's say if we were going to do a program on the U.S.-Japan security relationship. We could pull up an audience of interest there. An audience in which we could identify who of those were strongly interested and those who were only mildly. That was still in place and probably in better shape than before. The libraries had been well funded so that they were stocked with the best, kind of up to date books on most of these policy issues. The staff was, the Japanese staff as well as the American staff, was pretty much committed to this kind of program, and although a few might have had nostalgic longings for the old days, because most of the staff remembered those days, they were not pressing to go back. The program was in pretty good shape. In short I would say the USIS program was probably about as healthy as you could find. In those days Japan was still a country where the quality of officer was pretty good. First of all you had to study the language. That would eliminate some of the people that were not good at that sort of thing. The issues, because of the Japanese angle and the unique aspects of the history of U.S.-Japan relations, required a bit of serious study, rather than a quick 24 hour introduction. Because of all of this, I think it tended to get people, like myself, who were repeats and who were familiar with things and knew how to work there. So morale was pretty good. Most of us people were happy with what was going on. I would say as a result USIS was considered a fairly integral, valuable part of the mission valued by the ambassador and the various political, economic, commercial, DAO sections for what we could do with the press and other audiences. Also valued by the ambassador and other elements of the mission for what we could do to put them in contact with various kinds of people we knew around town.

Q: Did you find the dichotomy between a fascination with Japan on one hand but at the same time almost a missionary or reformist desire to shape Japan to our image on the other. You know, women aren't being treated in the way they should be or there should be more competition in stores or what have you. I mean was there a problem with us struggling to sit in the impulse to change the society?

BERRINGTON: Oh, yes, some of that went on, but as I think I mentioned last time, rather than just get out there and say you know wagging our finger at them now, now, now, you should do more with women or now, now, now, you should provide more rights to your Korean minority groups or whatever. Let's face it, those were basically internal issues, and rather than us telling them how they would you know, cure their own illnesses, we did more by kind of illustrating by example how we handled these things in the U.S. Japan has been a country that really looked outside to see which way the wind was blowing. From the Meiji era on, they have always taken from the West what was considered the most relevant developments, brought them home, and then crafted or shaped them into something that was very definitely Japanese which you could see how it had gotten its start from someplace else. You can see this in whether it was the development of the constitution back in the Meiji era, whether it was the development of the army, whether it was the development of the medical system. Incidentally, of all of those three things, the constitution came largely from Germany. The medical system came largely from France. They were interested in seeing what other countries were doing and would take all of this. So after the war and after the occupation, the United States was considered the place where things were important. We were now the leading power, not Germany or England or France or

anything. So they were always looking to see how we handled issues knowing full well that whatever was happening in the U.S. may very well start popping up in Japan four or five years later.

Q: I usually gave ten years. Any time we have a problem or a fad, this is serving abroad, you just knew this was going to spread.

BERRINGTON: The only reason I use five years, it probably was ten years at an earlier period, is because things are moving much faster. Of course, the 1980s is still the time before E-mail and the revolution in communications. But still things were happening quickly. There used to be an expression in Japan: when the United States sneezes, Japan catches a cold. They were very sensitive to anything happening in the United States, sometimes for fear of, and depending on which quarter you were dealing with sometimes in eager anticipation of what would eventually spring up in Tokyo or elsewhere.

Q: There was a time, now maybe this is later on when the Japanese economy was really booming. It looked like the Japanese were going to buy up the United States. This was not that period?

BERRINGTON: Well, this was the beginning of that period what they called bubble. It really reached its peak when I went back to Japan at the end of the 1980s. I was there from 1989 to 1993 as well. That was sort of the heyday of the bubble. We could really see it starting at this point. Of course, what was behind it, I am not an economist or a finance person, and when I get in these waters I have to struggle a bit, but basically what it was, was inflation in land values. The banks owned all of this land. People made loans, or took out loans, the banks made them. The collateral used on all of this was this land, and the land just kept expanding and expanding in value until it was absolutely absurd. I mean it got to the point in the late 1980s where they would say a piece of land the size of a postage stamp in downtown Ginza would be worth something like a million dollars. It was just unrealistic, madness. Then, of course, one day all of this burst as any commonsensical person would have expected. That then led to the problems that Japan is having today. But in the early 1980s this was just getting started. Japan was always an expensive place for tourists in the 1980s because of the rate of exchange. Japan was not necessarily an expensive place for the Japanese. This is something that is always hard to keep in mind. Yes, housing was expensive, no question about that. Land became expensive, so housing and land, yes that was a major expense for the Japanese. Certain luxury items became very expensive. A bottle of foreign scotch whiskey as opposed to Japanese scotch whiskey would be ridiculously expensive. Or if you had a meal in a certain western style high class restaurant, it was very expensive. But your ordinary day to day purchases, your train ride, your commute, the taxicabs, just the value of ordinary clothes, things in the supermarket, no Japan wasn't that expensive for the Japanese.

My reading is that it was the 1970s oil shock and all of that really led to the financial problems that started some of this inflation and provoked also the unsettling of the currency markets in East Asia. At that point of course, ever since the occupation up until the end of the 1970s, the dollar in Japan was 360 yen. It was sometime in the late 1970s early 1980s when the exchange rate started to drop against the dollar. So that from 360 to the dollar, it went down to the 200

area, and in the late 1980s early 1990s, it was hovering around 100 yen to the dollar. You aren't going to be a major economist or mathematician to figure out that if there is not that much inflation in Japan, yet 20 years ago you were getting 360 yen for a dollar and now you are suddenly only getting 100 yen for a dollar, for the foreigner goods are really becoming very expensive. Not so much so for the Japanese, but for the foreigner, it could be a really tough place. So this is all sort of the background of what was happening to the economics of the situation in Japan. This, of course was a problem in our relationship. I was not as privy to discussions in that field, but certainly USIS would do a number of programs on how to stabilize the exchange rate; how to make sure that the strains of this sort of these floating rates that were just plain chaos for the trading systems, how we could bring some order to all of that. Nothing was finally resolved. I think we all just managed to muddle on through.

Q: Let's look at the role of the American Center. Was there much of a relationship with the universities in the Tokyo area? I mean aren't the top rated universities there?

BERRINGTON: Well, the American Center had as its audience; I think we had eight or nine audience categories. The top two for us were the academic and the media audiences. By academic I mean university. This included both faculty and student. The media of course, consisted of the electronic and the print, magazines, TV stations, editorial writers, and everything. For the universities, once we had refined it down; it was not junior colleges; it was not high schools; it was not vocational colleges, nothing like that at all. Partly because you have to realize the audience universe in a place like Tokyo. Well, one of the universities the Nippon University, which we translated as Japan University, had 100,000 students. I mean let's face it, it was something of a diploma mill. How do you deal with 100,000 students? You can't! So once we refined it down to a university category, then we would refine it to what we considered the best university. What were we doing? We were trying to identify those people who when they graduated or when they moved into the employment field were those who would have some effect on U.S.-Japan relations. We were trying to influence the opinion leaders either of today or of tomorrow. So, we just didn't reach out to any university, a small select group of universities and within the set of small select universities there was a set of small select faculties within those universities. Tokyo University was of course one of them because Tokyo University for years was is and probably will continue to be the main feeder into the bureaucracy. If you graduate from Todai, that is the Japanese word for Tokyo University, you could almost write your own entree into the foreign ministry or the finance ministry or the ministry of trade and industry, just to name a few of the biggest ministries we were interested in. Of course Todai was a school we were very interested in. Within Todai it would be the faculties of economics and the faculties of politics and international relations because they were the places from which the kids that went into the finance or foreign ministries usually...or law. We didn't deal with faculties of medicine. We didn't deal with faculties of engineering. We didn't deal with faculties of veterinary science. Yes, they might very well turn out somebody who 20 years later might in fact have strongly held opinions about U.S. -Japan relations, but the likelihood of somebody coming from those faculties and having an influential role in relations was very slight.

Q: Sounds like you were making a calculation in Japan, which we had not been making in developing countries. In developing countries, at one point, we were trying to contact anyone with education. We wanted to have good veterinarians; we wanted to have good civil engineers

and good technicians, we were interested in bringing people up to what we considered a good standard.

BERRINGTON: Other than my time in Thailand, which was unusual because as you know, it was during the counterinsurgency period and our mission there was very specialized, I have never been in a third world country. Perhaps what you are describing is a U.S. mission in a third world country. So it is hard for me to comment on that. You would have to talk to somebody who had been in, as you know yourself and your own experiences.

We were aimed at informing an audience that was already quite well educated. You have got to remember that the Japanese educational system was a very advanced, very sophisticated educational system. I mean yes, it has its problems, some of them quite serious, some we have back here in the United States, but it was an educational system with many areas of excellence, high standards which turned out well qualified people in various fields. Who was it for us to come in and tell them that their civil engineer programs were no good? So no, that is why we were not engaged in anything like that in a country like Japan. Now, perhaps back in the occupation period there may have been more of that kind of thing going on. I wasn't there; I don't know.

Q: Well, in some of the interviews we have conducted under this program one gets an impression, the war had come and gone and we were trying to bring people back to a certain developmental state and all of that. We were the leading repositories of...

BERRINGTON: Yes, well, that is kind of the big brother little brother, white man, Rudyard Kipling is still alive.

Even when I first came to Japan in the 1960s that was never the case, even under the old programs. So basically what we were doing was trying to inform, not so much to educate as to inform a very defined audience, granted a small, I hesitate to use the word elite because to me elite signifies a kind of almost financial oligarchic sense. They are all sort of in Latin American terms these are the landed aristocrat types. That was not the case in Japan. Japan is a very mobile society. Even the poorest kid in Japan, if he can pass the entrance exams to the university can go on to become foreign minister. In fact this is the story in the case of Prime Minister Tanaka. His background was extremely poor. He went on just on sheer ambition and hard work to become the prime minister. He had no aristocratic or even any wealthy background. So given all of that, the word elite seems kind of inappropriate. An intellectual elite or maybe an educated elite may be more like it.

So in that respect I suppose we were. But as I say it was really informing them about things, so we would go for certain faculties and go for certain...

Q: Well, this is the Reagan period, and first term Reagan. Reagan had been known around the world as a movie actor and all that. What was the USIS approach to portraying this American President?

BERRINGTON: Well, USIS in those days had a fairly routine song and dance that we would do when there were any administration changes. This was largely because of materials that were made available through Washington. We would in whatever the jazzy format was at the time, would put together a folder of members of the cabinet, of leading people in the new administration including the President and Vice President of course, and give these packets out to the media. If we were doing a program on as we did a number of times, the foreign policy of the new administration and the expected Japanese policies of the new administration, of course we would make these materials then available to the people that were invited to this program. So, yes, we were trying to inform them about Reagan, and of course we would try to play down the movie star side. That was not something we made a big deal out of. He had been a governor; he had been a leading political figure in the States for many years. The Japanese also knew him as a governor. That is the important thing. You have got to remember he was governor of California. When I was the director of the center in Tokyo, I did a lot of traveling in the Tokyo area to some of the cities. My district was while it was predominantly the city of Tokyo, it did take in the same consular district of Tokyo which extended several hundred miles north and to the Japan Sea to the west, as well. So I would travel out to these places maybe once or twice a year. Every now and then I would go to a place, and the governor, or the mayor, or the university president or somebody would haul out this dusty old visitors book and ask me to sign. In flipping through the pages I was not at all surprised to discover that Governor Ronald Reagan and Mrs. Reagan might have visited this place on a California trade promotional tour or something like that. So he had been and California being a Pacific state facing East Asia, his travels in that area were not few and far between. So they were familiar with him as more than just a movie star. That is some respects I think probably made it easier for us than say maybe our counterparts in Europe might have had.

Q: Were you working at that time to combat the images of the United States as seen through movies, TV, records and all?

BERRINGTON: Well, that has always been a problem for us in every place. I mean I can remember when I was in Dublin. Probably the most popular television program of the day was something called Dallas. I am sure you remember that.

Q: Yes. Serious people would come up to me and talk about Dallas. I thought it was about a dynasty of oil people, basically a soap opera. This is serious stuff.

BERRINGTON: I don't quite recall if Dallas was still a big deal in Japan. Oh yeas of course, the movies, television. The other point, of course, and this is no news to anybody like you who has served overseas, American movies are extraordinarily popular overseas. They are one of our most successful exports. I think if you have to talk about the most significant products of American civilization in the 20th century, American film, and I say this with some regret, is right up there at the top. In terms of impact, in terms of financial return, in terms of forming opinion, I mean it is just incredible. So that was a major problem. And of course, television quickly became equally influential. In the case of the movies in Japan, except for, and this is what I always thought was a very curious combination, except for Walt Disney and Woody Allen, don't ask why because I don't know, but except for those two, all Hollywood movies were subtitled. So even, the Japanese are a very literate people so you know subtitles were maybe not such a big

problem for them. But if it was Mickey Mouse or Woody Allen it was dubbed. You know they actually had Japanese voices rather than subtitles. But nevertheless, movies, all the big Tokyo theaters and even out in the smaller towns, there would always be some kind of a Hollywood movie playing someplace.

Now when it came to TV though, that was a different story. Television became extremely popular, American television programs. They were all dubbed. I always found it amusing because clearly they would look for a Japanese who had the same type of voice, so that if the American actor had a raspy voice, they would look for a Japanese with a raspy voice. They were very good at it actually. So we were constantly dealing with the misperception, the misunderstanding, the kind of you know whether it was violence or glamour or whatever comes out of Hollywood movies and Hollywood television.

Q: When Ronald Reagan took office, he brought with him his new USIA director, Charles Wick, who was a Hollywood product and full of ideas. People interviewed in this program have provided a mixed review. Wick could get money for USIS and he had ideas, but he really wasn't focused on USIS' core mission.

BERRINGTON: Charles Wick probably wouldn't have known a public affairs issue if it bit him in the face. Of course, when he first came in, he was very much the object of derision among the professional corps. Who is this guy this Hollywood wheeler-dealer type whose personal style frankly could be rather coarse at best? Yes, there was a definite culture clash between the foreign service and somebody like Charles Wick. But as time went by, and this is when you will recall, this is when government budget cuttings started really coming on in earnest, and departments and programs and various activities started to find their funds cut, Charles Wick was an absolute genius at just calling up the White House and telling Ron; or his wife Mary Jane would call up Nancy, and we would always somehow manage to survive.

Charlie Wick was always interesting. As you know, the Washington Post always publishes a list of who was at the White House for X or Y dinner. The Wicks were always there, unless they were out of town. Even more important, if it wasn't an official party like a dinner for the king of Norway or whatever; let's say it was just the Reagans having Thanksgiving dinner. Who was there? Charlie and Mary Jane Wick were always there! So after awhile, yes, maybe we thought this kind of used car salesman type guy...we might not have liked his style or manners such as they were, but we sure were appreciative of his political connections and how he could save our budget. He would come out overseas. We would all cringe when he would meet local personages. He was very much a bull in a china shop particularly in dealing with foreigners. But, certain categories of people, you could see how across the cultural divide and the linguistic differences, Charlie Wick worked out. For example, there was one Japanese theater producer who had very close political ties to the Liberal Democratic Party. He was one of their major fund raisers. Whenever they needed a movie star, he could always get somebody to be there in the Japanese sense. We introduced him one time to Charlie Wick, and the two of them hit it off perfectly. They were just two peas out of the same pod. So he had his ways of relating to certain people, but it was always a bit of a trial for us to put up with Charlie's rather eccentric ways.

Q: Early in the Reagan Administration were we drumming away on the obstinacy of the Soviet Union on the northern islands or had that sort of faded from view?

BERRINGTON: Well, that was one of those issues that never went away. It was always a source of some consolation to certain Americans. Every year various Japanese newspapers would conduct opinion polls, which is the best nation in the world? Which is the nicest nation? Which is the nation we respect the most? That sort of silliness. Invariably number one in all of these popularity contests was Switzerland.

Q: You know the Swiss-Japanese relationship was so key!

BERRINGTON: Yes. And why? Because you know, pretty mountains and little Heidi like figures and Swiss watches and chocolates and the Matterhorn. Switzerland of course is really a threatening country. Maybe there was something in common through the bankers, I don't know. But Switzerland was always number one. Then number two could have been usually us, or maybe England. But if we weren't two, we were number three. Now going way down the scale, coming up after us would be France, or Italy, or Canada. At the other end of the scale it was always a struggle who was going to come out on top so to speak, on the bottom really. Would it be North Korea or Russia? They were always in a race, and depending on what might have happened in a given year, one would beat out the other. As a result, because of this ongoing strong enmity between the Japanese and the Russians which is if you look back historically there was the Russo-Japanese War at the beginning of the century.

Probably the real key element was right before the end of WWII ended, when Japan clearly was going to be defeated and was on its last legs. I think we had dropped the bomb on Hiroshima but not yet on Nagasaki. At that point the Russians declare war on Japan. The Russians capture and detain huge numbers of Japanese troops in Siberia. There were still many people who remember being POWs in Russian camps for several years who eventually survived and came back to Japan. Well, all of that has meant a lot of enmity, a lot of hostility between the two, much of which is reciprocated by the Japanese for their own insecurities. Another legacy of how the war ended, of course, was the Russian occupation of the northern islands. There is still no peace treaty between those two, Russia and Japan. It is not like there is an active war going on, of course not. But there is no peace treaty and for reasons that just bedevil both sides they have not yet been able to sign a peace treaty to resolve the northern territories issue. By comparison of course, even though our occupation of Okinawa and the Ryukyu Islands could be considered almost a mirror image of the Russian occupation of the northern territories, after rather protracted, long, and difficult negotiations, we finally did give back Okinawa. A lot of Japanese used to say, "See the Americans are our friends. They gave back Okinawa, but those dirty old Russians never gave anything back."

Q: So we didn't have to hammer away at that. It just was there.

BERRINGTON: No. Seldom did we have to say or do anything about the Russians. Now, do you remember the shoot down of Korean Air Lines Flight 007 by Soviet interceptors on 1 September 1983 over the Sea of Japan just west of Sakhalin Island? The shoot down initiated a major PR offensive by us. Much of it handled personally by Rick and Jean Kirkpatrick. With all kinds of

materials being put out. As in the case of anything we got in Japan we would translate into Japanese before giving them out to the Japanese, video tapes. It was a worldwide offensive on our part to expose the Russian duplicity on that. That was something that was certainly an incident that marked a period of time. Again we didn't really have to do that much. In fact, there were times I felt like we were going at carpet tacks with a sledge hammer. The Russians were just hanging themselves. There wasn't that much we had to do, but still it was a major offensive by us at the time.

The issue which probably, when I think back in terms of long term difficulty, the issue that probably has caused us the most, I mean apart from the trade issues which were a constant thorn on the side. But the issue of China, how to handle China; the Japanese have always looked on China as a kind of mother country. I mean in the same way that England looks on the continent as where so much of their civilization comes from, the Anglo-Saxon background. Japan looks on China in the same way. A mixture of respect and slight condescension because China is the source of the language; that is where Buddhism came from, much of the art and culture, Confucianism, all of that is from China. Nevertheless, by the 20th century, look where Japan is, a major industrial world power. Look where China is, still backwards, still split by competing forces with a population in some part starving. Clearly Japan could look at China and say maybe we got everything from you, but look where we are today compared to you. So it was with very mixed feelings how they regard China. But as China developed some nuclear weapons, and after the death of Mao and some of the struggles that went on there, and as China started to figure out its own world view vis-a-vis the U.S. or Taiwan or Korea or whatever, we could not always count on Japan to be right behind us on everything as much as we might have wanted it. There was no question that part of the Japanese differences with us had a racial element to it. You know, very much like Vietnam, they saw China as another Asian brother, and in fact if anything it was more like an Asian mother or father than brother. So for the western powers to deal with China in the way they did sometimes caused problems within the Japanese, particularly the media. There was the occasional thorny issue for us, and still is today.

Q: How about with the media? Did you see a change in how the Japanese media was dealing with the United States or using the Center or anything like that?

BERRINGTON: No, not that much change from what I had mentioned before with the media in Fukuoka. The Japanese media probably have the largest press corps in Washington from any country, including Europe or anywhere. If you go down to the National Press building, I mean every floor has some representative of the Japanese television station or newspaper or news agency or something. All of these offices have several members in them. So what this means is most of these people would be assigned to the U.S. for a year or two. They don't tend to keep them very long overseas. Journalists would come over here for a couple of years and then come back. There was a huge number of people who had experience in the U.S. and knew a lot about American politics or how American society worked. As a result, we weren't really dealing with the kind of ill informed third world type of journalist. We were dealing with pretty well educated, pretty opinionated, knowledgeable people in their own right who were not always quite so ready to take the embassy press release or the embassy word at face value. Whereas in some countries you could just give something out and you could count on it being kind of on the front page of the paper the next day, that was hardly ever the case. We had to struggle to get our

point of view across. Now, yes they wanted interviews with the ambassador, yes they wanted access to the visiting assistant secretary of state, yes they wanted to meet with the senator or the congressman when he or she came through. We would have some leverage over them in that respect. We didn't automatically give out these exclusive interviews. We were very careful as to how we gave them out, and if somebody had really made us angry recently, they might not get that interview this time. There is a certain amount of realpolitik in press attaché work, of course. By and large, we could count on their interest and we could count on their enthusiasm. As a result, America was reported on, not always correctly, often consciously, I think, incorrectly. But America was reported on on a regular basis, daily in the case of newspapers.

In fact, one of the points we used to keep making to the Japanese was almost information overkill. The Japanese would report on American issues or what was happening in America or anything that could happen in America that had a Japanese angle to it would get reported in the Japanese papers in a huge way. So that let's say Congressman Irving Schwartz from Fargo, North Dakota, who wouldn't know a Japanese from a Korean from a Chinese suddenly gets up in Congress and says, "Those Japanese, they are the most racist people in the world, and we should cut off relations from them." You know, first of all if there is anybody in the house listening that would be one thing. Nobody would pay any attention to it here anyway because Congressman Irving Schwartz on Japan, who cares. But back in Japan, headlines the next day, "Congressman Irving Schwartz demanding that diplomatic ties be cut." Now of course I am making this up, but the point is the Japanese would report anything about Japan in their papers. Whereas if you look at an American paper, and this is back in the 1980s, and sadly enough even more so today, you really have to look hard to find something on Japan. It was often with a sense of sadness that the Japanese would wonder why we didn't report more on Japan. Now they never seemed too concerned that there was over-attentiveness or what we would call a substance gap or kind of a credibility gap. Why report on Congressman Irving Schwartz if he isn't important back here, if he isn't crucial to the dialogue or to the power structure or to the issue at hand. But they didn't see it that way. And I have to say probably some of them never saw it that way because they never were quite sure who was important back here. So that was a constant problem for us, trying to put their reportage of American things in proper perspective, in a proper balance that would bring credibility to what was really happening. It was a major challenge for the press officer and for the embassy and for the ambassador and any of us who were out talking to the Japanese.

Q: These programs that you had at the American Center, which ones do you think were really right fit, of being on target and did very well to a certain audience or subject or what have you?

BERRINGTON: Well, Stuart, in my opinion there was never any substitute for face to face contact, what in USIS you have probably heard us call the "last three feet." The idea that like we are right here talking to each other across the table rather than reading something in the newspaper, rather than reading a book, rather than seeing something on television. I am not belittling that. I am just saying in terms of importance, the idea of the face to face dialogue and face to face contact was really very important, and made much more of a difference in convincing somebody or persuading somebody about an issue than the more passive form of a book or a newspaper. So those programs that fulfilled that function, that provided somebody for that "last three feet" were the ones that most of us thought were the most important, and by which I would say and I am not really in part order now. This is just what springs to mind. The

IV program, the international visitor program, in which we would send people to the United States and go down and meet their counterparts and come back. The speaker or seminar program in which we would bring out specialists or experts of one kind or another to talk about issues. Whether it was talking with 20 people or in some cases maybe just with two or three people, those were the programs that really made I think the biggest dent.

For example, when I was at the Tokyo American Center, well, Yokohama which is the biggest city south of Tokyo, it is about a half hour south of Tokyo, a major city in its own right. It is a separate administrative district, not part of the Tokyo administrative district. The governor for that area was a well known socialist party figure, meaning he was somewhat critical of the United States. His deputy governor was a much younger socialist party politician who had been to North Korea, had been to China, had been to Russia, had been invited to all these places several times, but had never been to the United States. He was somebody that I got along with, but we would constantly have this ongoing kind of debate about the United States. He really didn't know that much about the U.S. Well, I figured this was a guy who was going to go further, and so I nominated him for an international visitor grant. He went to America. It was his very first time. He went all over, met with Democrats and Republicans, mayors, senators, congressmen. He even stayed on an Indian reservation in New Mexico. He made a home visit with a black family in Alabama. We really gave him the whole nine yards. He came back and I debriefed him. He spoke no English, like most Japanese politicians. So everything was done through interpreters on his trip to the U.S. But he said he had never had an experience like that in his life. That by comparison his visits to Russia, Korea, China of course, were much more like taking you to a Potemkin village. He didn't realize that at the time as he did now in comparing it with his American visits. He said it just made a total difference in his outlook on the United States. The way he put it, he said, "I have come back a changed man." I think it was people like him, and he is not the only one, but it was a combination of people like him in the socialist party which have really contributed to the eventual kind of implosion of the socialist party into, well there is no socialist party now. They have been so doctrinaire, so irrelevant that enough people like him said eventually to hell with this. We can't continue with a party like this. They have gone out and joined other parties or you know, totally left the Japan socialist party. So it was that kind of experience that taken together really contributed to a lot of change in Japan.

I can also remember when I had Ed Koch, the mayor of New York, in for a seminar. We had a bunch of young city council people from Tokyo, young politicians. They just came away from that meeting absolutely, you could see they were all just so whipped up with enthusiasm in how they are going to go back to their jobs and really make a lot of changes and do this and do that. Not that New York was the model but just simply Koch's style and what he was trying to do in New York was seen as something that the Japanese should try to emulate. Without those face to face experiences, I don't think that anything like that would have ever developed.

There was another example, of Zushi was a small town south of Yokohama where there was an American, well it was very close to Yokosuka, where we had a naval base Zushi was where a lot of the personnel from the Yokosuka naval base were housed. The mayor of Zushi was an astronomer who had somehow gotten into politics. He was a good friend of a friend of mine who was a labor leader. This whole issue of housing the American naval forces in Zushi became a fairly bitter issue. The local folks didn't want this housing development. Zushi, the local

administration didn't want it. The mayor of course was sort of leading the charge on all of this. He even refused to see anyone from the embassy. He just wouldn't have anything to do with the ambassador or the political section. He didn't want to be seen as you know, sashaying with the enemy. So, the embassy, because this was in my territory because I was down there a lot, and because he was a friend of a friend, this was turned into the friend invited the mayor and me out to lunch. We talked about a few things, and one thing led to another, and I literally became kind of like an emissary. I would meet with him. I would talk about certain things. I would ask him questions. Then I would go back to the political section and report on what had happened, and the political section would say oh this is good or this is not so good, now what about this. Then I would go back and talk to the mayor. I felt like the Henry Kissinger of Middle Eastern shuttle diplomacy. This would not have been possible if we had not had an American Center because the American Center was physically removed from the embassy. Everybody knew it was part of the embassy. I had an embassy title, but simply because it was physically removed, and because it was in the Japanese eyes seen as a cultural program rather than a political or economic program, I could get away with this. Eventually over time, I was able to back off, and the embassy people and the mayor would get together and everything was fine. But again I think it was those "last three feet" that made a difference. If it hadn't been for first of all the American Center's removed or distance, and also if it hadn't been for the fact that I had the friend who was the labor leader, we probably couldn't have gotten very far.

RICHARD T. McCORMACK
Acting Assistant Secretary for Economic and Business Affairs
Washington, DC (1982-1985)

After attending Georgetown University, Mr. Richard T. McCormack assumed a multitude of administrative roles for the Nixon Administration in addition to serving under Governor William Scranton of Pennsylvania and Senator Jesse Helms of North Carolina. Mr. McCormack's career also included positions as the US Ambassador to the Organization of American States as well as Under Secretary of State for Economic Affairs. Ambassador McCormack was interviewed by Charles Stuart Kennedy in 2002.

McCORMACK: I was Acting Assistant Secretary from whenever George Shultz came into office, which I guess was in the summer of 1982 until 1985.

Q: Now when you came in, you mentioned earlier on the Japanese relationship that we had, so many of our people were nurturing this country because we wanted to make sure we weren't ever going to have to fight it again. Were there any countries or areas where we were saying let's not be too rough on these people because we have other fish to fry. We want to encourage their development so it is not just Americans selling stuff, but let them have a piece of the action.

McCORMACK: It is my impression that U.S. trade policy became increasingly concerned about a level playing field as our trade deficit began to mount. Early on foreign trade was such a small factor in our vast economy that we didn't really care that much. The only thing that slowed

further opening of the U.S. market was U.S. protectionist interests. From the economic point of view and certainly from the State Department point of view, we ourselves gain by having cheap products here to be sold on the American market. The consumer gains by these cheap products. Trade not aid was the thesis. There was also what was called the positive adjustment program, organized by the OECD. This was basically a strategy of actively encouraging the advanced countries to move out of certain areas to make room for third world countries to have jobs and to grow their economies. That was something that was never formally presented. The very existence of this “positive adjustment program” is something I myself learned about quite by accident. But that was in fact the banner under which some people operated. However, as the trade deficit mounted, senior people became increasingly concerned. Thus, increasing pressure was put on the Japanese to restrict their exports, particularly cars, to the U.S.

Many people, though, concluded that we couldn't get the Japanese to open up their market to U.S. exports, and therefore, we needed to slow up their penetration of U.S. markets. Eventually this led to efforts by Treasury Secretary Baker to encourage the Japanese to develop more domestic demand rather than rely so intensely on exports to grow their economy. The Japanese in fact attempted this, but unfortunately they carried it too far as they over expanded their money supply. They developed a huge asset inflation, and they eventually seriously damaged their financial system. To this day, the Japanese blame Jim Baker for that, unfairly, but they in fact do blame him.

After the Plaza Agreements, the Japanese currency strengthened somewhat, the dollar weakened, and our balance of trade stabilized until the 1997 Asian crash. Due largely to Baker's earlier efforts to correct the currency situation during the time when I served as Under Secretary of State, we had the smallest balance of payments deficit in many years.

Some elements of the basic strategy that the Japanese used to penetrate the United States are now being used by China against Japan and the U.S. This involves a variety of state capitalism, deployment of their savings via banks to support targeted sections of the economy, and taking advantage of low wages, cheap capital, others' intellectual property, and an undervalued currency to penetrate markets; while using nontariff barriers to protect vulnerable sectors of the economy.

We have now a 200 billion dollar a year balance of payments problem with China, which is growing every year. The Japanese are simply not able to compete in many areas with the Chinese at this particular point. Some of their industries are slowly hollowing out. This problem has them troubled. They don't know quite what to do about it. They understand the dangers. They are trying to persuade the Chinese to appreciate their currency, just as the Japanese were forced to appreciate their currency earlier. However, the Chinese are resisting. This is going to be an increasingly lively issue and very important for the U.S. and the global trading system that we succeed in this area. It won't be easy or automatic. It will require a conscious forceful U.S. strategy, now missing.

Q: We are still going back to the '80s. I notice you said when you went to China to set forth your three no's as far as export, that you consulted with the Japanese. Was there a feeling that after the Nixon shokus and all this, that we really need to keep the Japanese informed. Was that part

of the ten commandments for economic things?

McCORMACK: It was not part of the ten commandments; it was my own initiative. Nixon earlier stopped consulting on some sensitive matters with the Japanese after the Okinawa reversion because he felt betrayed by the Japanese Prime Minister on a trade-related quid pro quo that failed to materialize. But I felt that we had a shared interest in consulting with each other on some issues. Also out of courtesy, I felt that we should consult the Japanese since they were the main strategically exposed country in the region and our principal regional ally. Had they expressed major objections to our technology transfer policy to China, and if their objectives were credible to me, I would have certainly passed them on to Washington. This might have influenced what Bill Clark eventually recommended to the President. The fact of the matter is, when you have allies or you want to keep allies, you consult with them in advance rather than present them with *fait accompli*'s, if you want to maintain trust and friendships. So this was, as I say, my own initiative. But I also learned, after the fact, that the Secretary of State had not been consulted on this policy change. This had been a White House initiative, and there had been no meetings held either at the Assistant Secretary level or at the Secretary level on this issue. I did mention to the Secretary at a morning staff meeting that this was a live issue. The White House, however, did not want to have the policy preemptively destroyed. There was concern that if they had an interagency consultation, the Pentagon or conservatives on the Hill would have made it difficult to execute the policy. The White House wanted to do it for strategic reasons. So this issue was handled by an extremely small group of people, very quietly. This was not a unique situation in the first Reagan administration. When I reported to the Secretary after I returned, he approved of it and said that he had always felt this was a good idea.

WILLIAM PIEZ
Economic Minister
Tokyo (1983-1985)

Mr. Piez was born and raised in Rhode Island and educated at the University of Rhode Island and the Fletcher School. After service in the US Armed Forces, he joined the Foreign Service and was posted to Frankfurt, Kabul and Manila as Economic Officer. During his career Mr. Piez dealt primarily with economic matters of East Asian countries, particularly Japan, where he served first as Economic Counselor and, from 1983 to 1985, as Economic Minister. In the Department in Washington, Mr. Piez was Deputy Assistant Secretary of East African Economic Affairs, and from 1989-1991, Deputy Assistant US Trade Representative. Mr. Piez was interviewed by Charles Stuart Kennedy in 2009.

PIEZ: I left Washington in '82 and was assigned again to Tokyo this time to the economic minister's job.

Q: They couldn't get you out of there.

PIEZ: Well one thing that can happen to a foreign service officer is that you get categorized not

only in a career track like political or economic or consular but you get categorized into a region. I had never in my career asked for East Asia, but I got it. You get to know the people, and you get to know the decision makers. They tell you I want you here. It is very hard to say no I won't do that.

Q: Well also if you are looking at an overall sort of point of view of foreign policy. I mean have a man who speaks the language and knows people and I imagine in a country like Japan where essentially there is a lot of stability with the governing apparatus.

PIEZ: The political system was incredibly stable.

Q: Ok, you went out to Japan from when to when?

PIEZ: Well I was there from late in '83 until 1985.

Q: This is a continuation of the October 20 interview with Bill Piez. Ok, you were over there '83.

PIEZ: Yeah. I am trying to recall just what month it was. It was in the spring of '83 that I returned to Tokyo.

Q: Who was the ambassador?

PIEZ: Mike Mansfield. He had already been ambassador there for some time. He had arrived in '77, was first appointed by Jimmy Carter, and then Ronald Reagan kept him on.

Q: With Mansfield, how did he view the economic side of things? Did he say you know the business and let you go?

PIEZ: Oh yeah, he rated it as a very high priority. The political section was dealing with reporting on the stability in the political system we had mentioned earlier. But on the economic front there was always something going on. They were following closely the opposition to the LDP. The opposition was quite disorganized but sooner or later our political officers knew it would gain in power. We had many visitors, and our visitors really liked to call on Mike Mansfield. It was a feather in their cap just to be able to go home and say when I saw Mike, etc. And he knew that.

Q: Well did you sit in on a lot of these interviews?

PIEZ: Practically all of them. So many that it is difficult to remember many of the details. Mansfield's practice was normally to arrive at his office about 7:00 in the morning, and he would read all of the incoming documents and the newspapers. During that time he did not want to be disturbed. Beginning about 8:00 or 9:00 he would read the translations from the Japanese press for that day's newspapers. Then he would receive visitors about 9:00. He always wanted his appointments early in the morning. He would personally bring coffee to visitors from his serving counter between his office and his conference room. Japanese could hardly believe it. They always expected a tea girl to do such ordinary tasks.

Q: Yeah, but to put it mildly Mr. Mansfield was not a loquacious man.

PIEZ: No he was not.

Q: How did you find these meetings went? Did he sort of nod and listen to the people and let you carry the economic load?

PIEZ: He certainly would nod and listen, but whenever he could he would express agreement and support. It was rare for him to say outright that he did not agree. But his basic approach was to tell them, "Tell it like it is." If you are having difficulty bringing in your product or clarifying an import regulation when you talk to the Japanese tell it like it is. He would not tell them to pull their punches. He would not tell them to go easy on the Japanese because we have a hot political issue involving maybe some security question and we don't want to upset them. He did not link political and economic issues. He kept them separate. He very much ran his meetings his way. I was not there to talk very much, but to take notes and follow up. He was well informed about the Japanese economy because he checked the press, the translations, and USIS feed every morning. But he was slow to show off his knowledge, letting people learn for themselves that he had a good response to any question. He was in his eighties and a sharp as ever.

On one occasion he was visited by a former U.S. cabinet member who had just come from China. Mansfield knew China well, and asked, "Where in China did you go." The visitor said he had been in Kunming, perhaps expecting Mansfield to ask where that was. Instead Mansfield said, "Oh yes, Kunming, the land of eternal springtime. President Roosevelt sent me there on a mission during World War II." The visitor then changed the subject.

Q: This is an admirable trait because I know as a consular officer, if we had a consular problem in some embassies, sometimes it would be, "Gee I hope you don't raise that too much because we have got something else on the other side, base agreements or this or that." This is a very bad practice to get into.

PIEZ: I frankly cannot think of a single case where he told a visitor, whether it was an official from say the Treasury Department in Washington or a businessman or an old friend of his, maybe a lobbyist going back to his early days. I cannot remember an instance when he told them to hold back because it might hurt us with respect to another issue.

Q: Was there a change in the stance of the Japanese, particularly the bureaucrats but also the politicians, regarding trade and economics than before or was it pretty much the same business?

PIEZ: Was there a change in Japanese attitudes? Well I would say there was a gradual evolution in Japanese attitudes in the 1980's as the Japanese economy continued to grow at high rates and become stronger as time went by. Many Japanese were strongly aware of the fact that during the occupation the U.S. presence was benign and actually very helpful. There were times when we exported rice to Japan because the people were hungry. You probably know that when General MacArthur got there he realized that food was short and was going to remain short for quite a while. He gave orders that no members of the occupation forces were to eat food from the

Japanese economy. And if they ever had leave they were issued rations, C-rations usually, to take with them so they wouldn't be frequenting Japanese hotels and restaurants and buying food. There were things like that which many Japanese remembered. But as time went by I would say they nevertheless became more assertive and less willing to go along. For example, in textile negotiations they steadily demanded and got increased quotas. It got to the point where they couldn't fill the quotas. The negotiation would be on the subject of what to do with the overhang which was the code word describing the portion of the quota that was unfilled. They just got tougher and tougher all the time.

Q: Well were we looking sort of at Japan in the long run. The demographics in Japan today and back then they aren't good. They don't...

PIEZ: They aren't maintaining the population.

Q: And they don't, they are almost pathologically averse to bringing in foreigners.

PIEZ: Immigration is not popular in Japan.

Q: You know when you put those two together you are talking about a nation that is going to peak and just start going down because of too many old people. Is this something we would talk to them?

PIEZ: We noticed of course that the Japanese population was barely staying level. There were forecasts that they were facing population decline. But I would say at the time an awful lot of Japanese people felt there were too many Japanese anyway, and they were not worried about it. Today they are, but at the time I was there I would say they were not.

Q: How about the labor movement in Japan. Was this of concern or not?

PIEZ: Well there were well organized labor unions in practically all of the large companies. I can't think of one that was not organized. This during the occupation was something that we tacitly supported because it was a way to counterbalance the power of elites, including the elites that have military or aggressive inclinations. Sometimes Japanese labor unions were quite benign. Sometimes a union would strike for an entire lunch break, but no longer. The purpose was to demonstrate power and solidarity, but not hurt the bottom line of the employing company.

Q: Daibutsu or something like that.

PIEZ: Of course the old word for a Japanese monopoly was Zaibatsu. They have been renamed the *Keiretsu*. But they were essentially the same thing. It was Mitsubishi, and Mitsui and other groups of that kind. They were fully identified in the press. Everybody knew who they were and what they were. Every Keiretsu had a top bank, and a top manufacturing company. It would be a big auto industry or a big steel industry, and then there would be a big trading company and then a panoply of others of lesser importance, but all part of the group. It is a very important factor in the Japanese economy because within the Keiretsu there was an attitude of trust and confidence. It made productive risk taking easier and it had a lot to do with the growth of Japan at high rates.

Even during the time when Mansfield was there their economy would grow seven percent a year or more pretty regularly.

Q: Was this the period where we were looking at the Japanese model and saying we should emulate it?

PIEZ: There were some who said that, yeah. Then in 1991 the whole thing folded, but that was just about the time I retired.

Q: Well were you looking at the Japanese industrial model and were you seeing sort of both the strengths and the weaknesses?

PIEZ: Well I think so. I have of late wondered, seeing our own recession here, did we in Japan, observing the economy in say '85 take note of the fact that there were credit structures that were expanding beyond safe levels. And the particular area of overpricing was land and real estate. Well, as I think back on it, everyone knew that Japanese land and real estate was overpriced. The Japanese certainly knew it. It was a bubble that did burst in 1991. Now I cannot say that we reported Japan's got this bubble and it is going to burst sometime soon, because we didn't know that for a fact. But I think it was generally known and covered in reporting that land prices in Japan were unreasonably high. It was a risk. A credit risk.

Q: Were the Japanese at this point looking at China as a market or a rival?

PIEZ: They were looking at it as a market and a place to invest. I don't think they were looking at it as a rival. I don't think they foresaw that in the 1980s.

Q: What were the major sore points with our trade relations. Was it still automobiles or selling things in Japan, rice or things of this nature.

PIEZ: Well I think it breaks down really into three categories. There was first of all, Japan's huge trade surplus with the United States and the world. As part of that there were a series of negotiations led by treasury on exchange rate management by the Japanese. In time they did appreciate the yen. They had to. The second issue was the whole category of access to Japanese markets. They shipped to us. We felt that our shipments to them of goods and services were constrained in many ways, and a lot of our negotiations with them concerned improved market access. That was true both under Democratic and Republican presidents. The final field was the shipments of Japanese goods in large quantities to the United States, resulting in demands from U.S. producers for U.S. restraints such as quotas or anti-dumping measures. Those issues were more or less continuous.

Q: Could you explain what a dumping issue would be during your time?

PIEZ: Well, under the international trade rules, dumping is defined as exporting a product and selling it for less than you charge in your own country, or for less than the cost of production..

Q: How would that develop? Is it just they produce too many?

PIEZ: A businessman in the United States would say that his marketing of stainless steel flatware is being damaged because the Japanese are shipping this product and are charging prices which don't even cover their cost of production, or the Japanese are selling it in my market for less than the charge at home.

Q: Why would the Japanese or any businessman do that?

PIEZ: Why would he ship at a loss?

Q: Yeah.

PIEZ: Well of course under the rules we didn't care if they made a profit or not, only that they were doing it. The reason they would do it is they have the production capacity and want to keep it working. They are making enough profit in other markets so they can afford it. They want to increase market share and eventually increase the price.

Q: Well how did you work, I understand from stories I was reading at the time, that many of the Japanese technically wouldn't allow traders to sell goods easily in Japan but they would say you don't meet Japanese standards. I have heard stories there was one entry point where only one man would check the papers and just delay shipments, that sort of thing

PIEZ: Well there was any number of instances of that kind. One example that I think hasn't gotten a lot of public attention in the U.S. was glass. Construction is a big business in Japan. There is a huge consumption of glass in new construction. U.S. companies producing glass were competitive in terms of their own costs of production, but they had virtually no market. Sometimes the Japanese would say well it doesn't meet our standards. At one time Japanese standards required glass entry doors to be reinforced with wire mesh cast into the glass. Modern tempered glass is so strong such reinforcement is unnecessary, but the Japanese were slow in updating their standards. Other times they would say oh the market is really open; its just that you don't know how to sell to Japanese.

Q: What would you find though? Would you have your...

PIEZ: We would find that the four or five important glass manufacturers in Japan, each of them were members of a Keiretsu, and would sell to the construction company member of that Keiretsu, or they would buy from the trading company which would buy from the glass company. There were these established channels based partly on very strong personal relationships. These guys all knew each other. They had dinner together once a month. That was how business was done. If the glass company was asking an excessively high price, they would negotiate it out internally.

Q: Well how would we combat that to find a market for our glass?

PIEZ: Well we would say to MITI, "You need to issue some administrative guidance encouraging these people to look to other suppliers of glass including American companies." As

I have said, administrative guidance is called *gyoseishido* in Japanese and that was a phrase we would understand even without their interpreting.

Q: How did it work? I mean was this....

PIEZ: I can tell you with respect to glass it didn't work very well. But these impenetrable barriers were an enormous challenge, very hard to deal with.

Q: Well with your economic section could you send out people to deal with or sort of delve into complaints to sort of find out what was happening?

PIEZ: Yes. This was a big part of the work of the commercial service, the foreign commercial service and the economic section foreign service officers.

Q: What would you do? Would they sort of go out and...

PIEZ: Well just to take another example, it was very difficult for any American to sell any kind of boat in Japan. A motorboat a rowboat, a fishing boat, any sort of boat. Standards. The Japanese would say, "Well your Coast Guard has standards and so does Japan. We have a terrible time meeting those standards just to dock at Honolulu." So they had their counter arguments. The approach would be first of all get them to tell us what the standards are. It might not be easy to find out. Then you might be busily translating them. We found one standard that any small boat had to be dropped from a height of four or five meters onto its bow. Imagine a rowboat shaped like this (gesturing a prow). You lift it up and drop it four meters and see if it smashes. Well mostly they will. It might be a little; it might be a lot. But they had this standard. If you brought a boat to customs in Japan that was one of the ways they tested it.

Q: Were Japanese boats built, were they, you just didn't know.

PIEZ: Well if you asked them they would say oh yes. Of course we weren't in a position to go out and test Japanese boats. Another area was automobile standards, and they had a long list of little things like the parking lights could not be clear. They had to be yellow. The speedometer had to register in kilometers only. A speedometer that registered both miles and kilometers was not acceptable. The companies that shipped cars to Japan called the process of meeting Japanese standards "homologation," a new word for me. The U.S. auto shippers had a market and they had dealers. You could buy an American car. It was very expensive, and homologation might cost three, four or five thousand dollars. U.S. car dealers also upgraded cars. Japanese buyers demanded perfect paint finishes, so an imported car would be sanded and lacquered to a flawless mirror sheen,

Q: How were economic relations with South Korea at the time.

PIEZ: Between Japan and South Korea? Well I think their economic relations were pretty good. The Koreans have no particular affection for the Japanese. I don't think they expected or desired very much to export to Japan. They certainly didn't desire to import from Japan, and I think they did as little of that as possible. They, of course, found that as a smaller country they could export

to the United States and mostly stay under the radar, with the Japanese up front as the primary problem in our minds.

Q: Were there economic relations with Taiwan? Were these significant?

PIEZ: I would say not terribly significant, although the feelings between Taiwan and Japan were nothing like as difficult as they were between Korea and Japan. I was told the real reason for that is from 1905 the Japanese occupation of Korea was managed by the army which was very severe. But the Japanese occupation of what was then called Formosa was the Japanese navy, and they were smart and much lighter in their policies. The Taiwanese had some happy memories of the Japanese occupation.

Q: I was told it was considered sort of a recreational spot, whereas Korea was used for labor. For most of those places you kind of went on vacations for the well-to-do Japanese. Well then let's see, when did you leave there?

PIEZ: I left there in 1980. No, that was after my time as economic counselor. I left the economic minister job in Tokyo in 1985.

EDWARD W. KLOTH
Japanese Language Study
Fukuoka (1983-1984)

General Officer
Fukuoka (1984-1986)

Mr. Kloth was born in North Carolina and raised in New York. After service in the Peace Corps and private business, he worked with the Department of Defense, later joining the State Department. In his career with State, Mr. Kloth served several tours in Japan and Korea, In Washington assignments he dealt with East Asian, Political/military, Economic and Environment matters. He also spent two years on Capitol Hill as Department of State Pearson Fellow. After retirement, Mr. Kloth continued as advisor to the Department on variety of matters and served a tour in Iraq as Economic Officer. Mr. Kloth was interviewed by Charles Stuart Kennedy in 2008.

Q: What did you do after your year and a half back in the consular section?

KLOTH: Then I went to Japan, to Fukuoka via a six month refresher Japanese in Yokohama to bridge the December 1983 to July 1984 gap before the incumbent in Fukuoka transferred. Japan was very popular as an assignment. There was a boom of interest at U.S. universities too. Japan's economy was booming, and the trade friction with the United States made the trade issue number one. Now I understand that China is all the rage and understandably so. That's where my interest in the Far East started.

When I was in Tokyo in the late '70s as a graduate student, the Japanese press was full of trade issues and the back and forth about U.S. complaints about Japanese protectionist policies which were accurate. The Japanese, of course, said U.S. companies didn't try hard enough and that had some truth as well. For my second tour then, I thought I'd like to see the situation from outside Tokyo, and got a job at the consulate in Fukuoka as economic-commercial officer. A friend of mine recommended a consulate as fun, and it was. I did a lot of public speaking everywhere from Rotary clubs to Chambers of Commerce. I had two very good Japanese employees; we worked with American businessmen who were in the area and helped them sell everything from women's leotards and Texas beer to nuclear power plant equipment. I was there from summer of '84 to summer of '86. We had a consul, economic/commercial officer plus a consular/admin officer because at that time Japanese needed visas to come to the United States. We also had a USIS cultural center.

Q: Was the Japanese Red Army an issue at the time?

KLOTH: No, it was pretty well gone. We did computerized name checks for visas. Occasionally we'd have demonstrations in front of the consulate, but they were rather small and not a danger. Japanese police would always bring a police bus around, but I never saw a confrontation.

The Chinese consulate general was down the street from us. A big black right-wing bus would come by sometimes with its loud speakers blaring. Just after they passed my window you'd hear the guy changing from the anti-US to the anti-Chinese tape.

Q: Okay. How would you describe particularly from your perspective relations with the United States at that time?

KLOTH: Because of the heated negotiations over trade issues at the time, a key mission of the consulate was to get out and tell the U.S. side of the story. We also helped U.S. firms enter or expand in the market. We knew the people in the companies in the region as well as the local economic situation.

Japanese in our area felt the overall U.S. relationship was important to their country but that Japan was being picked on unfairly on trade. In their view, Japan needed to export to buy raw materials such as oil and minerals it did not have. Japanese companies' success was a result of finding out what foreign markets wanted and making it at a good price. Most Japanese I met felt that the basic problem was U.S. companies weren't any longer internationally competitive vis a vis Japanese companies. Trade complaints, and automobiles were the big centerpiece, were unfair. In their view, U.S. companies had gotten lazy and were not producing high quality goods from TVs to cars.

While U.S. buyers of Japanese products were clearly saying the same thing, in its post-WW-II drive to grow its economy, the Japanese government had, in large part by design but also because of the way its bureaucratic system worked, closed its market to protect its companies. One major issue in negotiations was the difference between U.S. and Japanese standards. We can go further into this and other trade problems later. In a consulate you do not negotiate but you certainly

investigate and provide useful information and perspective to Washington.

Take the case of autos. I went to the Cadillac dealer in Fukuoka. And I said to him, “You know, I’m reading in the press about all these safety requirements that are being levied on all foreign autos to conform to the Japanese ‘safety standards.’ Could you show me on the Cadillac what has to be done to pass Japanese inspections?”

He clicked off the list which meant that Cadillacs, like other foreign cars, had to have a number of modifications done in a GM shop in Japan. That added to costs. For example, cars were required to have turning signal lights visible from the right and left sides as well as from the front and rear, so GM had to put on additional little lights on. That’s probably not a bad idea for safety, but the “standard” that really got to him was that the requirement to have a metal plate under the engine. He had been told that was so if you parked on grass the hot engine wouldn’t set the grass on fire. Where, he wondered, do people park cars on grass in Japan?

I used to do a lot of factory tours and saw the strength of the relationships between Japanese firms and their suppliers that was very difficult for a foreign firm to break into. I visited a shipyard in Nagasaki in ’85. They said, “Well you know the competitive pressure is coming on from Korean shipyards, so we have to cut our costs which means our suppliers are going to have to cut their costs. But we send engineers around to them; we send bookkeepers around too and see if we can help them to cut back, to rationalize and improve the efficiency of their operations.”

The yard was reluctant to look for new suppliers even in Japan, let alone abroad in the US. Yard management knew their suppliers and felt they could count on them. From their viewpoint, the start-up costs of a new supplier were high. Nevertheless, shipyards are businesses. When in 1985, the Plaza Agreement greatly strengthened the yen against the dollar, we got a call from them asking for to help finding U.S. suppliers!

Rice was a very sensitive issue, you may recall. I went to Saga City to talk to rice farmers. They were pretty excited that the U.S. was demanding that they open their rice market. But it was not personal. They were gracious hosts. In that area, the farmers blamed Japanese government farm policies for making it difficult for them to be competitive internationally. Cheap farm credit and taxes, especially for small farm machines, let “weekend farmers,” people with office jobs, buy equipment and supplies at favorable rates and encouraged them to hold on to small plots and made it very expensive for full-time farmers to increase their farms size, and so, my farmer friends pointed out, become more competitive.

Q: Well, that rice thing was very tricky wasn't it? I mean, as agriculturalists in the United States know European agriculture is protected.

KLOTH: The U.S. also has quotas for agricultural products such as sugar. It is my bottom line and still is my bottom line: trade friction is an economic problem; it’s a political problem. At any rate, our job was also to give hands-on assistance to U.S. firms. We had a number of success stories for companies large, medium and small, on both sides of the Pacific. I worked with Westinghouse in Tokyo and a Japanese power company in Kyushu to restore their frayed

relationship on purchase of nuclear-power-plant equipment. I spent about a year and a half and the result of a \$10 million deal. As econ-commercial officer, I was not a Westinghouse salesman per se, but lived in Fukuoka and could act as a go-between. Living in Fukuoka I could make drop by and talk to the Japanese firm about how things were going. I could anticipate issues, call Westinghouse and tell them to come down and head off problems. We did the same thing for small U.S. businesses or new-to-market companies too. For example, our work resulted in a U.S. firm finding a Japanese franchisee after years of trying.

I also enjoyed living in Kyushu, having lived in Tokyo as a grad student.

Q: This was a period where the Japanese system seemed to be the world model.

KLOTH: Do you remember Ezra Vogel's popular book on Japan as number one? But there was another side; the Japanese companies did not escape the economic challenges businesses anywhere have. The Nippon Steel in Kitakyushu and Oita had had to institute a RIF (reduction in force) in the '70s and '80s. They didn't like to fire people, but tough business conditions forced them to stop hiring, offer buy outs; and "early retirement" workers, often by placing them in suppliers' companies.

I asked one supplier of industrial-size steel containers how that worked: did he need more help? I had heard some argue that because of "unique Japanese culture," Japanese large firms and their suppliers "cooperated harmoniously on such issues.

The small company manager I talked to had perhaps a different perspective. "Yeah, they did the RIF. I had a hundred or so employees. The economic situation was hitting my sales too. The steel company approached me to take three of their people. You've got to understand I buy the steel for my cans from the steel mill. The mill is also my major customer. Now, if they ask me to help them out, what am I going to say?"

I loved going to the plants and talking to the managers someone else not from the PR section. I worked at a Sikorsky helicopter plant one summer in college, worked on the production line. The best plant tours are always from a manager, engineer or foreman. You want someone who knows the business and the plant floor. A PR person knows a script. The foreman can really know what's going on, what it takes to keep production and quality up, and also some time perspective on changes at the facility. The most impressive thing for me in Japanese plants for all the excellence of the Japanese work force was that every plant I went to would start out the briefing with how they were automating further to cut down on labor costs.

Q: Was it apparent at that time that the Japanese had a real problem in demographics?

KLOTH: Yes, but the automation was being driven by a desire to be more efficient overall. Remember in the 1980s, the Japanese were very confident. Japan seemed to be number one; the economy was booming. Pollution and other such issues popped up in the '60s and '70s, and the government had started to address them.

Q: Were you seeing the change of the social dynamics of women, particularly businesswomen?

KLOTH: Yes, but it was still a very conservative society.

Q: They weren't, I mean I remember in Korea when I was there it was somewhat the same thing, people loved working for the American embassy, particularly women did. They were top rate people because if they worked for a Korean business, if they were married they'd have to quit. With us we didn't care.

KLOTH: That was true when I was in Korea too. And Japan. Big and medium companies let women go when they got married. Of course, women in, both countries did and still do run many small businesses.

Life was no picnic for men in even big companies. For example, the companies in Tokyo and Osaka would rotate their people to the "provinces." The big companies had one-room company apartments in Fukuoka for these tours. Families did not want to move the kids around and disrupt their education, when Dad did a two-year tour in Fukuoka.

Q: How did your wife find it being Korean?

KLOTH: Overall she enjoyed Japan and Japanese friends, and still found time to write her PhD dissertation, and have a baby, our son. A lot of the potters in Kyushu came over in the 16th century from Korea, so, while there was some prejudice, in that area, there is also a special relationship.

Q: Did the American military presence there cause any problems?

KLOTH: There are two major bases: the Iwakuni naval air base and the Sasebo navy base, both modest in size. As the economic guy, I wasn't involved directly if there were issues, the consul handled them. People in the area appreciated the security relationship, but criminal incidents or accidents grab headlines. There was one bad incident where a serviceman got into an altercation at a Mr. Doughnut's shop in the middle of the night. The Mr. Doughnut clerk wound up dead, so the consul worked with the base commander to ensure that the citizens of Iwakuni understood U.S. dismay at the incident. Expressions of regret are very important in Japan among Japanese, so it is critical that U.S. representatives be proactive. That is very important.

In Sasebo, if ships came in some demonstrators would go out in their boats and the Japanese police would be out there; but it was not like the situation in Okinawa. The footprint was pretty small in Kyushu. At least in the Japanese business circles I traveled in throughout the region, I didn't hear concerns about base-related issues.

Q: How were your relations with the embassy?

KLOTH: Actually my closest work relationships were with the commercial section of the consulate general in Osaka-Kobe. Our work was not negotiations and policy, but focused on helping U.S. firms come into the market or Japanese firms buy U.S. products, that is, establish relations with U.S. companies. We had a very good and experienced consul in Fukuoka.

For my commercial work I would go up every six months to Tokyo, and see the American Chamber of Commerce. That's how I learned of Westinghouse wanting to come back to Kyushu. Day in, day out. The Commerce Department's Foreign Commercial Service officer in Osaka was my closest colleague. We talked regularly to exchange ideas and leads.

We collaborated with Osaka to get more American business people to come down to Fukuoka. The likely candidates were those who already had made the mental leap out of Tokyo and were willing to go to Osaka, that is to the provinces. I had good relations with the Tokyo econ section and FCS. I did a lot of speeches, talked to people and local media, so I needed to know what was going on in the trade negotiations. But in terms of the real work on the commercial side Osaka was the big help.

JACK SHELLENBERGER
Language Training, USIS
Yokohama (1983)

Public Affairs Officer, USIS
Tokyo (1984-1988)

Jack Shellenberger was born in 1927. In addition to Japan, his career included assignments in Belgium, Nigeria, Iran, and Canada. Mr. Shellenberger was interviewed by G. Lewis Schmidt in 1990.

SHELLENBERGER: I had bid on PAO Paris, but I withdrew it after coming back from the Versailles summit. It struck me that the job in Paris seemed largely a case of wining and dining and being an escort for VIPs, at least that's the way Jack Hedges characterized the job. And suddenly, Tokyo came up, which was not expected at that particular time, and I did bid on the Tokyo job with the proviso that I get a year of full-time language training. So that was agreed to, and in 1983 I went to Yokohama, found a dark but comfortable apartment about a twenty-five minute walk from the Yokohama language school on the bluff overlooking Yokohama Harbor.

My memories of Yokohama are mostly the unrelenting grind of study, a very, very simple regime of study, munching a sandwich during the noon break, preparing a very simple meal at my apartment, and studying some more. I enjoyed the companionship and friendship of my *sensei*, the teachers, they were more or less my contemporaries rather than my seniors in age. And they opened many doors culturally to me so that I was able to get a sense of the Japanese culture of the '80s, which was then, as they often asked me, contrasted with the Japanese culture of the '50s. I think what I found most different in the '80s was the Japanese ability to speak out and laugh heartily during the day. In the '50s, it would happen only at night and when people had been drinking. But now it was much more up-front and much more natural, reflecting a kind of self-confidence that was not as apparent in the late 1950s.

At the end of the year, I moved to the PAO residence in Tokyo, which was a far cry from the

rather, I wouldn't say mean, but ordinary, establishment I had in Yokohama. Here was a two-story penthouse apartment with two balconies overlooking Akasaka and Roppongi, Azabu, a car and driver at my disposal, a housekeeper, cook -- so it was a different lifestyle entirely. My new wife and daughter joined me a month after I got to Tokyo. So again it was not only a new physical environment but a very different living regime.

The Tokyo years were, as they have always been, eventful. Having an Ambassador of the quality of Mike Mansfield as your mentor was a privilege. His standing within the Japanese official community, and unofficial community, was so high as to permit the resolution of many of our nitty-gritty problems. Ambassador Mansfield always said: we spend too much time in the minutiae of the Japan-U.S. relationship, and we should be crafting the framework for a U.S.-Japan free trade area. Some economists feel that that would not be to our benefit. It would lead possibly to a diminution of our technological edge. But, of course, it would also give our traders greater access to the Japanese market.

Q: Of course, our superiority in technology has diminished pretty substantially without the aid of an open-end trade agreement, and I don't think we've done nearly as much as we should to remedy that fact.

SHELLENBERGER: The '80s -- this is before '88 -- was also a time of continuing competition and rivalry with the Soviet Union in security matters, and Japan's steadfast performance on the security front and its readiness to share more and more of the burden -- the cost of maintaining our forces there -- I think muted some of the more eager members of the Administration who would mix the political security relationship with that of the trade relationship. Since '88, that's changed, and I think under the Bush Administration, there is disposition to take aim at trading practices that might have not been aimed at with the same force as during the last part of the Reagan Administration.

Among the events of the late '80s in Japan was the Tsukuba Expo, which was, for the U.S. Pavilion, explaining artificial intelligence. Complex subject, to say the least. But our involvement was marginal, it was actually managed by an exhibits team of professionals.

Q: Was that the one that Hank Goshu was masterminding?

SHELLENBERGER: Hank Goshu was the man in the trenches, handling the public relations part of it, but being a very constructive presence.

During our Tokyo years, we had the opportunity to see in action most of the major personalities in the United States lexicon: actors, poets, politicians, groups, orchestras, operas, ballet. It was simply a torrent of personalities coming to a country which was, as ever, fascinated by what was going on in the American scene, whether it be the arts or the politics, the technological. And the great difference between this time and 1955-59 was that most of these people were coming on the Japanese ticket. And that ticket could be very pricey, as we know when Reagan came out after his presidency as the guest of Fuji Sankei Communications for a fee of \$2 million.

In my role as the Counselor of Public Affairs, I saw more of these events and personalities than

would normally be the case. One is that I had very solid contacts with many of the media leaders, and the media often were the funders for these events.

Q: Was Yomiuri (newspaper) still riding high in that regard?

SHELLENBERGER: Yomiuri was -- they all were riding high, and they tried to outdo each other as to who could bring in the biggest, classiest, most prestigious act or event.

Q: At this time, had Japan progressed far enough so that they had cultural events, particularly in the musical field, which were favorably comparable with those coming out from the United States, or did you feel there was still a considerable difference between them?

SHELLENBERGER: Well, the market for things Japanese in the United States, while growing, and certainly sushi was one of the new fads, appreciation for Japanese cultural aggregations would be limited pretty much to your aficionado, whereas in Japan, there was no limit to the people who wanted to see Michael Jackson or the Metropolitan Opera. No, there was a difference of considerable degree.

The other thing that gave us access was the fact that the Mansfields were very selective about what they did after hours. And the fewer events the better, as far as they were concerned. So we would very often represent them, which offered a great opportunity to meet on repeated occasions members of the Imperial Family and leading people, personalities in the government and arts worlds.

I took up golf for the first time since playing in Mawlamyine, Burma, as a way of getting some exercise, but also as a way to, oh, have a point of reference with certain of these Japanese contacts for whom golf was a very important activity. And again, Fuji Sankei asked whether I would play in a celebrity tournament, which would precede a major professional tournament involving a lot of Americans, among others. So, like a fool, I did agree. The only thing I can be grateful for is that I didn't knock somebody in the head with one of my missed shots. Isao Aoki was in our group, and he would have been considered in those days one of the top golfers in the world. He was -- what's the word -- tolerant of my poor play.

Q: You ought to have been able to get a designated hitter.

SHELLENBERGER: Well, I was being watched by innumerable cameras, and that also inhibited me from getting a designated hitter.

When I compare Japan in my latter time there with the earlier time, and also with time in other parts of the world, I think what struck me most about my situation professionally was the fact that my title meant more than my name, as compared with the '50s, when my name meant more than my title. And truly, it was clear that in Canada, my name was more than the title. But in Tokyo, Japan, as the Counselor of Embassy for Public Affairs, that was the addressee, and Shellenberger had very little meaning. I remember in Yokohama, I had no *meishi* or name card. And it was always a matter of being somewhat rude and putting off some Japanese who didn't know where you were coming from, making them a little uncomfortable because they didn't

readily identify your status and so forth. Once I had the *meishi* with that title, I was, you know, given deference and being added to invitation lists to the extent that I was doing four or five or six evening events a week. Fortunately, weekend entertainment was purely social.

During my Yokohama days, I was able to meet what they call volunteer Japanese conversationalists. These were ladies who would come over once a week and just talk with a student about anything. And the one who was assigned to me had a brother in Tokyo that she wanted me to meet, said I would find him interesting. And indeed, when I got to Tokyo, we invited him and his wife over and subsequently learned that he was a minor powerhouse, plutocrat, not in the establishment sense but in having made it on his own. He was not an educated man, but he had gotten into the printing business at about the same time as the occupation and was awarded a contract. And he turned all of his profits into property acquisition.

Q: When it was dirt cheap.

SHELLENBERGER: When it was very inexpensive, and now here he was, a fifty-five year-old man who was semi-retired who had, among other things, an airplane with pilots and attendants; he had a yacht and hotels and restaurants. He didn't know me on the basis of my name card, I don't think he cared about that. And we established a relationship that was without reference to my day-to-day agenda. But it was again very rewarding. He didn't have English, and so it was an opportunity for me to use Japanese much more than would be the case with many of our more cosmopolitan contacts. But to be in his, what's the word...

Q: Financial league?

SHELLENBERGER: In his company and seeing how he moves and what he makes of political issues was quite at odds with a lot that I might be reading in the newspapers because he was a man of the streets, and he knew everybody's number. I don't believe he was a particular partisan of any cause, but I do know that his support, as it were, was sought after by all political figures.

Anyway, that was an interesting relationship that developed right from the beginning of my Tokyo days and continued. In fact, my last weekend in Japan four years later was spent at his bungalow (really a misnomer), but his place in Hayama overlooking a lovely harbor. So he is a memory.

Another memory is the chance to reunite with two old friends from the 50s, a professor of American Literature at Chiba University and a documentary film producer. We had been very close in the late '50s, and now we resumed our relationship, which again didn't have much to do with my work at the Embassy but which I think gave me other eyes, other spectacles, with which to see what was happening in our relationship.

I know you wrote a very memorable letter, end of the year kind of letter, about your impressions of Japan that was emerging in the late '80s as being resentful or -- not resentful but being...

Q: Somewhat arrogant.

SHELLENBERGER: Arrogant, condescending toward the American and the American presence, and certainly there's been literature on this.

Some have opined that the Japanese could turn into a very (vis-a-vis the U.S.) alienated power that would strike whatever deal it needed to for expediency. After all, in the world of economics, it is a mercantilist power, and ideologically, it could develop the same way. What will deter this, in my view, and I see a lot of it happening, and I think a lot of it was strengthened or at least emphasized during my tenure, was the growth of private relationships between Japanese and Americans. Exchanges -- just a whole panoply of interrelationships, whether it be through alumni organizations, through Fulbright scholarships, International Visitors Program, Youth for Understanding. These I think are nurturing among the Japanese who take part a sense that we and the Americans need each other, not simply as markets, but as forces for societal and global change.

Q: The thing that disturbed me particularly in the middle of last year, which was the time that I was getting all this feedback out there, was not only Ishihara's book, but there were two or three other books written. One of them was written by a reporter who had interviewed not very many Americans, but he had interviewed a number of the Japanese who had participated in the first three or four Japan-America student conferences back in the pre-war days and who had been very pro-U.S. as a result of that participation and even during World War II, had kept their distance to the extent they could from the Japanese government. They were almost as bitter about the U.S. in their conversation, as were others, less informed, even having had that pre-War relationship, which was very unusual in Japan in those days. They had come around to a rather hardened viewpoint on the American attitude toward Japan. They considered the Americans arrogant, non-comprehending, blustering and overbearing in their demands on the Japanese and unfortunately, were not ready to look sufficiently, I think, at their own failures in opening up their economy. But nevertheless, it isn't what the facts are, it's what they believe. The fact was that these were the kind of people who were expressing this sort of antipathy toward the United States, and there was an awful lot of it in the Japanese press. The press was quite bitter about it. And of course, that coincided with the time that the U.S. had just declared Japan a potential point of attack for Law 301, threatening to put them on the more or less embargoed list as being an unfair trader. I think it eased up a little this year, but I just wondered how much of that you encountered during the latter part of your term over there.

SHELLENBERGER: No, I felt that we were politically, economically -- our relationship was as Mansfield said, the best he'd known it in ten years when I left in '88. And he said as much. So the cracking and the seepage of this attitude that you speak of began after -- not that I had anything to do with it, but it began to leak out after the Mansfield years, not, again, because he departed, but events conspired to make '89 a year of rethinking on the part of very serious Japanese.

I have heard about a book that's just out by Tadashi Yamamoto and, I've forgotten the other, on U.S.-Japan societal perceptions of each other that I'm looking forward to reading. It's a brand new book. They examine it, using, as I understand, the Japan-America Societies themselves and their memberships in both the United States and Japan. Interesting, in my time in '88, I believe it was that Kyoto established its first Japan-America Society ever. And the ones that, the sister city, the sister state activities were increasing; university affiliations were on the rise and are still on

the rise. These are the things that I like to think count in bilateral relations. More and more Americans studying Japanese and more and more universities having Japanese connections, and vice versa, will, I think, engender attitudes among the younger generation that will not lead to the formulation that what we face is a great beast.

Q: About a month ago I read an article, I can't remember where, whether it was in -- it had to be in some paper other than a Washington paper because I read it while I was still abroad, whether it was a New York Times or the Herald Tribune or an English language Japanese paper -- but there apparently is a group of about half a dozen books coming out starting in August and September on the American side that are all very serious Japan-bashers. It's apparently the answer on the American side to the Ishihara book of last year, which, by the way, is going to be published in English shortly, I'm told, in the U.S.

SHELLENBERGER: It's not much of a book. Have you read it?

Q: I haven't had a chance to read it yet.

SHELLENBERGER: The version that was making the rounds in Washington was a pirated thing, and it is relatively incoherent, it needs a lot of work.

Q: Of course, part of the incoherence may be due to the fact they didn't have a good translator, but I'd be interested when the book comes out, I'd like to read it then. I hope that these books that are coming out aren't as seriously taken in Japan as I'm afraid they may be. It would just add more fuel to the fire of bitterness.

The next question I want to ask, and this has to do with something we were discussing before on the growing toughness of Japanese attitude -- of the antipathy, did you have any occasion to be in close relationship with any of the student populations, whom I gather are now, as they were in earlier years, attempting to be more radical? Students often seem to be among the first to develop anti-American attitudes or anti-foreign attitudes.

SHELLENBERGER: In contrast to the '50s, it was a totally changed picture. Whereas in the '50s we could rarely get on a campus, much less do any program work, now campuses were readily accessible. The thing about the student population in most, in all of the universities that I went to, and I went to all of them that I could as I went around Japan, I encountered not the slightest hostility that was ideologically based. There might be some resentment, especially in the Ryukyus about our military presence occupying so much of the real estate of Naha and it's environs, but it was never what I would call radicalized. In fact, what struck me most about the '80s is the relative apathy of the students, that the students were, as they are here, more engaged in preparing for a career or some kind of slot with an organization that would give them economic security. That was the number one goal of students. There obviously would be splinter groups that would come into the fore on issues, such as the banning on whale hunting and environmental disputes, but it never approached the numbers that could be turned out for a political cause as was the case in the late '50s. The demonstration against the battleship *New Jersey* visit in '85 was a great hype but a conspicuous failure in terms of numbers.

Q: Quite a contrast to Korea today, where the students are in the forefront in every anti-American activity that goes on and very bitterly so.

SHELLENBERGER: Couldn't be a greater contrast.

Q: I want to go back briefly to your comment about your title meaning and what it did. I think there's another difference between now and then. In the '50s, the old line ambassadorial group and the old line Foreign Service had not yet been willing to give USIA officers the kind of titles that would grant prestige among the people with whom we have to be in contact. The whole attitude toward the USIA program is today vastly different than it was in those days, which, of course, makes it in one respect much easier.

On another subject, how did you read the Japanese media on American-Japanese relations, particularly in the trade difficulties, which was, of course, one of the major, if not the major, source of friction?

SHELLENBERGER: Well, nowadays the Japanese media representation in Washington, D.C. is variegated and huge. And they cover microscopically every Congressional hearing, every Congressional statement and feed it back to the homeland. And what would be considered an obscure reference to the U.S.-Japan trade picture suddenly becomes a headline on the front page. And of course, it made our jobs very interesting. We would have to explain to the editor that, yes, this was said, but this individual's role in the Congress is of small moment. If you remember the time some Congressional people took hammers and beat a Toshiba radio, audio cassette to pieces, and the spectacle was repeated and repeated and repeated on Japanese TV. It became part of not only that days news show but of subsequent news shows. In fact, a year later, to open a discussion of U.S.-Japan trade relations, they would rerun this shot of the Congressional people banging on the Toshiba set. So there was a proclivity to sensationalize what was said and done by Americans, especially in the Congress, on trade issues.

But then, at the same time, coverage accorded governors who were coming to Japan seeking investment was full and fair, and the negotiations that took place constantly by ourselves and the Japanese were covered to a fault -- to a fault, I mean, because the Japanese media is used to being briefed about everything. And there's no such thing as a privileged negotiation from their point of view. So it would make our negotiating side angry. As Clyde Prestowitz would recount it, before a negotiation was even into its early innings, there would already be outcomes as projected by Japanese spokespersons to the media.

I think in the last year, a lot of this has been overcome. It's been partly the degree of discipline, maybe, that's been imposed by the Kaifu Administration in its attempt to not let the cat out of the bag. One particularly insidious example of media treatment was contained in a pseudo-documentary produced by Nogyou, an agricultural cooperative with immense resources, which suggested to the viewer that eating American agricultural products, or imported, I should say, agricultural products could lead to deformities, could lead to monstrous genetic effects, all done as if this was scientifically based. I learned about it through a friend who was in the film industry, and we obtained a copy. It was for sale in any video store. We fanned out as a country team. The Agricultural Counselor went to the Ministry of Agriculture; I went to the public affairs

person for the Foreign Ministry and told him about it. They got hold of the product and -- oh, the Labor Counselor went to the Labor Ministry -- and Japanese officialdom saw immediately that this was a gross insult. And it was withdrawn, the video.

Now a year, two years later, I saw another prime time TV program which is a cartoon something like the Simpsons -- a family, not flagrant at all, but very subtly suggesting that Japanese rice in no way should be augmented by imported rice because it had very special health giving, safe tastes and all the things. But it...

Q: Even medicinal qualities, no doubt.

MR. SHELLENBERGER: Exactly. And very cleverly done. It's not something you could say, wait a minute, this is an attempt to define other people's products as unsafe or unsanitary. No, it was -- but it was very subtle, with the message being Japan must not open its rice market. But done in a cartoon.

Q: With regard to the press play on things American, Bob Garrity, the gentleman who just before he retired was head of the Foreign Press Center here for USIA, said that the Japanese correspondents were having a very difficult time with their home newspapers because they were being leaned upon to find examples of American decadence and loss of skills, decline in their scientific and other similar activities, and also the decline in their finances and their will to operate, to compete in the world. The Japanese editors wouldn't take stories which these correspondents were sending back to their home papers that contradicted this viewpoint on the part of their editors. I don't know really how that's played out in the Japanese press, but according to this gentleman, there were a lot of disappointed and really frustrated Japanese correspondents here from the major papers in Tokyo who were getting these kind of requests and finding that stories to the contrary were not acceptable back home. Were you able to detect any of that?

SHELLENBERGER: No, I would argue that that would be maybe on the basis of a personality who's feeling the threat of competition, thinking that we can maybe get an edge over our competition by running the more bizarre, the more sensational items about the U.S. demise. But I think that would be the exception rather than any kind of rule. I was struck by the number of major media who gave their reporters free rein to do Americana pieces, what's going on in the small towns and the rural sections, not keyed to drugs or keyed to racial problems, but keyed to Americana and its overview. Again, I was struck by the variety of this sort of reportage that was available. Sure, you could turn on the TV and get mayhem at night in Detroit almost as a regular thing, but balancing that would be something quite thoughtful and expressive. So, again, I don't see it as a tide, I see it as rivulets that go into the media of any free country that doesn't have, you know, that isn't setting the media's agenda. And I don't think anybody is.

WILLIAM LENDERKING
Public Affairs Officer, East Asia & Pacific, USIA
Washington, DC (1984-1986)

A native of New York, Mr. Lenderking graduated from Dartmouth College and served a tour with the US Navy in the Far East before joining the Foreign Service of the US Information Agency in 1959. As Public Affairs, Press and Information Officer, he served in posts throughout the world and in Washington, D.C., where held senior level positions in USIA and the Department of State dealing with Policy, Plans and Research. Mr. Lenderking was interviewed by Charles Stuart Kennedy in 2007.

LENDERKING: I heard that there was a job in East Asia as the head of the office of public affairs in East Asia and Pacific, and I would also be the spokesman for the bureau, and they wanted someone who was familiar with Japan, and who could speak Japanese to deal with the Japanese press because there was a very large and influential press corps covering Washington and American politics. So that's how I got the job. Paul Wolfowitz, who went on to even greater fame, was the Assistant Secretary and he had a group of very able guys as deputies and the office directors were all very good, but the original purpose for which I was hired actually did not come to pass, as is so often the case. The most aggressive people that I had to deal with were Australians and New Zealanders, our closest friends, and I almost never had a really tough issue with the Japanese press corps.

LENDERKING: There was one perennial, and that was the adamant refusal of New Zealand to have anything to do with, or permit any contact with, nuclear vessels or weaponry or anything like that. That means that U.S. nuclear ships couldn't call at New Zealand ports. We couldn't conduct naval exercises with New Zealand ships if any of our ships were nuclear powered, and so on. It meant, in effect, that New Zealand had opted out of the very close mutual security relationship we'd had with them. It was a serious problem, for them and for us, not just a disagreement among friends.

Well, they stuck to their guns, and we still have a problem with them, but they sky didn't fall. New Zealanders are marvelous people and they have a lovely country, but they also tend to be a little self-righteous and they saw themselves as leading a crusade to keep nuclear weapons away from the South Pacific, and beyond. One might say, "well, good on them," but our immediate concern was our security relationships and we had good reason to feel the New Zealand position jeopardized our security. The Australians agreed with us. Our policy, to this day, is that we neither confirm nor deny the presence of nuclear weapons anywhere. We also feared that the New Zealand attitude would undermine our fragile working arrangement with Japan, which still had a strong nuclear allergy. Now, we and the Japanese eventually figured out a way to finesse this issue, and with New Zealand, we felt we had no choice but to exclude them from military cooperation operations and there was considerable cost to New Zealand.

Q: Turning to Japan, you say they have a large press corps here. Can you talk about your view of the operations of the press corps, because this is a subject about which we aren't very

familiar. How did they operate and was there much investigative reporting, that kind of thing?

LENDERKING: The Japanese press is large and very sophisticated, and in some ways outstrips our own. Their journalists are generally well educated, serious, and professional. Of course there are scandal sheets, just as there are in any country where there is a free press. They break down along conservative to progressive lines just the way our papers do but the numbers are vast, the readership and circulation figures. The Japanese have a big three, they are all national newspapers; the "Asahi," -- I don't know how it is now but probably basically the same, is considered the paper more for intellectuals and it was the most left of center, but it was a mainstream paper. And then the "Mainichi," centrist and mainstream, and then the "Yomiuri," which has the largest circulation and is slightly conservative, or at least it was then. I think in those days the daily circulation was around 12, 13, 14 million a day. They all put out English language editions, which were excellent, well written and full of information, necessary for the large expat colony, most of whom couldn't read or speak Japanese. And there were a lot of other newspapers too; one was the equivalent of the "The Wall Street Journal," another perhaps similar in editorial content to "The Washington Times." Now these are huge and very powerful organizations. Japan is probably the most literate country in the world, so you can imagine how important the media are in a democratic country like that. In addition, they have weekly intellectual, political, and cultural magazines, similar in content to our own except that there are probably more of them.

The correspondents for the established newspapers stationed in our big cities are all well educated; most of them really enjoy their assignments here because this is a place where events of world consequence are either happening or being hatched, and having good, reliable information about the U.S. flowing to Japan is essential to Japan and to us as well. I am ashamed to say it, even though there are many excellent American correspondents covering Japan, there are more Japanese covering the U.S. and the quality of their coverage in an overall sense is more thorough and more informative. Most of the Japanese correspondents here speak good English and they are often 'A team players,' so to speak. They developed good contacts and they were approachable; they weren't just off on their own, writing stories in a vacuum.

Q: Were there Japanese newsmen or newswomen burrowing down in the various parts of society and then all of a sudden stories would pop up that you had no idea were coming at all, and you had to deal with them?

LENDERKING: I can't recall a specific instance, but I think there must have been. I was constantly worried that the Japanese didn't call me much about stories they were working on. Yes, they had good sources, but with American correspondents and some of the others I got to know well, they called on me often as an official source and occasionally depended on me to warn them away from misleading paths or sources, and to the best of my ability and the limits of classification, I tried to do that -- it was an essential part of my job. Sometimes I couldn't talk about a sensitive subject directly, say, for example, most aspects of the nuclear issue, but I often could say, "there's nothing to that idea," or "you're on the right track," and so forth. Determining how far I could go was what made the job so interesting -- it was far more than just sticking to the press guidances. I'd say that any press officer who insisted on doing only that would be useless to his superiors and to the media as well.

Anyway, the Japanese didn't often call me, even though they knew I spoke Japanese and would help them if I could. Maybe it was their ingrained distrust of government officials. If they were working on a story and no one denied it, then they might feel a bit freer about what they wrote, just quoting sources. But of course not every seemingly credible source is reliable. With the Japanese, I knew most of them, and a few of them were friends and I saw them socially. But I found that a lot of times when they were working on a story, they would go out and develop their own contacts. We knew what they were writing. Our embassy in Tokyo did a press digest every day, so they knew we knew what they were writing.

I might explain that my phone usually started ringing non-stop around 1 pm, after the daily press briefing and when reporters were starting to work on their stories and meet deadlines, and it didn't let up until around 5 pm. Of course, I had other things to do besides brief reporters, so it always seemed I was doing a lot of things at once. But the callers were almost all Americans, Australians, New Zealanders, plus visiting non-resident journalists in town to do a story or two and set up some interviews.

WILLIAM T. BREER
Political Counselor
Tokyo (1984-1987)

Mr. Breer was born and raised in California and educated at Dartmouth College and Columbia University. After service in the US Army, he entered the Foreign Service in 1961. Throughout his career, Mr. Breer dealt primarily with Japanese, Korean and general Southeastern Asia affairs. His overseas posts include Kingston, Tokyo (three times), and Yokohama, His Washington assignments also concerned principally Japan and Korea. He served as Deputy Chief of Mission in Tokyo from 1989 to 1983. Mr. Breer was interviewed by Charles Stuart Kennedy in 1999.

Q: Well, then you went as political counselor to Tokyo from 1984-87?

BREER: Yes.

Q: Who was the ambassador?

BREER: Mike Mansfield.

Q: Had the political situation in Japan changed much when you got there from the way it was when you were there before?

BREER: If anything, I guess by that time, the LDP had strengthened recovering its grip on power. The prime minister was Yasuhiro Nakasone for a good part of the time and I think the LDP was gaining more confidence. Nakasone was a confident leader widely regarded as a sort of

nationalist leader in the slightly pejorative sense of “nationalist.” It turned out that he moved Japan to even closer cooperation with the United States. He had this wonderful Ron-Yasu relationship with the president and was admired by Reagan. Those were pretty good days in U.S.-Japan relations. We didn’t make a lot of progress on trade issues, which were probably the same old issues we were dealing with before and still are dealing with today. The fundamental issue is essentially that Japanese businessmen prefer to do business with other Japanese if they can get away with it. Americans like that too, but less so.

So, those were pretty good days in Japanese-American relationships. The Japanese loved Mansfield and Mansfield spoke up on behalf of a strong American-Japan relationship as the most important bilateral relationship in the world. He also preached to the Japanese on their need to open up and give more access to foreigners in their market. It was a good time.

Q: How did Mansfield operate? How did he use the political section, for example?

BREER: I never had the feeling that he really did use it. He knew that we were all out talking to politicians and meeting with opinion leaders in Japan as was USIS. We had a pretty broad network of important politicians that we were in touch with in those days. For example, we were at dinners and lunches with the current prime minister, Miyazawa. A lot of the guys who are leaders now we were in touch with in those days. We reported on what was going on in Japan and the ambassador accepted and absorbed all of that. He didn’t order us to do anything. We did our job, I thought in a competent way. He kind of led by example.

Q: Were there anything that we were concerned about, perhaps having a watching brief on? The fact that the LDP had been in power for so long possibly causing concern for corruption, too many old people and lack of new ideas, etc.

BREER: I think that was a subliminal concern. We didn’t attempt to promote the LDP in order to keep them in power. Some of the opposition complained that we favored the LDP too much, but after all it was the only government with which we had to do business, not the Socialists. There really weren’t any viable alternatives. The Socialists had never been a terribly serious challenger. It is very hard for political parties in Japan, even today, to have a distinctive platform and market it. The parties have never had that kind of expertise within themselves in Japan. So, it has been since the war that the LDP and the senior bureaucracy working together devised policy, and they were successful for a long, long time. But, as you say, it did get a little bit corrupted and a little bit too cooperative and a little bit creaky which has led to the situation we are in today. I think we all thought about that, but I don’t think anybody figured there was anything to be done about it. And, it was different from the Reischauer days. People were talking about a trend of growing opposition power in Japan and then all of a sudden that sort of stopped and it became apparent the opposition wasn’t going to take over the government for a long time. Eventually they did in the coalition of 1990, but during the ‘80s that wasn’t really feasible.

Q: Were there any areas of concern over what the Japanese were doing in regard to their foreign relations with China or the Soviet Union?

BREER: I don’t think with the Soviet Union so much or even with China. I think we probably

viewed Japan as an economic competitor to some extent, which is true today. There were moves and talk about economic development in Siberia and the Far East, but not much was done about it. There was some joint oil exploration in Sakhalin and I think that is still going on today. But, no major mineral or timber exploration in Siberia partly because of the northern territories issue, partly because by the time they started getting really serious there was a glut of those things and Siberia didn't need to be opened up. That certainly wasn't a very big issue.

Managing our security relations with Japan always requires a lot of work as the U.S. wants to fly their airplanes any time of day or night and Japan is a small country with a dense population and there was a lot of irritation between the bases and the local populations. That persists today. There are economic advantages in having a base but the nuisance factor is always present and that is true globally.

One thing I didn't mention was the host nation support thing. This is another fallout from the troop withdrawal in South Korea. The Japanese were fearful that the United States was going to withdraw even more from East Asia and we were running out of money in the late '70s. So, we entered into talks for host nation support. That is the Japanese would subsidize our presence there through a variety of ways. I think they started out paying the labor force and we started a construction program under which they spent billions of dollars and basically rebuilt all of our facilities. I don't think we have a collection of more modern facilities than our bases in Japan. That is still going on in Japan to the tune of about \$5 billion a year. But, that is something that the Japanese put into place in the late '70s and modified through the '80s.

Q: This was to keep us there?

BREER: Originally to keep us there. And then it was in response to arguments in congress about the free ride Japan was getting despite earning a great deal of foreign exchange. It is going to be controversial again I think because now they have been spending eight or nine hundred million dollars a year on facility improvements and I think they have just about finished the job. Yet, we want them to continue spending the money. That is going to be an issue in the next year or two.

Q: Were we seeing any effort on the part of the Japanese to exert influence around the world in foreign policy or trade?

BREER: During the '80s the Japanese economy was still growing and their foreign aid ventures were increasing quite dramatically until they finally surpassed ours in the early '90s. Japan is a greater aid donor than we are now and much more diverse than we are because ours is basically two or three countries. Yes, Japan was expanding its investments tremendously throughout Southeast Asia and all over the world, really. And, then in response to complaints here about imports here, Japan began to establish factories here. And then the yen appreciated and it made it even cheaper to do business here, more attractive. So, yes, during the '80s there was tremendous global expansion by Japanese financial and commercial interests. At one point Japan was a leading banker in New York. That is gone now.

Q: Was there concern in the embassy about Japanese investments in the United States during the '80s?

BREER: The Waikiki hotels I think were bought in the late '70s or early '80s. Then in the mid '80s came all of the trophies here, movie studios, big buildings in New York, golf courses, etc. I don't think we were all that sensitive about this in the embassy, but it was obviously beginning to bug people here. There was a kind of hysteria when I came home in 1987 about Japan owning the United States. A lot of people were on that bandwagon for a while until the Japanese bubble burst.

Q: Were we looking at the Japanese people and wondering how long they would put up with all this money that didn't seem to be changing their way of life from our perspective?

BREER: Still in the '80s there was a huge building boon of houses in suburban residential areas and they were very expensive. Buyers of these new houses are really suffering now because although their house values are down they are still paying a big mortgage. Our assessment of foreign living standards is very ethnocentric, thinking about upper middle class point of view and doesn't take into account that 20 percent of Americans live in very shabby housing. You drive through London and see all of these high rise apartment buildings and they are about the same size as Japan.

Q: I just came back from London and a significant portion of the housing is substandard, old and not particularly clean and falling apart.

BREER: Yes, and there is a lot of that in Japan, too.

Q: How did you find living there?

BREER: It was terrific. You had to learn how to avoid large traffic jams by returning to Tokyo Sunday afternoon, and things like that. Otherwise it was great. The air was good. Tokyo is a wonderful city with restaurants of all kinds.

Q: Did the cost of living hit our people?

BREER: Sure because the yen appreciated dramatically in the mid '80s and it became very expensive. But, we had fairly substantial COLAs (cost of living allowance) and we also had access to embassy shopping facilities. We had a store in the embassy.

MARILYN A. MEYERS
Economic Counselor
Tokyo (1984-1987)

Ms. Meyers was born in Virginia and obtained degrees from Southwestern University and Johns Hopkins School of Advanced International Studies. A Japanese and Burmese language officer, she served tours in Tokyo, Yokohama and Fukuoka in Japan and as Principal Officer (Chargé d'Affaires) in Rangoon.

Other assignments include Johannesburg, Canberra and Washington, where she dealt primarily with economic matters. Ms. Meyers was interviewed by Thomas Dunnigan in 2005.

Q: Then, after that, you were back to Tokyo and this time as economic counselor.

MEYERS: Everything fell into place. I got the timely promotion I needed to get the job in Tokyo. I got across the Senior Threshold and so I went back as economic counselor.

Q: How large was your section there?

MEYERS: Pretty good size. Now of course, by this time-- mid '80s -- the commercial and economic work had been divided. So I was economic counselor. There was also a commercial counselor who represented the Commerce Department. But my section itself had about five or six officers and several Japanese staff. The economic minister headed the two sections.

Q: Did the Ambassador pay much attention to what was going on in the economic section?

MEYERS: Lots. The ambassador was Michael Mansfield. Very interested in our work because trade issues continued to define our relationship with Japan. By this time semiconductor production was a problem. And also supercomputers. The U.S. made excellent supercomputers. How come the Japanese weren't buying any for their agencies? There were services access issues -- for example, U.S. law firms who wanted to practice in Japan. So, the economic, trade issues were still driving the relationship.

Q: Did you have a role in Vice President Bush's visit there in '84?

MEYERS: Well, I guess I didn't, because I don't remember it. I got there in July, just in time for Fourth of July.

Q: Well, he may have been there earlier in that year.

MEYERS: Perhaps, because I think I would have remembered. I certainly remember President Reagan coming for the Economic Summit in '86, the G-7 as it was then. So I was there for that and participated in that, writing some of the papers and so on.

Q: And we were having trade disagreements with Japan by this time, weren't we?

MEYERS: Yes, automobile exports were still a serious issue. The Japanese had come up with what they called VRAs, voluntary restraint agreements, whereby they would set a limit on how many cars they would export to the U.S. each year, trying to pacify our Congress. And they also, wisely, began to manufacture over here. I think Honda was the first, into Ohio, and then Nissan went into Tennessee, then Toyota into Kentucky. So that was going on. But automobile trade friction continued. The Japanese MITI Minister came to call on Ambassador Mansfield at one point to try to extract a "satisfactory" VRA number, but the Ambassador refused to be pinned down. The Minister and his entourage tried for about thirty minutes to get him to name a figure

but he simply wouldn't do it. A little aside: I often escorted Japanese business visitors to the Ambassador's office. Ambassador Mansfield was such a down to earth person that he would invariably offer them coffee. "Would you gentlemen like to have coffee?" Oh, yes, yes, they'd like to have coffee. Well, then, he would get up and he would walk into his executive washroom and prepare his finest instant. And I would say "May I help you, Mr. Ambassador?" "No, no, Marilyn, I think I can manage, I can handle it." And his Japanese guests were dumbfounded. Here is this woman, sitting here, and here is the American Ambassador, in his shirtsleeves, serving them, and me, as well. It kind of blew their minds, and was very good for them.

Q: Were you there when Toshiba got into problems for selling illegal equipment to the Soviet Union which was going to improve the Soviet submarines, make them much more quiet? We were very upset about that here.

MEYERS: I don't think I was there for that. I left in '87 and came home the long way via the Trans-Siberian Express!

MICHAEL E.C. ELY
Economic Officer
Tokyo (1985-1987)

Michael E.C. Ely was born in 1929 in Washington, DC and entered the Foreign Service in 1955. His career with the State Department included assignments to Malaysia, France, Algeria, Somalia, Italy, Japan, and Belgium. Mr. Ely was interviewed by Charles Stuart Kennedy in 1993.

ELY: I found out in the corridors that Tokyo was open: they were looking for somebody to run the Economic Section there. I threw my hat in the ring and, to my surprise, was accepted. I had been in Japan but really knew nothing in depth about U.S.-Japan trade problems. It took several months to find a replacement for me in EUR/RPE. Roz Ridgway, the Assistant Secretary, wouldn't let me go until she had a replacement. She was certainly within her rights.

I never had a chance to do much in the way of preparation for Tokyo; I was parachuted in there. I had a hard time coming in at a very senior level with no preparation. There was a tendency among the people in Tokyo to say, "Okay, you're very senior, you've got a good record, do it, buddy. If you've got any questions, we'll be glad to answer them. But since you're such a hotshot, you figure out what the questions are." And I found out, "Well, there's no money to do anything for you in Japanese language training. You can join a class with the Marines." But I traveled so much and had such work pressures I was unable regularly to attend language class. I made very little progress on the language, which I found discouraging.

We lived in a newly-constructed compound, which still houses almost everybody. I had the top two floors of a middle-rise apartment building. The accommodations were, by Tokyo standards, fabulous. It was a big, modern, comfortable apartment, very suitable for entertaining. But I found I was living in an American compound, with sullen teenagers, aerobic dancing, and Marines

playing basketball, bicycles on the lawn, people walking dogs, and Fourth of July festivals. I'm not against this sort of thing, but it's not why I went to Japan. There were people in the compound that never left it. And living there, you were really out of contact with Japanese life. You had all the disadvantages of both societies. After six months, I got over some of my culture shock and didn't like being there.

Then I found that the work in the Embassy was difficult. American policy toward Japan was then and still is subject to great tension. You basically had two poles. One was represented by the Political Section, the Japan Office in the Bureau of East Asian and Pacific Affairs, and the National Security Council, that looked (and I think, in many respects, correctly) not at the commercial and economic problems, but beyond that to the security relationship and the political relationship and would not allow economics and commerce to dominate the other aspects of the relationship. At the other end, you had the people who were self-serving Japan-bashers. They were saying, "Look, they've got a \$70 billion deficit with us, they've got to buy my products." Or "Look, we're getting no satisfaction on product X, Y, or Z. Go in there and tell them that unless they do something about it, we're going to do A, B, and C to them."

The State Department and the Congress had gotten to the point where they no longer communicated. People like Senator Danforth felt the State Department was playing its own game at the expense of American business in Japan. There was some truth to that.

The revisionist school of analysis of the Japanese economy and Japanese international behavior had not yet emerged. I got to know those people in Tokyo. Laura Tyson is one of them. Chalmers Johnson was the pioneer. Karel von Wolfran, a friend of mine who I knew before he wrote his book, taking off from Johnson, has come up with this idea that Japan doesn't really behave like other countries: the structure of the Japanese economy and the structure of Japanese society together are basically exclusionary. Dealing with Japan on the basis of Ricardian comparative advantage, exchange rates equilibrating trade flows over the long term, reciprocal foreign investment in each other, exchanges of science and technology, doesn't work.

I think this is right, it doesn't work. This doesn't mean that the alternatives of managed trade are better. But we had then, and still have, a very severe problem of trying to manage our economic and political relationships with the Japanese. We tend to sentimentalize. Basically, I agree with the major thrust of our policy: Japan is important to us, we're important to the Japanese, and that link is essential. But when I got to Tokyo in '85, we were getting beaten across the board. In any area where you can keep score, the Japanese were beating us, not just trade, but investment, technology, and technology transfer. The gains in all of these exchanges went to the Japanese, not to us.

We couldn't get our lawyers in.

We had this longstanding, nightmarish argument over containers for goods. The Japanese have containers that are slightly smaller than the international containers. International containers cannot be carried in Japan. This I believe, but I certainly can't prove, was designed this way to keep out the foreigners.

Similarly, their electrical standard is 100 volt. No other country in the world has 100 volt, 50-60 cycle. So they can produce for anybody with 50-60 cycle, including the American market, which has both. They can also do 110-220, 50-60. But Europeans with 50 cycle can't use step-down transformers into Japan, Americans with 60 cycle can't use step-up transformers into Japan.

Similarly, their FM band barely overlaps with ours. So foreign FM sets cannot be sold in Japan, but Japan makes large numbers of FM sets to international standards that sell around the world.

These are anecdotes. The Japanese economy is extraordinarily regulated; everything is regulated. The results of these regulations, sometimes unintended, sometimes a result that was understood and not unwelcome at the time the regulations were installed, impede trade.

Similarly, speaking very broadly, it is a country without the rule of law. There are only 15,000 lawyers in Japan. There are all kinds of impediments to having more. There aren't many courts. It costs a lot to try a case. It takes forever, and you're likely to die before it happens. They have no punitive damages. They don't have a jury system. So on the commercial side, there's very little recourse to law.

This means that people deal with the people they trust. It takes a long time to build relationships of trust. And, indeed, enterprises tend to congregate into the Keiretsu. Interest groups would coalesce with banks, and insurance companies attached to them. The Keiretsu tend to deal with each other because disputes can be worked out within the family, so to speak. This is a system that basically puts outsiders at a disadvantage -- Japanese outsiders first, and foreign outsiders at a greater disadvantage. The Japanese basically believe that if some foreigners have a hard time in the Japanese market, the foreigners should become more Japanese; they should join Keiretsu or form their own. They insist that the main reason that foreigners don't do well in the Japanese market is because they don't try hard enough; they should work harder.

This is foolishness. Of course, they should work harder. We all should. But the failure rate in the Japanese market is extremely high. American companies that have done well have had very deep pockets and gone at it for a long time. It was adversarial exporting, and only into niches where there was no Japanese competition.

Companies like Honeywell have done well in Japan. But they brought in new technology and new products; they did not compete with Japanese competition.

The only company that ever (well, not the only one, but anecdotally) -- Weyerhaeuser managed to get into the Japanese paper market, a chunk of it, after years of effort, by building a special factory and warehouse and designing special paper-handling equipment and meeting the price. They knocked on the door for years and years and did everything right. Finally, the door was reluctantly opened a fraction, and they were let in.

The area where it all came to a head was on supercomputers. I got to know the trade people who were trying hard to sell supercomputers in Japan.

This is a complicated story. Laura Tyson, in her recent book *Who's Bashing Whom?*, has a rather

complete and good account of it. I wish I'd had as much information to work on in Tokyo when I was there. I had to work on anecdotal stuff.

Seymour Cray invented the supercomputer; had a natural monopoly on it. He was a science wonk from Milwaukee who spun out of IBM and set up Cray Research, which invented the supercomputer and still produces most of them, although the technology has since changed.

The Japanese government had never bought any Cray supercomputers. And, indeed, when I got there, there had been only two of them sold to the private sector, one to Toyota and one to Recruit, which later got involved in the scandal as a result of intense political pressure by Mike Mansfield directly.

The Japanese had many reasons why Cray couldn't sell: the price wasn't good enough; Fujitsu and Hitachi were, by that time, producing supercomputers and selling them. In other words, no supercomputers were ever purchased by the Japanese until there were Japanese producers, then the Japanese producers got the whole market. Budgets were kept small by the research institutions that purchased them. Fujitsu and Hitachi sold at enormous discounts -- seventy percent...

Cray can't do that. It's not part of a combine. It's a free-standing, medium-sized company that finances its research and development out of current receipts. Cray had been pounding on the door for years and essentially getting the runaround. They also were not well represented from a sales standpoint. They eventually got themselves a Japanese manager as their sales rep.

We had a very intense meeting with the senior Japanese on the supercomputer problem, along about the middle of my second year. Clayton Yeutter was then STR. He came out and we had a formal negotiation.

Q: Special trade representative.

ELY: Yes. Then he became Secretary of Agriculture and then chairman of the Republican National Committee. Yeutter is an extremely able, fit, strong negotiator. Mike Smith, who was the chief negotiator for STR, was with him. I was there with a couple of others. After we'd had formal negotiations, the Japanese took us to dinner at a traditional Japanese restaurant, in a lovely *tatami* room, and we started over again. And this time, Makoto Kuroda, MITI Director General for International Trade, who was famous for being tough and blunt, quite un-Japanese, said, "Look, you know, we've been doing this for a long time. Let's be frank. You people, and Cray in particular, are *never* going to sell supercomputers in Japan. You're not going to do it under the present system. You've got to change. Either you nationalize Cray, so you've got the U.S. government behind it, so it can go in and be aggressive and compete with our companies, or you merge it with General Motors or IBM, someone with very deep pockets. Otherwise, you know, you're basically wasting your time."

I was amazed and shocked by this and immediately went off and dictated a telegram laying all this out, with a comment on it: "This argument gives credence to those who believe that Japanese companies and the Japanese government seek eventual Japanese dominance in the

supercomputer industry." I passed it around. Mike Smith made a few changes, Yeutter said fine, and I sent it off.

It was leaked in Washington, out of the House of Representatives. George Shultz sent a cold letter to the congressman who leaked it, and there was some heated discussion about whether perhaps the law should be brought down upon him. Shultz said, "Don't be silly. We can't do that to members of Congress."

Anyhow, the telegram leaked. It is quoted in Tyson's book, and it was clear that I was the author; I was the only one that could have been the author. The Japanese knew that I was not a friend, that I was a critic -- and a suspicious and hostile one. I knew that, at that time, my utility in Tokyo had probably ended.

At the same time, I got in a fight with Desaix Anderson, the Deputy Chief of Mission. Honeywell was going to market Fujitsu computers to the U.S. Air Force for specialized training simulation exercises. I said, "Well, this is a terrible idea. If, while the Japanese are screwing us on supercomputers, we blithely go ahead and buy Fujitsus by government procurement, why, they're going to think we're not serious." We should say to the Japanese, "Look, fine, we like your computers, but we'd like to see a little progress on some matters in which we're interested before we make this concession for you on government procurement," which is not governed by GATT rules anyhow. Government procurement is generally handled on the basis of reciprocity or unilateral action.

Well, Desaix Anderson said that my telegram laying this out was contrary to policy. We'd made a link between government procurement on one hand, and Cray's trade problems with Japan on the other. And that George Shultz's policy decision sometime earlier had explicitly rejected making such linkages.

I felt baffled. I was not party to that earlier decision and felt that if we went forward, we would be undermining our case. I thought about sending a telegram on the dissent channel. I finally decided not to use the dissent route, which I knew to be mainly employed by sore heads, not serious policy advocates.

Q: Back-channel being a...

ELY: A dissent channel. But I knew it would have ended up in the Policy Planning Staff, and the people wouldn't have known what to do with it. It was hard to staff out. So I said, "Okay," to Desaix, "You know, you and I disagree on this. As a policy matter, I consider myself overruled, but I think I'm right."

About that time, I got a call from George Vest, asking if I was interested in going to Brussels to be deputy to Al Kingon, the Ambassador to the European Community. I said, in a formal way, "I'd like to think about it." A few days later I agreed. So two years after I arrived in Tokyo, I was direct-transferred to Brussels.

Q: Basically, it was not a happy assignment there at that time.

ELY: Well, it was wonderful, in a sense. I learned a lot. It was extremely active. I opened a window, a new world. I worked very hard and enjoyed my personal contacts there. Learned a lot about Japan, in a superficial way. Without the language, you never go terribly far. It was unique, vigorous, exhausting, exhilarating, but fun it was not.

Q: The Ambassador for many years was Mike Mansfield.

ELY: He was my Ambassador when I was there. Ambassador Mansfield was an admirable man. He didn't like to talk very much. He had very sure political instincts. He was no longer young at all, nor was his wife. The Japanese venerated him. He stayed above all the trade issues. But, typically, you'd come to the point on a trade issue where you were very close, and the Japanese would go to him and say, "You know, you've got to intervene."

And he would always say, "Well, just a minute now. If I do anything, you've got to do something, too. And we can perhaps together close the gap. But remember, you know, you've got to do more."

The Japanese would say, "Yeah, yeah, that's okay." They expected him to say it, which struck them as fair. But it helped them to go back and say to their people, "See, we talked to Mansfield-san, and Mansfield-san says we've got to do more. Then they'd say, "All right, we'll do a little more!"

Then Mansfield would write a telegram, or I'd write it for him, and he'd fix it, saying, "You know, I understand there has been a very tough negotiation. The Japanese are going to do a little more, and if we can do a little more, we can fix this." The telegram would go out, and eventually, the agreement would be reached, and everybody would be happy, except that the Ambassador got the reputation of being kind of the middle-man for the Japanese. In other words, he was running the same technique in the mid-'80s that we had used in the late '70s, and the problems were a lot worse. The Japanese wanted to maintain the pattern of agreements when the Japanese basically didn't have to do very much.

Another problem when we were there...about the time I arrived, Jim Baker put together the Plaza agreement, and the dollar tumbled against the yen.

Q: Jim Baker was the secretary of the treasury at the time.

ELY: The dollar tumbled against the yen, losing very rapidly a substantial amount of its value. I, trained in classical financial comparative analysis, expected that trade flows would eventually reflect this change.

I also noticed, to my consternation, Japanese imports had been growing less rapidly than the Japanese GNP. That meant that Japan was becoming *less* interdependent. It was not becoming integrated to the world economy, it was separating itself from the world economy. Unheard of! No other modern industrial country has ever gone through a period like that. And when the dollar exchange rate did not produce any perceptible effect, I began to believe that we were really in

some sort of a strange world and that Japan and the United States were not playing according to the same set of economic rules.

This is a theme that was later picked up by a number of people and since '87, has been studied a lot. It is now a general consensus that, yes, it is true, Japan doesn't march to the same drummer. However, the argument that we therefore need managed trade doesn't follow either. We've got to get the Japanese to do more, we've got to do more ourselves, et cetera, et cetera. I think I buy that. I've been thinking, since I left Japan, about what to do about a country that systematically puts its best talent, technology, money, capital, management into exports, with a system that operates across the board to exclude imports except where strategically necessary, where they complement the strengths and penetration power of the Japanese economy.

Now this analysis itself is being somewhat overtaken by events as Japan and Americans go into more joint ventures, where Japanese failure in the fifth-generation computer becomes clearer, where you find that Hitachi and Fujitsu have been chasing their white whale, IBM, down a blind alley (IBM is in trouble, and they're probably in trouble, too), when Japanese trade surpluses really don't seem to make a hell of a lot of difference, and the Japanese economy is in deep trouble. Not as deep as some people say, but still, they've been having big financial problems. And the natural advantages of much lower cost to capital is disappearing.

We're coming into a new world, where Japan is no longer about ready to elbow the Americans aside to the number-two position in the world economy by the year 2000. Still, handling Japan remains a very serious and difficult job.

Jim Baker really never paid any attention to that problem, mainly because I don't think he had anybody who could do it for him. And the problem is going to come back again.

Q: Today is April 22, 1993, and we continue. Mike, you went to Brussels from '87 to '90. What were you doing?

ELY: I was deputy chief of the U.S. Mission to the European Community. As I mentioned during our last conversation, because of the supercomputer episode I thought that my utility in Tokyo was going to be restricted. When the Director General of the Foreign Service asked if I was interested in becoming Deputy Chief of the U.S. Mission to the European Community, I decided, yes, this was probably a good thing to do. Also, I found working in Japan strenuous. I enjoyed it and found it stimulating, but it was a struggle. Each day, every day was fight, fight, fight, either within the Embassy or with the Japanese.

Q: One question about with the Japanese. Did you find that you had to go out a lot at night to sort of business dinners and things like that? I speak from my experience in Korea, and these were a little bit difficult because it meant a lot of heavy drinking.

ELY: With the Japanese, it was not the same. American businessmen had to do the drinking business, both the local resident and the visitors. We foreign officials were considered in a different category. We had to participate in all kinds of official entertaining, but not in going out, eating and drinking and taking our hair down with our Japanese counterparts. So that part of the

work was not particularly onerous.

However, I became friends with Karel von Wolfran, who was one of the founders of the revisionist school of analysis of Japan. I found that I was then, and am now, in full agreement with von Wolfran in his characterization of Japan as a country where everybody collectively and nobody individually is in charge. Dealing with the country is very difficult. An individual can hardly engineer a common appreciation of what he's trying to do among people whose agreement will be necessary for decision. Accordingly, you end up chipping away with individuals and making very little progress.

I found it, and I'm not the first, quite a frustrating experience -- Bill Clinton, being the latest member of this club, with the Japanese saying yes, but they really mean no. The Japanese are very embarrassed by that but know there's some sort of American truth in it.

SAMUEL VICK SMITH
Economic Officer
Tokyo (1985-1988)

Samuel Vick Smith was born in California in 1940 and graduated from New Mexico State University. He served in numerous posts including Nairobi, Vietnam, Madagascar, Tokyo and New Zealand. He was interviewed by Charles Stuart Kennedy in 2001.

Q: Well, then, let's put it, you went to Tokyo in 1985?

SMITH: Right.

Q: You were there until when?

SMITH: '88. For three years.

Q: Okay. First, what was, how would you say, particularly economically, what was the state of relations between the United States and Japan when you got out there in 1985?

SMITH: I'd like to say a little more about the way I felt. By this time I was a true believer in the magic of the marketplace and also I had seen that Japan was very successful at exporting manufactured goods to the United States. Especially in those days they were very good and often inexpensive. Also, I was well disposed towards Japan for many reasons. One, having lived there as a little kid, and two, I had been in Geneva for a total of five weeks at the conference. The Japanese delegation, had been very supportive. When push came to shove the people that I depended on to support me when I was almost isolated would be the Japanese and the Danes. So, I was well disposed towards Japan for many reasons. What I found when I got there was that the frustration was very high on both sides, as the new economic minister counselor perceived when he got there about the same time I did.

Q: Who was that?

SMITH: Mike Ely. He said that we just keep talking to each other and we just keep saying, “open your markets, open your markets, open your markets.” The Japanese keep saying, “try harder, try harder, try harder.” Now, I may be unfair in my paraphrase of what he said, but that was about it because there was a lot of talk and not a whole lot of movement. What movement that occurred was very difficult. The Japanese market in many different ways was closed to our exports. Some of it was government action, some of it was actual laws. Some of it was just their distribution system. Some of it was cultural. It was very difficult for American products to get sold in Japan, while our market was essentially open. Most of the economic section, which was a large section, of about ten people spent most of its time working on this. Delegations would come from Washington: ad hoc ones, and regularly scheduled ones. There would be meetings and things were accomplished in some narrow areas. From my point of view, not enough. It wasn't long before I was not nearly as well disposed towards Japan as I had been before I got there, because I felt that they were treating our traders unfairly. My job was I'd say three-fold. I was the deputy section chief. When the economic counselor would be away I would be in charge of the section, but there would still be an economic minister-counselor above me. I also supervised two junior officers. One who handled the macro-economic reporting and the other hand who handled mainly Japanese, economic relations with developing countries reporting on their aid programs. Then my other job was my job title, which was ‘regional resources officer,’ which meant natural resources. That was primarily energy, which meant trying to get the Japanese to buy our coal and our natural gas, explaining to them why they couldn't have our Alaska north slope oil because that was against the law, and talking to them about who they were buying their oil from, that sort of thing.

Q: Well, now just on the side, but why was the Alaskan oil forbidden to Japan?

SMITH: As you know today there's much controversy about whether additional places on the north slope (the Arctic Ocean coast of Alaska) should be drilled because it might harm this caribou preserve. In those days when this was opened I guess in the 1970s, a deal was worked out in Congress to permit this oil to be developed and the pipeline to be built all the way across the wilderness from the Arctic Ocean to the Pacific Ocean. The deal was worked out that this oil was needed for our energy security. Therefore the only people that could use that oil would be us even though oil is fairly fungible. Why couldn't we sell it to somebody else and get somebody else's oil? Frankly, much of the reason was that if that oil were going to the United States it then would come under the Jones Act which we talked about in the context of maritime affairs. That meant that all of it would travel from the south coast of Alaska to probably the west coast of the United States or somewhere else in the United States on U.S. ships, U.S. built, U.S. flagged, and U.S. manned ships. United States ships that trade internationally don't have to be built in the U.S., but if they trade between two U.S. ports then they have to be built in the U.S. So, this was a deal worked out with the environmentalists and the shipbuilders and the ship operators and the labor unions. That's why the Japanese couldn't have north slope oil.

Q: I thought Japan had a lot of coal?

SMITH: They did, but it was not easy to get to. It was more expensive than buying it from us or Australia and more dangerous because it was in very inaccessible places. They of course mined a lot of it for years, but they'd mined so much that what was left was hard to get to. Some of the biggest coal mines were under the ocean, off of little islands near Kyushu and the miners would go down this shaft and then go out under the ocean to get the coal. So, it was expensive in addition to dangerous.

Q: Well, let's look at the embassy. Who was the ambassador and DCM and the top economic person?

SMITH: The ambassador was Mike Mansfield. He'd been there for a long time because he was a Carter appointee and this was the Reagan administration by this time. The DCM was Desaix Anderson and the top Econ officer for two years was Mike Ely, Michael E.C. Ely. He was replaced later as minister counselor by a lady, Aurelia (Rea) Brazeal and then under them was the economic counselor, who when I got there was Marilyn Meyers. She was replaced by David Brown.

Q: Did you have much to do with the Japanese economic establishment?

SMITH: My main interaction was with the ministry of foreign affairs and MITI, the ministry of international trade and industry. In MITI, it was almost entirely with the energy office.

Q: How did you find dealing with them?

SMITH: At that time it was very easy, cordial. I heard that later it got more difficult, but at that time it was a pleasure. Probably easier than any other place I had served. I had access to the people I needed to talk to. I could almost always get an appointment, just call them up and say I need to talk to you about this and so we'd set a time and I'd come over.

Q: Well, I mean, there are two things, there is access and then there is dealing. Were you doing the equivalent of negotiating and trying to open up things or was that done by a different team?

SMITH: Well, I wasn't negotiating the trade agreements. I would sometimes make a pitch for this, that or the other. Often what we went to see the foreign ministry about was on some multilateral issue where we wanted their thoughts on a particular conference and gave our views on how we wished they would vote. So, there was a lot of that.

Q: You say you became disenchanted with, what disenchanted you, here you had good access and?

SMITH: For my personal work I don't think I ever became disenchanted, but the major work of the economic section, trying to open the Japanese market to American products: I saw what was going on there and that's when I became disenchanted.

Q: Did you feel that you know, that others that you had been talking to were dealing with this, was this a vast Japan incorporated conspiracy or was it just how the system was put together?

SMITH: It was not so much the way it was put together, but the way it worked. I wouldn't call it a conspiracy at all. I don't think anybody on their side really felt that they really needed to do anything more to open their markets. Some of them probably thought their markets were opened adequately, but they weren't. To get them to do anything was very difficult. I'm glad in many ways I wasn't involved in that. That was where the action was, but I think I'm glad that I wasn't getting my nose bloody trying to do it.

Q: What sort of things were you trying to get? Was it mainly information that you were getting?

SMITH: What I was doing?

Q: Yes.

SMITH: Some of it was gathering information, some of it was setting up meetings, a lot of it was instructions from Washington on what do the Japanese think we should do at the next conference of this, that or the other. They were usually pretty good, they were very good, they were very well organized.

A couple of vignettes might be interesting. In the foreign ministry most of the officers spoke good English. At the Ministry of International Trade and Industry this was not as true and so in every office, the office director and his deputy director would be able to speak English, but the others might not be able to. My main counterpart was a deputy office director in an office in the Ministry of International Trade and Industry, which dealt with international energy matters. I frankly can't remember the exact name of the office. I remember his name, but I won't give it. He was a bright, young man who had studied in America. His English wasn't terrific, but it was good. I would probably call it S-3+ or an S-4-, something like that. This meant that he frequently had to be fairly blunt in what he said because he didn't have the nuances he would have had if his English were better. One time in order, just to get some information, I had talked to somebody else in another office who he had introduced me to earlier and that guy had been brought in as the expert on coal. When I got through with speaking with the coal expert a second time, a little bit later I got a phone call from the deputy director of the energy office. He said, "Mr. Smith, you shouldn't be calling the coal expert. You should always come through me and if you don't come through me you won't be able to talk to any of these people." That was pretty direct.

That reminds me of another thing that occurred in that office. I can't remember the exact period, but it was fairly early on. I think it was late '85 or early '86. You may not remember, but the price of oil plummeted to about \$10 a barrel and this was amazing because the Iran-Iraq War was still going on and the price of oil was down around \$10 a barrel. The director of that office was constantly bemoaning the low price of oil. Well, here is the industrial power of the world that has to import the highest percentage of its oil and he's worried that the price is too low. Finally, one day I think he was just sort of overwhelmed, and I said, "Why are you worried about the price being so low when you should be benefitting from this?" He said, "We have all these government programs that we're responsible for on renewable energy and other things which are funded by an extra import duty on the oil. It's a percentage duty so when the price of oil falls in

half we get half as much money for our budget.” Their budgets are probably more of a problem even than our budget. This was what was bothering him, but it took a long time for that to come out. Another vignette, which I think was interesting: twice a year we had a set of meetings on energy. They were called the “energy working group and the energy experts group.” I don’t know which one it was, whether the energy experts or energy working group, but people from State, the Department of Energy, and the Department of Commerce would come from Washington and we’d have these meetings with their counterparts in Tokyo. One day we were sitting in this meeting in MITI and the American side asked the Japanese side about a particular issue. This is all being done through interpreters. The director from MITI gave his answer. When he was done the director from the ministry of foreign affairs stuck up his hand and said, “I think what Mr. so and so meant to say was such and such.” The first MITI official, dropping interpretation, said, “I don’t need the ministry of foreign affairs to interpret what I meant to say. What I meant to say was what I said.” That opened a lot of eyes.

I want to mention that because I was nominally the regional resources officer, I was sent to China to talk to the Chinese, mostly about coal and oil. I didn’t really want to go, but after I went and came back I was pleased that I had gone. So I went to Beijing, helped out by the embassy and then took a forty-hour train ride north to Daqing which is in the middle of what used to be Manchuria. It’s very far inland. It’s their biggest oil field, but it’s an old oil field. Even in ‘86 it was an old oil field. It’s about halfway from Harbin to Qiqihar. It was a new, manufactured city because that’s where the oil was. I think the most interesting thing I saw was that a lot of the oil pumps weren’t working. Then we visited a museum of petroleum and you couldn’t see anything there because there were no lights. Here in the center of their oil production area they didn’t have enough electricity. Behind the sort of motel hotel where they billeted me was an oil rig, which ran on electricity, too. They were drilling for oil. In the middle of the night the electricity came back on and the rig came back on and it ran all night. This was, I think, a commentary on a lot of things-how communism had run an oil field. The biggest single oil field and there wasn’t enough electricity to run it.

Q: While we’re still in Tokyo, how did your family find it? Did it work out pretty well?

SMITH: Oh, very well. The school worked out well for our daughter. This was ASIJ, the American School in Japan, founded in 1902. The most famous graduate was Reischauer, JFK’s future ambassador. It was a good school; it profited my daughter a lot. The Japanese she learned there permitted her to go to Hawaii and enter Japanese studies and skip the first year of Japanese. My wife loved it. She still is pining to go back.

Q: How did sort of the Vietnamese/Japanese thing work out?

SMITH: Well, most of the time, fine. The cultures aren’t the same by any means, but then they’re more similar to each other than the European culture or American culture is to Vietnam. I think one of the things my wife liked the most is that you can get around Tokyo so easily by public transport and it was so safe. She had more freedom there than she probably had ever had anywhere, perhaps even more than here. It was about a ten-minute walk from our housing compound to either of two subway stations. She could go anywhere in Tokyo and its vast suburbs by subway, bus, and train. She had a good time. She took art lessons. She took Koto

lessons, which is a musical instrument. She really loved it. As I said, she still to this day wishes we could go back.

Q: How did you find expenses there?

SMITH: In those days it wasn't anything like it is now. It wasn't that bad, primarily because we had good access to U.S. commissaries. So, for necessities you didn't have to worry about the exchange rate. And a good cost of living allowance had been worked out by the embassy and Washington. It didn't hurt us. I always said it was the best of both worlds. We had this large apartment centrally located and we could live there like Americans and then go out and enjoy the Japanese ambience and then come back to our large apartment.

Q: In '88 you left there?

SMITH: Right.

Q: Is there anything else you should cover do you think?

SMITH: Well, maybe a few things. This was a period when the Japanese seemed to be able economically to do nothing wrong and we seemed to be having our troubles. The Japanese didn't mind tweaking us about that. A lot of Americans who should have known better were thinking maybe the Japanese had the right idea of how to run an economy. It was thought that one of the impediments to our entering the Japanese market was the weak yen. While we were there the yen started strengthening and the dollar started weakening.

One of the things I did in my job was keep a monthly record of the trade deficit and the exchange rate. It turned out that no matter how strong the yen became in those days, the deficit stayed at \$5 billion a month or \$60 billion every year. Well, they said this was the "j" effect. We'll finally get over it, eventually this will take effect, it didn't. It was shown by some studies done, I think by economic journalists here in this country, that when the yen got stronger against the dollar, it didn't make any difference in the price of Toyotas here or American products there, where in Europe it did. The price of BMWs would go up and down with the Deutschmark exchange rate, but not the price of Japanese cars. This was of course the time that the Japanese started taking care of this anyway by building car plants here. The other thing is that I don't believe anyone realized that this period, the late '80s, was the last period in which the Japanese would have a growing economy. For the last eleven years it has been stagnating. As you can see, the series of Japanese prime ministers and Japanese governments since 1990 have been unable to solve the problem. So, the second largest economy in the world is stagnating and it always seems to be left to us to pull the world along behind us and now our economy finally is beginning to stagnate.

Q: You know, one of the things that is interesting is as one examines this thing, American foreign relations and all, how often accepted trues or at least in two major, major examples. One being the Soviet Union, the Soviet Union is you know, ten feet tall and it couldn't break up and it would keep going and all and yet, by '89 it began to collapse. The other one was and you know we weren't, at least no significant part of our intelligence or analytical side of the government was really willing to accept or was predicting this. Here we have something far more open, but the

Japanese problems I guess you might explain them I mean why were they looking so good and weren't so good? I mean were there indicators there? Had we become sort of prisoners to the same thinking of conventional wisdom or something you think or what?

SMITH: Obviously not. I think the one thing that people might have noticed more was that the inflated value of real estate property in Tokyo had gotten just out of this world. That turned out later to be one basis for the beginning of this eleven-year slump; it's when the bubble burst in land values in Tokyo. A lot of wealth was tied up in that and a lot of banks had loaned money on the basis of property being worth "x" when it was only worth half "x." That's been part of the problem, and as you know, even today they are still working on how they are going to have their banks write off their bad debts.

Q: Were we looking at the Japanese on the economic side of the inability... Did you see rigidity of inability to look at a situation and respond to it? There are certain rules like the bank should start taking care of matters or something or not being able to lay off people.

SMITH: At that time, since their economy was doing well, nobody would think to criticize them for anything except that they weren't importing more. A few of us pointed out that their rice policy meant that a lot of land that was devoted to growing high priced rice could have been used for something else, maybe building houses so that the people could live better. In fact, one high U.S. government official did make that point. It obviously fell on deaf ears. This was a time when the world market price for rice was about \$400 a ton and the internal price in Japan was \$1,400 a ton. I was able, at a small meeting to reveal something to James Fallows, the journalist and author. He was living there in Tokyo or about to. It's what I always call the "cow story." The Japanese had beef import quotas to protect their highly inefficient beef industry where one farmer might have one, or at most two cows which he lovingly cared for and then produced wonderful beef at a terrific price.

Q: Kneaded them and all that?

SMITH: Yes. Massaged them.

Q: Massaged them.

SMITH: So, what had happened was the price had gotten so high that other Japanese, who obviously weren't in the agricultural side of the economy but were in the distribution side of the economy were going to the United States and buying up herds of cows in the middle West, fattening them to Japanese tastes, and putting them on airplanes and flying them to Japan where they then were quarantined for five days and then slaughtered. Even after you slaughtered them and throw away the bones, the resulting beef was still cheaper than the price in Japan, even including the airfare. This could be done because there was no quota on live cattle. Somebody saw this loophole and the local price was so high that it paid to fly the animals in live. Fly them in, not on cattle boats. They made the trip from Kansas to Tokyo in less than twenty-four hours. This is symptomatic of the sort of things they did. They were growing rice for three times the world price because the farmers and their political friends had been able to convince themselves and the populace that after the starvation of World War II they needed to be self-sufficient. Well,

they were self-sufficient in rice, but only because they were importing the fertilizers and other chemicals to grow rice with. But they weren't self-sufficient in anything else. You can't eat just rice. It was all the politics of the rural vote, which is much stronger in relation to the urban vote than the population numbers would seem to indicate. This is the problem that now, just now, finally they are facing and this is one reason that the LDP has been in trouble recently.

Q: The Liberal Democratic Party.

SMITH: Right. They've been in trouble because the city dwellers are finally getting tired of being taken advantage of.

Q: You look at Japan and it's sort of a unique society. Was it of interest, I mean, was somebody in the economic section, maybe this would be CIA or INR, but looking at the population, the work force, I mean it's becoming apparent now some 12 years after you left. The Japanese have another big problem in that they do not accept foreigners in there willingly to work. Their work force is aging, or is this a problem?

SMITH: Well, they were facing that eleven years ago. Even eleven years ago they were very concerned about their aging society and how they were going to support them. So, they were facing that. At that time the way they got around the work force problem was they were importing workers from other Asian countries-Bangladeshis and Filipinos.

RICHARD M. GIBSON
Japanese Language Training
Yokohama (1986-1987)

Political/Military Officer
Okinawa (1987-1989)

Richard M. Gibson was born in Florida in 1942. He received a bachelor's degree from San Jose State College in 1965 and his master's in 1966. He served in the US Navy from 1966-1971 as a lieutenant overseas and entered the Foreign Service in 1971. Mr. Gibson was assigned to Rangoon, Bangkok, Songhla, Yokohama, Okinawa, and Chiang Mai. In 1998, he was interviewed by Charles Stuart Kennedy.

GIBSON: I just wanted to be in Japan and after my experience in Burma which was the only country that I served in where I did not speak the language, I said to myself I am never going to serve in another country where I don't speak the language. I wanted to go to Japan but I didn't want one of the jobs in the embassy where you didn't need the language. It is no fun to live in a foreign country if you don't speak the language.

Q: How did you find Japanese?

GIBSON: Extremely difficult. A poke in the eye with a sharp stick starts to look pretty good after a few months of Japanese. It's the hardest language that I've ever attempted and linguists say Japanese and Korean are supposedly the two most difficult languages for a native English speaker to learn. I believe it. They have incredibly complex grammar. Pronunciation is a piece of cake. That is not a problem. It is not like Thai, where the real issue gets to be pronunciation. With Japanese, the grammar is incredible and, of course, there is the vocabulary. The American unabridged dictionary is about six inches thick. I don't know this for a fact, but I am told by linguists that a Japanese unabridged dictionary would take up a whole book shelf. They have just a tremendous number of words and an awful lot of those words sound an awful lot alike. Then, of course, you've got all the little characters. It's quite a mess. I was never very good.

Q: My other question was, is it a situational language? I'm not sure if it is the right term but in Korea the language you used depended who you were and whom you were talking to: above you, below you, male, female, and all that.

GIBSON: Japanese is that way but what the Foreign Service Institute does, it teaches you the middle level, your basically polite conversation amongst equals on the theory that you are a diplomat and you don't have to worry about it. It is sort of an all purpose polite level and if you use that level you can talk to anybody. As an American diplomat, you are fine. I will make a couple of comments, observations, on the Japanese language program which I thought was really good. They were able to make guys like me speak it passably well, well enough to do my job. They deserve a real attaboy for that. Compared to the Thai section when I studied Thai, the Japanese were much more business like, much more organized, pushed harder, a lot less fun but they did the job a lot better. I thought my three-three in Japanese was better on a relative basis, than my three-three in Thai. I thought the Thai wasn't really a three-three though they gave you a three-three. I could do more with my Japanese than I could with my Thai as a three-three, that's what I am trying to say.

I think there are some problems with the program though and I think I was a prime example. In 1985 I was 43 years old already. Do not take people at 43 years of age and invest that kind of time and money into them, as much as I was enjoying it. I wanted it so I was quite pleased but it makes no sense in a bureaucratic situation. I think you've got to get younger people and do it. I think the other thing you've got to do is somehow demand a high language aptitude. The personnel system has subverted the old system where you had to have a decent language aptitude. Now, and I was in personnel, we just assign people. If they don't have the language, too bad. That person is going to Ankara. You are going to teach him Turkish. I would see where FSI didn't really like that but they acquiesced. I think in the Japanese program in particular, there really should be a level of screening for the aptitude level. I don't say MLAT is the answer because I'm not sure that test is all that good.

Q: There is a test that has been used for a long time...

GIBSON: It's MLAT isn't it, Modern Language Aptitude Test?

Q: Yes.

GIBSON: It's indicative.

Q: *Whether they use Farsi or something like that.*

GIBSON: Kurdish I'm told. My MLAT score when I came into the service was 66 which is sort of okay but it is not particularly good. They used to say the cutoff for hard languages was 65 but it didn't matter because it all became moot because of the changes in the personnel system. It goes all the way up to 80. Most of the people I was studying with in Japanese were up in the 70s. The difference between their aptitude and my aptitude in the middle 60s was night and day. I really think the system is wasting their time on guys like me. I loved the heck out of it.

Q: *Did your wife pick up Japanese?*

GIBSON: No. She's not going to study that stuff, she was raising kids, having fun.

Q: *In '87 you went to Japan?*

GIBSON: Actually in '86 I went to Yokohama for the second year. The first year is here and the second year is in Yokohama. In Yokohama I went with my son, and my wife and daughter stayed in Falls Church. Yokohama was for about nine months and the idea of ripping the whole family up to move there didn't appeal to us. My son needed adult guidance. He needed somebody bigger and stronger than him so he came to Japan with me. We were in Yokohama for about nine months or then we came back and picked up the family, packed out and went to Okinawa.

Q: *You were in Okinawa?*

GIBSON: Yes. From '87 to '89. I was the political military officer there.

Q: *What was the situation on Okinawa from the American perspective and all when you arrived in '87?*

GIBSON: The seeds of what happened three years ago or so were well planted. The friction between the local Okinawan populous and the American military was very real. The political strain on the island was leftist and not necessarily anti-American but anti-military. They didn't like the Japanese military either so it was sort of an anti-military attitude. It sort of got twisted around to be anti-American in some ways, although I think that is overplayed. I think it is just anti-military. They said, quite correctly, that we have all these American bases on Okinawa that are taking up a lot of the good land, and there is not a whole lot of land. I recall the population of Okinawa is maybe 1.2 million or something like that, most of whom are on the main island. On the main island nearly 20 percent of the land area is taken up by U.S. bases. I think it was something like 15 percent for the Okinawan prefect on the whole but on the main island I think it was close to 20 percent or maybe it was 15. I forget. Anyway it was a sizable part and a lot of it was right down in the heavily populated areas.

You always had incidents in addition to the economic issue, the idea that if we can get you out of

these bases we can develop shopping centers, convention centers, houses, whatever, there were the irritants. Nineteen year old Marines are not necessarily the best diplomats that we can send abroad and most of them are single. They are rowdy and obnoxious and they did a lot of bad things.

Then there are always the training accidents. When I was there, in the village of Kim there was a big hoopla because the Marines that were training there with live fire were not always shooting in the right direction with their live fire and the bullets would land in this village. Usually no one was killed or hurt, but there would be spent bullets around, through a window, or something like that. There was another case where a taxi cab was driving down the west coast road and from the east coast where we were doing some training (there is a mountain range down the middle of the island) a 50 caliber bullet went over the mountain range and shot the guy's taxi cab. It didn't hurt him, but it put a big hole in his taxi cab. Sometimes pieces of airplanes would fall off, like a sonar-buoy. A sonar-buoy is just a little thing, it's not really going to hurt anything unless it hits you. Sometimes an extra fuel tank would drop off, empty usually.

At times helicopters would have to have emergency set downs. They would be flying around and all of a sudden the red lights come on and the pilots would look for a school yard, or a flat area to put their helicopter down. Whether it was going to crash, that's an overstatement. That was the view of the Okinawans; the plane almost crashed, they just barely got it down. What it was were the warning lights telling the pilot that procedures had to be followed and had it been in a combat war situation, he probably wouldn't have landed there. Still they have to set down.

Then there is the constant noise from the jets taking off and landing and going right over populated areas. You add to all of this, at least when I was there, a total insensitivity on the part of the American military commander to the irritations they are foisting upon the Okinawans. One of the greatest expressions, the first time I ever hear it, when the Okinawans would complain about the roar of jets right next to their house or right over their houses, "that's the sound of freedom". Right. Anyway this was the attitude.

I still remember this one thing. PACAF, Pacific Air Force at Kadena Air Force Base, had an F-15 pilot who was their sort of regional demonstration pilot. He was a tremendously good pilot. A 26 year old kid out there with a 40 million dollar airplane having a ball. What they would do was every Wednesday afternoon, or maybe Thursday, this guy to keep his flying skills honed, would get up over Kadena Air Base and start doing his show routine which included full power climbs, screaming dives, spins and all this neat stuff which of course is making a racket like crazy. Apparently he couldn't do it over the ocean because with the horizon and the ocean, you're asking for trouble. If you do it over land the pilot can see what he is doing a lot better and he lives longer that way. The Okinawans would complain. Why do you have to do it over Kadena Air Force Base, can't you go and do it anywhere else? Why does it have to be right here in town? Kadena Air Force Base was surrounded by town except on one side where the ocean is. But the embassy said to him we finally, you know the embassy nagged them enough and they finally quit I guess.

I'll give you an example of the insensitivity of the U.S. military. The Okinawans attitude toward nuclear bombers and everything too, the B52, is not positive. There is this famous picture at the

officers club at Kadena Air Base taken during the Vietnam War. It's a composite photo pieced together from a really wide angle, showing something like 105 B-52s lined up at Kadena. Until reversion in '72, that was a major bunch of bombers going over to Vietnam all the time. The Okinawans just absolutely didn't like that. They are all anti-war, anti-military because of the destruction that was wrought upon them. We had this one general who presented a proposal from Pacific Air Forces, I don't know where it came from, that as a public relations measure, the air force would send a B-52 to Kadena Air Base and put it on static display and they would have with it a mock-up of a nuclear bomb. How nice!! It is scary enough that some idiot thought of this in the first place but then it was scary that the initial reaction from the U.S. military in Okinawa was "Yeah, we could probably do that. It might be a good idea." Naturally we, the embassy, everybody, jumped all over them of course and they backed off but it showed the attitude.

Q: I think this is an important thing. I take it that as the political military officer there you were dealing with a hostile power, the American military.

GIBSON: Not hostile. We just had different viewpoints. Socially, personally, it wasn't an issue. It was kept on a professional level by and large.

Q: This has been a constant refrain of people, not in other places but for some reason our military on Okinawa seem to lack the sensitivity that has been drilled in military officers throughout Europe, they really understand this. But marine officers that rise to the top are considered by people who have been to the war college, as being really better than the air force as far as understanding sensitivity, being more politically aware.

GIBSON: The top marine officer when I was there until right towards the end, was a guy named Norman Smith. He had a two year tour and came and went almost at the same time as me. He was totally insensitive. I think he did fairly well after that. I think he got his third star. He was a nice man, gracious socially and everything, with a good sense of humor. Just a good guy, but he was totally insensitive to the Okinawan concerns. Either insensitive or he just rejected them as that's the price of freedom. We are here protecting Japan and if you don't like it, well, you have to break a few eggs to make an omelet, that sort of attitude. And it ran down. His successor I understand was different and his predecessor was a little different too. There were two air force generals when I was there who were both one star. They both struck me as rather insensitive about the noise issues and things like that. They didn't seem to care. It was just this overall attitude of we're here to protect you and we have to do this.

I think there were seven marine generals on the island when I was there and they ranged the full gambit from jerks. They had one, who shall remain unnamed, who was an aviator and a complete jerk. Then you had guys like (can't remember name). He was one of the slickest guys I had ever seen and could be an ambassador anywhere. He was very sensitive, very intelligent, Scottish by birth, immigrated to the States as a teenager. Bob, I'll figure out his name. He was tremendous and really sharp. There was another guy who was a colonel at the time, Colonel Zinni. Now I think he is a three star general and is really big in the Marine Corps. These guys were really good and very sensitive. They would fit the mold you are talking about, but there were a bunch of other guys who were just sort of jerks. A mixed bag.

Q: *What did we have, a consul general there?*

GIBSON: Yes.

Q: *Who was the consul general?*

GIBSON: A man named Spence Richardson.

Q: *How did our consulate general work?*

GIBSON: His view, rightly or wrongly, was that the most important thing to him was a good relationship with our military people there. He kept good relations with our military people there.

Q: *I would imagine the embassy would be breathing heavily because obviously they had other fish to fry and I would assume that sort of the mainland Japanese people would use the Okinawa situation to play up, it's dead (or big) news.*

GIBSON: It would get the press whenever anything happened of course. Unlike in Thailand where the ambassador is the boss, in the relationship between the embassy and the military in Japan, the ambassador is not the boss of the military over there. The setup is different. The commander of the U.S. forces Japan is a three star and I think almost always an air force officer. Basically when the ambassador is dealing with him, he is not quite like an equal. The ambassador in the end will win but he can't just order these guys to do something. You've got to work with them and you've got to persuade them. Whenever you are talking about constraining their ability to train, you are getting very close to the bone with those guys because they have seen in Okinawa as well as the rest of Japan, a steady erosion of their ability to train and to be prepared to fight wars. They resent that so I think that is probably why they will fight anything that they see as a curtailment on their operational abilities and on their abilities to train. The embassy has to pick its battles very carefully. That is my view from someone in the trenches.

Q: *I would have thought that there would have been more shuttle flights of airplanes and all over to Korea to do this stuff with the Koreans. They kind of like to have American military around.*

GIBSON: A lot of the Kadena Air Force Base wing that was there, the first air division or whatever it was called at the time, (I think it went back to wings but it was a division at the time) always had F-15s forward deployed to Osan. They always had forward deployed units over there, and they had RF-4 phantoms as reconnaissance birds. They were always over there fooling around. I think it was a function of cost to take those F-15s, fly them all the way to Korea and play all the games. With the per diem, the fuel and all of this, I think it was a cost factor.

I was thinking that I had come from an environment where the ambassador was god and if he were a smart man like John Gunter Dean, he could have his way. John Gunter Dean used to sometimes get generals in his office and chew them out like buck privates. He was just incredible. The military knew from the minute they walked in the door, they were not John Gunter Dean's favorite guys. John Gunter Dean was boss and he let everyone know it, whereas

in Japan it's that different relationship. It is a much more cooperative, give and take relationship.

Q: Was Mike Mansfield the ambassador still?

GIBSON: Yes, I guess he was the ambassador while I was there. Just as I was getting ready to leave, Mike Armacost came and replaced him but basically it was Mansfield. Mansfield was a nice old man and he wasn't going to go to war with the military. I don't know what Armacost did, I had left.

Q: Besides working with our military, what else were you doing?

GIBSON: That's about it.

Q: It sounds like a full time job.

GIBSON: Oh yes. I'll tell you how things worked. You had asked what the consul general did and what was his thing. This was a fascinating system. Whenever a local community had a complaint with the military, the military had a policy that the military does not see civilian protesters. In other words if Kadena Air Force Base is making too much noise for the mayor of Kadena, the mayor of Kadena can not take a protest note over to the air force general next door. That's nice. The consul general said that these are all leftists doing the protesting and they largely were because most people on the island are sort of leftist. He didn't want to get involved in it because he had more important things to do, which he did frankly. As pol-mil officer, I was the duty receiver of protests.

It was sort of seasonal but it was frequent that there would be protests. It was so Japanese it was just incredible. They would come to the consulate and they would sit in our conference room. There would always be a lot of them and we would have no cameras, no recorders and this sort of thing. They would come in all dressed up in coat and tie and very polite including sometimes a communist, sometimes a socialist, and whoever. They would present me a protest letter. I would welcome them with a few words and this sort of thing. The best Japanese I had was welcoming people and telling them I was glad to see them, good relations and all this stuff. Then the leader of the delegation would read the document word by word and I would follow along. I had my FSN over here to keep me straight and narrow. They would read it all and then they would sit back. I had this spiel about how we understand exactly, this is a very sensitive issue and very important to our relations and we want to be good citizens here on the island. Usually the delegation would be from a local town or village so there would be more than one party represented. The lead guy of each party would insist on saying a few things and I would nod understanding about half of what he said but with my FSN telling me the rest. At the end I would thank them all for coming, shake their hands and lead them out the door. It was all very ritualized. I would then take the protest note and pouch it up to the embassy and fax a copy over to the marine base commander, or to whoever the appropriate guy was. That is how we dealt with protests. We'd just take them all upstairs to the embassy.

Q: During this time the Soviet Union was going through Gorbachev's period and things were beginning to change. Were any of you thinking about maybe time is running out for Okinawa as

far as a military base?

GIBSON: Yes. The military were aware and they didn't want to hear about it. They said we are here not because of the Soviet Union. This is Okinawa. This is not the guys up on the mainland. We are here because of the Korean Peninsula. Just because the Russians are starting to lighten up is not an indication that all is well on the Korean Peninsula. They are right of course. Their point was we're here to fight on the Korean Peninsula and to project power into Southeast Asia and so on. That was their position and so they didn't see that as meaning they had to pack up and go home.

While I was there, there was the continuation of long protracted negotiations on reducing the size of our bases and turning over unnecessary bases back to the Okinawan land owners. I was the consul's representative on the meetings up in Tokyo with the working level military guys on this. Occasionally some Japanese military guys would come in, the Defense Administration Agency. They were civilians but they ran the bases. We were doing that and I think as I understand after I left, we did turn over a couple of places and a few years later we turned over some more and this sort of thing. It is an ongoing process. We had a lot of bases there on Okinawa and a lot of areas which we were not using but the military still didn't want to give them up because they might need them. They are right, they might need them. The land issues were tough.

When I was there we put in motion to give back a couple of places but they weren't very big, it was an ongoing process. There were areas that had been turned back before I got there, in a couple of cases years before I got there, that still weren't fully developed by the Okinawans because then the problem became, you turn these land areas back, April 1945 took care of most of the land records on the island. Once you get an area cleared of the Americans, you go in and tear down all of those structures and everything and sort of prep it for doing something with it, then you have to sort out all of the land ownership records and that was an incredibly complex task. It would tie things up for years and years. There were two pieces of land in particular that had been turned over five or six years before I got there, and they hadn't done anything with them because they couldn't sort out the land records. It's very complex, the whole land thing in Okinawa.

Occasionally on a military installation you would put a little fence around an area about the size of this room. That land belonged to somebody who refused to sign the lease to let U.S. forces use it. They were anti-war landlords so they would just fence off their area and that was their little piece of land and we couldn't use it. There were many landowners who were getting much for the land that we had for our bases that wasn't really worth much, and on the open market it would not have been worth much to the landowners. But because of the money that the Japanese government was paying to the landowner as rent for us to use those bases (we weren't paying for those bases), that made the landowners want to keep the Americans there. So you have this split there. Meanwhile you have a lot of the American military people convinced that they are the backbone of the economy.

Most American military commanders, their subordinates, and even privates and their dependents, believed that without the American military presence there, the Okinawan economy would shrivel up and go away. You'd ask them for a guess of how much the U.S. presence contributed,

and they would say three quarters of the total GDP, or something like that, of the island that we contribute to. They all really believed this. I pointed out to them that it was really down to around 12 percent and that was an eye opener for a lot of them. There was still this mentality among the American military there that this was sort of our area.

Q: *We conquered it, it's ours, I think that was the attitude particularly when the reversion came.*

GIBSON: There was a lot of that attitude there. The fact that a lot more Okinawan and Japanese got killed than Americans got killed there, didn't seem to interest them much. In fact the biggest casualty figures came from the Okinawan civilian population. There was that attitude.

WILLIAM CLARK, JR.
Deputy Assistant Secretary
Washington, DC (1986-1989)

Ambassador William Clark, Jr. was born in California in 1930. He graduated from San Jose State College with a B.A. degree in 1955. He served in the U.S. Navy intermittently from 1949 to 1953. In 1957, he joined the State Department, serving in Sierra Leone, Japan, South Korea, Egypt, India, and Washington, DC. Ambassador Clark was interviewed by Thomas Stern in 1994.

Q: *As you mentioned, in mid-1986 you were assigned back to Washington as the senior Deputy Assistant Secretary for EA. What were your functions and responsibilities?*

CLARK: All the regional bureaus operated differently. Most of the senior deputies were *alter egos* for the assistant secretaries. They didn't have jurisdiction over specific regions or countries. In EA, we have four deputies: one for economic affairs and the other three had responsibility for specific countries. I had watched EA for a long time and had seen it try various organizational arrangements. It was clear to me, and Gaston Sigur agreed, that one deputy could not be responsible for both China and Japan. The work-load would have been too great. So Stapleton Roy returned from Singapore to handle China, Australia, New Zealand and the Pacific Islands matters. I was responsible for Japan and Korea, administrative affairs of the Bureau and its public affairs. Dave Lambertson handled ASEAN, Vietnam, Laos, Cambodia and Burma. It was a good division of labor and I think worked quite well. When Sigur resigned in February, 1989, I became acting Assistant Secretary, which lasted for about five months.

The Department at the time viewed a Bureau's Executive Director as a deputy assistant secretary equivalent. He or she was given a document stipulating that rank. But I was always interested in management and took an active interest in administration and personnel matters. I tried to run the Bureau on a day-to-day basis so that the assistant secretary could focus on the major issues as he chose. Of course, I also supervised the Country Directors for Japan and Korea, countries with which I had personal involvement and continued interest.

In the 1986-89 period, which was the tail end of the Cold War, we had an opportunity to move

away from our central concern of the previous decades, namely security. This is not to say that we have given a thought to sacrificing our defense establishment in and around Japan, but the world situation was such that we could begin to focus on other US-Japan issues besides the common defense. We had for a number of years concerned ourselves with the major trade imbalance between the two countries and that remained a major bone of contention. But in this end of 1980s period, we were able to begin to engage the Japanese in other issues such as UN, Cambodia, North Korea, etc. Today, I regret to note, we have returned to the "single issue" era -- i.e. trade -- that all other matters are pushed so far in the background that they are almost unmentioned in the dialogue between the two countries.

On the trade front, I don't remember the situation being much different in 1986 than it had been a year earlier when I was also working on it. There was no question that it was a major issue, which it continued to be for as long as I have been involved in Japanese affairs. At the beginning of the Bush administration, we did obtain final approval of the FSX program. This was not something that a new administration was necessarily comfortable with, but it was essential that it be done. That was the program that permitted Japan to build its own fighter aircraft with US assistance. It should be noted that now, five years later, no aircraft has yet been produced. But in the late 1980s, to get Congressional approval was a major fight, primarily because those that worried about Japanese "unfair" trade practices, led by Dick Gephardt, were just set against helping that country to develop a competitive fighter aircraft by transferring our technology to it. So the FSX program became a trade issue when it should have been viewed as a common defense matter. I took several "beatings" during Congressional hearings on this issue with the antis insisting that the trade imbalance should be rectified before we worried about security. I was the Department's principal witness on the FSX issue with one exception when Cheney, Mosbacher and Eagleburger -- the three secretaries -- testified as the final administration witnesses.

On trade issues in general, USTR was the principal administration spear-carrier on the Hill. The regional bureaus were of course involved in setting of the US trade policies -- much more than they are today, according to people who are still in the Service. The Bureau for Economic Affairs was also involved, but I am told that the Department as a whole is not nearly as involved in trade issues in the mid-90s than it was at the end of the '80s, with the exception of perhaps Joan Spiro, the Under Secretary for Economic Affairs. I testified on trade issues as well as security issues, often with representatives of other State bureaus. It was not unusual for deputy assistant secretaries to be the Department's lead witnesses; it was not a role that assistant secretaries sought or enjoyed. Generally, I was part of a three person panel with other representatives from the Department and other agencies. All the witnesses knew each other and had almost daily work contacts, so that the administration witnesses were a congenial group. That was true for trade, security and the FSX issues.

This was my first real exposure to Congressional testimony, although I had been a witness on a couple of occasions when I was the Japan Country Director, when I represented the administration on the issue of whaling. That was not an easy issue to deal with. I was a witness along with someone from USTR and someone from Commerce. There were some members of Congress who wanted to cut off all trade with Japan because of their whale fishing practices. A famous expert had just finished studying the humpback whales who lived off the shores of

Argentina. His daughter had made recordings of whale sounds. She appeared at the committee meeting just before we did. It was a tough act to follow. She gave every member of the subcommittee a copy of the book she had just written on whales. All I could bring to the table was information on the extent of our trade with Japan and what the consequences would be for American business and labor if that trade were severed. That sobered the subcommittee a little!

I was fortunate in one respect when it came to testifying in the late 1980s. Much of my testimony was in front of the Asian subcommittee of the House Foreign Affairs Committee. The chairman of that subcommittee was Steve Solarz, whom I had know for sometime going back to his visits to Korea. I also saw a lot of him when he visited Japan. So I had a known quantity in the chairman. I also knew some of the other members of the subcommittee -- e.g. Congressman Solomon (NY) who was a Japanese linguist. I learned early in the game to keep the opening statement short; I would submit a longer and fuller statement for the record. Congressmen tend to become testy and impatient if they have to sit and listen for too long. The more appearances I made, the easier it became, although it was never an experience that I enjoyed or looked forward to. After a while, I became accustomed to sitting in the well with my interlocutors sitting at higher levels so that you always had to look up. At the beginning, it was a little intimidating; you felt sometimes that you were facing a panel of judges. One time, I was lucky. I had been asked to brief the whole Foreign Affairs Committee on China; it was right after Tiananmen. I had told the staff that I could not testify in open session, but that I would be glad to brief the Committee in a closed session. On that occasion, I sat in the Chairman's chair and the Committee sat in the well. During this briefing, Solarz made a comment and I was about to "rule him out of order", but refrained. I told him later that I had come very close to doing that!

You could never be sure what question might be raised nor could you be sure that your answer was heard with the same meaning that it had when I delivered it. You know what you said, but you don't know what the Congressmen heard. In general, we knew what the questions might be because we had discussed the hearings with the staff. So we usually were prepared for at least the Chairman's questions. Some of the Committee members would wander in and out of the meeting and they were much less predictable; it was not rare that we had to answer a question that had been asked before when the member was not in the hearing room. But with the Chairmen, regardless what subcommittee was involved, we knew pretty well ahead of time what issues would be addressed and what the objectives of the hearings were. The staff was quite good on giving us advanced notice. It was usually a very good collaboration; we knew what information they wanted and they knew what we needed to know.

In addition, Congressional testimonies are difficult because you are addressing several audiences. Not only did the committees hear your testimony, but the Japanese press certainly covered much of it; even a small number of American press might be present. The Japanese bureaucracy was of course informed of every word you uttered through the ears of a Japanese Embassy official who covered the hearings. Then there was the Washington bureaucracy. Quite often, I would appear at hearings having covered the issue with the Chairman of the subcommittee in private. But the Chairman held the hearings because he wanted to make a specific point. I remember once, when I was testifying together with another administration official, he gave an answer that we had agreed would not be given. The Chairman immediately went after him and the two went off into discussions that were useless and possibly counter-

productive. I finally interceded and managed to bring the dialogue to an end. After the hearing, the Chairman told me that he never wanted to see the other witness again. I told him that I had no control over that because he was not a State Department official. Furthermore, I suggested that having that hearing was not necessary and that it ran the risks that in fact developed. He said that after having gotten that wrong answer, he could not let it stand unchallenged, thereby taking the discussion into areas which were not at all profitable and being diverted entirely from the objectives he had in mind for the hearing.

Being part of a panel always runs some risks. I am sure that some of my colleagues from other departments did not always agree with my comments. But in general I think, as I suggested earlier, the administration witnesses were on the same wave length and usually quite well prepared. I did find myself on occasions in tight spots. For example, as the senior deputy assistant secretary, I was responsible for testifying on appropriations for the Asia Foundation, which got much of its financial support from the US government. That was in part because the Asia Foundation was at times a useful adjunct to the US government overseas representation because it could do some things that we could not. One year the Department's Comptroller was former USIA official -- Roger Feldman -- and he felt that the Asia Foundation was not worthy of US support because he thought that USIA could do all that the Foundation did. The Foundation had good Congressional support. Every year, the Department was required to write an assessment of the Asia Foundation, which we did as objectively as possible. It was usually quite favorable. The Comptroller would use this assessment as the preface to the budget request, but then would not seek any budgetary authority. We were precluded by Department regulations to discuss budgetary issues during any of our Congressional appearances, which is an interesting experience when you are testifying before a Committee that is responsible for appropriations. Once, I was before the appropriations subcommittee with the Comptroller sitting in a spectators' row behind the witness table. Congressman Obey commended me for my report in the Asia Foundation activities, but wanted to know why the Department was seeking reduced funds to support it. I told him that I could not answer the question, but I suggested that since the Comptroller was in the room, the Congressman might wish to ask him. It was a silly game; the Department would send its budget request to Congress which would show a reduced requirement for the Asia Foundation. I knew that this tactic would not fly and that Congress would add to the amount requested. I told Feldman that he was just giving the Congress control over the Department's budget because it would restore the amount cut by reducing another Departmental account which was probably damaging to the Department. But I could never convince Feldman that he was acting against his own interests by reducing or eliminating the Asia Foundation support.

I should mention that most of administration testimony is public and on-the-record and often covered by the press. There are occasions when the testimony must be classified and then you closet yourself with the committee in one of the secure rooms. That is a little more intimidating because in a closed hearing the Congressmen can raise any questions they wish. You don't have the protection of an open hearing when you can always say that the matter is classified and that you would be happy to brief the Congressman privately or in an executive session. But in a closed session, you don't have that protection. An administration witness always has to be aware of the Germanness of a Congressional inquiry. Just because it is a closed session, that does not open the discussion to anything that might be on the Congressman's mind. The question should

be germane to the subject of the hearing. You just couldn't afford to allow "fishing expeditions". I always made sure under those circumstances just to say that the issue was not in my purview or the subject of the hearing; I would never try to mislead or talk around the question. Fortunately, this problem didn't arise very often, but you always had to be aware of the possibility. On the other hand, closed hearings had the advantage of not being open to the press and you didn't have to worry about tomorrow's headlines. A closed hearing is likely to require the submission of more documentation, which raises a new set of problems because classified documents are supposed to go through the Intelligence Committees where they are available to members. But Congressmen often chafe at this restriction and would much prefer to have the administration witness hand over the documents right during the meeting. On one occasion, I faced the issue of recursion. The issue was Vietnamese funds frozen in US accounts and whether some might be released. Lambertson was in charge of Vietnam issues, under Sigur. But on this occasion, it turned out that I was the only senior official in EA who didn't have a share of IBM stock. IBM was a plaintiff; so every one else recused themselves and I ended up being the witness on a subject that I did not know very well. I accused both Sigur and Lambertson of buying a share of IBM just so they would have an excuse to recuse themselves. The stock dropped in price soon thereafter, so I am glad I didn't own any.

I testified several times on Korea and especially on security issues. The atmosphere was different than that existing when Japanese issues were discussed; the trade tensions were not present. Furthermore, there was a palpable and obvious military threat. So the questions were most often directed to the future and the likelihood of a North Korea invasion. So the questions concerned troop capabilities and locations. The Korea question was not particularly acute during the 1986-89 period, but the tensions on the Peninsula was of continuing interest in Congress. In State, we felt, and we were supported by some people in Washington, that some movement towards North Korea might be appropriate. We devised what was known as a "modest initiative". In 1988, Sigur went to New York and gave a speech which had not been cleared through the bureaucracy, including the Secretary of State's office, as widely as it probably should have been. He said that we would remove regulations against the use of credit cards for Americans who wished to travel to North Korea, which involved a change in Treasury regulations and a notice in the Federal Register. Sigur also said that we would allow "humanitarian" trade which also involved some changes in regulations. We also said that we would make it easier for North Korean academics, clericals and press to travel to the US. Finally, Sigur said that he would authorize American diplomats to have substantive discussions with their North Korean diplomats at third party functions. In the same speech, we told the North Koreans, that in return for the easing of regulations that Sigur had announced, we would like some reciprocal actions and we gave them a list of actions from they could choose. We used this technique because we had found out that the North Koreans were very reluctant -- in fact, did not -- to talk about *quids pro quos*. So we used a public speech to communicate with the North Koreans.

When I became the senior deputy in the Bureau in 1986, there had not been any great attention paid to the question of taking some positive steps toward North Korea. However, sometime during the next two years, we slowly developed the idea of taking some initiatives. There had always been a lot of discussions about the North in the Department and in other parts of the bureaucracy. The complete absence of any movement was just unnatural; furthermore, as long as the situation was as frozen as it was and as long the North was as isolated as it was, the

possibility of miscalculations was very real. We thought that if we could get some dialogue going, we might be able to raise some warning flags before it was too late. We just wanted to find some ways of alleviating the tensions that had existed on the peninsula for many, many years.

There were of course the continuing military-to-military meetings in Panmunjom which were part of the armistice agreement. They were very formal meetings which were not really a good forum to raise political issues. We had tried some approaches through the Chinese. There had been some indications that perhaps the North was becoming more interested in a dialogue. We decided to test the waters by using a technique that would not involve us in endless discussions about either the process or the eventual outcome. We used the 1988 speech to give the North Koreans an opportunity to respond; they could have said "Thanks very much. Let's talk about it" or "We are interested in talking about one of the matters you have raised" or "Forget the whole thing. It is just another imperialist plot". The North could have responded in many different ways.

George Shultz' first response to the speech was that it was outrageous. When the speech received approbations, the Secretary then complained that we never sent him speeches that were that good. Of course, he never would have delivered anything like the speech that Sigur gave because it was so far in front of existing policy.

The speech had some effect. First, the North Koreans contacted one of our Embassy staff in Beijing at the International Club and requested that a meeting be set up. This was not in one of the actions listed in our "modest" initiative; the North Koreans had requested a bilateral session whereas we had stipulated substantive conversations only in a multilateral forum, such as a social occasion. I was asked what our response should be. I mulled it over for a couple of days. I then instructed our Embassy in Beijing to tell the North Koreans that meetings at the International Club would be acceptable at the Consular level on the grounds that the Club was owned by the Chinese government which then would become the third party to the dialogue making it a multilateral one. That in fact became a channel that has operated since soon after the Sigur speech. Nothing much came of the opening, but at least it opened a channel outside the military-to-military one. It gave both parties an opportunity to discuss political issues. I should add that I of course, in the course of drafting the Sigur speech, considered adding a provision for a direct North-Korea-US dialogue, but I didn't believe that the bureaucracy -- in State, in DoD, some in NSC -- in Washington would have found that acceptable. A question would have been raised about why we would wish to accede to what we knew the North Koreans had wanted for a long time; they had not shown any great willingness to be forthcoming. The other parts of the "modest" initiative could be defended on their own merits -- e.g. humanitarian aid, credit cards, visas to certain North Koreans (which was merely an expansion of a policy already in effect). Of course, the North Koreans never took advantage of the openings we provided; they never sent journalists, clerics or other categories; they have restricted their visits to the US to their own diplomats and some "academics" -- i.e. people who worked for the government.

The speech received considerable approval in the American academic community which for a number of years wanted to open a dialogue with their North Korean counterparts, preferably in Pyongyang. Many people used the speech as a jumping off point for their conversations with

North Korean representatives; other country diplomats used it to illustrate how the US was trying to be reasonable. There were some academics who opposed our initiative basically on the grounds that we were granting privileges which were not needed or desired. But the speech did not generate the kind of sustained debate in the US that I had hoped for, but it was heard in Pyongyang, which was certainly one of our objectives. Our dialogue at the UN did not increase until much later nor did North-South talks really begin at this time. On the other hand, the reaction to the speech in the United States I think made it eminently clear to my bureaucratic colleagues that mentioning the possibility of a dialogue with North Korea was not a kiss of death.

Although the thaw in US-North Korea relations was barely noticeable by 1989, later it did become easier for Americans to obtain visas to visit Pyongyang. Some went at North Korea's invitation which may have served the North's propaganda machine, but was useful to us as well because it gave us some first hand insights that were not available to us otherwise. We eased slightly the restrictions imposed on the North Korea mission to the UN by permitting some of that staff to travel in the US to participate in conferences. I think our pace of improvement of our relations with North Korea was glacial at times and incremental at best. I think the Sigur speech opened the way, but it was almost another fifteen years before any major discussions between the two countries really took place. For example, when I was the Assistant Secretary for EA in late 1992, I received a call from Dave Locks who was in charge of the annual Prayer Breakfast. He was planning Clinton's first Prayer Breakfast and wanted to know whether some North Koreans could be invited. I referred him to the "modest" initiative and told him that clerics, academics or journalists would certainly be acceptable. The North Koreans submitted the names of seven participants, six of whom were government officials and the other was their Permanent Representative at the UN. I said that that list was not acceptable, but I finally told Locks that the UN representative would be acceptable. Unbeknownst to me, that North Korean was given a seat at the head table along with General and Mrs. Colin Powell, Senator and Mrs. Ted Kennedy, Senator and Mrs. Sam Nunn and I think the Mongolian Ambassador and his wife. I asked Powell later how it went; he told me that the North Korean didn't seem to have a clue about what the breakfast was all about and didn't have anything to say. I think the North Koreans missed a major opportunity.

The history of US-North Korea relations is a tortured one. Carter tried to open a dialogue using a three party proposal -- North Korea, South Korea and the US -- when he visited Seoul in 1979, which was summarily rejected by the North. Then came Sigur's speech in 1988, which at least opened another channel for dialogue in Beijing. The North, I think, in 1988 might have been interested in trilateral talks, but then we were not interested. We suggested in lieu that they hold bilateral talks with South Korea. I think that was the appropriate response in 1988 because the North was obviously at the time trying to get us to talk directly to us holding the view that the South was just a US "puppet". The North was using pejorative language when referring to the South and did not seem interested really in relaxing tensions on the peninsula. So the atmosphere was all wrong in 1988 for any progress. After that, it was inch by inch when there was any progress at all until 1993.

Our relationships with South Korea had its ups and downs. On the issue of democracy, I was in Seoul in 1980 when its fledgling beginnings were forcefully suppressed. By 1986, Chun Doo

Wha, the President, was on his last gasps. Roh Toe Woo made a "grand" gesture to the opposition by agreeing to terminate certain undemocratic practices, thereby assuring his election. In any case, the political process was much more open in 1986 than it had been eight years earlier. In early 1988, I went with Secretary Baker to the Roh swearing in -- Sigur didn't go because Ed Dwerinski, who was then the Counselor of the Department, went and Gaston didn't want to be the third ranking State Department official. On the way to Seoul, I kept telling Baker that the name of the new Korean President was pronounced "Noe", even though it was spelled Roh. Baker was well received even though, since he was not a head of State, he did not rank among the most senior of the guests. Soon after that, President Roh paid a visit to the United States. I told Baker then that his name was to be pronounced as "Roh". The Secretary said that this was contrary to the advice I had given him earlier. I pointed out that the situation was different; that when in Korea, the name was pronounced as "Noe", but when in the US, it was "Roh". In the United States, for public relations purposes, the Koreans felt it was far better to referred to their President as Roh Toe Woo and not Noe Toe Woo -- it was too much like Doctor No.

We were encouraged by Roe's election. In addition, we were very active on the "democratization" front. In the last days of the Chun Doo Wan regime, some University students had occupied our USIS offices in Seoul. Harry Dunlop, who was the Political Counselor during this incident, held long discussions with them, permitting them to air their grievances and trying to talk them into leaving the building. He wasn't successful and the police finally had to force the students out. But Dunlop and the students had a long conversation about Kwangju, during which he felt that he had done a masterful job of explaining the course of events as we knew them. After that, Dunlop suggested that we publish a "White Paper" repeating essentially what he had said to the students. The Embassy supported Dunlop, but we did not see any good reason why the issue should be publicly debated again. I saw Dunlop's report on what he had said while visiting Seoul and did not quite conform to my recollections as a resident American diplomat during the uprising. Secondly, we had some reservations about issuing a paper when a friendly government was in power, particularly since the new President had been involved in the Kwangju matter. It was after my return from that trip that I turned the matter over to the Historian's Office, as I described earlier. That report was issued in part to put our views on Kwangju on a written record, but our action was also designed to encourage Roh to continue on the democratic path he was following and hopefully, even accelerate his pace. In the final analysis, I think Roh made tremendous progress in bringing his country into the democratic fold. During his regime, that was not really a major issue between our two countries.

As further evidence of the great progress that the Koreans had made on democracy, we noted the freedom that both Kim Dae Jung and Kim Young Sam had in Korea. When I had been in Korea in the late 1970s and early 1980s, these two men were either in prison or under house arrest. They were seldom free. But by the late 1980s, they had fairly free reins. One could visit them if you were in Seoul. Kim Young Sam was politically very active and Kim Dae Jung was free to tell his side of history. The Embassy did have contacts with the two in the late 1970s, when they were not imprisoned. After the "Seoul Spring", in 1980, the Embassy had considerable contacts with Kim Dae Jung. We urged him not to address college audiences so that passions would be unnecessarily stirred up; he ignored our advice.

There were some trade frictions between the two countries in the 1986-89 period. Beef was one commodity that was always in debate both with Korea and Japan. I used to tell the Koreans that I was depressed by their position on beef imports because only a few years earlier I used to cite them as a shining example of free beef traders because we used to sell as much beef to "little Korea" as we did to "huge Japan". The Koreans closed the market for our beef exporters. It was a shameless comment, but then shamelessness has been a hallmark of diplomacy for centuries. We also had some problems with American companies that were leaving their investments in Korea, like Dow which sold its assets to "Dynamite" Kim. But in general, trade issues were not a major bone of contention.

When I first returned to Seoul in 1986, after an absence of six years, I was struck by the tremendous changes. There was no curfew for example nor were there any troops on the streets. The atmosphere was very different, although I must say that even when the curfew was in effect and the troops were on the streets, we did not feel the heavy boot of oppression. The Korean government did not interfere with our daily lives; I thought it was not any worse than Paris during the Algerian crisis when you could see machine guns on the street corners and troops heavily armed everywhere. That was suffocating. By 1986, the society was much more open and the economic boom was evident. Buildings were going up everywhere, particularly on the south side of the river almost all the way to Suwon. Development had engulfed the farm areas which in 1980 still surrounded Seoul. More bridges had been built as had been Yoido, an island in the middle of the Han River which had been densely developed.

The Han River project was almost finished. This was a water-management project that had been under discussion when I was in Seoul in 1980 and for which the Corps of Engineers had done some planning work. That project made Seoul a different city introducing boats and parks to the entertainment landscape for the citizens. Seoul did not look anymore like a capital under siege; so the change in the physical appearance also made it seem like a freer society.

I might make some comments about anti-Americanism in Korea. It seems to follow closely political unrest in the country. It was quite virulent in 1980 after Kwangju. In 1987, when the Koreans were becoming unhappy with Chun Doo Wha, anti-Americanism rose. When Roh Tae Woo had stabilized the political situation, anti-Americanism abated. But I think it is fair to say that it always existed to some extent in Korea. There was a recent newspaper story recently about a young Korean, who after having completed academic studies in the US, returned to his country and killed his parents for the inheritance. We have been accused of being the cause for this young man's actions because we somehow educated out of him the family tradition and filial devotion that he would have been taught to strictly honor had he remained in Korea. So there seems to be always a feeling below the surface that somehow the United States, even though praiseworthy for defending South Korea, nevertheless is less than perfect and that some of its cultural patterns were really not welcomed in Korea. My personal contacts from 1980, which I re-established when I visited Korea in 1986 and thereafter, were certainly less anti-American than they had been. This was particularly true of the American missionary community which was much more at ease with their government in the late 1980s than it had been at the end of the 1970s. That can be explained in part by the fact that the missionaries were not as harassed as they had been during the Park regime; their new-found freedoms made them more benevolent toward the US. My Korean friends reacted pretty much the same way. Their views of the US had

also evolved.

The Embassy, I thought, was working well in 1986. I was not happy with its physical location which remains a problem even today. We don't own the building or the lot; we had signed an agreement that stipulated that we would vacate the premises when our assistance program had ended and I think after 1979 we could not make a very convincing case that we were still extending assistance, either economic or military. But fifteen years later, we are still squatters. We do own land in Seoul which we have never developed, but never seem to be able to find the resources to build a Chancery. Our position on this issue is unseemly, at best, for a major power. We now occupy an old building, built soon after we began an aid program to Korea, not at all consonant with the modernity of much of the city; the Embassy's switchboard and the heating system is in a building next door.

We had a good working relationship with the Embassy. We were on the phone frequently with both Seoul and Tokyo, although unlike some other deputy assistant secretaries or country directors, I did not believe that a daily telephone conversation with every embassy was necessary or desirable. When daily calls are required, I believe it seems too much like micro-management and that is not the role of the Washington bureaucracy. Information nevertheless flowed freely and I think both we in Washington and the people in Seoul were pleased with the relationship.

It was during my tour as deputy assistant secretary that the Koreans began to make some headway in their relationships with the Soviet Union. They had for a long time tried to establish contacts with the other superpower, but until the late 1980s, had had limited success. We did not urge them to be more vigorous in their pursuits nor did we interpose any objections. The opening to Moscow was Roh's legacy as were his efforts to establish a dialogue with North Korea. I think the Koreans did a marvelous job on this issue and are rightly proud of their accomplishment. Their timing was good and the establishment of official contacts with the Soviet Union was followed soon by similar successes with the People's Republic of China. We did not play much of a role in these initiatives, which may have been one of the reasons the Koreans were successful!

Now let me move to our relationships with Japan in the 1986-89 period. The Japanese have never been as interested in involving themselves in world affairs to the extent that we would like. Of course, there are some that they say that the average American is also not sufficiently engaged in world affairs. The Japanese, by and large, including the ruling circles, we do not want to be perceived as a world power. Influence yes; their views taken into account, yes. But not the responsibility that goes with being a world power. The Japanese public is certainly not prepared to take on that responsibility. I wonder however what their views were in the early 1940s when the war was going very much in their favor. Since there weren't any public opinion polls at the time, we will never know. The Japanese did what they did in the 1930s and 1940s because their Emperor wished them to do so; that was enough for the average Japanese, although there were some who warned of likelihood of failure. The Japanese theory then was basically that of *jujitsu* -- a small man properly trained could beat a big man. When applied to countries, the Japanese felt even more comfortable taking on a democracy. I think most of the Japanese felt that way, although history proved them wrong. The Japanese view since the end of WW II is not too different from the isolationism that Japan practiced for most of its life. It was essentially closed

to the outside world for 300 years, although it did invade other countries -- particularly Korea and later China -- in that period. I think the Japanese are happy with their society as it is and are reluctant to have it "contaminated" by outside influences. The Japanese are essentially very conservative and are not seeking much change; they like their present situation, although the strains are beginning to show since labor shortages are forcing them to import people from other countries. That is likely to cause changes in Japan which it will resist; the Japanese believe that their aggressive policies of 1941 was a big mistake; i.e. attacking China was one matter, but attacking the US was just plain dumb. They don't want to repeat the same mistake. Today, the Japanese see themselves as a small country which might be stepped on if it wonder too far off its own shores. This concern is reinforced by the emergence of a powerful neighbor - China -- which has had more political influence than Japan in the world since the end of WW II and which has a larger military force, although that force has no projection capability. China has not been an economic rival of Japan, but that is also changing. Those who had great insights might have been able to detect the emergence of China in the late 1970s if they had believed Deng Xiaoping's vision for his country. Not many then believed that China would emulate the "Four Tigers", although we were particularly amazed that Deng included Hong Kong and Taiwan in his list of countries to be emulated. I don't think we paid enough attention to Deng's pronouncements in the late 1970s; the Japanese did not either. In fact, the Japanese corporations were late in trying to make inroads in China despite their providing government-to-government assistance to that country. They are present now, but still not in the magnitude that has been the hallmark of some other investment efforts. Since we couldn't provide assistance, our private economy stepped in with its investments.

One of the continuing problems between the US and Japan is an asymmetry. That still exists today. In the late 1980s, we assumed that the Soviet threat was a major one. The Japanese didn't dispute our view, but since they were not in a position to take any effecting measures, they tended to be more relaxed than we were. They did not have the same sense of urgency about the Soviets being a regional threat. There was a continual shift in the definition of roles and missions in the national security sphere. I think both sides came to agree that the United States was not in Japan primarily to defend Japan, but rather to insure stability in Asia; that was an important revision in Japanese views which resulted in a force restructure.

In 1986, we viewed the US-Japan and the US-Korea relationship through the prism of the Cold War. That emphasis continued throughout my tour as Deputy Assistant Secretary. Even in 1989, we in EA at least had not detected that the Soviet empire was collapsing.

Finally, I think I might just briefly discuss my role as the day-to-day manager of the Bureau. I was faced with the perennial problem of insufficient resources. We were always looking at the possibility of reducing the State Department component of an embassy or of closing posts. We had to do some of that. The issue of US representation overseas was always facing us; the contentiousness of it increased during my tour because other Cabinet Secretaries were deciding to take even the minutest issue up with the Secretary of State. That I thought was a ridiculous waste of everyone's time and the issues which dealt with one or two or even three more positions certainly did not warrant the attention of Cabinet level officials. So overseas staffing was always a major issue. Shultz used to periodically make some noises about the size of US overseas representation, but it was very difficult for any Ambassador to make his decision to reduce

staffing stick with other agencies in Washington. Just to go back to my Cairo tour, I should note that there I developed a plan which would have required a 10% reduction in the total Embassy staffing. I did that at the urging of the Department of State. When we submitted that plan, we were left holding the bag; the Department gave us absolutely no support at all. My impact was a little greater later when I was in New Delhi, but in general the US leadership in the field is essentially impotent when it comes to the question of the size of US representation. In 1986-89 period, the Washington attitude was that the bureaucracy in the Capital should be reduced first before any cuts were made overseas. But the only Cabinet department that seemed to follow through in reductions is the Department of State. That was compounded both in Washington and overseas because the Department is a very minute component of the total bureaucracy; therefore any reductions have percentage-wise a much greater impact on the Department than they do on other agencies. Other agencies are so large that a reduction in Washington is barely noticed. The Department's financial squeeze was real in the 1986-89 period. Resources in real terms were reduced with every succeeding year. Costs rose, but the budgets did not rise at the same rate. For example, the costs of our operations in Japan went out of sight during this period without any significant addition to available resources. That left us with the dilemma of whether to reduce our presence in Japan or to take the resources out of another embassy's budget and staffing. The EA budget from 1985 to 1992 grew perhaps 15%. The yen-dollar ratio rose probably 75%; that is a losing formula.

On the personnel front, diversity was a major management objective. In this period, women, who by this time were represented in the Foreign Service in large numbers, won a law suit which stipulated that a certain number of the higher level positions, such as DCM, be reserved for them. That caused some minor difficulties for us. It wasn't that there weren't qualified women available, but Personnel, in its management of the over-all assignment process, would at times come down to the last few assignments for the year and realize that it had not met its established quota for women. That forced all bureaus to begin to shake things up, canceling assignments already made, moving people before the end of their tours, etc. Had Personnel planned better, these last minute adjustments would not have been necessary and the assignment process would have been much smoother. We also had to manage a couple of problems relating to African-Americans. We had an excellent black officer who was very good in the function that he knew. The powers-that-be decided that he should be assigned to another function because that would have increased diversity. He and I had agreed on a career development program, but he was under great pressure from some of his colleagues to move into another area. As we predicted, he found himself floundering and received some very damaging efficiency ratings. The whole assignment was unfair to this individual; it put him a position where he had to have language and reporting skills that he did not have. It was a poor assignment for an excellent officer; he survived, but that assignment set back his career unnecessarily. In general, the Bureau was under pressure to place more African Americans in the Far East; there had been and still was a great imbalance among bureaus with AF having the greatest proportion of African-American staff than any other bureau. Of course, there were more Asian-American staff in Far East posts than there were in other parts of the world. The Department had decided that these concentrations based on ethnicity were not good and made an effort to spread its ethnic personnel resources more widely. It worked alright, but everyone interested in the issue must realize that it is a long term process and that immediate results could not be expected.

The Bureau's relationships with the central Personnel Office were good in 1986. They went downhill from there. George Vest was the Director General until the Spring of 1989. Bill Swing was the senior deputy. In my first year, Personnel was very cooperative in making appropriate assignments. We did a lot of things that according to the rules were not allowed, such as "stretched" tours. Sigur was interested in personnel assignments as were all the deputies. Personnel had the formal responsibility for making assignments, but there was an assignment board which actually made the assignment recommendations. Of course, most of the process was based on the "bids" that every officer made for vacancies when his or her tour was coming to an end. All bureaus were represented on this board. I had been in the Service for many years and by this time knew a lot of people. I sometimes counseled people not to bid on certain specific jobs because I thought that the assignment would not have been good for his or her career. I said that I would try to help the officer, but that he or she was making a mistake bidding for the particular job they had in mind. Personnel might well have made the assignment because the officer was the right age or had the right credentials, but I knew that it would probably not work because of the nature of the job or because of the personality conflicts that might arise at the post. So in my first year, I was very pleased by our personnel management accomplishments. The next two years were an entirely different story. Personnel became very uncooperative and blocked many of our assignment desires, despite the fact that I had been friends with both Deputy Directors General: Bill Swing and Larry Wilson. But I found that increasingly, the Personnel's front office promised to take certain actions which the staff below did not carry out; if the staff felt that an assignment was not within the rules, it tended to ignore the stated guidance from the Director General or his deputy. So the personnel operation became very rigid and calcified, which it continues to be today. I believe that even as we speak, Personnel is about to assign someone to the Political Counselor position in Seoul who has never been in Asia, much less knowing anything about Korea. It makes absolutely no sense at all, even if you give the individual language training which is not likely to be very effective given the age of the officer. This is the kind of assignments that were beginning to happen in 1987; the justification seemed always to be that the central office was trying to break "the old boy network" -- that was Ron Spiers' expressed intention. He had held that view for many years. I always considered the "old boy network" as a management tool. I think that part of the Department's problems stem from the tendency to turn management over to the people in "M" (the Under Secretary for Management). The officials who should really be responsible for management are the senior people in the operating bureaus, but they don't pay enough attention to problems. When they do pay attention to management, it is usually through the "old boy network," which is then criticized as being the enemy of good management. It is a vicious circle; I feel rather strongly about the whole management process of the Department, as you may have noticed!

We also faced the perennial debate of functional vs geographical specialists. For much of this period, Ron Spiers was the Under Secretary for Management. Ron has always upheld the importance of functional specialists; I have always leaned towards geographical specialists. This is a time honored debate. Ron always referred to us as the "regional Barons". We were in the 1986-89 period able to keep regional specialization as the most important ingredient in the assignment process. I insist that the Department of State deals with cultures; that requires deep knowledge of country or regional history which is more important than global environment, etc. In fact, there cannot be one approach to our foreign relationships; each issue has to be addressed on its own merits bringing in most cases the best regional and functional experts together. Some

issues might be resolved by functional experts alone; some by regional experts alone, but most, I believe require the closest cooperation between experts on different matters. The artificial distinction that many make between function and geographic doesn't make any sense in most instances.

In general, I must say that the Department of State is not very proficient in the management field. It is a very difficult job, even if you know what you are doing. To do it well in the Department is very tough; to do it the way the Department wants it done is damn near impossible! We had one major challenge during my tour: a staff reduction which required a meeting of all of the assistant secretaries with the Under Secretary for Management. That meeting with Spiers on the first issue was interesting because no bureau wanted to point a finger at a sister bureau, even if it felt that more of the reduction should come out of somebody else's hide. I attended because Sigur decided that that I should represent EA. The meeting must have lasted two hours trying to make the case that an across-the-board reduction applicable evenly to all bureaus was not the appropriate approach -- it certainly wasn't "management". We all thought that the senior levels of the Department should establish some priorities and then let the bureaus decide how the reductions might be applied to their own operations. Spiers listened to all of the arguments, nodded his head periodically and at the end of the meeting told all the bureaus to tell him how they would apply a 7 1/2% reduction to their own operations. As far as I know, "management" in the Department has not progressed beyond that simplistic and unthinking approach to resource reductions. The relationship between policy objectives and resource utilization has never really been developed in the Department of State. The Department seems to be unable to prioritize its objectives and functions. Everything seems important to everybody every day! That of course is not the real world, but that is the way the Department exercises its "management" responsibilities. The debate between functional and regional bureaus has been active for many years. I would say that today the functional bureaus seem to have priority, although I don't know how long that is going to last. Clearly the Clinton administration came in with a bias toward looking at the world on a function by function basis.

Lateral entry at mid-career levels was not a problem in the 198-89 period. It had been a problem when I was Country Director in the early 1980s when, as one administration was coming to an end, political appointees of that administration were trying to enter the career service before their party left power. It was very poor timing for the individuals involved. But during my tenure as a DAS, I do not recall any great pressure to take into the mid-level positions of the Service any people from the outside. We did face the issue of politically appointed deputy assistant secretaries, although EA was not directly involved. We did not face that because Sigur was a non-career appointee and he wanted to have career people as his deputies. After Sigur, the pressure increased and the Clinton administration is even more eager to fill some deputy positions with non-career people than the Bush administration was. I have heard that even positions below DAS have been filled by non-career people. That was done in a couple of instances during the Carter administration; those people are now part of the career service.

ANTHONY C. ZINNI
Regimental Commander, Marine Expeditionary Unit

Okinawa (1987-1989)

General Zinni was born and raised in Pennsylvania. After graduating from Vellanova College he joined the Marines, which became his lifelong career. His distinguish career took him to Vietnam, Okinawa, Philippines and Germany, where he served in senior level positions. Attaining the rank of General, Zinni served as Commander-in-Chief of CENTCOM, where he was deeply involved in worldwide missions including Somalia, Iraq and Afghanistan. General Zinnia was interviewed by Charles Stuart Kennedy in 2007.

ZINNI: Well, I think besides the military sort of evolution of your experience, the war colleges and schools and command at different levels all the way up, I think the most significant thing was the exposure to the different cultures. Living overseas, operating in a number of different environments, working with forces from different nations, so being involved in their environment and in their culture so I think this whole exposure. I mean, we had a mission during the Cold War to go to Norway so we had cold-weather training. We continued our jungle training, mountain training, desert training and exposure to those environments out there so it was sort of this global environment, being exposed to that. And then not only commanding a unit in Okinawa, but I commanded a camp, so then I was required to interact with the local community.

Q: This was on Okinawa?

ZINNI: This was on Okinawa. I had to work with the mayor of Kin, a town that my base was located in and the assembly and so that gave me more exposure to, you know, interaction of working with them and, you know, the social aspect and all that, going to their funerals and to their weddings and everything else and getting to know them on a personal basis, too. And the same thing in Europe and elsewhere and so I think the most significant thing beside the military experiences during that time was the exposure to such a variety of cultures.

EDWARD W. KLOTH Japan Desk Officer Washington, DC (1988-1990)

Mr. Kloth was born in North Carolina and raised in New York. After service in the Peace Corps and private business, he worked with the Department of Defense, later joining the State Department. In his career with State, Mr. Kloth served several tours in Japan and Korea, In Washington assignments he dealt with East Asian, Political/military, Economic and Environment matters. He also spent two years on Capitol Hill as Department of State Pearson Fellow. After retirement, Mr. Kloth continued as advisor to the Department on variety of matters and served a tour in Iraq as Economic Officer. Mr. Kloth was interviewed by Charles Stuart Kennedy in 2008.

KLOTH: In the summer of '88, I moved to Japan desk to work on trade. At that time, U.S.-Japan trade issues were highly contentious and had been for over a decade. When I first came to Washington in '80, at seminar at the University of Maryland one weekend, I heard a UAW rep, Ford lobbyist, and Toyota lobbyist discuss the problems of the U.S. auto industry and its demands for the U.S. government to stop Japanese imports into the US. People asked the Ford and the UAW reps if limiting competition would just enable the U.S. auto industry to continue to develop unpopular products and so take the pressure off it to become competitive in the U.S. and world markets. I remember one or the other of them said very frankly, "That's a legitimate, but the political pressure from inside the industry and the union is such that we will demand the U.S. government to do it."

Predictably, of course, the "voluntary" limits on Japanese cars led the Japanese auto industry to bring in higher value vehicles which were head to head with even more of the U.S., industries' models. If you're limited in number of units, you want higher profits per unit, so that Japanese reaction was easy to anticipate and led to the price of Japanese cars going higher without lowering demand because Americans were willing to pay the premium for a better product. The U.S. industry did bring some better products like the Taurus, but two decades later only Ford management seems competitive.

The upside for U.S. workers is that major Japanese, Korean and German makers build cars here. The irony is that in the late '70s, though, a Japanese banker told me that U.S. trade pressure gave Japanese auto firms the excuse to override "keep-jobs-in-Japan" politicians and bureaucrats and build plants here – a move that made economic sense – arguing that Japanese firms did so only "to escape U.S. protectionism."

At any rate, the political antagonism to the Japanese, who were running protectionist policies, make no mistake, was high. When I moved from Korea desk to Japan desk, a Congressional staffer I knew well warned me, "Ted, our relationship is going to change. Don't take it personally, and you've been really helpful to me and my Senator. But the feeling up here on the Hill, the antagonism over these trade issues means that when you move to Japan desk, and we talk, it's not going to be in the consultative kind of way that we've talked up to now. The nickname on the Hill for State's Japan desk is 'the second Japanese embassy.'"

I could understand. The U.S. was running a large trade deficit with the Japanese, and the Japanese had continued protectionist their policies developed after World War II to rebuild their economy. By the '70s and '80s, Japanese industries were internationally competitive. The auto industry comes to mind but others such as ship building and electronics were doing very, very well, so the protections that had been erected became an obvious economic issue in terms of U.S. products being able to have access to the Japanese market in the same way their products had access to our market.

It was a complex picture because there were some restrictions that were pure politics. The government party depended on rural voters, so there were zero rice imports, not a big U.S. export, but beef was, and beef imports were tightly controlled.

There were also other issues such as standards which were kind of a second level of obstacles to

foreign importers. The issue was whether or not, for instance, safety standards for construction materials were drawn up in such a way that manufacturers in Japan had an unfair advantage. Japanese standards were set in centimeters. A board needed to be X by X centimeters to meet code. The issue was whether an X by X inch board from the U.S. could bear the same load. If you specified in terms of load-bearing rather than linear measurement, it was better for U.S. saw mills, and Japanese consumers. Japan demanded clinical trials in Japan for medicines.

Standards got the U.S. government's attention as an issue from around 1980, when a U.S. baseball bat manufacturer complained to our economic/commercial officer in Osaka that his metal bats were "not up to code in Japan" because the code had been deliberately set to ensure only Japanese bats would qualify. He had done all the right things in Japan in terms of coming to Japan and building relationships with potential purchasers and having a good product at a good price. The American bats did not meet Japanese specifications because they were not milled on the inside, which made no difference to safety or performance but was a requirement of the Japanese standard, and there was strong suspicion, given the collaboration between Japanese government and industry, that this had been set to keep U.S. bats out.

Further investigation revealed that the standards issue was a big one for many U.S. products, even when the Japanese bureaucrats were not trying to be deliberately protectionist. They too often set specifications in terms of form rather than function. Other issues such as the relationships between the banks and the large Japanese companies emerged. Negotiations started with the Japanese on a full range of these complex problems, including the value of the Yen.

Q: What piece of the action did you have?

KLOTH: Well, I had automobiles, construction, and others, including the so-called large scale retail store law. This law was developed to protect mom and pop stores in Japan, which were the largest number of stores and so the largest number of voters, from competition with Japanese department stores, but also hurt U.S. firms like Toy 'R U.S. trying to enter the market. There were similar, it turns out, laws in places like Germany. We never had American companies complain about them, just as we never had American companies complain about the German auto industry. After World War II, the Europeans had let U.S. firms back in, and Japan had kept them out.

Q: Sure, the Ford was producing the Taurus and all sorts of ...

KLOTH: Later I discovered Australia is highly restrictive on imports of automobiles, but Ford and GM long ago opened plants in the country. Restrictions on autos not made in Australia served their interests too.

Q: From your perspective were you able to make, you being obviously part of the team, make any progress and how did you deal with this?

KLOTH: U.S. Trade Representative (USTR) is the one who leads the American team, although that office sometimes agrees to a delegation of work. Department of Commerce, for instance, led a team trying to open the Japanese government construction market to internationally

competitive bidding

In the midst of my time on Japan desk, we had a transition from Reagan to Bush I. In terms of watching Secretary Baker and his team move into the Department, one would have thought that would have been seamless, given one Republican was replacing another. In fact, I recall it as being a time of some stress for those at levels closer to the secretary than I was as a desk officer, but that stress was passed on down.

Secretary Baker moved into the Department rather quickly, as I recall. He had an office on the first floor, the transition office, and people were very favorably impressed both by the team members they met and by the new Secretary-to-be's own demeanor. I remember our OMS (Office Management Specialist) came back one day very excited. She had been in the lunch line, and the Secretary designate had been right behind her.

When the transition actually took place, although Secretary Baker had a very sharp team he brought from Treasury where he had been under Reagan, the seventh floor (where the Secretary has his office) seemed uninterested in much of the Department's work. Only a few issues like Russia interested them, so no guidance on many issues was coming out. Morale went down.

In EAP, however, we had a new Deputy Assistant Secretary for economic affairs, Robert Fauvre from Treasury, so we in EAP/J felt we were in the loop on the new U.S.-Japan Structural Impediments Initiative (SII). Treasury developed the SII as a comprehensive approach to move beyond the individual item by item negotiations that seemed endless. In addition to talking to the Japanese about individual issues brought up by individual companies, we would look at six areas where the structure of the Japanese system impeded foreign companies coming in. They included a broad range of issues from the relationships between companies and banks to the distribution system (defined as everything customs to the large-scale department store law) to price differentials.

Price differentials, led by Commerce, turned out to be a great one from the public relations point of view. You could often buy Japanese products cheaper in the United States than in Japan, but U.S. products would be more expensive in Japan than in the US. Up until the early '70s, Japanese aware of this thought is a necessary measure to keep consumption low and investment high. Further, as a resource poor nation Japan had to import things like oil and pay for them in dollars gained through exports. This was the development model they had and was widely accepted.

By the late '80s, Japan had been doing very well for decades, and Japanese were starting to do things like travel with families. They wanted a reward for their hard work and thought they had earned it. When a Commerce Department and Japanese counterpart survey was done, and the results got into the Japanese media, the Japanese public and media response was, "Yeah, why are we paying so much more for this or that?"

It was not all the result of policy to make imports more expensive. When we looked, for example, at the distribution system, all these small mom and pop stores need more frequent deliveries. So, of course, there is a cost for that. Our argument was that the restrictions of the

large-scale department store law made it very difficult for a new large store like Toys ‘R Us to set up in Japan and bring goods at lower prices to Japanese consumers. There were other issues too, the question of how long it took to come through the ports to get through all the customs and other clearances.

Q: Looking at it did you find that the customs clearances were just trying to stall rather than to do what one should do, necessary operations or a lot of other things like that?

KLOTH: Well, we found Japanese Customs was an unexpected ally. The Japanese Customs did not have the latest information technology and was way behind U.S. Customs not only in the technology but in the use of technology. For example, they had not developed as sophisticated set of risk-evaluating algorithms, including input of intelligence information, as U.S. Customs had. Japanese Customs realized that their government’s agreement to our “demand” for faster processing could force the Finance Ministry to fund modernization of their data-processing system.

Q: If you examine these two different systems, this is sort of the American perspective in reading about this in the various newspaper accounts. You have the feeling that the American system is basically practical; the Japanese was designed to keep things out. I mean did you come away with this impression?

KLOTH: True. But other factors were also at work. In Fukuoka the head of the local office of the Ministry of International Trade and Industry (at the time called MITI) said, “Japanese have much more of a sense that the government is responsible for the quality of products that they buy as well as for the organization of a host of other things in society. It’s a big problem for the government, if something comes in that turns out to be problematic.”

Listening to Japanese officials in countless meetings, I realized that in many areas they were already much more worried about Chinese than U.S. imports. China in the 1980s was just gaining steam, but the Japanese were quite prescient in seeing quality issues coming. Look at U.S. reaction to lead in the paint of kids toys from China! For example, if Japan accepted U.S. test results for pharmaceuticals or even construction materials, they would open themselves up to great pressure in the future when China wanted to send exports to Japan. Lately Americans have been criticizing a lack of import testing here.

Fundamentally, the Japanese were frustrated by our attitude. “When we sell you our products, we find out what the U.S. requirement is, and we manufacture to the requirement. Now why don’t your firms manufacture to our requirement?”

Our manufacturers responded, “Because you restrict our ability to sell in quantity in many different ways, so it’s too expensive.”

Starts too sound like the chicken and the egg in some aspects, but in the end the U.S. is a bigger market, so foreign companies are go meet our standards.

Q: Were the Japanese and the European Community demanding kind of the same things or had

our trade gotten so sophisticated with the European Community that it wasn't an issue?

KLOTH: We had some issues with Europe, but nothing of the scale of friction with Japan. There were issues, for example, European government support for Aerobus. In the case of Japan, there were so many issues. It was so broad and so deep that it was a major negative element in the relationship and very serious.

So many members of Congress had industries in their districts that felt they were unfairly disadvantaged trying to export to Japan, which was by the '80s a large potential market. Certainly the beef, a highly symbolic issue, and the autos were infuriating for many Americans. Japanese would talk about the "cultural" importance of rice to Japan. In fact, the United States was not going to export very much rice. The Japanese were much more concerned about rice coming in from Southeast Asia. Americans could make both a "cultural" as well as economic argument about autos or beef for America. The political chemistry was bad.

Q: Okay, you've got our special trade representative who's the lead person. What from your perspective was the role of the State Department in the Japanese trade negotiations relations?

KLOTH: We worked closely with USTR and our embassy because there was no USTR representative in Tokyo. At a larger policy level our DAS in '88 Bill Pease, who was replaced by Bob Fauvre, said well. Our job at State was to be sure that one, issues identified as targets for negotiations with the Japanese were of real importance to the United States, given that the U.S.-Japan relations were critical to U.S. security as well as economic interests. Two, as the prime U.S. experts on Japan and the dynamics of Japanese government and business, the Japan desk and our embassy had to work actively to develop strategies that led to real results for U.S. business, and to minimize the kind of nasty political posturing, and huffing and puffing that some in DC agencies were tempted into simply to score points in the U.S. domestic process. Trade fights hurt our relations with Japan, a close ally. We had to make sure the benefits were worth the price we paid. I found the biggest challenge to your diplomatic skills was working in the Washington interagency process, not foreign capitals.

I guess my own quick and dirty on trade issues is that I'm hard pressed to think of a trade or an economic issue that is really an economic issue. They're political issues. In general, tariffs or quotas whether in Japan or the U.S. are the result of political decisions. The United States does not restrict sugar imports into our country from abroad because it makes economic sense, unless you are a sugar crop producer.

Q: Let me ask an indiscreet question. You were involved with negotiations on high visibility subjects. Leaks are often an issue when stakes are high. Did you ever leak? If not, why not?

KLOTH: No. At State in '82, when I joined, there were two big things on the minds of the people running our A-100 incoming officers' basic course. They were mid-level and upper mid-level officers, an O-3 and an O-1. One was the question of leaking. These officers, if they had not been in Vietnam, had certainly been in the Vietnam era Foreign Service. They and more than a few senior officials, who addressed us, emphasized that you have an obligation within the walls of the Department to put forward vigorously the position that you think the U.S. should follow.

But once a decision has been made on what that U.S. position would be, your job is to advance that position. That includes defending it on the Hill and defending it to the media.

If you disagree with it, then you have a number of options. One is to just proceed forward. If you feel that your disagreement is at a level where you cannot in good personal conscience continue to defend it, then you should either seek another job in the Department or you should resign. Those seemed reasonable terms of employment to me.

Further, while there are different motives for and results of leaks, my experience was that in most cases with the issues I worked over my career, leakers were trying to subvert agreed policy or gain advantage outside the process when their arguments were unpersuasive in the process. That struck me as sleazy. If you don't like the policy for whatever reason, move to a different job or quit, then go public if you're so moved. Maybe I was just lucky; perhaps deliberations on the issues that I worked on didn't produce a result so disagreeable that I felt tempted to leak.

The other thing that was much on their minds was the Iran hostage taking, because this was March 1982, so there were people in the training world who knew people who had been hostages. Bruce Langdon came and spoke to our group about the Middle East and about being a hostage. It was also made very clear to us that the U.S. government was not going to negotiate for our release, and that meant that might increase the chances of your being killed or held a long time. The Department wanted everybody in the class to think this through and be sure you really wanted to be part of the service.

RICHARD T. McCORMACK
Undersecretary of State for Economic Affairs
Washington, DC (1989-1991)

After attending Georgetown University, Mr. Richard T. McCormack assumed a multitude of administrative roles for the Nixon Administration in addition to serving under Governor William Scranton of Pennsylvania and Senator Jesse Helms of North Carolina. Mr. McCormack's career also included positions as the US Ambassador to the Organization of American States as well as Under Secretary of State for Economic Affairs. Ambassador McCormack was interviewed by Charles Stuart Kennedy in 2002.

Q: What happened on the Japan-related issue?

McCORMACK: We had a much more open market in the U.S. for imports than was the case of Japan. I was in favor of pressing the Japanese harder to open up than some of the other people in our Department. My view was widely shared on the Hill. A very strong piece of trade legislation called Super 301 was passed. The second Japan-related problem was of a structural nature. A very strong dollar during the early part of the Reagan period was partly a consequence of very high U.S. interest rates. High rates attracted a lot of foreign money. You had many other countries that wanted to build up their manufacturing bases and were perfectly delighted to see

the U.S. dollar remain very strong. That was what the Plaza agreement was meant to address. A strong dollar meant, all other things being equal, that the U.S. manufacturers were going to have difficulty competing. This situation plus import barriers abroad helped cause the Midwest industrial implosion, what was eventually called the rust belt. Unemployment soared in parts of the country during the first Reagan administration.

A basic structural flaw in the overall trading system evolved. As tariffs became less important, competitive currency policies increasingly determined the terms of trade. The floating exchange rate system was not allowed by mercantilist countries to operate freely. This certainly worsened after the 1997 Asian banking crisis.

But in 1989, I felt that we needed to lean harder on the Japanese to reduce non-tariff barriers and some of the other structural obstacles that were making it very difficult for foreigners to export to Japan. As an example, at one point we pressed the Japanese because we were concerned about Colombia needing something to export besides drugs. So we asked the government of Japan to let the Columbians export their flowers to Japan. After tremendous pressure by the trade office, the Japanese formally opened the market for flowers and removed all tariffs for such flowers. However they also immediately instituted a new customs procedure that required inspection of each individual flower at the airport before it could be marketed. Of course that made the business impractical. The Germans told me that in the case of automobiles, 30% of the value of every single German car sold in Japan was related to costs of complying with non-tariff barriers and special standards that the Japanese had established to discourage exporting cars to Japan. And on and on and on. The State Department was naturally interested in preserving a good relationship with the Japanese, and I was also. But I felt we needed to create a more even playing field. This was not always a popular view at the Department's Japan desk.

Q: This raises a very important issue. The one between trying to right an injustice, and trade barriers, and good relations. You know, you can have great relations with a country if you do everything they want you to do. This is a classic battle. But I would think by this point, the late '80s early '90s, that even the Far Eastern Bureau would see Japan for what it was, taking unfair advantage of our open market and their relatively closed market.

McCORMACK: It wasn't just the State Department that was not totally supportive of being tough on Japanese trade and currency problems. The Japanese admitted to Treasury in 1988 that they were spending nearly a billion dollars a year wiring Washington: providing money to think tanks, former senior U.S. officials, people who had political connections and access to the White House, etc. They created a huge and effective lobbying operation. Thus, you not only had to deal with the political sensitivities that would emerge from the State Department process, but you also had to deal with Japanese lobbying connections to the White House and the press. An enormous effort was made by Japanese officials to shape foreign press coverage of sensitive Japanese economic, trade, and financial issues.

It was widely believed, correctly or not, that if you cooperated with the Japanese during the time that you served in government, and was viewed as their friend, after you left government, you might be retained as one of their lobbyists or industry advisors. One high-ranking White House official was dismissed in part because of improper handling of a Japanese-related matter. Soon

afterwards he was given a million-dollar contract by the Japanese to study a possible second canal through Central America. In any case, it was very difficult to keep any secrets from the Japanese because they had so many different opportunities to find out what was going on inside the U.S. policy process.

Q: Was there any effort made by the FBI, the State Department, or somebody else, to identify people who were essentially on the payroll?

McCORMACK: As a matter of fact, after I left government, there was a major review by the FBI of people getting paychecks from the Japanese and other foreign interests but not registering as lobbyists. There was a whole series of proposed indictments that were drawn up by the FBI and sent to the Justice Department, according to media reports in 1992. Many people were taking money but not registering as foreign agents. When the Clinton people came into office, they noted the many prominent people who were involved in this potential problem, including some of their friends, and decided to quash the whole investigation. According to the media, two senior FBI officials resigned as a consequence of this. I have not verified this beyond what was leaked to the press.

Q: What I am talking about, if nothing else, is that you were dealing in an atmosphere in which you felt that you couldn't really trust a lot of people.

McCORMACK: No. I felt I could trust many people. I also felt, however, that there were no secrets as it related to U.S. policy toward Japan on trade issues as I mentioned earlier. When I left government in 1991, I went to the Woodrow Wilson Center for scholars. While I was there I was earning my \$40,000 a year stipend and recovering from 10 years in the State Department, ill and bone tired. I soon received a visitor from a prominent Japanese company who said how much they valued my analytical skills, and offered me a large retainer. I told him that I didn't really feel I should do this because I had been dealing with Japanese issues for the U.S. government.

Some few political appointees, who plan to be in government for a brief period of time, use government service as a career launching pad for subsequent service of an entirely different kind. These people sometimes leaked. Subsequently, an executive order was passed slowing down the revolving door, prohibiting this kind of thing, and requiring a period of cooling off before you could become involved in lobbying. The issue continues. In one of his final acts when he left office, President Clinton canceled that executive order. This gave his people the opportunity to do things that he had been quite proud to prohibit when he was President.

These are the kinds of little problems that exist in this town. We all know they exist. The point I want to make is that when you are dealing with the Japanese and others on matters of trade policy, there are no secrets. You basically had to operate on the assumption that they knew everything that you were going to do and say. Therefore, when you moved to deal with them from a substantive point of view, you could not use classical diplomatic techniques. You basically had to prepare a power position that you knew was supported by the President and Congress. If you had that power position, you were able to go forward with your negotiation and possibly get some results. If you were operating without this explicit support, issue by issue, you

would be politely heard and ignored. That was the complicated reality.

Japan was not the only country where this was a problem, but it was a conspicuous example because in those days they dispensed hundreds of millions of dollars annually wiring Washington, a tiny fraction of their vast trade surplus. Such lobbying was viewed merely as a cost of doing profitable business here.

There used to be a Japanese joke. Where is the most expensive intellectual capital in the world?
Answer: Washington, DC.

Q: From your perspective at the time you were in the State Department, you were looking at this and did not see this as a particular weakness or problem.

McCORMACK: We knew that it was a long-term problem. One also assumed that sooner or later when you have a vast program that is not actuarially sound, this will become obvious to enough people. Politics will then do its thing; democracy will do its thing; speeches will be made; commissions will be established; changes will be made. Bear in mind a political appointee, who is in an office for a brief period of time, manages this policy debate for a short time. You start by building public awareness. You conceive strategies. To make these strategies work, you have to build a consensus. For major issues, this process can take years.

In the case of Japan, I decided after I left government to continue to provide my analytical services free to my successors and give them the benefit of everything that I had learned in dealing with Japan. Every year I do a major review of global economic trends, including the Japanese financial system. These reports were read by top people in successive administrations, beginning with Lloyd Bentsen when he was Secretary of the Treasury.

In 1997, the White House asked me if I wanted to be considered for Ambassador to Japan. So I know this work had some value. Each of us has some area of expertise. People who have done the Arab-Israeli issue very often offer their advice and thoughts to successive administrations as they move on. The period where you actually have power is brief. Power in our system consists mainly of sitting around a table, making your points known to your colleagues, and trying to persuade them. The second bit of power that you have is the ability to hire people and therefore magnify the point of view that you would like to see expressed within the system. But it is a very diluted thing because so many people have overlapping portfolios. There are always at least three different agencies that are watching the same issue that you are watching not to mention your other colleagues in your own agency. You have to be able to justify what you are doing and sell what you are proposing.

ROBIN BERRINGTON
Cultural Attaché, USIS
Toyko (1989-1993)

Mr. Berrington was born and raised in Ohio and educated at Wesleyan University

Harvard Universities. After service with the Peace Corps in Thailand, he joined the Foreign Service (USIA) in 1969. During his Foreign Service career Mr. Berrington served at posts abroad in Thailand, Japan, Ireland and England, variously as Public and Cultural Affairs Officer. He also served several tours at USIA Headquarters in Washington, DC. Mr. Berrington was interviewed by Charles Stuart Kennedy in 2000.

BERRINGTON: Back to Japan. Sayonara was not part of my vocabulary. I was there from the summer of 1989 to the summer of 1993.

Q: So a good four year tour. What were you doing there?

BERRINGTON: Well, I was the Cultural Attaché, what they called the senior CAO. USIA had a number of so-called senior CAO positions around the world. One was Japan, one was Germany, One was India. I think maybe Mexico might have had one as well. I think they were the four posts where the cultural program was large, well funded, had branch posts, almost all the basic USIS activities in play, so the American staff was large enough that they would make CAO a senior CAO and I had both a deputy CAO as well as assistant CAO. Not many places had that array of titles and officers. Frankly speaking it was just title inflation as far as I was concerned. But nevertheless, that is what I was. I should add that I was fully surprised to be back in Japan. I never expected to be there again because when I looked at the staffing profiles, the way things were, the incumbent CAO in Japan, the job that I would have been most likely a candidate for and the one I was most interested in, was supposed to be in place for a number of years yet. The job would not be open when I was available. Anyway, what eventually happened is that he decided he didn't like Japan. He decided it was time to retire, and after two years in Tokyo, he surprised everybody by upping and retiring right then and there which then opened the CAO position unexpectedly. That's how I got there.

Q: Who was the ambassador? I guess you had two didn't you?

BERRINGTON: Well, in the last months while I was on the Desk, we were kind of in between ambassadors. Mile Mansfield had left Tokyo in December 1988 and Mike Armacost arrived in May 1989. In effect by the time I got there and by the time I got into play, Armacost was the Ambassador. He was in effect the chief of mission for the whole time I was there.

Q: You arrived in 1989. This, of course was the year of destiny. The whole Soviet Union fell apart. Were you seeing a change in what we were after in Japan during this period beginning to move out of the cold war?

BERRINGTON: Well, not really. As I may have said before, cold war determinations did not affect our activities in Japan quite as much as I think they must have in other countries. The one item that had a clear cold war impact was, of course, the security treaty, the U.S.-Japan security treaty. Because that, in a way, kept the Japanese from rearming. You would have thought that the Chinese would have been opposed to any kind of security treaty between the U.S. and Japan, and of course they were years before. At this point the Chinese actually came to see it as kind of a good thing, in a way sort of keeping the cap on the bottle of Japanese militarism, or cork in the

bottle I should say. Of course the Koreans were very happy with it. When I say the Koreans I mean the South Koreans, because we had our own treaty with the South Koreans, but also because it just added to the security of East Asia as a whole. You know, for much of that time the most potential flashpoint has always been the border between North Korea and South Korea. Even the Chinese, who maybe felt comfortable talking about Taiwan or whatever, didn't really present that much of a real danger. So it was really more the Korean problem we had to worry about. The cold war really took on more of a regional coloration, and the real enemy there was more likely to be North Korea than anybody else. The Russian element in cold war politics in other parts of the world didn't play as big a role, I think, in what we were doing in Japan. So the whole collapse of the Soviet Union, all of that didn't really change our basic mission that much. Again the trade issue was predominant and always has been, probably always will be. The trade issue was so strong. The security treaty, and then other areas of cooperation between the Japanese and us in say environment or technology. Energy sources were of course always an ongoing concern. That wasn't a real issue that divided us; it was one where we tended to agree.

Q: Of the issues at the time I can think of, were you engaged, as cultural affairs officer, in activities relating to the Gulf War and the rallying around. Iraq's invasion of Kuwait had an effect on Japan of course because of its dependence on the Persian Gulf oil.

BERRINGTON: Yes we were engaged; we were involved, but it was more in the - I guess you would say - in the opinion forming process than anything else. You know, we would bring out, the cultural section would organize and bring out speakers to talk about this. We would provide materials from our libraries, which incidentally at that point were starting to be called information and resource centers rather than libraries. The word library over the years kind of became a dirty word. It reeked of old fashioned and a lot of people back in Congress couldn't understand why we needed public libraries in countries around the world like Japan,. They would argue we don't have enough libraries in our own country. I mean that is confusing the issue, as though libraries in South Carolina are dipping into the same pile of funds as libraries in Japan that the embassy supports. But anyway we would provide materials from our information resource centers.

You have to recall at that time the Japan program had access to electronic data. Our computerized programs were very much state of the art for its day. If a newspaper man who was covering something about the Gulf War, he could get into one of our information resource centers, talk to one of the staff. She could put him to a computer or get the material herself. In any case we were in a position to provide these kinds of materials almost instantaneously and very completely, and in much greater detail than we could have before the onset of the computer and all of that was provided there. So yes I guess that is kind of a roundabout way to answer that but yes we were in the whole business of shaping opinion and informing key audiences, members of the audience, yes we were engaged in things like the Gulf War.

Q: This is your third tour in Japan. Had you noticed an evolution in I won't say Japan itself, but I how opinion and how opinions were working. You are trying to inform and influence and all. I was wondering whether you were seeing a change through the eyes of a new generation, more people willing to get away from the lockstep of Japanese society?

BERRINGTON: Let's see my first tour was 1969-1975. The second was 1981-1986, and third, yes this is the third time in Japan. Over these tours I would say there were some very definite changes. I mean this was the time when I think all this change was becoming much more evident. First and foremost was the role of women. The opportunities for women had been gradually increasing over the years, but really at a snail's pace. In the 1990s it started to really open up. A number of reasons for this. One was the violence of the so-called bubble economy, when there was just lots of money around, lots of job opportunities around. The Japanese population, if you ever go to Japan, it is an extraordinarily crowded and jammed group of islands, but in fact it is a fast aging society so the number of people available for jobs particularly in that time when jobs were increasing by leaps and bounds was not that great. There weren't that many young people around, so that sector of the population that normally would just go to school, graduate, get married and stay at home and tend the kids and clean the house suddenly were right out there in the job market. The whole business of birth control changed as well. Women were now not having babies as quickly. I mean, if it all sounds similar to the changes here in the States, it was. It may be 10 or 20 years later in Japan, but the whole business of what women could do was moving down the same track, at a slower pace but...

Q: But you know, you've seen these changes in a society, and were we trying to reach women's groups? Were things changing for you target audience?

BERRINGTON: Oh yes, well more and more organizations like the sort of Japanese equivalent to the National Organization of Women or whatever. There were groups like that out there. And if they were of a national level of impact, and if they were concerned with issues that we were concerned with, then we would try to work with them, or we would invite them to activities or include them in events that were going on. They would become a part of our target audience.

We found out it is a very curious question. We found that many of the kinds of public action groups or community organizations like say consumer groups in the United States. Consumer groups in the U.S. of course, worked for lower prices and for greater availability of goods and higher standards and you know environmental protection and whatnot. In Japan, organizations like consumer groups weren't necessarily working toward the same goals. It is a strange thing about Japanese society, but many of those kinds of pressure groups or lobbying groups had such strong ties to the government already that they were almost part of the government apparatus, so that in a trade issue where our argument was bring in the U.S. good. We argued it will create more competition and lower the prices, which seemed to be an automatic argument for any self respecting consumer organization. No, it didn't fly that way in Japan. The consumer groups there would argue, why do we want American foodstuffs. American foodstuffs would come in and put the Japanese farmers out of business. In other words they were just mouthing the Japanese government line. It was very frustrating for us because we couldn't understand how consumer groups with any self respect could in effect simply parrot what had become a version of the government line. But in Japan, most pressure organizations had to have that kind of political connection to be effective. The idea of being a gadfly or a Ralph Nader type troublemaker would just not a role model for the Japanese. The just didn't see that kind of function doing any good for society. So we did not work as much with some of these organizations that on the surface you would have thought oh the embassy must be working with X and Y, because they were just not that useful a group to go with.

Q: You talked before about bringing in speakers on program themes that had become sort of automatic. How did you find it when you came back this time?

BERRINGTON: Well, as I had said before, a lot of those changes had become fairly well institutionalized, and they had their ups and downs. By the time I got there in 1989, it struck me as being another one of those down periods. But 1989 was an interesting time for the embassy. I am sure nobody really gets any credit for doing this on purpose, but it was as if all the old gang came back. And by that I mean people like Mike Armacost, the ambassador, who had been in Japan as a special assistant with Ambassador Ingersoll years ago when many of us were there during the Carter period that I mentioned earlier. The DCM (Deputy Chief of Mission) was a guy named William Breer who was also very familiar with the USIS program and what we were doing. He had been a political counselor in previous years and now he was back as the DCM. Rust Deming was now Political Counselor. Then there were people within USIS who it was now time for them to come back. It just was a very kind of unified and compatible group that was there at that time. The PAO was Rob Nevitt who had been with me in Thailand actually years ago in the late 60's. Although this was his first time in Japan, he understood the value of having a well organized and well thought through and very carefully targeted program. So he had no problems with any of that. Many of the center directors and many of my colleagues in the press office or even within the cultural office they were in agreement as well. So, in effect even though it was a little bit rocky when we all started coming back in the summer of 1989, I would say by the end of the year we had formed a fairly well knit and good program. We all sort of knew how each other could work and it was quite comfortable, the situation.

Q: How did you find by this time ties between American academic institutions and Japanese institutions? Were there strong ties?

BERRINGTON: Not really. There were some sister school type relationships. It didn't work very easily for several reasons. First of all was language. If an American student or American teacher goes to Japan, to be really effective at the university there, he or she has to have Japanese. The classes in Japan are not run in English, they are run in Japanese. How many professors or students in the U.S. are comfortable with the language to be able to do that? The same thing applies in reverse. If a Japanese student or professor is going to go for a year to the sister school or whatever, they have to have good English. Obviously the English level of most Japanese is far better than the Japanese level of most Americans. Even still the English level of too many Japanese, and I am sad to say this is particularly true of the academic community, is insufficient to the task I think academics tend to be less outgoing and have that kind of extroverted personality that you really need to develop a language well, to learn a language well. In any case few academics in Japan had the English ability to survive as a student or a teacher in the U.S. Even though many schools in America and in Japan wanted that kind of relationship, the Americans wanted it because again this is the bubble economy and Japan is rich, money, money. You will remember also at the same time when Japanese businesses were seen as absolute successes. They had the most brilliant management ideas. Things like theory X and all of that where all these books being written. Japan was the hot number of the early 1990s. Everybody wanted to find out what the secret of Japanese success was. So sure there was a lot of interest, but the language was a pretty big barrier for a lot of people.

Secondly, Japanese universities were run by the ministry of education. The ministry of education in Japan has to be one of the most feudalistic, backward, hardened, hard-edged, I mean just a very stubborn bureaucracy which does not like new ideas or change. They found the arrangement running the big state schools, universities of Tokyo or Kyoto, all the best schools, they found it all very comfortable, why should they change? It was working for them. So any type of school agreement, any kind of exchange program that might be set up would have to have the minister of education's stamp of approval. Getting that was sometimes a big problem.

A third problem, again going back to the bubble economy, Japan in those days as you may know from your own experience because you had passed through Japan at that time was extraordinarily expensive place. This was the era of the ten dollar cup of coffee and all the horror stories you hear. Now it was expensive because you were converting from dollars to yen, not necessarily expensive if you had yen to begin with. Nevertheless, that meant a lot of Americans simply wrote Japan off their list. They might have been interested. They would love to go pick up on this or that management program, but they just didn't have the money to spend at that time. So for all those reasons there was not much exchange going on between Japan and the U.S..

Q: Within your circle of Americans and Japanese, were there Cassandras saying look at this economy. It's a bubble economy based on real estate values and there are real problems or was the atmosphere in the embassy and also in your Japanese's social group this is the way it is going to be.

BERRINGTON: There may have been a few. Unfortunately those that said those things had kind of blotted their notebook with rather anti-or statements critical of Japan that kind of reeked of slightly racist or that evoked memories back to WWII or whatever. Many of the criticisms of Japan that might have been Cassandra like would be somewhat compromised by the known political standing or attitudes of the person that was saying this. It made his or her comments far less credible. I am afraid most of us were pretty guilty of just being sucked up by the enthusiasm of the times.

Yes, a lot of us had lived and worked in Japan knew there were problems, knew that these kinds of inflated prices, property could not go on forever. I mean it was called a bubble economy during that time. We all know what happens to a bubble economy, it bursts. That is the nature of the beast, so we knew it was going to happen sometime. Just when of course, nobody knew. But until that happened, there were a lot of people willing to go out there and join in the party and rake in the money and take advantage of all the opportunity that was there. It is hard to criticize people for not being a little bit more realistic about the weaknesses of the system at that point.

Q: Well, during this time what were your projects that may have been different from other times?

BERRINGTON: One of the big issues for us in the cultural office and in fact it connected with what you were asking earlier. This is what we called the branch campus problem in Japan. What this was because of the reasons I have just explained why there were no sister school relationships or very few, and because of the expense and whatnot. Many American schools wanted, they wanted those Japanese students to come to their campus in Kansas or Texas or New

Hampshire or whatever. But that wasn't going to happen. So if they couldn't get the kids to come to the U.S., what they did was to take the mountain to Mohammed so to speak and they would set up a branch campus, Smith University or Johnson College, you know I am just making names up now. They would set up a branch campus in Japan. The idea was the Japanese students could enroll at this American branch campus, study English, study other kinds of programs, get a degree from this school, and then while staying in Japan, and then move on into employment or whatever. This kind of arrangement was set up usually with the cooperation of local authorities in a city or prefecture or local politicians or local businesses. It was usually seen as a money making machine. Its academic credibility, its academic credentials quickly became suspect. The ministry of education was always very suspicious of this because they didn't like the idea of all these foreigners coming in and setting up branch campuses all over the country. The quality of teachers that were hired to teach at these places sometimes were brought over from the U.S. but often were hired locally. They didn't get great teachers. Some of these schools promised more in the way of programs and degrees than they were prepared to follow through and provide. Well, after about a year or two of all of these schools coming in to set up these campuses, things started to get rather nasty with the ministry of education, parents of students, local authorities and others getting more and more upset with this kind of an arrangement. Lawsuits, threats, started causing political problems. It became quite unpleasant. As a result the embassy was drawn into this because many of the Japanese parents or people from the ministry of education wanted the embassy's input trying to control or bring some stability to what was a very bad situation. So we were very much involved with that problem. That was probably one of the main things that marked the four years I was there. In fact my deputy cultural affairs officer, that was one of the main things he handled, that and nothing but that.

Q: Were we trying to dampen this thing, because it was giving us a bad name.

BERRINGTON: Oh yes. It gave American education a bad name. It gave the schools that came over a bad name. It was just a losing proposition for everybody. The only ones that gained from this were usually the local Japanese businessmen or others who had, because the ministry of education insisted on local control, wanted these Japanese businessmen or politicians to sign on as presidents or members of the board. These guys usually gained financially from this. No problem for them, they were getting money, so if the school didn't do a good job, they didn't care. They were just kind of guys behind the scenes. Often they were, members of the board were not even known to the public at large. Yes, we wanted to put a stop to this kind of academic and financial hanky-panky simply because it was giving a bad reputation to American education and the United States in general.

Q: What issues seemed to come to the fore? How about movies and all just doing their things. It was a business that had been going on for years.

BERRINGTON: Yes, very much so. There was no change there. In fact the 1989-'93 period was largely, because of all the money that was in play, was not a terribly crisis ridden period, except for the continuing trade issues. Even they I don't think seemed quite as bad at times. I mean I can recall you had people like member of congress Helen Bentley [Republican Party], I believe, from Baltimore. She took a sledge hammer to a Japanese car in front of the capitol building one day. It was all a photo opportunity. She didn't just see a car. They had brought in a Japanese car and

then the Congressmen all bashed on it with sledge hammers. [Editor's Note: In 1987, Bentley organized a public relations stunt in which she and several GOP colleagues used sledgehammers to destroy a Japanese-made radio on the Capitol steps.] That caused a bit of a ruckus in Japan.

No the relationships between the two governments were quite good, quite compatible. The exchange of information, there were even the start of some programs where you were exchanging members of the bureaucracy, members of a Japanese agency might go to the U.S. for six months and work alongside their American counterparts. Then vice versa, members of the U.S. bureaucracy would go to Japan and do the same thing. It was evidence I think of the closeness of the two governments, bureaucracies and how smoothly that it worked.

Q: Were we concerned at the time in Japan's growing prosperity Japan and Japanese entities buying Rockefeller Center and all that and the American reaction of Japanese bashing in the United States?

BERRINGTON: Yes, that was always a constant undercurrent. It was frankly because of one basic thing and that is, I am sorry to say, but there is a racist element in America, and Japanese are a different race. Memories of the war were still - most of the veterans were old men - but there were some memories of WWII. You certainly didn't look at the amount of investment in the United States from Holland, Canada, Germany and the UK all of which were still higher than Japan at that point. Yet there was not Dutch bashing or Deutsch bashing or anything like that, but they were behaving this way toward the Japanese. It was hard to not regard it as a form of racism.

Q: Is there anything we could do about this?

BERRINGTON: Well, no, because this was a problem back in the U.S. of course. The embassy was in no position to have any kind of effect on things back home. I mean newspapers would write editorials or local politicians - a Congressman or a mayor or somebody - would make some inflammatory statements. There were even a few well known academics who would kind of like to wave the flag and engage in this kind of practice. No there wasn't anything we could do about it. If those people came through Tokyo as they occasionally did and wanted to meet with the embassy, of course we would meet with them, and we would try to reason with them and present what we thought was a more accurate realistic picture of what was going on. But a USIS program is not organized to deal back in the U.S. The embassy really had such small resources that we really can not affect the discussion like that back in the U.S.

But Japan was very concerned. The foreign ministry and the Japanese government was definitely upset at this. Constantly when you would go out and meet with, and it wasn't just the government officials. The Japanese people, as I mentioned before in the papers, there was what we called this significance gap where the papers would report on every single thing that happened in the United States that concerned Japan. Even if it were so irrelevant or insignificant, you know if something happened in some small corner of North Dakota or a Congressman that nobody has heard of before or since says something. Who cares? But the Japanese would care. It would get reported in the papers, big headlines, pictures, stories. So the Japanese were definitely concerned because they wondered if things were just going kind of haywire vis-a-vis the U.S.-Japan relationship.

You have to realize the Japanese look at the rest of the world as a source of so much that they need to survive. The energy they need to keep the country going, the cultural stimulation they need to keep society going, all of this comes from abroad. Their main partner, the Japanese are very concerned about the hierarchy of the world situation. In the Japanese eyes, their main partner, their main benefactor, their main ally was the U.S. So if they think something is happening in the U.S. that somehow we are slipping into an anti-Japanese way of thinking, they found this a concern. They were not happy with this. But the Japanese were sometimes their own worst enemy. For example, on American TV, let's say some American politician says something outrageous in the emotion at the moment, you would think that a member of the Japanese embassy or a well known Japanese of some international reputation could then get on American TV or in the U.S. newspapers and do an interview, do something that would show how the Japanese really think or their side of the argument or something that would be persuasive or credible. They had a very hard time doing that. They are just not comfortable speaking in public. They are not good on TV. Their English language ability was always a serious barrier for allowing them to communicate internationally. Several of us in the embassy used to just batter over and over again on the point why don't you train a group of whether it was government officials or scholars or journalists or anybody who can get out there and talk about these issues so that your side of the story is getting across to the public in the U.S.? It is not. You are literally leaving the whole discussion up to the Japan basher side. Why not engage these people; why not present your side of the issue? Over the years a few did emerge, a few Japanese that could do this. But they are not good at public affairs. The whole concept of what we had been doing in our work for years, public diplomacy, is just not a function it is not a value that they have. As a result they suffer from it. I mean the other problem, too, is, I mean if I were ask you to name the Japanese prime ministers since WWII, you would probably have a hard time to give more than about two or three names. Whereas if you were Japanese and I were to ask you to name the American presidents, you could rattle them off, bingo, bango. Or name famous Americans, they could do that. But could you name some famous Japanese personalities?

Q: This is tape seven side one with Robin Berrington. For famous personalities, how about Mr. Toyota, Mr. Honda, Mr. Sony. But aren't these made up brand names?

BERRINGTON: No, there really is a Mr. Toyota. There really is a Mr. Honda. If he was to walk into this room you wouldn't even know it. These are not well known. They are not recognized; they are not public personalities like American business leaders or political leaders. Even famous scholars in America like Henry Kissinger will develop into a public personality. That doesn't happen in Japan. {Editor's Note: sounds like] "Lord Ika," who is one of the most impressive people in the 20th. century in Japan, was very much castigated by his peers for being so well known, for having this kind of personality. Why? Because he spoke English, because he was very dynamic and kind of liked to get out there and be in the spotlight. There is an old Japanese saying, if the nail sticks up, it gets pounded down. That is the problem with Japanese society. Any business, government or whatever, anyone who sticks up, who gets attention, society pounds them down. You don't have the kind of individual in Japan that can stand up and say, "That's wrong," or be a public speaker. In the States almost all of us have public speaking courses in high school or somewhere along the line. That never happens in Japan. It is just inconceivable in Japanese education. So it is just a totally different attitude about how you deal with each other, how you deal with the public, how you cultivate and nurture personality. As a

result the Japanese are their own worst enemy.

Q: You've watched Japan over a period of years since 1969. Do you see a change? Because what you are describing is a national characteristic, but it is a national characteristic that is not a winner's characteristic in a competitive world.

BERRINGTON: Well, and you see what is happening now. After the bubble burst, Japan has really struggled to deal with it. The Japanese used to get very depressed when they would think about how many Nobel Prize winners they had compared with the other countries with similar GNP's or research institutions or level economy or whatever. The reason they don't is because the idea of promoting innovation, inventiveness and all of this is just not part. It is difficult for me to say why, but it is just not part of again Japanese character. So when the bubble burst and the economy went into such a drastic slide, you know, it has been years and they still are not really sure if they are out of the woods. I remember just a couple of months ago there was something in the papers about how the last quartet it looked like things were finally turning around. But in the quarter after that, it was back into negative figures again. So they haven't come up with any good ideas on how to turn the economy around. There still are not that many well known Japanese personalities or figures that can stand up and excite public emotion. Having said all of that, yes it is changing. It is definitely changing. There are more and more women in business, in government. In the last election there were more women elected than ever before. You know, just a couple of weeks ago in the latest election. More and more companies are being started up, you know the Japans dot-com's have come along. So, yes, the change there is just a much more glacial change. The thing is it is getting better, and it is too bad the bubble economy had to burst when it did and it has taken so long for things to stabilize. I think most of us that have been involved with that country know that it is just a matter of time. They will probably be stronger for the experience. But they do have some definite negatives that they just have to deal with, one of which is the bureaucracy which is so overwhelming and so inflexible and rigid and just tends to dominate every aspect of society.

Q: Is there anything else we should talk about or should we move on? Were you there when President Bush visited?

BERRINGTON: Oh, yes. Well, as the cultural attaché, I was always in charge of the wife. On that particular visit, I was in charge of Mrs. Bush. She was terrific. We had a good time. I remember she was interested in problems with old folks so we took her to an old people's home. She wanted to do some sightseeing and other things. It was a very nice schedule. He was there for 48 hours, two days. On the second day, President Bush was playing tennis with the emperor and the crown prince. Ambassador Mike Armacost was his partner. So it was Bush and Armacost versus the emperor and the crown prince. Mrs. Bush and I got back to the place where they were playing tennis just as the game was winding up. We all sat around and talked. The President looked tired. He had been suffering from a bad cold or something. The Japan stop (January 7-10) was the last in a series of visits that started in Australia on December 31, 1991 and went to Singapore (January 3-5, 1992), and Korea (January 5-7). They went back to the hotel, and at that point the only event for the rest of the day was the state dinner being hosted by the prime minister at his residence. As control officer for the President's wife, I accompany her the whole time she is on her separate schedule. But when she goes back to the President's party, in other

words when she is traveling with the President to a state dinner or whatever, I, as her control officer, back off, because the President's control officer automatically takes her under their umbrella. So I was in effect finished for the rest of the day. It was very tiring as you know. I went home. I was watching the event on TV. This is like 7:30, 8:00 at night. I was watching it on TV when suddenly I saw something was not right. He slumped over. The cameras were way in the back of the room. You couldn't really see up close what was happening, but when everybody realized that the President had slumped over and fallen under the table, then everybody suddenly got very tense. The camera tried to zoom in. But within minutes the phone rang. It was controller of the president's visit. They said, "Robin, be prepared to get down here right away." I said, "Why?" They said, "Well, as you may know, the President has taken ill, and we need somebody to deal with the imperial family."

One of my other functions in the embassy was as the sort of main contact with the Japanese imperial family. This was partly a function of my job but also partly was based on something I had developed over the years by being in Japan so long. I had gotten to know a couple of members of the imperial family through their interest in the arts. One thing led to another. For example, the empress used to call me up if she had questions or she wanted a copy of a book or materials about the United States. She would just call up and say, "Mr. Berrington, can you get this to me?" I would. The emperor and the empress were very interested in music. We would provide music opportunities to them, for example, Orpheus, the chamber music group. When Orpheus came to Japan, I arranged for Orpheus to provide a private concert for the emperor and the empress and their family, because all the members of the imperial family play musical instruments. The idea was they would be able to play with Orpheus.

I was often invited to accompany the crown prince when he would go to maybe an opera or a ballet because they liked to have a foreigner or two with the official party, and because I could speak Japanese and I knew him, I was an easy pick. I would often be invited to their houses or palaces for dinner parties or cocktail parties. I wasn't a foreigner that was going to embarrass them or cause trouble, and being cultural attaché doesn't hurt either. So anyway when the President got sick, there was just immediate concern that the imperial family would get very concerned because the President and the ambassador had been playing tennis with the emperor and the crown prince and would the emperor feel upset that maybe the President had overdone himself or they had not been good tennis players. Concerns like that. So they wanted me down there in case someone from the imperial palace showed up with flowers or just in case. So I said, "Sure, of course. I'll come down." As it turned out they quickly realized that all he had was stomach flu. As you know of course, he up chucked his dinner in the prime minister's lap. When they took him back to the hotel and had the doctor look at him, they knew exactly what the problem was. It turned out the emperor didn't show up or the crown prince didn't come and there was nothing like that, and I didn't have to do anything. But, it was quite a tumultuous evening.

Q: While we are on the subject, do you see an evolving role of the emperor, the crown prince, and the royal family or were they hemmed in by the court bureaucracy that sounds like something out of the Austro-Hungarian Empire.

BERRINGTON: Yes, yes, yes. They were hemmed in, and the bureaucracy was an extraordinary one. Everything I have said about Japanese bureaucracy, just multiply it by three or four times

and you will have the imperial household agency. Probably the most hidebound, conservative, tradition oriented, inflexible, rigid bureaucracies in all of Japan. Because it is the emperor's bureaucracy, they feel that what they say goes. They don't have to worry about what others think. You know, we speak for the emperor. I can remember one time when Reagan...

Q: The emperor at this time was Akihito.

BERRINGTON: The emperor was Akihito. His father Hirohito did it the same way. But, Akihito, you have to remember, was tutored by an American Quaker. One (Elizabeth Gray) Mrs. Vining.

Q: She wrote Windows For the Crown Prince: Akihito of Japan.

BERRINGTON: Yes. So there has been...this was of course during the occupation after the war, and American influence there helped to raise Akihito, who was the Crown prince at that time, with an westernized outlook and slightly better exposure to the outside world. I mean he went to Gakushuin University which in the old days was a peer school, peer meaning nobility. The peer schools then after the war opened up to a lot more people. The current crown prince also went to Gakushuin but went to Oxford as well. This is the first time a member of the royal family or I should say an, crown prince level of the imperial family had been to university outside of Japan. Akihito, of course, married a commoner. The empress is not a member of one of the collateral imperial families of the old nobility. Her father was a flower maker. I don't mean flowers like in the garden but flour that makes bread. I mean he was a very wealthy, very well placed businessman. That marriage was something that just didn't happen. It was definitely arranged, and all the things that led to it were carefully orchestrated. So the family is changing, but the bureaucracy still calls the shots. But it is opening up, it is loosening quite a bit. I mean the fact that of some of my closest friends who were nephews of the emperor, the fact that they could do some of the things that they did. I mean they weren't in the immediate line. You know it would take three or four deaths before they would ever get up there, but some of them went to school in Canada or Australia. Some of them married commoners. On down the line, so things are shaking up. But the imperial family is very much a reflection of Japan. They are a very reticent family. Everything is kept very close to the vest. None of them are very outspoken or individualistic in any way. They are all very careful in what they say. They are basically cake cutters and ship launchers. They preside over fundamentally ceremonial and other kinds of state functions like that. They don't have what you would call glamorous or exciting lives.

Q: Compared to what has been happening in the royal family in England, they are probably well off.

BERRINGTON: Well, the Japanese family is probably in much better shape. Most people tend to respect the Japanese family. They do not particularly want to be like them, but they tend to respect them, and they are not held in the kind of ridicule or disregard that the English are. It is a totally different family system.

WILLIAM T. BREER
Deputy Chief of Mission
Tokyo (1989-1993)

Mr. Breer was born and raised in California and educated at Dartmouth College and Columbia University. After service in the US Army, he entered the Foreign Service in 1961. Throughout his career, Mr. Breer dealt primarily with Japanese, Korean and general Southeastern Asia affairs. His overseas posts include Kingston, Tokyo (three times), and Yokohama, His Washington assignments also concerned principally Japan and Korea. He served as Deputy Chief of Mission in Tokyo from 1989 to 1993. Mr. Breer was interviewed by Charles Stuart Kennedy in 1999.

Q: Today is October 12, 1999. Bill you are DCM in Japan from 1989-93. I can't think of a job that is more foreordained for you. How did that come about?

BREER: I was office director of Japan affairs in the State Department in the spring of 1989 and Mike Armacost was nominated and shortly thereafter he asked me if I wanted to be his DCM.

Q: What was Armacost's experience in Japan?

BREER: He had been there as a teacher at ICU (International Christian University) in 1969. I guess he had been teaching at Columbia University before that. Then he had served as the special advisor to Ambassador Ingersoll from 1972-74. Then he had worked on Japanese affairs and after that, I think, went to policy planning. He was the deputy assistant secretary for East Asia in the Defense Department, deputy assistant secretary of state for East Asia, and may have served at the NSC.

Q: The ambassador sets the ground rules as to how he is going to use his DCM. How did Armacost use you?

BREER: Mike was a kind of hands on person. I think he used me to make sure the embassy functioned properly, that any visitors were accommodated properly and as an advisor. We talked about policy a lot. He didn't really set out specific ground rules. He just sort of expected that I knew what I was supposed to do and what he wanted to have done. We were together a lot. I was in the meetings with him and all the important visitors, which is kind of traditional.

Q: Obviously you had been dealing with it in Washington, but when you arrived back in Japan did you find the political climate was changing in Japan?

BREER: Not when we arrived so much. We were through with the FSX issue although its after effects were still being felt in Japan, but we had a deal for co-production and were moving ahead with that. Japan was still booming and the Japanese were full of vigor and dollars. I don't think the political climate had changed all that much.

Q: Would you say that around 1989 the United States was suffering a decline?

BREER: Well, yes. Many Japanese thought that we were on a permanent decline and would never recover economically and they were on a permanent upward path which would never taper off or decline. So, the crash the following year was a shock to the Japanese.

Q: Did you find that this had any repercussions in how the embassy and the United States was dealing with Japan? Was there a feeling that maybe these guys have the answer?

BREER: I think that was a more general feeling in American business because I think during the '80s despite the trade problem and complaints about unfair practices, etc. they were trying to figure out what made Japan tick. We certainly came back with more competitive vehicles in the '90s. So, I think we learned from the Japanese experience of the '80s in terms of quality and on-time delivery.

Q: Was there any feeling of wait until next year because the United States was beginning to retool and rethink business practices?

BREER: I didn't feel that at that point. I don't think it was a wide spread feeling in the United States that we were on the way back. I think we were still kind of gloom and doom at that point.

Q: How did you find all these disparate groups that huddled around the embassy or were attached to the embassy like trade, FBI, etc? It is a huge embassy and practically every department had a representative there. How did they fit together?

BREER: Loosely. The trade people, though, I think gained considerable amount of presence in Japan. The foreign commercial service was gaining some momentum at the end of the '80s and had some very bright people in Japan who were aggressively seeking out issues and solutions for them. A major one was the Narita International Airport which was in the early stages of planning in 1988-89. It was a big part of our construction industry negotiations with the Japanese in the '80s and '90s. I discovered huge turf problems among law enforcement agencies which I don't think I ever did resolve because those can be resolved only in Washington when these guys figure out the line of demarcation on drugs and currency laundering, etc.

Q: Was there concern about possible Japanese mafia and our own connections?

BREER: I don't think it was that strong in those days, but there was concern about drugs and the Japanese were in a period of denial about drug use by Japanese. Japan was the most affluent market in the world, although I don't think the problem ever approached the level that we had here at that time. There was some coordination but it was an uphill effort.

Q: Did the turf wars between DEA and the FBI and all cause any embarrassment for the embassy?

BREER: It was pretty much an internal turf war although I'm sure the Japanese knew what was going on.

Q: Was there any problem working with the trade representative organization to keep them from being overly aggressive?

BREER: I can't think of any incident when we tempered our trade policy because of security interest.

Q: This a time when there is considerable sort of Japan bashing in the movies, editorials, etc. The United States was feeling hurt that it was not considered number one. Did that cause you problems?

BREER: I think most of us were interested in and hoped for a more constructive engagement because we had major security interests and the cold war wasn't over yet and we needed at least cooperation to continue our foreign policy aimed at having peace and stability in the region. And, also aimed at deterring North Korea and providing a platform from which to operate in Korea in case of an emergency. In retrospect the FSX issue was not so much a crisis or setback in U.S. relations as much as it was an issue that had to be dealt with and we had to find some way to reconcile the ambitions of Japan to build its own aircraft which was kind of understandable with our trade problems and the interests here of playing a role in whatever advanced aircraft the Japanese make and protecting American commercial interests. In other words, there was a strong feeling here of why shouldn't the Japanese buy aircraft right off the shelf from us when we had a trade deficit with them. Wouldn't that help balance the trade deficit.

Q: Also, President Bush was from Texas where General Dynamics is located. Was that at all an issue?

BREER: Not directly, but obviously it may have been more directly connected with other parts of Washington.

Q: During the time you were there how did this play out?

BREER: It played out that everybody sat down and went to work to build the FSX. I have forgotten the exact division of labor but we were to provide computers and the Japanese were going to manufacture a super high tech kind of plane. We did haggle over the division of contracts and I have forgotten exactly how it was worked out but it was something like they got 60 percent and we got 40 percent. The American contractors moved a whole bunch of engineers and I think everybody sat down and worked the night away and tried to build this airplane. And they built it. There have been some test flights and I think they found some problems with the wings. I'm not sure if it is flying yet.

Q: When you were there did Okinawa cause any problems?

BREER: I don't think there was any major incidents in Okinawa, but Okinawa is always a place that is somewhat contentious. American bases occupy a great deal of land in the southern part of Okinawa. We had consolidated, moving out of bases near downtown Naha by the end of the '80s and many of them are still vacant. But, still it was taking up a high percentage of a restricted land mass and injecting a large number of U.S. forces and families into a densely populated alien land

space is not easy. But, I don't think there were any huge problems at the time.

Q: You were there during the tremendous changes in our relations with the Soviet Union. At the very end I guess it ceased to be the Soviet Union.

BREER: Yes. On my way to the embassy one day on passing the Soviet embassy the gates were open and they were having a flag raising ceremony of the Russian flag.

Q: Did that cause any changes, particularly concerning the northern islands issue?

BREER: I think some Japanese thought it was the time to take advantage of Russia and really push hard on the northern islands issue. It was a mistaken impression, I think, because the last thing Russia wanted to deal with was more territorial breakup. I think we tried to engage Japan in providing financial assistance to Russia and that was more or less successful. They were kind of reluctant, I think, given the territorial question.

Q: What about the Gulf War?

BREER: That was probably the biggest trauma during my entire stay there.

Q: The embassy must have been pushing against Japan to give assistance.

BREER: We were trying to figure out all kinds of things. Many Japanese colleagues were trying to work with us to find ways in which Japan might be seen as supporting the western effort. We talked about using [Japanese] aircraft. We talked about Japanese aircraft for transport, ships for transporting goods and moving refugees. We tried all kinds of things and nothing visible ever worked given Japan's constitution and politics at the time. Finally, they first put up \$4 billion and then \$9 billion for support of the cost of the war. Neither one of those ever got much publicity. So, Japan didn't get much credit for their help but got a lot of criticism for not being on the scene. It was a period of really serious strain in Japan, strain between us too but, there were Japanese who were embarrassed that Japan couldn't find a more positive way to support the United Nations. Ichino was one of them and is still around in politics and pushing for Japan to be able to send troops abroad. He called it "normalization." That led, I think, pretty directly to the split in the LDP and the current political situation we have now with a coalition situation.

Q: How did we feel about Japan being a "normal" nation. Germany has gone through the same trauma and after all the war has been over for more than fifty years. In a way we have all grown comfortable with a Japan that is sort of out of it and wasn't intruding its own interests and more or less following what we wanted or at least staying out of the way. Were there internal debates about what we wanted Japan to do?

BREER: There were debates in Washington. Most of the Japan experts understood that Japan was not going to be able to participate militarily or even in a support role. They did dispatch minesweepers to the Gulf after the war was over. They played a crucial role in cleaning up the Gulf and they were exposed to some danger. At the same time we all believed that Japan could and should play a more responsible role. We had been urging Japan for a decade to play a more

responsible role in the [Middle East]. But our definition, of course, was as we see it. But, this was one time that despite the fact they have the constitutional restraints, political restraints, and legal restraints, I think a lot of people were acutely embarrassed by Japan's inability to move quickly to play a big role. They didn't come through with their second contribution of money until the war was almost over. But, they did pay it in full. Between the time the Diet appropriated money and the time it came to pay it, the yen had appreciated to the tune of \$6-700,000,000. We said they had promised us \$9 billion and they went back and coughed up the foreign currency difference.

Q: Did you find the embassy in the unenviable position of trying to explain Japan to Secretary of State James Baker and President Bush? These were men who were familiar with the situation but had a crisis on their hands and they wanted more.

BREER: I think we were reasonably successful in explaining the situation. Armacost met with the Japanese leadership a lot, privately and otherwise, and wrote a lot of his own cables about what was going on. I think Washington had a pretty good feel but that didn't make that much difference.

Q: Did Secretary Baker come out?

BREER: Treasury did come out.

Q: On this issue?

BREER: Yes. The first time was in September. Secretary Brady came out and met with Hashimoto and walked away with, I think, \$4 billion. The second meeting, I think, was January of the next year, just about the time the war ended, took place between Hashimoto and others in New York. Hashimoto and Ozawa played a key role in Japan's coming up with the money. They were deeply embarrassed by the fact that Japan was paralyzed over the issue.

Q: What was their background? Do they represent a newer generation? I'm not familiar with these gentlemen.

BREER: They were both younger men than the leadership. Hashimoto was in his early 50s and Ozawa about 50 and were regarded as the young leadership in the party. Hashimoto was the more traditional politician. Ozawa wanted Japan to play a role and be seen to be playing that role. Hashimoto was a little more reluctant, I think, but Ozawa had the upper hand at that time. They had a very weak prime minister in Mr. Kaifu. The foreign office was under heavy pressure to try to figure out something to do.

Q: Did it come rather quickly to the general public's attention that their oil supplies were being challenged by Saddam Hussein's invasion of Kuwait?

BREER: Yes, but, there was also a feeling in Japan that oil could be obtained at a price. If Iraq took over Kuwait they would still have to sell their oil.

Q: Was there still the same sense of outrage that I think hit the United States?

BREER: I don't think quite as strong.

Q: How about the takeover?

BREER: There was a feeling that Kuwaiti leadership was no better than any other leadership in the Middle East, no more democratic.

Q: The Kuwaiti leadership is one of the problems.

BREER: They are back in there now aren't they?

Q: Yes, they are back in. I have talked with people who have dealt with it in the area and the Kuwaitis seemed to have gone out of their way before to stick it to the United States. In other words, it was not considered a really friendly regime.

BREER: I never thought we should reinstall them.

Q: Well, I guess we had a real problem there. How about the financial shock, the stock market crash? Were warning bells going off by our economic counselors, etc?

BREER: Yes, I think everybody was skeptical of the stock market at whatever it was, 37,000 yen with P/E ratios off the chart, much worse than our market is today.

Q: Profit sharing ratio?

BREER: Yes, price ratios. Market share was more important [than profits]. They have learned now that they have to have profits to stay in business, I think to some extent. Other than that, and, of course, real estate was sky high, too. There was a vacation colony that we used to visit once in a while where land about the size of a suite or maybe twice the size of a suite was \$3 million with a house on it. They were asking that, I'm not sure they ever got it. I don't recall anyone sounding the alarm. A lot of people had gotten used to the Japanese economic and financial management with heavy leveraged debt for the private sector.

Q: How did we respond when this happened? Were we basically observers? Did it make much difference to the United States?

BREER: I don't really remember but it must have scared the hell out of the people here when a foreign market like that collapsed. It was the most heavily capitalized stock market in the world. People must have been scared that the whole house of cards was coming down. I don't think really that Japanese prosperity ended with that. After all, only three or four years later the market doubled. I don't think anybody realized the magnitude of the problems it caused until much later. But, during the bubble period people were putting up \$1 million property as collateral for loans that two or three years later were worth only \$250,000. I'm sure that hit some people, but I don't think it hit the general public as heavily, except that there were a lot of people who bought

houses at a peak rate only to find the value of their houses were cut in half but they still had to pay the same mortgage. There is a lot of that still going on. Gradually, over a period of three or four years it became apparent that things were not going to revive immediately. The Japanese economy wasn't miraculous, capable of pulling off miracles, so there would be a decade of retrenchment.

Q: Were there any other issues that we had to deal with?

BREER: We had trade, of course, although it came upon the scene towards the end of the Bush administration. They had been on the scene but we had voluntary restraints that nobody acknowledged but nevertheless enforced. It gave some breathing space to the American embassy and then Toyota and Nissan were able to increase their exports.

There were disputes over parts procurement in the United States, because we found that the Japanese would build a factory and also bring along a lot of their suppliers and set them up in the factory rather than buying from American suppliers. Then gradually they increased the share of suppliers. But then those companies became American so that became an issue for traditional American auto parts. Now it is all mixed up. Some suppliers supplied the Japanese as well as GM and what have you.

There was a lot of concern also about Japanese purchases of property in the United States including Rockefeller Center, a piece of Time-Warner, all of Waikiki, hotels, movie studios, etc. Half of the office buildings in downtown LA were owned by Japanese. Many feared that if the buying rate continued at the same pace, soon the Japanese would own the whole country. There was a lot of jingoism about that. I didn't notice it so much after I went to Japan, but it was certainly clear the last year I was in Japan. But, of course, the collapse of the bubble slowed all of that way down and then the collapse of real estate in the United States in 1990 killed their investments here as well. They took big losses on that. They took bigger losses later on in the '90s when the dollar went to 180 yen or something like that.

Q: When you left there in 1993, were you seeing a more normal relationship? The trade issues were sort of working themselves out.

BREER: By 1993 the trade deficit was going down. The decline of real estate value stopped the exuberant purchaser. They weren't buying real estate at bargain rates. The market crashed here in Washington. My daughter and son-in-law bought a house in 1989 and they are staying in it.

ROBIN WHITE
Japan Desk, Chief Economic Officer
Washington, DC (1990-1991)

Ms. White was born and raised in Massachusetts and educated at Georgetown University. After graduation she worked briefly on Capitol Hill before joining the Foreign Service in 1973. A Trained Economist, Ms. White served at a number of

foreign posts as Economic and Commercial Officer. In the State Department in Washington, she occupied several senior positions in the trade and economic fields. Ms. White was also a Japan specialist. Ms. White was interviewed by Charles Stuart Kennedy in 2005.

WHITE: I was only there for a year and then I went to the Japan desk (EAP/J) and became head of the economic section there. I began the summer of 1990 and soon after I arrived Iraq invaded Kuwait, so that was the dominant problem for many people.

Q: Was it the same issues on the economic side or were things changing?

WHITE: On the trade side we continued the Structural Impediments talks and I did a lot of work on the distribution system. The Kuwait/Iraq war ended up consuming a lot of our time. Japan was in a unique and uncomfortable position because of Article 9 of their Constitution. Written by the American Occupation authorities, it says that Japan is not allowed to have a military and not allowed to take aggressive military action in international affairs. The Japanese embraced the concept whole-heartedly after the miseries of World War II and became intensely pacifistic as a nation (despite the fact that their Self-Defense Forces are well trained and well equipped.)

When the coalition formed against Iraq, Japan couldn't put boots on the ground both for legal reasons and because of public opinion. Many Americans didn't understand these constraints. We got a lot of calls from congressional offices asking how much of Japan's oil was coming from the Middle East. It was a very high percentage, at least 80%, and that figure obviously showed up in Congressional speeches, e.g. "Japan gets all its oil from the Middle East and they're not sending any soldiers. They're letting us spill blood for their economic growth." The anti-Japanese feelings generated by trade problems were greatly exacerbated by Japan's passive posture.

On the economic side of the war, we got involved in heavy USG pressure on the Japanese to contribute money and eventually they gave about \$14 billion to the war effort. They were the only country that actually raised taxes to pay for the Iraq war and for the coalition. It was a difficult process and left bad feelings. A high level official Treasury went in to negotiate this amount but the agreement failed to specify whether it was going to be in dollars or yen. The Japanese said they agreed to a certain amount in yen, but the Americans expected the \$14 billion. When the exchange rate went the other way, it got quite unpleasant. There was no good record of the meeting for our side because Treasury didn't allow any Foreign Service Officers in the room to take notes.

The end result of all these problems was that when the coalition had its victory parade down Constitution Avenue, the Japanese weren't invited to sit on the viewing stand with all the other members of the coalition despite the fact that they basically paid all the American costs of the war. When Kuwait took out full page ads in the New York Times and Washington Post thanking all the countries that had helped them, the Japanese weren't mentioned. The Japanese were angry and humiliated and they still remember the slights. The people in the Ministry of Foreign Affairs who were working on these issues were very burned by that experience and determined never to see it repeated. We saw the results in a much more positive way after 9/11 when they were quick

to respond and offer help to the U.S. It shows now in their involvement in Afghanistan and Iraq today, which is far more than I would have expected 15 years ago.

Q: During this time you were dealing with a country whose nose is out of joint and probably quite rightfully so.

WHITE: The Japanese ended up doing things that were enormously difficult for them, even though it was hard for outsiders to see that. Their political system moved very slowly. While there were sophisticated people in the Ministry of Foreign Affairs and the Prime Minister's Office who knew they had to take action -- send medics, send mine sweepers, make some physical not just financial contribution -- they were stymied by a rigid system. Because the U.S. had provided a security guarantee, they had rested on their peace constitution and hadn't had to define their military role in the world. They eventually ended up sending some mine sweepers, and they did their best to send trucks and autos, vehicles that the troops welcomed for their good air conditioning. U.S. forces modified them for military use but even with the vehicles they made bizarre distinctions. The public and politicians were so wedded to Article 9 that the use of their vehicles in combat situations was unacceptable to them. The vehicles could carry bandages, but not ammunition, that sort of thing. Of course they were used in many ways and some Ministry people were well aware of this but wanted it to be kept quiet. A number of Japanese worked very hard to be supportive and it was hard for them to see the lack of public gratitude.

Q: Were there any warning signs about the Japanese economy and the overinflated bank loans at the time?

WHITE: What we started seeing at that time was the real estate price boom, the bubble that got to ridiculous proportions. That started in the early '90s because a lot of companies held real estate as collateral. They were able to borrow on it and then it became like a pyramid scheme to the degree that at one point the theory was that the Imperial Palace land was worth more than the state of California. The high prices allowed companies to borrow against the land that they had in Tokyo or other cities and then use that money for all sorts of speculation.

It became a bilateral problem when the Japanese began investing in a major way in the U.S. On the one hand, states were trying very hard to get Japanese direct investment in their states. Some states had offices in Tokyo and people working to get companies to come with job-producing factories. They offered subsidies and other incentives. The actual physical plant investment wasn't a problem, but when the Japanese started buying Rockefeller Center and Pebble Beach Golf Course people noticed. These purchases were so visible that there was a strong negative reaction, e.g. "the Japanese are going to buy up this country." At one point a Time Magazine cover had the Statue of Liberty wearing a kimono.

The other one that caused a lot of attention was Sony's purchase of MGM. I was in the Under Secretary's office at the time, so it was probably 1989. He was one of the people who sat on the investment review committee called CFIUS, Committee on Foreign Investment in the U.S. They were asked to review anything that might involve national security, which usually meant a European company buying up a high tech manufacturing concern, but in this case somebody asked CFIUS to go over the motion picture purchase, perhaps for fear the Japanese would use

films for propaganda purposes. McCormack's view was that the case should go through the long process rather than an expedited review so that Congress and other critics could be satisfied that a very careful look had been taken. In the end the purchase was not blocked.

Q: Of course nobody knew what would happen. It didn't seem that Sony Pictures was going to produce Japanese language pictures.

WHITE: No, the fear was somehow Sony would become a propaganda arm of Japanese business/government. One critic pointed to the film Exodus and how much an effect it had in generating American sympathy toward Israel. What if the Japanese started doing that? But that was a rather far-fetched idea, as people are so sophisticated these days and were quite anti-Japanese and suspicious at the time.

Q: Then there was a joke going around about a new ad campaign, now we bring you the new Toyota by those wonderful folks who brought you Pearl Harbor.

WHITE: People used the phrase "economic Pearl Harbor" and that indicates the strong negative feelings toward the Japanese. But their economic onslaught turned out to run its course, and they were actually buying land at highly inflated prices that left them holding bad investments. And not just land. We also saw the Japanese buying Van Gogh paintings for huge sums of money and many purchases went downhill. They ended up holding on to vastly overpriced land and buildings, particularly in Hawaii. They're still recovering from the prices that they paid for buildings and hotels there.

JOSEPH A. B. WINDER
Economic Minister
Tokyo (1990-1993)

Joseph A. Winder was born in New York in 1939. He received a BA from the University of Michigan in 1964 and his MBA in 1965. Mr. Winder served in the US Army from 1959 to 1962. Upon entering the Foreign Service in 1966, he was posted in Santiago, Bonn, Jakarta, Bangkok and Tokyo. In 1999 Mr. Winder was interviewed by Charles Stuart Kennedy.

WINDER: ...Ambassador Armacost in Japan asked me if I would come to be economic minister and I jumped at the opportunity because I had done economic work most of my career, Japan was the center of the Asian economy and U.S.-Japan economic relations were really one of the most important in our entire foreign relations. I thought it would be a wonderful way to cap my career and so took the job.

Q: And, you did that from when to when?

WINDER: I did that from 1990 to 1993. I that three years in Tokyo and enjoyed it very, very much. It was a good period in our relationship, although we had some frictions. We made the

transition between the Bush and Clinton administrations which wasn't easy because the Clinton administration team came in saying that the Reagan and Bush teams were all wrong and they were going to do it their way. Changes were more style than substance. We had a lot of activity going on with Japan. A lot of interaction in a whole range of various trade issues primarily. I was sort of the ambassador's deputy on the economic side and viewed my position that way as did he and the DCM, Bill Breer. So, I was able to get out and about in the business community. I put a lot of time and effort in cultivating the Japanese business community because I thought it was important that they knew Washington's perspective and conversely that Washington knew their perspective. I think I was reasonably effective in broadening our ties with that group.

There had been some friction between the economic and commercial section when I arrived and the commercial minister and I quickly sorted that out. We represented USTR's (U.S. Trade Representative) interest in Thailand, and I think very effectively. There had been some moves in USTR before I arrived and there was some notion that perhaps they ought to send a USTR official from their own office out there. I think they were satisfied with the way we handled their affairs. We worked with the Commerce Department. It was good. There was a lot of interagency coordination. A lot of working with the different Japanese ministries - MITI, telecommunications, fair trade, etc. It was very rewarding.

Q: Japan has the reputation of being an absolutely closed market, but it had been changing. How did you find the market when you went there and what were we doing?

WINDER: Japan is always difficult to assess in that regard. Looking at it closely, it looks like there are huge obstacles to market access. And looking at it through a longer time frame, there is change, but it is very slow and frustrating to people. By the time I had left, the conclusion I had come to was that the market for American products that were sold directly to consumers was relatively open. Clothing, toys, consumer goods of one kind or another, things that people bought that were recognizably foreign could get in the country. The big problem was with American products that companies bought as components for other operations. In the case of automobile parts, machine tools, things that companies bought as part of their investment program or for working capital, the traditional links between the purchasing agent on the one hand and the sellers on the other were extremely difficult to penetrate. That was true in a number of different sectors including automobiles, glass, paper, telecommunications, government procurement, etc. It was a source of great frustration to us to be unable to make more progress, quite frankly in breaking down those barriers. The business-to-business ties were long standing and very, very difficult to penetrate.

Q: What was the instrument that one dealt with on these ties?

WINDER: We had a number of mechanisms in dealing with the Japanese. In the '80s we tended to focus on sectors in particular and engaged in a lot of sectoral negotiations, whether it was construction or automobiles or pharmaceutical equipment. We took problems a sector at a time. In the late '80s the administration decided that the talks ought to be much broader. To look at structural impediments, there was something set up called the SII (structural impediments initiative). A process was established whereby on the Japanese side, the finance ministry, foreign ministry, and MITI all participated and on the U.S. side there was a broad range of people from

State, Commerce, Treasury, USTR, etc. The hope was that it would bring some of the economic ministries in Japan into the process and perhaps put some pressure on them to make some of the necessary changes.

When I arrived the SII was in full swing and we actually made quite a bit of headway, I think, in getting them to make some changes in some of their procedures. Unfortunately, dealing with the Japanese is to change one procedure but not another. So, it is sort of like peeling an onion where you never quite seem to get at the core, although you make a little headway. At the same time we were doing SII, we were still continuing an emphasis on sectors. A double whammy approach.

The Clinton administration didn't like the SII stuff and came up with a different process called the "framework." The "framework" was a process that looked at economic issues and structural issues at the same time. Of course, that is what the Republicans had done, too, but had just called it by a different name. The main difference was the Democrats thought they ought to focus more on results than on process, so if the Japanese agree to a specific result you would have more success. The Japanese said they were not going to do quotas and not going to agree to that. So, they were able to somehow fudge it over in such a way that the United States could call it results and the Japanese would say it isn't. The end result was the continued series of negotiations in sectors as well as more broad negotiations in the framework process.

Q: As economic minister, were you involved entirely in trade? There must have been a major portion that wasn't.

WINDER: That was my main area of interest. We had long standing financial ties between the Japanese finance ministry and the U.S. treasury department and those contacts stayed pretty much in their own framework. I chaired regularly a meeting with the financial attaché and the commercial minister and the agricultural attaché in an attempt to make sure that we all knew what each other was doing. I represented that group in the daily senior staff meetings that the ambassador held and I kept them informed about what was going on in the senior staff meetings. But, basically the Treasury and Finance Ministry talks had their own momentum. Even though I was economic minister, I was head of the State Department part of the embassy, so my job on the other areas, both agriculture and finance, and to some extent commerce, pretty much handled the trade promotion aspects of U.S. business interests. We, in the economic section, took care of the policy side whether it had to do with civil aviation, or trade. Civil aviation was a big deal. We had a lot civil aviation negotiations with the Japanese. Market access basically, trying to get more slots at the airport for our planes. We had a variety of different areas that we worked with. But, I think, the frictions were mainly in the trade area.

Q: Was there any disquiet when we were looking at the Japanese situation about investment, borrowing type of organizations which not too long thereafter caused real problems?

WINDER: I am not sure what you mean.

Q: Weren't there too many loans or too much money on real estate?

WINDER: We were concerned about the Japanese economy, that is true. The real estate bubble

burst while I was there. The time I arrived in Japan was interesting. At the time in early 1990s, Japan was king of the hill. Books were out saying that the United States was never able to keep up with Japan and had sort of turned everything over to them. They are eating our lunch everywhere all across the board and it is all our fault. And, we shouldn't let it continue. By the time I left, the Japanese economy was in the doldrums and no body was talking anymore about poor American manufacturing and good Japanese manufacturing. The American manufacturing sector had reinvented itself. It had re-structured, downsized, focused on core competence and focused on the kinds of things it needed to do and was again very competitive. The Japanese industry was just entering that period and they still haven't worked their way through it. So, when I arrived, if anyone had said the Japanese were going to have negative growth, you would have been laughed out of the room. And, now, if you think you are going to have positive growth of one percent you are laughed out of the room. It is an amazing turn around.

PAUL E. WHITE
Development Counselor, USAID
Tokyo (1991-1998)

Mr. White was born and raised in Indiana. He received his education at Sacramento State College, Valparaiso University and the East-West Center in Hawaii. He joined USAID in 1970. During his career with that Agency, Mr. White served in Vientiane, Seoul, Phnom Penh, Panama City, Lima, Guatemala City, Tokyo and Mexico City. He also had tours of duty at USAID Headquarters in Washington. Mr. White was interviewed by Charles Stuart Kennedy in 2006.

Q: You say you were doing this for a couple of years, we get up to 1991, 1992. Then what?

WHITE: Well, a couple of things happened. First of all, the person in AID who ran Asia, Near East, South Asia, Pacific Bureau [Assistant Administrator Carol Adelman] decided that was far too much for one person and so they split it up into an Asia bureau and a Middle East bureau and an Eastern Europe office. And the person I had been working for maintained, while the Asia bureau moved she made the argument within AID that the political programs should stay with her and that meant keeping the Philippines, Afghanistan, Pakistan and Cambodia with her, even though some of those programs should have moved to Asia. She maintained the Middle East and Eastern Europe. So there was a date set for when all of the programs in Asia would move to her and we talked about that and I decided that at that point, when those programs moved to the Asia bureau, I would move on. But before that happened AID decided that they wanted to put a person in Japan to help coordinate U.S. foreign assistance with the Japanese foreign aid program, that was now the world's largest program. And my name came out of the computer as having had some Japanese. So I was approached and asked if I would be interested in accepting that job. I said, "Yes" and so in 1991, as those Asia programs were leaving the bureau, I left and went to Japan from 1991 to 1998.

Q: Wow! What were you doing?

WHITE: That's a good question. When I got there the head of their aid program made it clear that I was there at Japan's request and they had had so much trouble trying to coordinate with AID because we're decentralized that he wanted someone close at hand in the Embassy who could help him, advise them on how they approach AID, who they worked with and all of that. So from Japan's perspective, that was why I was there.

From our perspective, I was there for several reasons. The Japanese aid program was largely infrastructure transfer to countries. They did almost nothing on policy. They did almost nothing, how should I say it, trying to use their aid as a lever for trying to achieve different kinds of policy in countries. They did nothing on the soft side, that is in democracy, women in development, environment, HIV/AIDS, population. That just was not a part of what they did in their aid program. They built buildings and supplied equipment. So my job was to try to move them towards a program that would look more like our program.

So those were the two big reasons why I was there. What I did is, I spent most of my day, I learned very quickly that JICA (Japan International Cooperation Agency) was not AID's counterpart, that JICA was more like a consultant. JICA was not part of the government of Japan, for instance. Their aid program was run by their Ministry of Foreign Affairs. So that became my key counterpart and I spent every day over at the Ministry of Foreign Affairs, either trying to figure out what they were doing and why, or how I could influence them to do different things.

Q: What was your impression of the Japanese aid structure?

WHITE: Before I went there, my impression was that JICA, their grant aid group, was our counterpart. I quickly learned that their aid structure was very different than that, that what they had was a Ministry of Foreign Affairs that made all of the policy decisions and then a series of implementing bodies, JICA being one, but also their Ministry of Trade and Industry, their Ministry of Fisheries, they put their money out to various implementation organizations. So that was very different from anything I had confronted before and almost immediately I started thinking in terms of, if USAID ever were to become part of the State Department our program would probably start to look more like the Japanese program. While my job was to change them to look like us, what I saw down the pike was possibly us changing to look more like them.

Q: How about your counterparts? Would they have a different attitude than you did, did you find or

WHITE: Yeah, certainly they had a different attitude. I think the Japanese aid program started as war reparations in the Greater East Asia area where the Japanese had ravaged so many cultures and countries. So in a sense they were paying back the Koreans and the Thai and all of the East Asian countries. They saw aid as a concentric circle, where you put almost all of your money in your neighbors in East Asia and you trickled just a little bit off to Africa and South America and other places, largely because of international community pressure to cover the world, but that East Asia was the primary target. So they could never understand why the U.S. didn't have that same philosophy and why we didn't basically concentrate our aid program on South America and then a little bit elsewhere.

Another big difference that we had was over the issue of equipment and buildings. They built things, they equipped things. They had a lot of white elephants. They built things that countries couldn't run. They couldn't understand how we could go in with soft assistance, curriculum reform and teacher training. To them those all seemed like interferences in the affairs that should have been of those countries, whereas they were just coming in and doing something that was apolitical and providing a wherewithal for someone to have a better building and perhaps have better research because they had better equipment but they weren't interfering in the structure of the country. So we had some pretty major differences.

Q: Did you make any difference, you feel, or did they make any difference with you?

WHITE: I think we made a huge difference on them. Their program now looks very similar to ours. When I first went there, it was the (George H.W.) Bush Administration and they had a program for working with the Japanese called the Global Partnership and under the Global Partnership what we tried to do was institute a few really large cooperation projects around the world. So we started...one way to get them to work in environment, for instance, we negotiated with them to do a joint environmental project in Indonesia, where we put in ten million dollars, the Japanese put in ten million dollars and the Indonesians put in ten million dollars, so a thirty million dollar project to do biodiversity in Indonesia. So we tried to use our money as leverage to get them to do things that they hadn't done before. That Global Partnership started several projects like that, large projects around the world and then all of a sudden the Bush Administration ended and the Clinton Administration came in and we were in the midst of this shift, so the question was what do we do? And we decided to continue with the program but change the name. So we changed the name to the U.S.-Japan Common Agenda and continued to work with the Japanese. We got them to commit a huge amount of money, nine billion dollars, to work on HIV/AIDS and population, in an up front kind of commitment that they would work with us around the world on those areas, because they were receiving a lot of pressure, not only from us, but from the international community to do more in areas like population and HIV/AIDS. They would say, "HIV/AIDS, we don't have that problem in Japan. We don't understand it. So we can't do it." But they were willing to fund it if they worked with us and we kind of developed the activities and they provided funding. So over time we were able to develop a lot of different projects around the world where we worked together and their aid program gradually started to shift to work on biodiversity and population and HIV/AIDS, a lot of the things that they hadn't done before, democracy, even. So at the end of that period of time I think, yes, they had changed their program substantially.

Q: Was the Japanese society, the universities, producing sort of committed do-gooders? I'm using the term in the best sense of the word. I mean people who really wanted to help, because it's such an enclosed society I think it would be hard to bring these people to the fore.

WHITE: Yeah, I think they had real trouble understanding the way that the U.S. has a sense of responsibility for the world. They're a much more inward-looking society. But a couple things happened. They had a really active Japanese Peace Corps and I think the universities started to change when many of these young Japanese Peace Corps people came back from Africa or Bangladesh or wherever they had been, the South Pacific and enrolled in the university and

started looking for ways to continue what they had started overseas. The Japanese government, the Ministry of Foreign Affairs, also had a very enlightened look at how they could involve the Japanese people, local governments, local NGOs and the universities in their aid program. So from the top down they also started to involve these people, in really interesting ways that we don't involve groups. For instance, they would form a group of local community people, NGOs, universities, as an evaluation group. Get twenty or thirty people together from a cross section of their society, send them to Indonesia to look at the Indonesia biodiversity program and evaluate it. They would have maybe a movie star and a famous baseball player in this group as well. So these people would come back and talk about what they had seen and why. So the Japanese public, something like 80 or 85 per cent, is in support of their aid program, whereas our public was maybe 15 or 20 per cent, if that, because they did this. As a result of involving people like this, universities started developing programs, development programs that help people understand the importance of economic development in the Third World and it would start producing people that would become advisors to the foreign ministry. So they had a different relationship with society than we have. I think a much more positive relationship.

Q: As an observer, did the Japanese become involved with the South Koreans particularly and the Chinese? These are two rather dynamic societies but coming from obviously different backgrounds. How did this work out?

WHITE: Interesting. When the Japanese would ask me, "What do you think the biggest AID success story is in the world?" I would always say "Korea." They would say, "How can that be? Why isn't it somewhere in South America?" I would say, "Well, when we started working in Korea" and even I could say when I went to Korea in the late Sixties. "Korea was one of the poorest countries in the world. It was poorer than many of the African countries. It had been devastated by the Korean War. Now they're like the 12th or 14th leading economy in the world." And what AID was doing in those days was the old style programs of building cement factories, building the North-South Highway. Infrastructure, what Japan used to do. And so I would say, "With the investment that we made in Korea it's really turned around." They see Korea as their success story. I always used that because that got into a really rich argument about infrastructure and soft assistance and all of that.

They had a difficult time in Korea because they had changed Korean culture. They went in and required the Koreans to paint the Korean names off the grave markers of their ancestors and put Japanese names on the grave markers. So there's a lot of hatred of the Koreans towards Japan and there's the "comfort women" issue and all of that. So a discussion of Korea always brought out really interesting things in Japan. I guess they felt that they had poured a lot of money and they *had* poured a lot of money into Korea. They had not done that as much in China, where you also had tremendous hatred of the Japanese, but their main point in foreign aid to Korea and to China was to start to change the opinion of how people looked at Japan, to get them to forget comfort women and all of that. And they felt that they were making headway. In part they were making headway because as older generations died out and they dealt with younger people that hatred was much less. But they certainly put a lot of money into those countries.

Q: What about North Korea?

WHITE: We had some conversations about North Korea, Iran, Iraq and other places like that because I often had talking points from State to go in and find out what the Japanese were doing and to try to convince them not to provide assistance to Iran or Iraq, specific kinds of assistance. North Korea was one of those as well where occasionally I had to go in and just see what they were doing. They weren't doing much in North Korea.

Mongolia...as the communist world started to disintegrate, there were opportunities to get the Japanese to take a leadership role. It's Asia, it's where they feel like they have a natural leadership role. Why don't we work with them to get them to be, hold the donor coordination group? Instead of holding it in Paris, France, where they've always been held, why don't we get them to hold the coordination group for Mongolia, which they did. Again, if you look now, Japan is taking a lead on a lot of that stuff. In those days, the first reaction was, "Of course we can't do that. It's Asia, we'd be interested in it but Paris is where that's done and we've never done that before." But they've really grown into that role well.

Q: You'd had that Japanese experience early on, which had turned you off. Did you feel that you were looking at a new Japanese person, in a way, or were you seeing one develop, or not?

WHITE: Yeah, I think I appreciated the chance to go back full circle and go back to my original love and to do it not as a poor university student eating noodles with no position in society but doing it as the number two or three person or four person in the embassy, where I commanded a lot of respect. So in part I saw not a new Japanese person but I was in a different position. Therefore I was treated very differently. But I also saw developing confidence in Japan, in terms of their ability to work with other donors. Before you'd talk to people, if I asked the aid people around the world, "What do you think of Japanese counterparts?" when I first went to Japan, they would say, "Oh, Hashimoto-san goes to the meetings but he sits over in a corner of the room and smokes a cigarette and keeps notes but never says anything." By the time I left Japan, not because of me but just because of the way things were changing, Hashimoto-san was an active participant in those meetings because he had something to say. They were doing the kinds of programs that other donors were doing. The Hashimotos that went out earlier and didn't speak English very well and all of that had been replaced by young Japanese who had good command of English. I must say their Foreign Service program is superb, in terms of producing high level people who speak languages.

They do something that I think we don't do and that is early on they identify the people who are going to be China hands or French hands or whatever. They send them to university for several years in the country that they're going to specialize in, the language they're going to specialize in. Then they give them several language assignments that enable them to use their language skills. And so you find Japanese Foreign Service people now who, I think, are exceptional at the top layers.

Q: During the time you were there was a difficult time in terms of the Japanese bubble and Thai bubble, they all popped, burst. How did you find that?

WHITE: I found that it affected the Japanese tremendously, in the sense that they felt that they had a development model that worked, the West had a development model that was a failure. So

they felt that their investment in infrastructure in East Asia and South Asia and Southeast Asia had led to the “tigers.” They commissioned the World Bank and the IMF to do a study of the East Asian miracle, expecting it to say that Japan’s development model led to this and this was right at the time the bubble was bursting and all this. The study eventually said that these countries made right decisions and it gave little or no credit to the Japanese aid program. So that was a crushing blow for them, because they had funded this study with the hopes that it would show something else.

In Japan it had two effects. One, it made people, the fact that they were experiencing financial difficulties, it made people question why Japan needed to be the leading donor in the world. They were at ten or twelve billion dollars a year, we were at eight. So they were way above us and then everybody else was way down below us. In Japan there’s a saying that the tallest nail is the nail that gets hammered down. So everybody came to them to ask for money, instead of coming to us. So there was a lot of domestic pressure on them to reduce their aid program, which they eventually did. So it had that impact.

In terms of living in Japan, I guess one of the things that I continued to be amazed at was that every restaurant you went to you had to stand in line to get in. You literally did not see the impact in the way that people lived in Japan but certainly you read about it in the newspapers and there were big changes like reducing their aid program and other things, but daily living, you didn’t notice it.

Q: How’d you find living in Japan and Japanese society?

WHITE: Well the second time around I loved it. The Japanese were very gracious. I traveled all over the country doing speeches, some for USIA and some just on my own. I taught at a Japanese university and I also went out to other universities as a visiting professor. The second time around I really loved it. I continued to find that the Japanese, they find it hard to accept a foreigner who understands their country and speaks their language a bit. They like to be kind of secretive and think that they have a special society unlike any other in the world. I remember during the rice negotiations, when we were trying to get more U.S. rice into Japan, they were making the argument that the Japanese intestine is not like foreign intestines and can’t digest foreign rice. They really do have a view of the world that is unique.

When you went into a Baskin-Robbins, the American ice cream franchise, and said, “I’ll have one scoop of vanilla and one scoop of chocolate” you see the clerk’s hand starting to sweat, because that’s not what you do. So they would go back and ask the manager, “Is it okay that we put a scoop of chocolate and a scoop of vanilla together?” It’s a society that lives by so many rules and that everything is a routine. If you go outside of that routine it’s difficult for them. So once you understand that, it’s wonderful, trying to figure out what little kind of things are going on in every situation you’re in.

Q: Who was the ambassador during your tour?

WHITE: When I first went there it was Ambassador Armacost [Ed: served from May 1989 to July 1993], who was absolutely wonderful, received AID into the embassy with open arms and

was very supportive and then Mondale came [Ed: served from September 1993 to December 1996] and he was even better. We got along really well together. Anytime I asked him to go out and give a speech or go visit, he always did it and very gracious. Then just as I was leaving Ambassador Foley [Ed: served from November 1997 to April 2001] came and I overlapped with him for a short period, several months. He was on a steep learning curve. Mondale, as far as I could tell, didn't have a learning curve. He was the kind of guy who was...he would just absorb everything and then go back in the right way. Foley struggled a little bit at the beginning, in just learning what it was to be an ambassador and how to do it. But all three ambassadors were wonderful.

Q: How'd you find the rest of the embassy? Japan is not a country where AID, since MacArthur's time, has had much of a presence. All of a sudden you're there?

WHITE: Yeah, but I was really well accepted. When I went there the big issue was should I have an independent office or should I be folded into one of the traditional embassy sections? So they decided to put me in the econ section, because the econ section had monitored Japan's aid program before I got there. Also an issue was would they continue to do that or would I take over those monitoring functions that the econ section had done? The other issue was should I go in with the rank of a minister/counselor, co-equal with the minister/counselor for econ, or not? They decided not to make me a minister/counselor for development but just a counselor for development and that was fine with me. I'm not interested in that. So I sat in the econ section and that was good.

I worked in partnership with the U.S. economists and also the local economists that had worked on Japan affairs. We became our own team of Japan ODA (Office of Development Assistance) or development experts. Had no problem within the econ section. Had no problem with the other, what I did, in a sense stepped on the toes of many different groups, the political section, the Foreign Commercial Service. The kind of things that I was working on were the kind of things that they had worked on traditionally with Japan. They quickly saw me as an aid expert, knowing what I was talking about, a lot of that stuff and all of those things came to me with no conflict within the embassy. So that went really, really well.

At some point, when the econ, that econ minister/counselor left, we did separate AID off and moved to another floor and became our own office [Ed: The State Department publication "Key officers of the Foreign Service lists Mr. White as a separate AID office in its Fall 1994 and July 1995 booklets]. That was good and bad. That was not something that I instigated. It happened partially because of space and a lot of other things. For me the bad news was I no longer sat in the classified section of the embassy. So it was much more difficult to have access to all of the classified cables and I had no place to store them and all of that and I missed that part of it but that was the only part that I missed, having a separate AID office. But the embassy was wonderful. Never had any issues with the embassy, other than GSO issues that you have everywhere you go.

Q: General services office, those are housekeeping matters. You mentioned the Foreign Commercial Service. Did we get into any problems between Japanese aid and American aid, the difference between John Deere and Kubota or something, different types of tractors or anything

like that?

WHITE: One of the other big things that I went to work on, my original mandate, was to work on Japanese tied aid, the fact that they not only built buildings and supplied equipment but that the equipment they supplied was all Japanese and the world community, through the Development Assistance Committee of the OECD, had tried to get all donors to untie their aid, saying that the fair thing for any country was to be able to pick the John Deere or Kubota or whatever tractor was most suited to their needs and the best price and if the Japanese were continuing to tie their aid that was something that we needed to work on. So I worked on that really hard with the Department of Commerce and over time we got the Japanese to gradually untie their loan aid. They do something that we don't do. They provide loans to countries. So the argument was if you're loaning India the money, that money in a sense is Indian money that they should be able to do with as they want, including procuring from whatever source they want to. Eventually we won that argument through a lot of hammering at all of the international meetings of the OECD and through my efforts. Every time there was a big Japanese loan program, say loan program for telecommunications in India, the telecom people would be out talking to us about how do we get the Japanese to open this for our market. Another one that the Japanese worked on a lot were railroads. They built a lot of railroads and bought a lot of engines and things like that, so General Electric and General Motors, they would be out immediately to Tokyo, to meet with me, to meet with Foreign Commercial Service, to make the rounds of all the procurement agents in Japan, to talk about opening the bid. So I spent a lot of time on that. That was maybe the most contentious area that I worked in but we were very successful in that area.

Q: Another thing that was happening during the time you were there was essentially the collapse of the Soviet Union, particularly in Asia. Were the Japanese involved there?

WHITE: What I saw was more on the margins of the issue. Japan had its own problems with Russia, the Northern Islands and so the relationship between Japan and Russia was a difficult relationship. While I was there a couple of interesting things happened. We talk about the U.S. diplomacy with China through ping-pong diplomacy. What I call wild bird diplomacy happened in Japan. A Japanese NGO, the Wild Bird Society, found that certain birds migrate from the Northern Islands in Russia down to Japan and then back and they were able to start a dialogue between Japan and Russia about wild birds that eventually bloomed out into a more political discussion. But that was one difficult area. Another area that I worked on related to that was something I call trilateral projects. I found that if the U.S. and Japan were working together to support a project it neutralized a lot of the negative feelings, either towards the U.S. in certain places or towards Japan. So we were able to do some joint projects, the U.S., Japan, Russia, where it just cancelled out the Northern Islands issue and other things. So I was on the margins of that. What I did not see was the more political issues between Japan and Russia. A lot of things were playing out at that time on the political side, as the Soviet Union was disintegrating and everybody was trying to position themselves for what might come next, including Japan. Of course there were also the issues of the United Nations and what Japan's role would be in the United Nations, on the Security Council. There were a lot of those kinds of issues, as well as the trade issues that we all are familiar with.

Q: When the Soviet Union broke up and all the "sans" emerged, the Central Asian countries.

Were the Japanese interested in this or not?

WHITE: Yeah, this was at a time after the Mongolia Consultative Group meeting was a big success, Japan had run it, that Japan decided to try to play a role in all of the stans. They tried to become the consultative group host instead of France for the stans and they did that successfully. As I said, every Japanese trading company interested in trade had specialists and they had specialists for each of the stans and they had lots of interests, oil pipelines and selling their Kubota tractors and all of that. So, yeah, Japan took a big interest in being actively involved in what went on there, politically and economically, after those countries became independent and took the lead in the consultative group meetings and took the lead in being the number one donor in dollar terms for many of those countries.

Q: Were the Japanese doing anything in Latin America; there was a large Japanese immigrant community in Brazil, and the president of Peru was Fujimori. Was there much going on there?

WHITE: Certainly, traditionally, in the Japanese aid program they had a category for overseas Japanese. So they provided a significant amount of assistance to Bolivia, Peru, Ecuador, Brazil, where there had been a lot of large migrations of Japanese in the past. They provided assistance to those communities, to be able to come back to Japan and get an education and that kind of stuff, more USIA kind of fellowships and grants and all of that. But they also provided bilateral assistance to Latin America, in fairly small terms. The old formula was seventy per cent of Japanese aid should go to East Asia and ten per cent should go to Africa, ten per cent to South America and ten per cent to South Asia. That was kind of their tradition, how they saw aid. But a lot of pressure was on them to do more in Africa and at certain points to do more in Latin America.

We had a State Department, the head of ARA, Latin America affairs bureau, came to Japan a number of times and developed a good working relationship with the Japanese and it was all around something called the Partnership for Development and Democracy in Latin America, which was a State Department initiative and they wanted Japan's aid program to join in that, as a partner with AID, to support activities, mainly in democracy. So that became a major thing that I worked on and we got the Japanese to actually take a role as a leader in one of the working groups under this PDD and to up their assistance somewhat to Latin America and to try project areas that they hadn't tried before like environment and democracy. So the answer is, while they didn't up their program that much they responded to pressure and they inched their program up for Latin America and for Africa.

Q: You'd been with AID a long time, was there a growing international aid group, I mean were the individual donors coalescing, rather than everybody doing their thing and did you find yourself in a way part of this jointness as a representative in Japan?

WHITE: Yeah, I think there was at least some sense, there was more of a sense, that if donors cooperate together you can get more done than if everybody goes their own separate way and while philosophically people would agree to that, when it got down to the rubber meeting the road everyone still did their own thing, because the requirements for developing projects and the way that we fund them and the reporting we do is so different from one donor to another that it's

very hard to cooperate. That of course is an argument, if it's difficult for us it's even more difficult for the host country, who has to keep different kinds of books and different reporting for every donor they deal with. So there's been a lot of attempts at the Development Assistance Committee level at the OECD to develop standard reporting formats and standard budget formats and all of that but it never goes anywhere because most donor programs are based on the politics of a situation and things other than the development itself. So those efforts haven't ever gone anywhere. So while theoretically I think people are much more willing to say, "When we work together things happen better than if we don't" practically they don't do it, even now. Certainly over time there's at least an awareness that is an issue.

WILLIAM CLARK, JR.
Assistant Secretary, East Asia Bureau
Washington, DC (1992-1993)

Ambassador William Clark, Jr. was born in California in 1930. He graduated from San Jose State College with a B.A. degree in 1955. He served in the U.S. Navy intermittently from 1949 to 1953. In 1957, he joined the State Department, serving in Sierra Leone, Japan, South Korea, Egypt, India, and Washington, DC. Ambassador Clark was interviewed by Thomas Stern in 1994.

Q: In 1992, you were nominated and confirmed as Assistant Secretary for East Asian and Pacific affairs. How did that come about?

CLARK: It came in a couple of ways. Baker became unhappy with Pickering, then our Ambassador at the UN and wanted him reassigned. Tom had always wanted to go to India and the Department granted him his wish. That started a chain of changes with Assistant Secretary Solomon moving to the Philippines and I returning to Washington as the Assistant Secretary. I don't remember whether any one called me or whether I read in the newspapers that Tom was being sent to India. I did get a call from Eagleburger offering me the EAP job -- an offer I couldn't refuse! Tom and I worked out the timing because he was in no hurry to arrive in Delhi and I was in no hurry to leave. I stayed until mid-summer, although the change had been announced several months earlier. I did return in May for my son Jerrod's graduation from Columbia. Since I was back in the States in any case, I suggested to Alan Cranston, my Senator from California, that I have my hearings while I was in the U.S. He told me that he didn't have certain reports from EAP that he had requested and that although I was not responsible for the delay, he was not going to proceed with my confirmation hearings until he had received those reports -- which, by the way, had nothing to do with me but were on some subjects of interest to the Senator. So I went back to the Bureau and got the reports sent to Cranston. Then he didn't have time for the hearings at that moment, so I went back to Delhi and returned in June for the hearings. I was in Washington then just for the day -- forty-five minutes for the hearing and back to Delhi. As was true for my previous confirmation hearings, I appeared before two Senators, one Democrat and one Republican. In the 1992 hearing, Cranston was in the chair and Frank Murkowski was the minority representative, as he had been three years earlier when I was being confirmed for India. Frank was an old friend; he would come into the hearing room, throw me

some "soft balls" and leave; for the Assistant Secretary hearing, he stayed a little longer. Then it was back to Delhi for the goodbyes and return to Washington in mid-summer.

The Secretary of State was Jim Baker. Larry Eagleburger was the Deputy Secretary and Arnie Kantor was the Under Secretary for Political Affairs. These were all people whom I had worked when I was the Acting Assistant Secretary and who knew me well. As far as I was concerned, the Baker team was very good. There was a lot of criticism that the "Baker gang" was a closed circle which you couldn't penetrate. But since I knew the people well, I did not have any problems. Also just as I began my tour as Assistant Secretary, Baker began to phase out in preparation to his transfer to the White House. I always had easy access to the Secretary and the Deputy Secretary. Baker held a staff meeting every morning which permitted all the Assistant Secretaries to keep him informed and to receive guidance unless it was a complicated problem which required a separate session. So it wasn't necessary to see Baker frequently. I used to see Larry more frequently on personnel and other issues. I saw Kantor once a week at a regularly scheduled meeting; the same was true for Frank Wisner who was the Under Secretary for Security Assistance, Science and Technology. These were meetings strictly on EAP matters.

My days as assistant secretary would start early so I could read the night time telegraphic traffic before diving into the day's work. Then I would go to the 8:45 staff meeting which took about a half hour. That was a meeting of the Seventh Floor principals and the regional assistant secretaries; one or more functional bureaus would be represented on a revolving basis. I remember those meetings well because there never seemed to be enough chairs; on a couple of occasions, people had to stand against the wall. After that, I probably had a meeting with Kantor or Wisner or another Seventh Floor principal. In the afternoon most of the time I would chair one study group or another; I had formed several on one topic or another. Then there was always the constant stream of visitors and the staff. The day would end about 7 or 7:30 p.m. EAP had jurisdiction over a disparate group of countries. I don't think we were nearly as disparate as my colleagues in NEA were; there is more commonality in EAP than in NEA. We basically had ASEAN, North East Asia and Oceania; those groupings in effect covered all of the countries in EAP and I think could be supervised adequately by one person, as long as he had four deputies. Now one deputy handles Japan, Korea, ASEAN and Burma which is much too much. I disagree with the way the Bureau had been organized by Dick Solomon because one deputy carried too great a workload and I certainly disagree with the current organization. We will try to develop a regional security policy as are the countries in the area; I don't think it will be entirely effective because I am not sure you can separate out one part of the world without much relationship with other parts. On economic issues, ASEAN is developing its own as is AIPAIC; then there are the burgeoning economies of Japan and China which far outweigh all the others. You can't develop a meaningful general economic policy for the whole Far East; there are too many issues that require special and distinct attention. That is not to suggest that there aren't enough commonalities among the nations of the Far East that would require separate regional bureaus; I believe one can handle all the issues, but I don't believe that one regional policy will ever replace the webs of bilateral relationships. Country experts are still absolutely essential. It is a fact nevertheless that our position vis-a-vis one country is becoming increasingly important to our bilateral positions with other countries; we do set precedents when we act in a certain way on a bilateral issue; other countries in the area expect the same treatment. If we are developing a policy towards China, for example, we must take into consideration its effect on other Asian

countries. We have not done that sufficiently because the whole phenomenon of Asian assertiveness is new; those countries are collaborating much more and are not always supportive of our actions. They want to be consulted -- real consultation and not just notice ten minutes before the public announcement. For example, for the Japanese being on good terms with the U.S. was sufficient reason to go along with us. The rest of Asia, if the Japanese agreed, would also go along. Now some Asia countries will advise the Japanese not to go along with us on certain matters. The Japanese are also becoming more concerned about the impact on Asia of any agreements they might reach with us. It is a different game and we are very slow in catching up with the new reality. The ascent of China, along with the increasing economic importance of many Asian countries, has made for a new ball game in the Far East. Other Asian countries are impressed by the obvious expansion of the Chinese economy; this has been happening for the last fifteen years, but has become impressive only recently. The growth of China's economy has of course security implications for all Asian countries and that is becoming a very important factor in their policy considerations. Furthermore, ASEAN has graduated from the poverty; Japan has to be more careful about its US policy in light of the growth of China and ASEAN. All these new developments require new US approaches and perceptions. Despite all of this, I still think that one person can give oversight to US policy in the region, particularly if, as I did, he or she has very good deputies. I used to see my deputies all the time; we exchange information often and directly; my door was open to them all the time. I held a small staff meeting three times a week and a large one once a week. Then we had a meeting with deputy assistant secretary levels officials from DOD, CIA and other agencies. It was very informal intended to let all of us know what was of concern that week to a particular agency. That meeting was unique in the Department; I don't think other bureaus had such an exchange with other agencies. It was a system that Paul Wolfowitz started and I think worked very well, as long as it was not used as a platform for a lecture by an assistant secretary.

The evening social season was not that burdensome. I think we may have attended functions two or three times each week; it was not a great burden. There were also two or three lunches each week.

By summer, 1992 the Presidential campaign was in full swing. That had some impact on one issue that I dealt with, such as the sale of 160 F-16s to Taiwan. The General Dynamics plant where these F-16s were built was located in Texas. the political campaign meant that the decision on the sale was made much quicker than otherwise might have been the case. Our memorandum requesting a decision was devoid of any reference to the domestic political issues. Once the decision was made, I recommended that a high level emissary be sent to Beijing, so that the Chinese could berate someone for our actions. I thought that would be good therapy for the Chinese. I also suggested that we provide the emissary with some good news to offset the Chinese unhappiness. That recommendation came back approved with a note of congratulations because I had been chosen as the "high level" emissary. If nothing else, our approval of the sale made G.D. a much better buy for Lockheed which occurred a couple of years later.

The "two China" policy had always been a very delicate balancing act for the U.S. By the time I became Assistant Secretary, the Chinese had been berated, as they are almost every year, by the Congress; the President had vetoed the anti-Chinese legislation and had been upheld. So I found a stable situation with the U.S. maintaining close relations with both Beijing and Taipei. My

deputy, a China expert, Lynn Pascoe, who is now the head of the American office in Taiwan, was very good; I had brought him on board as I had all of my deputies. He is still young and has a very bright future in the Foreign Service, which is one of the reasons why I had him assigned as one of my deputies. When he first reported for duty, he was still carrying the traditional banner "We can't do anything for Taiwan." Our Ambassador in China, Stapleton Roy, opposed the sale; he was a real student of Sino/US relations having been involved in that process for many years. He believed that the sale was a violation of the letter and spirit of the 1982 communique, which had become the central tenet of our China policy. I thought somewhat differently; I saw no reason why we couldn't be more forthcoming with Taiwan and I was pushing our policy in that direction. I asked for a review of our China policy which has just now been completed. With Lynn's assistance, we wrote a very balanced decision memorandum for the President. I was able to take some of the heat out of the dire predictions that the China experts were making; he on the other hand was able to convince me that some of the predictions were probably right. So I felt comfortable with our memorandum because while it did predict strong Chinese reactions, it did not assume that all ties with China would be broken by our sale to Taiwan. I was told by a number of people around town that the White House had already reached its decision; that didn't seem to me to erase the desirability of forwarding a balanced, well considered memorandum with options. It was Lynn who suggested that among some other actions we might take a high level emissary be sent to Beijing. We knew that it would be a terrible visit during which the Chinese would vent all of their frustrations on the U.S. delegation. We also put together a package of four "goodies" so that the Chinese could rightly say that while we were selling the planes to Taiwan, they had not been forgotten. For one, we settled four FMS cases that had been held up since Tiananmen. We closed the cases -- the Chinese lost a lot of money in the transaction and got their junk back. That action permitted the Clinton administration to start its relationship with the Chinese on a level field. Secondly, we agreed to re-establish military-to-military talks and for that I invited Teddy Allen, the head of DSAA at the time, to join my delegation. He came in full uniform and a military presence which I believe made our offer to restart the talks more credible. Thirdly, we agreed to have a joint committee hearing on commerce and trade that the Chinese were anxious to hold. This was an established mechanism which we had also put in abeyance after Tiananmen. For that purpose, Barbara Franklin went to China in December 1992 on a trip which was greatly criticized, but which was absolutely critical to the calming of the roiled US/Sino waters. She was criticized for a "boondoggle" trip which was unjustified because she managed to get \$2 billion worth of contracts signed. Lastly, we also agreed to restart the Science and Technology joint committee; that took place in Washington and was important also to calm the Chinese apprehensions.

We worked out this package and then I took it to Eagleburger. I told him that I could only be effective on this trip if I had a U.S. Air Force plane for the trip. He said that I just didn't qualify for that. I pointed out that I was a high level emissary. We finally compromised on a small airplane that took me from Tokyo to Beijing. That plane was so small that we had to refuel somewhere both on the way to and from Beijing. The meetings with the Chinese were even tenser than I had imagined. I knew that I was going into rough waters when I was met only by Roy at the airport -- no Chinese. Got to Beijing and Roy and I talked about the game plan and did some fine tuning. Then we went to the Foreign Ministry where I was received by the Director General for American Affairs, who is now the DCM in Washington. I spent about two hours with him with me explaining why we had made the sale, why we thought it was good for the Chinese

and then what we had in mind to do for China. He told me that I spoke with no honor and that I had a forked tongue; this was all done with great formality. Then I was asked to wait because my next meeting was to be with the Vice Minister for Foreign Affairs, Lee Hung Qwa. We waited for about half an hour and then the Vice Minister came. He read from a script, which I did note had been somewhat modified to take into account what I had said to the Director General. That meeting lasted for about a half an hour and that was the end of my meetings with the Chinese. The package I brought with me was not that great, but since the Chinese only expected me to explain our rationale behind the F-16 sale, it was helpful. We did not make a big deal of the four "goodies" because that would have been counter-productive, but we just explained the sale and said we had also decided to proceed on the four items that I mentioned. We never linked the two, but the package was presented as matters on which we wanted to proceed because it would be good for both us and the Chinese. Although these were not my more pleasant meetings, I think the whole trip was worthwhile for it did reduce the level of hostility that Beijing was manifesting. The Chinese press was rather low key about my visit. In the first place, they didn't want to treat me as a Presidential envoy, which I was, but rather as an Assistant Secretary. That was alright with me. I have seen my two Chinese interlocutors since that time and they both have always assured me that their coolness was not a personal matter and that I should come back to Beijing when they could host me appropriately. That was an interesting trip!

On the F-16 deal, we worked very closely with Frank Wisner, the Pentagon and the NSC; to a much lesser extent, with PM in the Department. EAP was the action bureau and we wrote the report, obtained the clearances and sent it up the chain. That is a process that was different than that which might have been used some years earlier or is used today. I always prefer that the action bureau be a regional one.

I mentioned before that I hired a new deputy for China matters -- Pascoe. I hired one other one and kept two who had worked for Solomon. When I arrived, the principal deputy was a Japan expert; it didn't make any sense to have both the Assistant Secretary and his principal deputy being expert in the same area. I wanted some one who knew China and that was Pascoe. Then I wanted a real go-getter and recruited Don Westmore who was the DCM in Sri Lanka -- a job for which I had recommended him. He dealt with ASEAN affairs. He has unfortunately left the Foreign Service and is now the regional rep-resentative for AT&T. So one deputy handled China and Korea, one was responsible for Japan and ASEAN, one had Vietnam and the Pacific Islands and one handled region-wide economic issues. That was a different arrangement than had been customary for EAP, but I wanted to shake things up and therefore changed the deputies' areas of responsibility. Long before I became the Assistant Secretary, Sandy Kristoff, the economic deputy, had been at USTR and had asked me whether she should take the EAP deputy job. I knew her from India where she had served before her USTR assignment. Now she is at the NSC. So I knew all my deputies well and had worked with most of them at one time or another.

In general, I was satisfied with the level of competence that I found in the Bureau. I did think that it was not as lively as it might have been. It was not as pro-active as I wanted it to be. Some people had been there too long and were obviously in need of new challenges. So my first goal was to shake the place up and I am glad to say that the core of my new staff is still in place today. I knew of course that economic/trade issues would be central to our relationships with Japan and therefore selected an economic officer to be that Country Director -- Steve Eckton,

who had been at the OECD and was a Japanese language officer. That was the first time that had been done. I also recruited a few more Country Directors -- people that I would be comfortable with.

Vietnam became a central issue for me. When I arrived, Ken Quinn, for whom I had great respect, was the DAS responsible for that part of the world; he was taking a lot of flack on our MIA and POW policies toward Vietnam. He had been targeted by all the critics -- "The League of Families", etc. I also found that in DoD there was very hard line official in ISA who had a direct connection with the Secretary. He used to by-pass his Assistant Secretary, Jim Lilley. I found that the head of the "League of Families" used to come to meetings of government officials on the subject of Vietnam. That didn't seem to me to be appropriate, so I just didn't hold anymore meetings. But I did want to proceed with normalization; I thought that it was time to bring the Vietnam war chapter to a close. I think we -- i.e. those of us who saw the situation in the same light -- got very close to striking a deal and almost convinced the White House over the tenacious objections of a lot of people in Washington. We had the White House almost convinced that the time was ripe for serious discussions with the Vietnamese on normalization because I felt that they had been sufficiently forthcoming on the MIA/POW issues. Had my recommendation been followed, the Clinton administration would have had a much easier time when it started down the normalization path. Even though I started my efforts before the election, I pursued it even after Bush lost because I thought it was the correct policy and I wanted to start something that the Clinton administration could bring to a conclusion. There was no chance of doing anything before the election, but after it, I was pushing very hard for a change in our position. We did manage to do a lot of the necessary staff work. General (ret) Jack Vessey, who had been in Korea as the CINC when I was there, was very helpful since he was our principal negotiator with Vietnam on the MIA issue. But to get the Washington bureaucracy to look at the Vietnam issue again and to change course, was a very difficult challenge. Some parts of the bureaucracy in DOD and at the NSC never did agree. I was always convinced that once we had decided to proceed with normalization, the threat of a major political back-lash by the veterans' groups would not occur and in fact when the Clinton administration pursued it, there was not much of an uproar. I think Clinton deserves considerable credit for pursuing what we started; my only criticism might be that the process is moving too slowly.

We worked closely with some Congressional members on the Vietnam issue. That was Quinn's task. He urged Senator Kerrey, a Medal of Honor winner in Vietnam, to hold hearings on the subject and we got a lot of help from various Members of Congress. Without their help, we could not have changed course. It was the Congress in fact that approached us. A couple of people, like Senator McCain, went to Hanoi. Both Kerrey and McCain carried considerable credibility on the issue because they both had suffered greatly during the war. Both wanted to move toward normalization and had started the ball rolling even before I returned to Washington.

As I mentioned, I took over as Assistant Secretary in late summer, 1992. The election which the sitting President lost, took place three months later. That really created a vacuum, although I found it somewhat easier to work with because Eagleburger was first acting and later Secretary. As I have said, he was an old friend and we work well together. So I had complete access to the top decision maker in the Department. I think the hiatus also enabled me to get the Vietnam issue to the White House and almost approved, although I was never able to get formal NSC approval.

I found that in fact the change in administration did not interfere with progress, such as the North Korean issue. There was a decrease in White House drive to accomplish things, but within the Department, momentum was maintained.

I mentioned North Korea. I had been away from the subject for three years, but I did not in 1992 find that there had been much change in Pyongyang's attitude. The big issue during my tour as Assistant Secretary was one that in fact I had dealt with three years earlier; i.e. the nuclear question. Back in 1986-87, we suspected that the North was taking actions that were consistent with a process of nuclear weapon development. By 1992, we had further confirmation of this development. It is true that the North Koreans had signed the NPT in 1987; by 1992 they had finally concluded an agreement with the IAEA for full scope safeguards. That enabled IAEA inspectors to look at manufacturing facilities and laboratories where development efforts might be taking place. We also had information that we thought should be made available to the IAEA particularly when the inspectors began to have some concern about the accuracy of the North Koreans' information. This was the first time that we released "overhead" intelligence collection material to a non-ally. The membership of IAEA included several country representatives to whom we would normally never had divulged our intelligence findings, much less evidence of our capabilities. But in the case of North Korea, we felt that we had to break with past practices and turned over relevant intelligence collections. Of course, the IAEA had also found religion; it had been embarrassed by the Iraq surprises and had become much more thorough about its inspections. There was a wide spread divergence in the intelligence/nuclear armament community of what the North Koreans had done or were about to do. There were some who felt that weapons had already been built and that the US had to destroy them as soon as possible. I disagreed with that view profoundly. We also started a dialogue in the UN on the issue where a very good working group and process went to work. I spent considerable amount of time going to New York to talk to some of the Permanent Representatives and I thought that real progress was being made in bringing some rationality to bear on the North Koreans. Although I recognized the potential danger of the situation, I was also intent on not raising it to a hysterical level, which I think it became in 1993-94. I did not think that raising the status of North Korea to "super power" level even if it had built four nuclear devices made any sense. Such status would only encourage them to build more, some for themselves and some for sale.

We laid all we knew about the North Korea situation to the Clinton transition team. The fellow responsible for East Asia was a young Hill staffer who knew remarkably little about the area. We also gave Winston Lord a full briefing. I stressed to both that I hoped that we would not permit the situation to escalate unnecessarily. We did write papers which we eventually sent to the NSC. We used the change in administrations to request a review of our China policy, as I mentioned earlier. We wrote a lot of papers on East Asia issues for the new team, fully expecting that Lake would ask for them sooner or later. In fact, the new NSC never asked for them, but we sent them anyway. Winston showed up soon after inauguration, but was really shackled and not able to function at all. Over the years, the government's guidelines on what nominees could or could not do had been tightened considerably; now, until one is confirmed, one can essentially fill a chair and a desk and that is about all. When Carter was elected, Holbrooke sent Ken Quinn, who was to be his executive assistant, to the Bureau to let everyone know that starting January 20, he wanted all the DAS gone because his new appointees would start working on that day. He moved into the Assistant Secretary's office on January 20 and began to act as if he had been already

empowered. That process had changed by 1993; Lord moved into a small office and I stayed on as Assistant Secretary until April. A couple of weeks before his confirmation, I did move into the office that Lord was occupying and Lord moved into one of the DAS offices. He would not move into the Assistant Secretary's office until he was confirmed. In fact, I weaned myself away and the Bureau's Executive Director became acting assistant secretary. One evening, someone called him and told him that there were a lot of papers to be reviewed. He said that he was leaving and that someone else could look at them. Over the January-April period, I just slowly faded away into the background; at the end I was available if needed, but the Bureau operated without me essentially as April rolled around. I think the transition went very smoothly. I was a little surprised by the change on the Seventh Floor. The advance word had been that the new team would be much more open than the Baker group. Towards mid-February, I finally saw the new Under Secretary for Political Affairs, Peter Tarnoff. I suggested that he needed to see the assistant secretaries more often; it had been the pattern for many years that the Under Secretary for Political Affairs saw each regional assistant secretary individually at least once a week. Tarnoff resisted that; he was willing to see us if we had a problem but was very reluctant to schedule a regular meeting. I pointed out that that just wouldn't be adequate because he would not necessarily know if there was a problem. In the three months in 1993, there was one meeting with all the regional assistant secretaries which was very short because after Tarnoff had said his piece, he was called out of the meeting. The Secretary also made a couple of speeches emphasizing his interest in openness, but I can't say that we saw much of him. He held staff meetings with his senior people all the time, but assistant secretaries and others only saw him at staff meetings that he held every Wednesday. Those meetings usually were taken up by a lengthy presentation by one person and then quickly at the end, we went around the table to see whether anyone had anything to say. That was not a recipe for openness. When Baker chaired those meetings, some decisions were made or at least there was an intelligent debate about an issue. Christopher's staff meetings were much too large for that kind of dialogue. This all may have changed by now, but in early 1993, I thought that Christopher was more remote than Baker ever had been. Fortunately, there were not many issues in the three months that we are discussing that required Seventh Floor involvement; we handled most of them at the Bureau level. As soon as Lord was brought up to date, it was he who went to see Tarnoff and went to the NSC meetings. In EAP's case, the transition worked well; I understand that in other bureaus, there was considerable friction with some of the newcomers being shut out as long as possible. I thought that type of behavior was silly and it didn't happen in EAP. It also helped that Winston and I were friends of long standing.

I'd like to talk now a little about Cambodia. Dick Solomon had worked long and hard putting the Paris Accords together. There was a good working group at the UN on Cambodia. The sessions at the UN would normally start with a meeting of a small group -- France, Great Britain, the U.S. and someone from the Secretariat -- which would be followed by a larger group meeting, which also included the Germans, the Russians and the Chinese. All countries had accepted this process and it worked quite well. That was a very useful avenue and Dick should get a lot of credit for getting it started. When I became Assistant Secretary, it was becoming obvious that the Paris accords were not being followed. We reviewed the situation and decided that it was highly unlikely that the Paris Accords would ever be followed strictly. But there was enough movement in Cambodia to make it worthwhile pursuing the peace arrangements. Most of the debate both in Washington and in the UN was the extent to which we would permit modification of the Paris

Accords and still maintain momentum. We agreed to just keep moving the process along as long as it was going in a positive direction and would not insist on strict compliance with the letter of the Accords. In the final analysis, an election was held in Cambodia and we had a surprised King. So I think we took the right tack, even if the process was not as smooth as it might have been.

I certainly found that EAP was relying on the UN more in 1992 than it had in 1989. Cambodia was certainly a large part of that shift since the UN had been used first to organize the Paris talks and then to monitor progress in Cambodia. We also used the UN on North Korean issues because the IAEA is a creature of the Security Council and therefore we thought that the Security Council was an appropriate forum to express our concerns. The Chinese did not reject this approach. There had been enough dialogue on the North Korean nuclear issue in the UN so that when the IAEA governing board had to take up the matter, there was no debate; all the bases had been touched and we were able to marshal virtual unanimity in the IAEA; there may have been a couple of objections from countries like Libya. It is true that the Chinese said that had the issue been subjected to a vote in the IAEA they would have abstained, but since the IAEA works on consensus, it usually does not take a vote and we viewed the Chinese statement as more a warning to North Korea that it couldn't count on China's unswerving support.

So there are some issues that are best discussed and dealt with in a multilateral context. I do not think that this new process made my life as Assistant Secretary more difficult. In fact, issues that lend themselves to international scrutiny are easier for an assistant secretary to handle if they are dealt with in an international forum. I did not find that other parts of the Washington bureaucracy were anxious to be the lead unit even when the matter was being addressed in the UN. It may be that I was just lucky because our representative at the UN in the early 1993 was a temporary delegate since Albright had not yet been confirmed. The Assistant Secretary for IO was also very cooperative, so that I found using the UN a very good and bureaucratically effective method in dealing with Cambodia and North Korea, at least. My philosophy is somewhat different than the present State Department team which concentrates much more on functional issues to the detriment, I believe, to bilateral relations. That new approach puts a lot more of the policy development and implementation burdens on functional bureaus. For example, it is Gallucci, as the head of PM, that spearheaded the US policy towards North Korea. I would have preferred to have EAP be the lead bureau.

Japan was always an issue for the EAP Assistant Secretary. It was always the trade problem. We were aware that the White House was considering using Japan for campaign purposes, but fortunately that didn't happen. By 1992, I had watched Japan trade issues for thirty years. In retrospect, the best I could say is that it could have been worse. If we hadn't engaged in trade negotiations and other dialogues, the Japanese would have had even a greater current account surplus. Their markets would have been more closed, although they might have some weaker economic sectors. Our pressure for "market opening" has forced Japan to modernize some of its sectors and become more efficient. I guess I would have to say that on balance our efforts have had some positive results although it would be hard to prove by just looking at the statistics. You have to remember that State has had one policy; you can argue that the White House and Treasury have followed two policies. State had always supported free trade and market opening in the hopes that would increase our exports to Japan and decrease their imports to us. The White

House and Treasury agree with that thrust, but they also have pushed the strengthening of the yen which hopefully would have had the same results as the market opening efforts. That yen strengthening policy is the one that is always discussed and I think it has been very effective in restraining the trade imbalance. I have already commented about the lack of understanding in Washington about Japanese culture and its decision-making process. By 1992, I think Washington had come a long way in understanding those factors. That did not ease the burden on the Embassy of not appearing to be Japan's spokesperson. It is always the burden of an Embassy of trying to explain the cultural differences between its host country and the US without appearing to be a defender of its hosts. I think when I was in Tokyo we managed to maintain a balance in our reporting, which has not always been the case. But even today, even with an increased understanding of the Japanese culture and process there is a lively debate in Washington on how you deal with it. That debate has not changed in the last ten years, although the environment in Japan has changed markedly. We still have the Team A and B concept: at one time we negotiate, at other we beat on the Japanese. Arguably, ten years ago, Team B might have had the right approach, but now, with Asia growing in confidence, it won't work in Japan and in fact creates a back-lash from other Asian countries. Those other countries will agree with our goal of market opening, but do not agree that strong arm tactics -- such as numerical targets and the "301" approach -- are appropriate. In 1992, EAP was involved in trade issues; I have the sense that today USTR has taken over entirely. Of course, once again, the fact that I had a friend in USTR, Jules Katz, helped; we had worked together many years. Jules and I didn't agree on many issues but we respected each other's views. It is a fact, I think, that the Japanese "experts" have an entirely different view on how to deal with the Japanese than other Washington bureaucracies. The Japanese "experts" have to be careful lest they are perceived in the same way as our Embassy in Tokyo was seen from time to time. It is very much a matter of presentation; if you emphasize tactical routes to achieve commonly agreed objectives, then you will have a much better hearing than if you say that the Japanese just won't do some things. Unfortunately, most "experts" tend to take the second line and that is not the road to success.

By the time I became Assistant Secretary, the famous Bush trip to Tokyo was history. That was one of the best prepared trips that had ever been developed for a President; it was then cancelled and then reinstated and became one of the worst trips. The President's illness didn't help, but it was not a well planned trip to start with, even though we did reach some agreements with the Japanese during his stay in Tokyo. In any case, during my tour as Assistant Secretary, the Japanese trade issue was not a major preoccupation of the administration.

As I mentioned, cooler heads prevailed at the White House and Japan did not become an issue that Bush discussed at any great length. I think the Clinton team had a much harder time when they came into office because they had discussed the issue during the campaign -- although the Democrats didn't make it a major issue either -- and had hinted at a much tougher policy. That made cooperation with the Japanese somewhat more difficult. China was the big campaign issue with Bush being accused of coddling the Chinese dictators. That also caused Clinton more trouble when he became President -- as evidenced by the whole human rights fiasco. I should note that the transition team did want to be briefed on what we had been doing on human rights; I think we had a fairly good record on that score. But it was not a subject of much exchange. On China, Lord knew it well and we didn't spend much time talking about it. We did raise the Philippines with the transition team because at the time the SOFA agreements had expired and

we had no legal protection for our armed forces in the Philippines who still used the islands for exercises. So we needed to have new agreements negotiated.

I should mention finally that I wished I had been able to make a couple of changes in the process. I would have liked to stay on to bring those changes about. But the new administration had already selected its team; it did offer me the ambassadorship to the Philippines. It took them a while before they finally decided and that gave me an opportunity to look at other possibilities. Just as they were about to send the paperwork forward, I decided to look for greener pastures. My case is an illustration of the mess we have made of the nominating process; it is now so complex and the confirmation is becoming increasingly longer that it is a wonder that any new appointments are made. I think increasingly people will not be willing to wait that long.

PAUL P. BLACKBURN
Public Affairs Officer
Tokyo (1992-1996)

Paul P. Blackburn was born in Hawaii in 1937. He received his BA from Haverford College in 1960 and an MA from the School for Advanced International Studies in 1962. His postings abroad include Bangkok, Khon Kaen, Udorn, Tokyo and Kuala Lumpur. Mr. Blackburn was interviewed by Charles R. Beecham on November 18, 2002.

Q: So you were refreshed and prepared to go back to Japan.

BLACKBURN: Yes, I was. And again I had the rare good fortune to return to a post where I had earlier served. To do so once was unusual enough, but to do it twice was extremely rare. I never have heard of another case of it happening.

Much to my amazement, the basics of the USIS Japan program to which I returned were essentially unchanged from what they had been during the days of Alan Carter and Barry Fulton. It still had a well-functioning DRS, a program development office for speakers, a first-class press operation, and even Carter-era FSOs back on hand to serve in key positions. My outstanding deputy, Hugh Hara, was formerly BPAO Nagoya and fully steeped in the Carter/Fulton systems approach. Veterans Bill Morgan and later under Emi Yamauchi made sure that the Information Section hummed along at peak efficiency. And I was so fortunate to have Japan guru Robin Berrington and later Art Zegelbone running the Cultural Section. Another stand-out performer was Alex Almasov, who was a most worthy successor to Warren Obluck, Robin Berrington, and me as Director of the Tokyo American Center.

Robin was ideally suited to working with Mike and Bonny Armacost. They were deeply into the Tokyo cultural scene and liked to have frequent artsy receptions at the Residence. That was something Robin loved and was so good at. Later, when the Mondales arrived, Art was equally terrific in assisting Joan Mondale with various cultural projects that were important to her and conveyed good cultural messages.

Though we had had a top-class operation in Japan, it was extremely costly, taking up about half of the East Asia budget. Our FSNs earned an average of \$100,000 a year. At one point, because the exchange rate dropped below 90 yen to the dollar, the senior USIS FSN, Mr. Konya, had a salary of some \$230,000, which made him the highest paid USG employee in our history! He was getting even more than the President of the United States, who at the time got \$200,000. We lost a few positions along the way, had to close down one post, and terminated Trends magazine, but basically did not suffer heavy cuts. The reason was that everyone in Washington recognized that we had an extremely important mission to carry out – in both the economic and security fields.

Q: Was Mike Mansfield still involved?

BLACKBURN: No. He was out of the picture once Armacost took over in 1989, well before my return to Japan in 1992. I had about a year with Mike Armacost, and then worked for the latter three years under Walter Mondale.

But I will tell one Mansfield story. Before departing for Tokyo I saw Mansfield at a reception and asked if I might stop by his office and get his views regarding our public diplomacy effort in Japan. In his usual laconic and to-the-point way he said, “No need for that. When you get to the post, just ask Robin Berrington for his advice. He knows everything about what needs doing.” Although I did indeed get plenty of counsel from Robin, I would have liked to hear from the great man himself.

Q: So what were the major specific issues you were dealing with there?

BLACKBURN: This was still a time when many Americans feared that the Japanese were going to overtake us economically and buy up our most treasured assets. The revisionist “Japan as threat” thesis was in full flower. Its proponents held that the “Japan Incorporated” web of private-government strategic interconnection was not only directly harmful to the U.S., it was also spreading threatening tentacles throughout the world, particularly in Asia.

Q: Setting up a new East Asia Co-Prosperity Sphere...

BLACKBURN: That’s right. And many in our country felt we Americans were not up to this challenge, because we didn’t have the access to the Japanese market we needed. And the trade deficit kept getting bigger and bigger. So trade was a top priority for my whole tour.

Many of the economic issues were very technical and thus hard for USIS to deal with, but we were effective in making the broad case for free trade and open markets through our speakers, the IV program, and our publications. In addition, the press office was in constant motion supporting the constant stream of U.S. negotiators, Cabinet officials, CODELs, and other VIPs.

Q: Did you still have the branch posts?

BLACKBURN: Yes. We had super teams of officers and FSNs at the American Centers in

Sapporo, Nagoya, Osaka, and Fukuoka.

Q: What about Kyoto?

BLACKBURN: Kyoto, too, for part of the time. Unfortunately, I had to close it for budgetary reasons. Having looked on Kyoto as the dream USIS post – along with Florence – from my earliest Foreign Service days, I particularly hated being the one to preside over its demise.

Q: I would have thought that would have been one of the last of the branch posts to close.

BLACKBURN: Its cultural position was certainly important. Though we never had a Consulate in Kyoto, the Embassy was always happy we kept a BPAO there. They could send over the visiting firemen and know there was an FSO on the spot to look after them – to show them around, introduce them to important local personages, and the like.

Q: But perhaps the hard issues were not ones of concern in Kyoto.

BLACKBURN: Right. Few of our DRS audiences were interested in our priority issues, and they could be reached from Osaka, which is less than an hour away. When closing Kyoto, we changed the name of our operation in Osaka to the Kansai American Center – to emphasize that we would continue to give a high degree of program attention to key contacts in Kyoto. Though our friends in Kyoto were very unhappy to see us pull out and I wish we could have kept the post open, I understand the new arrangement is working pretty well. Shortly before I left Japan, we also came close to shutting down Sapporo, and after I left, they actually did so.

A bigger issue was whether or not to have a branch operation in Naha, Okinawa. Though it was out of the question to set up a full-fledged American Center there, over the years the Consuls and senior Embassy officers like DCMs Bill Breer and Rusty Deming had encouraged USIS to assign an FSO and some FSNs to Naha. I strongly, and successfully, resisted the proposition, but Louise Crane, my successor, had a different take and transferred one of the Cultural Section FSO positions down there. My argument, based in part on whatever authority I could derive from having spent two summers in Naha in my college days, was that there was little for a BPAO to do except work as a kind of glorified assistant to the Consul. The audiences for discussion of bilateral issues were extremely small – except when it came to the “100-pound gorilla,” that is, our bases on the island. For the latter issue, there were already the officers in the Consulate and the vast military public affairs apparatus.

I said we would send Press Office personnel down on TDY whenever needed. AIO John Lundin was especially effective handling such TDYs. I also pointed out that despite all the IV grants lavished over the years on the two Okinawan dailies, those newspapers never cut us any slack at all on bases issues. If anyone could have any influence on their editorial and news treatment policies, it would only be the Consul or the military brass. Besides, I argued, the Consul’s job is more than 50% public affairs anyway, so we should be concentrating on giving public diplomacy training to the Consul and his or her FSN staff – or perhaps assign a USIS officer as Consul. Even after the consolidation of USIA and the State Department, the Department still hasn’t taken up either suggestion. Anyway, those were my arguments, and they prevailed for a time.

Q: How was the Fulbright program in those days?

BLACKBURN: The Fulbright program occupied a lot of my time, just as it did Rob Nevitt and most of my predecessors. A senior Japanese Foreign Ministry official and I (as the Ambassador's representative) annually rotated the positions of Chairman and Vice-Chairman of the bi-national commission, formally known as the Japan-United States Commission for Educational Exchange (or JUSEC).

JUSEC is one of the very best, most active Fulbright operations in the world. The extraordinary Caroline Yang, who became its Executive Director early in the 1970s, was still there. After leaving the job she became a member of the J. William Fulbright Board of Foreign Scholarships, and now is its Chair. She was replaced by Sam Shepherd, a top-notch exchanges professional in the field who we selected after an exhaustive open competition – and after successfully fending off Japanese arguments that the job should be reserved for Foreign Ministry retirees.

The Fulbright program in Japan is generously supported by its Japanese alumni. Many of them came to the U.S. after the war, got advanced degrees, and then returned to Japan to make a lot of money. These alums made a substantial contribution, as much as a million dollars each year, and I enjoyed getting to know them – and to thank them for all they had done and were doing to support the program.

The alumni put on an annual golf tournament, which was a big money-making and social occasion. However, unlike for avid golfers like Mike Armacost, Rob Nevitt, and Caroline Yang, for me it was something of an annual embarrassment, because I don't play golf – at least don't play it with skill and enthusiasm. The event was held at the Totsuka Country Club, and each participant paid a \$700 fee. The money covered not only the golf game, but also the chance to win one or more of the terrific donated items – which sometimes included a car and always several international plane tickets. They would raise well over \$100,000 from the 150 or so people who attended. I didn't actually have to pay the \$700 fee, as one of the more affluent alums would cover expenses for the Japanese and American chairmen, as well as the Executive Director.

So I would go and play, and be a good sport – and actually have a lot of fun, too. One year I won the “booby prize,” a very large stuffed animal I gave my young daughter. The Japanese are very smart about these things, and award this prize not to the person who registers the lowest score, but instead – knowing some people might purposely play badly in order to be the worst golfer – give it to the player with the second to worst score. That was me.

Q: Didn't your tenure there overlap the 50th anniversary of the end of the war?

BLACKBURN: It sure did. We spent a lot of time thinking about how best to posture ourselves for 50-year anniversaries of such 1945 events as the fire bombing of Tokyo, the Battle of Iwo Jima, the Battle of Okinawa, the atomic bombing of Hiroshima and Nagasaki, and the formal end of the war.

I was particularly concerned that we help the “main island Japanese” better understand what really happened during the Battle of Okinawa and how the horrific fighting there figured so centrally in the American decision to drop the atomic bombs. The Governor of Okinawa at that time, Governor Ota, was considered by many in the Embassy to be very anti-American. He had received a Ph.D. in the United States, had written a history of the Battle of Okinawa, and was very opposed to our bases. Having been on Okinawa in the 1950s, when memories of the devastating battle were still raw for the Okinawans, I recommended that we pay respectful attention to Governor Ota during whatever commemoration the Okinawans thought appropriate for marking the awful tragedy. Following the advice of many of the old Japan hands, Ambassador Mondale and the top U.S. military brass did just that, I am happy to say. The Okinawans put on a very moving ceremony, and inaugurated a unique peace park that lists the names of all those killed in the battle: Japanese, Okinawans, Americans, Koreans, and Chinese.

To help get us past the August 1995 Hiroshima anniversary, I encouraged Ambassador Mondale to visit that city in 1993 or 1994 and give a speech to the chamber of commerce, as previous Ambassadors had done. Though the speech would primarily deal with commercial matters, we could expect that in the Q&A period he would get a question on the A-bombing. I hoped he would have a chance to say something to the effect that though most Americans had supported that action as a way to bring the war to a decisive conclusion, we who are alive a half century later must look to the future and do everything possible to ensure that nuclear weapons are not used again in the coming fifty years. Words to that effect, anyway. The idea was to get an on-the-record statement that we could refer back to when asked for comments during the actual anniversary period. In the event, the Ambassador never did get to Hiroshima during those years.

At one point, I also favored recommending to the White House that President Clinton include a brief stop in Hiroshima during his 1993 visit to Japan. Despite my argument that such a visit would be a statesmanlike gesture and perhaps help defuse anti-American sentiment when the actual anniversary came along, others in the Embassy adamantly insisted it would be much too risky, so the idea never went forward. Despite my failed efforts to forestall public affairs problems, the Hiroshima and Nagasaki anniversaries came and went without a great deal of the agonizing I had anticipated.

I also got into the middle of the Air and Space Museum’s ambitious plan for an exhibition around the plane that dropped the bomb on Hiroshima, the Enola Gay, which ultimately produced a big controversy and much embarrassment for the Smithsonian. The museum proposed to display part of the aircraft and supplement it with a four-part exhibit highlighting the evolution of the war up to mid-1945; the testing and preparations for using the bomb; the actual delivery details of getting it from Tinian Island to its target; and the on-the-ground devastation. This multi-sided concept represented a major departure from the usual celebratory exhibitions at the museum. When the curator, Tom Crouch, and others came to the Embassy, I was the point person to talk with them. I told them that as far as the Embassy was concerned, the Air and Space Museum could make its own decisions, but that I personally applauded the idea of educating the American people about this important part of our history. I also suggested culturally-sensitive ways for them to approach the Japanese and elicit cooperation while maintaining control of the content in the most problematical fourth segment of the exhibit. The Japanese involvement was essentially worked out to everyone’s satisfaction, but the curators

faced insurmountable “cultural” problems in dealing with the U.S. Air Force veterans! They unleashed a storm of criticism against the entire concept. The veterans didn’t want anything in the exhibition about devastation and suffering on the ground – or about the evolution of the war, either. Essentially, they wanted the exhibition confined to technical aspects of its second and third themes: the development and delivery of the bomb by the Enola Gay. The whole scheme fell apart and became a first-class fiasco, one that cost the director his job. The museum finally mounted a very modest display, but without most of the contextual material originally planned.

Q: It sounds like the military relationship was very high on the Embassy’s agenda in those days.

BLACKBURN: Our concerns never seemed to have a moment’s rest. In the fall of 1995, just after the U.S. had, with the help of the Japanese, avoided most of the pitfalls surrounding the various 50th anniversaries, we were jolted by the news of a horrible gang rape of a young Okinawan girl. Many of us feared that that dramatic, horrifying event might well become the catalyst for our being forced out of some or even all of our bases in Japan.

USIS closely monitored the Japanese mood, in the media and elsewhere, which suddenly became quite critical of the U.S., especially our continuing to have bases in Japan. Over the months of the crisis, I reported on Japanese opinion at a number of meetings with senior U.S. commanders in Japan (including General Richard Myers and General Pete Pace, currently the Chairman and Vice-Chairman of the Joint Chiefs of Staff) as well as with senior visiting Defense Department officials such as Secretary William Perry (who had seen devastated Okinawa at the end of the war) and Joseph Nye. The DOD leadership, and senior military officers on the scene, deeply concerned about protecting the Okinawa bases, made sensitive expressions of remorse and apology, and worked with State Department counterparts to fashion policies to reduce our “footprint” on that island.

Meeting over lunch with a group of contacts who were senior editors at the major dailies, I learned that early in the crisis they had met among themselves to discuss what could be done about the growing mood of anti-Americanism – not only on Okinawa but throughout the country. They recognized that Americans were observing this trend and beginning to conclude that the Japanese public wanted the U.S. to remove the bases right away. Believing that such a withdrawal would be very harmful to Japan’s interests, particularly at a time when the Chinese were conducting intimidating missile tests in the Taiwan Straits, they decided – in Japanese consensus fashion – to calm down the reporting by their correspondents and use their editorials to support continuance of the bilateral security relationship. Once those policies were implemented by the Japanese mass media leaders, public opinion rather quickly returned to where it had been. In the four main islands, that is, though not on Okinawa itself. I think that gives a good example of how “Japan Incorporated” sometimes operated in the U.S. interest.

Q: Did the Japanese ever get to try the rapists? Or were they tried in an American court?

BLACKBURN: The Japanese eventually tried them, though I don’t know exactly what happened. As a result of this awful case, we agreed to changes in the SOFA, or Status of Forces Agreement, that made it easier for the Japanese to indict our soldiers in such instances. One of the reasons the Japanese had been so upset with us over this incident was that our military had let

the alleged perpetrator of a previous rape slip out of Okinawa and get back to the U.S. before anyone could nab him. Understandably, they were highly suspicious that such a thing might again happen in this case.

Q: Did you have speaker programs on security issues as well?

BLACKBURN: Yes, we had many, both by non-governmental and USG specialists. One innovation I made was to introduce a new regional forum for addressing issues related to the U.S. security presence in Asia. I dubbed it SNEAS, or the Symposium on Northeast Asian Security. It was designed to bring American experts together with Japanese, Korean, Chinese, Russian, and Mongolian security specialist alums of USIA and CINCPAC's long-standing Symposium on East Asian Security, or SEAS. With participation by Ambassador Mondale, Assistant Secretary Winston Lord, and – via digital videoconferencing – CINCPAC Joseph Prueher, later my Ambassador in Beijing – we held the kick-off SNEAS conference in Tokyo in 1996. It was cosponsored by the Japan Institute for International Affairs. The next year SNEAS was mounted in Seoul, I brought it to Beijing in 2000, and later it went to Ulan Bator and back to Tokyo. I don't know if it is still going on, but during those years I felt it made a valuable contribution to our broader security effort.

Q: What was it like working for a former Vice President?

BLACKBURN: Working for Walter Mondale was always interesting. Mondale of course is one of the great American politicians of our era...

Q: By what measure?

BLACKBURN: In my view he represents the highest standards of integrity and public service. Besides that, I found him to be good-hearted and on the right side of issues that I care about. The Japanese were delighted to have him there as our Ambassador. They love to have us send them an “oo-mono” – meaning a person of great prestige as well as substance, someone with the ear of the President, like a Mansfield, Tom Foley, or Howard Baker.

Mondale made an excellent public impression. He particularly enjoyed talking to bright and powerful younger people, the second echelon power structure, if you will. He wanted to get things done, while minimizing long discussions and formal exchanges of platitudes that are so much a part of meetings with older Japanese.

Joan Mondale was enthusiastic about being in Japan. She always seemed to be having a great time, was ever on the go, and made friends easily. Known during her Washington years as “Joan of Art,” she had an activist agenda for promoting closer cultural ties between the U.S. and Japan. Her pet project was promoting U.S.-style “public art” in Japan, and in collaboration with CAO Art Zegelbone developed an interesting talk on the subject that she presented at numerous venues.

Q: Did Mondale go out and talk to students, on the campuses and elsewhere?

BLACKBURN: Only to some extent. But when he did, he was terrific. He also had a wonderful touch with the media, and was readily available to correspondents, especially American ones, with whom he held background sessions from time to time.

While many of Mondale's press activities were suggested by us in USIS, he would sometimes initiate them on his own. For example, when a Japanese student was murdered in New Orleans, he was so disturbed by it he told us to set up an impromptu event that morning where he could express his apologies and sorrow. He also wanted to explain that America – despite the horror stories one hears – really is essentially a safe and welcoming country. That personal gesture was something only a big-league American representative could have carried off. It got excellent media play and helped defuse the sense of outrage surrounding the crime.

Mondale had no complaints about Bill Morgan as his Press Attaché, but he felt frustrated not having a personal press assistant on his immediate staff.

Q: How come you didn't give him one?

BLACKBURN: He really wanted something we couldn't provide. In Bill and then Emi Yamauchi, the Embassy was served by top-of-the-line Information Officers/Embassy spokespersons. In fact, Bill Morgan had ratcheted up the Press Office operation to meet Mondale's need for early information on the Japanese press by instituting a daily four- or five-page "Quick Read." That document took a lot of Japanese FSN and American time in the early hours, but was available at the opening of business. It was a terrific product and much appreciated by the Ambassador - and everyone else in the Embassy.

Q: But that wasn't enough? Is that what you are saying?

BLACKBURN: Yes. He wanted someone, he told me, who would function like one of the staffers he had had when he was Senator and Vice President. Some enthusiastic young person who loved to go out in the evening and socialize with reporters, who would pick up the gossip, and who could at times drop a hint or give out a little something that might produce a favorable item in the press. He was mostly thinking of American correspondents, not Japanese ones, of course. He said he had no criticism of USIS, but wanted to supplement its outreach to the media by means of someone more directly focused on his day-to-day interests. Realizing that we did not have anyone to assign to him on that basis, Mondale went to USIA Director Joe Duffey and asked for the allocation of a Schedule C political slot. In the end Duffey found the position, and Andy Meyers, who was resident in Tokyo and had previously done some advance work for the White House, was hired to do the job – though several non-USIS people in the Embassy tried in vain to talk Mondale out of the idea.

Anyway, Andy was brought in and we all made the best of what was an awkward situation. The fact that Andy didn't know the local or international media or have any resources to contribute to his interactions with them – other than their knowledge that he was on the Ambassador's personal staff – meant that he depended heavily on the USIS Information Office, which continued as before to carry out the mainstream media relations program of the Embassy. Though Bill Morgan handled the situation with outward aplomb, I felt I had let his operation

down by not successfully heading off Andy's assignment. After a month or two of breaking in, the arrangement sorted itself out. Andy proved pretty easy to work with, and used his advance-man skills to arrange some good public affairs events, such as an Ambassadorial visit to a Japanese super market selling American products. It wasn't a great situation, as I think the Ambassador probably soon realized, but Andy and USIS cooperated to make it work as well as possible.

Q: Were there any Presidential visits during that era?

BLACKBURN: Yes, there were two visits by President Clinton, beginning with the 1993 G-8 meeting in Tokyo. It was Clinton's first overseas trip as President and included a strong speech on regional security issues at Waseda University, an event we helped shape and carry off. The White House press advance people, led by the meticulously-professional Anne Edwards, were in a state of high anxiety, which made us even more anxious than usual to get everything right. I asked for and got a "dream team" of carefully-selected USIA officers assigned on TDY from all over the world. We laid on a great support operation, for which we received many kudos - despite the fact that on the way into town from the airport the press bus I was traveling on with Anne Edwards got into an accident right on the Shuto Expressway (with a police escort, yet). Working in the trenches with Anne on two POTUS visits laid a good basis for our collaboration on the much more complicated and even more high-profile Clinton visit to China in 1998.

Q: What else did you focus on while you were there?

BLACKBURN: Working with ACAO Anne Callaghan, an immensely talented Japanese speaking officer, I spent a great deal of time trying to support - or rescue - American branch campuses that had been set up by U.S. universities in collaboration with Japanese institutions during the heady "bubble" period around 1990. Both the Americans and their Japanese business/academic partners had unwisely thought these operations would make a lot of money. At the peak there were about 30 such ventures all over the country, but the flawed dreams of the educational entrepreneurs who set them up quickly went up in smoke. Besides the effects of the economic downturn, the collaborations suffered from destructive cultural clashes between the Japanese and American partners. Ultimately, none of them were profitable, some folded even before they got started, and only the already-functioning Temple University branch survives to this day.

Q: Were these for American students or Japanese students?

BLACKBURN: Mostly they were intended for Japanese students, though Americans resident in Japan or on overseas study programs could also attend. The hope was that many Japanese would take courses for one or two years at the branch campus, and then go on to the U.S. for further study. The prospect of large numbers of fully funded Japanese students was of course enormously attractive to the American colleges and universities.

When things began to get difficult, the organizers of these programs looked to us in the Embassy for help. For instance, they wanted us to lean on the Japanese Ministry of Education to afford the branch campuses some kind of formal recognition. Such status would help them with everything

from recruitment to student rail passes. The Ministry, a particularly conservative institution, was not inclined to bend over backwards for these not-yet established branches, especially since they showed at best a minimal willingness to follow the regulations applied to Japanese colleges and universities.

I also tried to help American academics teaching at Japanese universities who claimed (often with justification) that they were victims of Japanese prejudice against foreigners. On several occasions they had a chance to voice their concerns directly to Ambassador Mondale, and with my help he spoke to Japanese officials on their behalf.

We gave good advice to the struggling campuses and helped the professors as much as we could, but were less effective in moving the Japanese bureaucracy than I – or they – would have liked. One activity that did bring me satisfaction was my involvement in what we called “the Oiso group.” It consisted of ten top American and Japanese professionals in cultural and educational exchanges between the two countries. Some participants were from foundation world, while others - like a Japanese Foreign Ministry official and I – were governmental. We produced a report that took direct aim at some of the fundamental Japanese practices and regulations that impeded the growth of international interchange. Our practical suggestions, and the clear way they were presented, helped form the basis for ground-breaking legislation promoting the growth of NGOs. However, caught completely by surprise by the report, my up-tight Foreign Ministry counterpart on the Fulbright commission was angry that I had been involved in a project that implicitly criticized the Japanese government, especially having done so in league with one – or perhaps more – of his bureaucratic enemies. He called in DCM Rusty Deming to formally complain about my “inappropriate and undiplomatic” actions. Rusty was unfazed by the criticism, agreeing with me that the influential report never could have been done if it had been subject to an internal Japanese clearance process.

WALTER F. MONDALE
Ambassador
Japan (1993-1996)

Vice President Mondale was born and raised in Minnesota. A graduate of the University of Minnesota and its Law School, Mr. Mondale served as State Attorney General before his appointment and subsequent election as United States Senator from the State of Minnesota. Elected Vice President of the United States in 1976, Mr. Mondale served for the duration of the Carter Administration as active participant and advisor. President Clinton nominated him United States Ambassador to Japan, where he served from 1993 through 1996. Throughout his career Mr. Mondale has contributed substantially to the welfare of the nation in both the public and private sectors.

Q: Let's jump forward to your ambassadorship to Japan. You took up your post as ambassador in August '93. This is a post at which there's been a long tradition of non-Foreign Service people being the ambassador. How did this opportunity to be ambassador arise for you? Obviously you

were a senior member of the...

MONDALE: Well, Clinton had asked me to be ambassador to Russia and I accepted and then called him back the next day and said I didn't think so. I figured that was the last I'd ever hear from him. But in about 3 months or so, Christopher called and asked me whether I might be interested in being looked at as ambassador to Japan. I said, "Yes, I'd like that." I was selected.

Q: How did you hear? Who called you?

MONDALE: I think the first guy to call was Brian Attwood, who was in the State Department. He's now the dean of our Humphrey Institute. I said, "Well, Brian, you can put my name in there, but I don't want it speculated on publicly. I don't need that at my age." So, of course, he said, "Nobody will know about it" and it was in the paper that afternoon. What's new?

Q: Is America a great country or what?

MONDALE: Yes, it's wonderful. There were some others that were interested. I don't know how the process went, but I'm told that Christopher came down on my side, he said he thought he could work best with me. I had had a good relationship with Clinton. I don't think he had problems with it. So, off I went.

Q: Most of our interviews are with career people. We don't often get into "How did you prepare yourself for this once it was official" because there is a number of very unique steps in this process. Just the announcement that you're going to be the nominee is...

MONDALE: Yes. This is me talking about myself, but I have had a lifetime style of really soaking in things. In other words, if I'm going to do something like this, I want to read it all, I want to hear from the best, I want to sort through and weigh the issues and how they might work out, the politics of the thing and so on. So, from June or so to August while I was going through the vetting process and the confirmation process and the rest, I had any number of meetings with State Department officials, with think tanks in Washington. I went up to Harvard, Columbia universities. I was out at the University of Washington and maybe Stanford. I spent a lot of time digging into this stuff. A lot of people came to see me like Haru Reischauer, the widow of Edward L. Reischauer, who is a relative of ours. She came... She's the first one to tell me I was going to be ambassador. There was a leak somewhere and she came out here and we spent a couple days together and she gave me the books I was supposed to read. You've Got to Have Wa. So, we spent an awful lot of time on that. Then I started to connect with the career people that were going to help me: Bill Breer, Russ Deming, Desaix Anderson, Japanologists that could help me better understand what I was going to handle. So that's what I did.

Q: So then the confirmation with the Senate was pretty perfunctory?

MONDALE: It was wonderful.

Q: Some people you'd met before.

MONDALE: Oh, yes, and everybody... Bob Dole came in. The old Jesse Helms was for me. It all worked out very well.

Q: The first time you arrived in Japan was the trip as Vice President?

MONDALE: I think I was there once or twice as a senator.

Q: Probably going through on your way to Vietnam.

MONDALE: Yes, I did, and Reischauer was the ambassador once in '65, something like that. Of course, Joan was related to him, so I stayed at the embassy and I talked to Reischauer. So I had been there, I think, twice, as a senator.

Q: Now you're walking in the door... You were in charge of the place.

MONDALE: Yes. It's different.

Q: Who's there? Who's in this house of the American federal government?

MONDALE: Let me begin by summarizing. It was about as impressive a group of people as I've ever seen, as committed, as knowledgeable, as helpful, with a good spirit. It really makes you feel good to be an American. They were so good. Many of them are still my friends. Still got somebody coming into town next week. We're all getting together to talk about old stories. If the American people could have seen what I saw, they'd feel a lot better about how they're being represented.

I started out with Bill Breer, my DCM, and I asked him to stay on a couple of months to get me started. I asked Russ Deming to come over to be my DCM following that period. I forget just what the timing was. So, Bill helped me get started. He'd been there under Armacost and is an old Japan hand. Peggy Breer was very good to Joan, helping her get started, as was Russ Deming. Then I got to know all the station chiefs and department heads in my embassy. I would have the morning meetings. We'd have the issue conferences. We'd meet in the auditorium and talk about questions. It's a big embassy. Because there's a lot of American military over there, you've got a whole additional section that deals with that. A big commercial relationship, a big section dealing with that. A big immigration flow. All this stuff. And several significant consulates around the nation and several significant military bases. So, there was a lot to learn. Incidentally, the commander of the US Forces Japan was a guy named Dick Meyers and his assistant was a guy named Pete Pace, who are still in the business. [Editor's Note: General Richard B. Myers, USAF, became the fifteenth Chairman of the Joint Chiefs of Staff on Oct. 1, 2001. From November 1993 to June 1996 General Myers was Commander of U.S. Forces Japan and 5th Air Force at Yokota Air Base, Japan. General Peter Pace, USMC was advanced to Major General on June 21, 1994, and was assigned as the Deputy Commander/Chief of Staff, U. S. Forces, Japan. He is currently the Vice-Chairman of the Joint Chiefs of Staff.]

Q: They are. General Pace was just in the papers the other day. But isn't that just the point? The public really doesn't understand that... If you ask the general public, "Oh, it's the State

Department overseas,” but in fact, it’s the house for the federal government and it’s one way of defining what issues are important with that country because you have the Commerce Department there or the Treasury Department or the FBI...

MONDALE: Or the Ag(ricultural) Department or the Department of Energy or the National Science Foundation, all of that, that broad range of government agencies.

Q: The embassy in Tokyo has a science section?

MONDALE: It did and I think it still does. One of the first things an outsider like me had to learn was that what appeared to be kind of a single agency running the embassy, the State Department, was in fact that plus all these separate agencies represented by their people. Although you have the famous President’s letter to all of them, that “You’re it and you can throw people out of the country and so on,” it doesn’t work that way and you have to develop cooperative attitudes and respect to make it work.

Q: Just as an illustration of that, at the time that you were there, there were some major commercial and economic issues: auto parts and Kodak.

MONDALE: Insurance. We had a lot of tough economic issues.

Q: How did these issues come before you? Was there a pressure group back in Washington and...

MONDALE: Most of the issues arose either from the STR (U.S. Special Trade Representative) or from Commerce, maybe from the State Department. We were having yawning current account and trade deficits, a strong belief existed that there was widespread mercantilism at work. Under Mickey Kantor and some others, they were trying to do something about it. So, these issues, the main ones were cars, car parts, insurance, construction, some intellectual property issues, foreign direct investment issues, a long list.

Q: And if it isn’t issues in Japan, it’s their investment in the United States. In fact, doesn’t that sort of illustrate that countries don’t interact on a single issue or two; they interact over such a broad range of circumstances that that’s why you call it “managing the relationship.”

MONDALE: And that’s why one issue is rarely isolatable from other issues. If it’s significant at all, they relate to each other and they push the agenda of what’s possible. So, if you really pressure trade issues, you might have security issues or other kinds of questions that come up that will be presented in a way that’s not as favorable as if you didn’t have those issues. So, whenever you press another nation to do something that’s significant, you have to ask not only what is it that you want and how you’d be glad to get it, but what is it that you might have to pay, perhaps elsewhere or in the relationship itself, and is that worth what you’re asking for.

Q: When you first arrived in ’93, how would you characterize the temperature of the relationship?

MONDALE: I thought it was good but a little anxious – good because the underlying elements of the relationship were and remained very solid. Both democracies, a strong economic trade relationship, a treaty alliance that worked and was very strong, common interests. Japan and the United States worried about Russia or other security threats in the region meeting each other, all those things. I thought it was very good. The edginess was arising over basically trade. By the time I got there, there had been already a couple of dustups over trade. I forget what we called those... We wanted some kind of guidelines to measure our progress. The Japanese government under the previous Bush Administration had agreed to a certain number of cars that were going to be sold over there and they wanted to get off that idea right away. We weren't asking for numerical guidelines, but we wanted some kind of measurement of progress. So, by the time I got there, that was getting a little bit edgy. But the rest of the relationship I thought was excellent.

Q: Of course, the guidelines are helpful not only for you to calibrate how you're going, but it allows you to go back to the US and say to interested parties there, "Yes, we have accomplished this. We're sharing with you our guidelines."

MONDALE: But I also think that trade is a very touchy and potentially explosive issue. It's not a one, two-step between demanding something of another country, getting public support back home, and everything being positive. People are worried about it. Pressing these policies too hard will lead to a damaged commercial and economic relationship. It could lead to irresponsible protectionism. That the market will take care of these things better than government can take care of them. I would say that after a couple years of fairly intense US-Japan trade tension is something that should be studied by scholars to see what we learned from it. Progress was made in the specific issues but what did we learn? I wish somebody would study that.

Q: Because there is always Newton's third rule of physics in that for every action you make, you are getting a reaction out of the other side. He has his domestic concerns.

MONDALE: Right. And the essence of diplomacy is trying to understand their needs as well as your own in seeing how you can align them and make it easier for both sides.

Q: Which I suspect is not all that different from the legislative skills of a senator.

MONDALE: No.

Q: If you've got to get your bill through...

MONDALE: If these politically-appointed ambassadors that we sent over there, like Mansfield and myself and Baker and Foley, bring anything, it's that we spent a lifetime trying to see how the process works and you're no good at that game unless you first understand what the other side must have and try to find common ground.

Q: One of the contentious issues, or one of the issues that had to be managed with some sophistication, of course was the U.S. military presence on Okinawa.

MONDALE: Right, a terrible question.

Q: How did you and your staff work with that?

MONDALE: What brought the issue to a head on my watch was the rape of a 12-year old girl by three members of the U.S. military. The public outrage against it was very understandable and shared by me. But within a few days, it had morphed into that issue to be sure but beyond that into the question of whether Americans should withdraw from Okinawa or at least sharply reduce its presence there, change the SACO guidelines to permit easy access and prosecution of American soldiers. For a while, it was really very tense around there. There is so much historic resentment in Okinawa toward the huge presence of American forces there that it was an issue that readily metastasized, not only just Okinawa but in a large part of the country.

We spent the better part of a year walking that thing backwards or sideways so that we could make the changes that we could make but keep our security presence there. And we made a lot of changes, including agreeing on conditions to close Futenma. So that was a big issue. The Japanese government wanted to come out where we did. There was never any question. In the privacy of my discussions with their leaders, they didn't want this to fracture. They didn't want to kick us out of Okinawa. They wanted to get this thing back to some kind of stability, but they were politicians and they had to deal with it, too.

Q: And I would suspect that they were coming to you in part saying, "Can you help us out in the case for our own people?"

MONDALE: Right. And we had many meetings with the specialists, with political leaders... Kono, now the speaker, was the foreign minister. Hashimoro and some of the others were around. We would have many meetings trying to figure out how to reduce tensions. The agreement on the Futenma base was the biggest thing, but we also agreed to reduce our footprint in Okinawa, to reduce a number of marchings on streets and ammunition practices and artillery practices and parachute landing practices, and in many ways try to be less obtrusive there. While we didn't change the SACO rules, we did agree that where there was commissions of crimes of high morale something (I forget the exact word) that we would allow easier access to the charged party.

Q: On the part of the Japanese police.

MONDALE: Right. Baker got this. We insisted that it be an American lawyer around. They didn't want that. That's now been agreed to.

Q: What you're talking about is the SACO...

MONDALE: Strategic Action Committee on Okinawa. SOFA is the Status of Forces Agreement. That's the one where they prescribe how criminal matters should be handled.

Q: Yes, what each government's authority is.

MONDALE: Right. And those things are difficult because it's not just how they're handled in Japan, but if you change it in Japan, every other country where there are American troops will say, "Hey, here we are."

Q: "How come he got that and we didn't?"

MONDALE: Right.

Q: And so there is always the pressure for a common level of approach.

MONDALE: Right.

Q: Also at that time there were the defense guidelines worked up between ourselves and the Japanese, which was to try to get to a different issue in the security relationship of interoperability... What were some of the issues?

MONDALE: There had been some guidelines that were in being that had been issued in '87 or something like that, but they were toothless, they didn't really give much instruction. I think what had happened, the way I remember it, was that we got into some really tense relationships with North Korea. In '94, there was a time there where we were actually preparing for the worst and making plans for moving refugees into Japan and building up American forces in Japan and in South Korea and maybe going to war. That opened up a whole range of private discussions with the Japanese about how we cooperate, about whether these things are prohibited, acts of collective defense, and whether we could buy supplies from them, and whether we could use some other bases or ports, and whether they could help us, say, with mine sweepers and things like that, and if we were attacked defending Japan, could they come to our defense, and that sort of thing. The answers were not there. Neither country thought the answers were there. And so we spent the better part of a year and a half grinding away on those questions. Then in April of 1996, we had one of the most successful U.S.-Japan summits ever. Clinton came over and we signed the guidelines, the defense agreement, and several other agreements, that I think brought a lot of these issues to a very strong resolution.

Q: But isn't that interesting. Here you're ambassador. The average person would think that you're responsible for bilateral US-Japanese relations only, yet a stimulus comes from afar, from the Korean Peninsula, into this bilateral focus and you then have to work together with the Japanese government to adjust to this outside situation.

MONDALE: Right. Not a bad point because it really underscores the fact that while you may think your job is the U.S. ambassador to Japan, in fact, because of that you get involved in all kinds of regional issues that bear on how Japan fits with those other countries. You don't run Japan, but together you're talking and working to resolve these issues in a way that together makes a solution more practicable. So, North Korea is a very good example. It still dogs that part of the world. I think one of the many reasons why Japan and the United States are very close is they share a common fear of what an irresponsible North Korea might do.

Q: Might do and the end result might be. You were talking about evacuations into Japan.

MONDALE: Right. With the missiles that we now know they have. If they have nuclear weapons as is speculated, it's not just "over there." They could hit us over here. So there's a lot of reasons why we're concerned about this with the Japanese.

Q: Let's look at the Korean situation a little bit. As you were saying, in '94, things seemed to be spiraling down. The North Koreans withdrew some of their nuclear promises and whatnot. Former President Carter goes to Korea. Did you know he was going?

MONDALE: His first visit to Kim Il Sung was June of '94. I was over there. I think he came by Tokyo on the way out and he told me about what he had talked about. He was very hopeful that this would help resolve the North Korean issue, that they were willing to open up peninsula talks, they were willing to put strength behind the idea that there should be no nuclear weapons on the peninsula, that Kim Il Sung was ready to talk to his counterpart in South Korea, that they would return American bodies still there from the Korean War, and Carter thought he had made good connections there and there was going to be...

Q: His trip in the first place was a little unsettling to some people.

MONDALE: It was, not to everybody.

Q: Only those who were responsible for the policy at the moment. But before he went, did he pass through Tokyo? Were you aware what he was doing, outside of what the newspapers were saying?

MONDALE: I'm not sure. I remember talking to him about it. I remember him telling me how it had gone with Kim Il Sung. He talked to me on the way out. I'm trying to remember whether he did also on the way in and I can't remember.

Q: That was a very interesting intervention on his part.

MONDALE: And this is a good thing for the State Department to ponder. The fact of it is that Carter's talk with Kim Il Sung came at the last moment that that was possible. He was soon dead. Carter came back through Tokyo on his way for the second trip. On the way out to the airport, he was informed that Kim Il Sung had just died. But that first trip opened up commitments and possibilities, but even people who didn't want Carter to go later used to try to influence the son when he took over. So, I think that what you have there is the special prominence and stature in this case of a former President who can gain access with a guy like Kim Il Sung and have serious, multi-day discussions about things that none of us could have talked to him about. But in the doing of it, how does our government control the brief that the President uses? How do you tell a former President, "Here's your talking points. Here's what you can say?" To get the best out of people like that, we have to find ways of doing both. I think there's strength there that sometimes the traditional diplomatic system can't fully reach.

Q: And in part, that's why we have politically appointed ambassadors because you're trying to send a special message or create a special bond.

MONDALE: I think one of the things that helped me a lot was the feeling by the Japanese government that I had access back home, that if there was something that was important to the relationship, that I could get into the highest levels, I could talk to the President, the Secretary of State, the Secretary of Defense, and do what had to be done to make certain that my concerns about our relationship or about various things would be heard expeditiously at the highest level. That in turn gave me an improved ability to work with the Japanese leaders. Everybody I've talked to like Baker and Foley and Mansfield felt that that was a big edge and advantage.

Q: That's a big edge, and did you use it?

MONDALE: Yes, I did. Not every day, but if I thought there was something compelling, I would go to the President, I would go to Christopher. I remember talking with (Secretary of Defense) Perry many times about this defense guidelines and Futenma decision, we worked almost every day... That's an exaggeration, but whenever I wanted him, I'd call him.

Q: And Sak Sakoda and people from Perry's office would be out there.

MONDALE: And I remember one day the vice minister wanted to know something about a policy that we had in the UN that wasn't apparent from the stories, so I called (Ambassador to the United Nations) Madeline (Albright) and in a half hour call back and said, "Madeline Albright tells me that this is what they want." He said, "That's very helpful." That's one thing you can do.

Q: We're talking about third country issues that impact on US-Japanese relations. Another one that came up at that time was the Senkaku Islands imbroglio. How did that unfold?

MONDALE: Either it was some Japanese that went out and occupied one of those little dots on the ocean-

Q: And put a lighthouse on it.

MONDALE: Well, there was two different island disputes. One was the Senkakus and the other was the islands down around the Philippines. The Senkaku islands, I think it was either Japanese or Chinese that went out there, in effect staking sovereignty claims through their private actions over these islands. The question was, well, what is the American policy toward the Senkakus? Is it a part of the administered areas referred to under the treaty with Japan? Or is it separate from that and thus more eligible for Chinese claims of sovereignty? That issue came up. I made inquiry back home about what I could reliably tell the Japanese government. I was told reliably from our own government that the Senkakus were a part of the administered area and I called the vice minister at the foreign ministry and told him so.

Q: That's actually our standard response, isn't it, that we don't draw other people's borders?

MONDALE: No, but we have this unique relationship with Japan and we have a treaty in which we pledge to defend Japan that refers to "administered areas," areas that we administered after

World War II as part of our occupation, and this issue comes up every 2-3 years over there. I saw it came up again the other day. The same answer.

Q: But isn't that an interesting aspect of international relations, that issues will repeat, that you have tradeoffs?

MONDALE: Yes.

Q: Which leads me to ask, one of an ambassador's jobs is creating an image of the United States in the country that you're resident in. How did you rate the embassy resources for the job of public diplomacy on Japan and what did you do to assist that?

MONDALE: I thought the people working there were wonderful. I really enjoyed it. My wife was active in the arts and there was a group of people in that side of the embassy that worked very closely and she was able to do what she wanted. They loved it. Everything you do every day is part of this public. You go out and give speeches. You travel around the country. You meet with their leaders. You meet with various groups from Japan. You write articles for the newspaper. You hold news conferences. You go over and see the prime minister or the cabinet secretary or this person or that person. The idea is to create a public presence and the development of public issues in a way that strengthens the relationship.

Q: How about the resources for the embassy to do that?

MONDALE: I was somewhat disappointed in that. We were going through a time of budgetary restraint. We weren't quite there yet, but we were about to go through this issue of whether USIA (United State Information Agency) was separate or to be folded within the State Department, which created some anxiety in the USIA. We had closed the cultural consulate in Kyoto, which I thought was a terrible idea. It had been there for 40 years. They had tried to close the one in Sapporo. I think they got it back, but I was fighting rear guard action all over trying to protect the little presence we had. They closed a lot of the libraries down before I got there and while I was there. The people we had were very talented, but we didn't have much of a budget to work on with a country that size. I thought, not with many of them, but with a few of them, that some... I'm saying this because I know these things are important to the State Department. Most everybody in the embassy worked with us very closely but there was an attitude on the part of a couple of USIA officers – not most of them – that they were truly independent and separate and to get involved with us, to promote policies, was a corruption of their independent role as the tribunes of truth. So, I had a couple of get together meetings with them about that.

Q: We're talking about the consulates... So what's one consulate?

MONDALE: Oh, I think they're very important. In many ways, per capita, they have more clout than maybe the embassy. That consulate down in Naha, Okinawa, is tremendous. The one up in Sapporo is very important. These consulates have on the ground in touch relationships. I remember when the State Department was going to close Sapporo because of budget reasons, the governor of Hokkaido came down to see me. He said, "We've made a decision. We'll pay for it. Don't close it. We'll pay for it. We want you here."

Q: And I think that's something a lot of people don't understand. Oh, well, gosh, you have an embassy, you can read the national newspaper and therefore you're fully informed.

MONDALE: A lot of people think it's kind of striped pants cultural feet arrogance. In fact, it's the most fundamental kind of connectivity that really helps sew our relationships together.

Q: Particularly among democracies.

MONDALE: And it's people with language skills, with cultural background, with a sense of history, many of them over the years have developed a connection of contacts and friends and sources of information and advice that is invaluable to our country.

Q: You were talking about President Clinton stopping by one time. There were a couple of times when he skipped Tokyo on trips to Asia.

MONDALE: Clinton for the record was in Japan more often and for more hours by far than any other president in the history of the United States. But this was after I left... He took a trip to China with Hillary and their daughter and he turned it into an official trip but also sort of a tourist trip, which is fine, but he should have come back to Japan and he didn't. That was duly noted in Japan and was not good.

Q: Those are the kinds of things that can set the groundwork or set up some tremors.

MONDALE: Right. When he came there in '96, he was stunning. I've never seen a public leader capture the affection of people like he did. You could just feel it. It was throbbing. I'm sorry that a later venture diminished some of that.

Q: We've been talking about the use of consulates and whatnot.

To start a summation, what do you see as the role of an embassy overseas and the kinds of things that it can do? They're always under budget pressures.

MONDALE: I think that's a good place to begin. We need to see the value of these things. Fulbright liked to say how 40 years of Fulbright scholarships, with all that meant, cost less than half a Polaris submarine. We're talking about money, but in terms of the size of our nation, the wealth of our nation, the issues that we have at stake, the cost of our diplomacy, the very modest expenditure and the most productive yield of almost anything we do, I think we have a question of not only what's spent but what we get for it. I'm told that Powell has been very good about this and that people love him for that. I do, too, if that's what he's done because he was in a position where he could leverage.

We were slipping. I think when I left, the real support for diplomacy in our budget had dropped in real terms by almost 50% over the last 15 years. The nominal amounts were there, but inflation had eroded it there. A terrible thing. And we were cutting things. At one time when the yen got really expensive, our whole embassy and their families couldn't even go out at night to

go see a movie. They had no money. A great nation like ours, hamstrung. So I think that it's one of the best things we do. We need to be better at it. We need to work to improve the morale of these officers so they know we know they're important. We need to support their education so they get the languages and the background that really helps them become good officers. I believe that the overly prompt rotation – that's the way I saw it – of skilled young career officers was a mistake. I know there are other reasons, but you'd get a young officer there for 2 years, they'd get some skills in the language, start making contacts, and then be shipped off to Russia or something like that. I don't know the bigger picture, but I believe that there ought to be maybe another year in those first assignments, that we ought to make certain that there's a liberal opportunity to really get good at the language more than we do.

I was irritated sometimes about how what I used to call the "GLOB," the State Department Personnel Office, would make decisions about who came and went from my embassy. For example, when we came up to the time of the auto negotiations, in the month or two previous to those negotiations, every one of our top officers who was a specialist in that field got ordered somewhere else. Every one of them. There were 3 or 4 major principals that knew all about it. Out they went. I called the GLOB and said, "You can't do this to me." They did it to me. And as a matter of fact, they sent word back they didn't appreciate my calling. It's kind of a headless operation. I think there needs to be some way... You can't have politicians running- (end of tape)

Q: And in fact, representation budgets, for example, are crucially important. In this law firm where we are conducting this interview, I'm sure you'd take your colleagues and your business partners out to lunch, but according to Congressman Rooney, he wasn't about to let those striped pants Foreign Service officers spend good taxpayer money on a function which we know is enormously invaluable in making human contact.

MONDALE: That's right.

Q: Which speaks to the issue of public support for diplomacy.

MONDALE: And public understanding of what diplomats do.

Q: Yes. And that comes at you in a number of ways. When I would come back from a tour, I'd call the public affairs guys and say, "Okay, I'm back in Seattle. I'll do some public speaking for you." "Well, now there's no budget for that." So, the American public is denied in one sense the knowledge that their sons and daughters from Washington state and Minnesota and Arizona are Foreign Service officers. There still are lots of people who don't understand the broad base of the Service itself.

MONDALE: Also, 9/11 and what did we learn about those risks? What could we have learned about those risks if we had better language officers around the world? How are we going to deal with this growing threat of terrorism from around the world that's more and more apparent if we don't have people who can participate in trying to find out and protect us? I'm not just talking about the CIA, although that's part of it. This is also a part of every State Department and other official overseas. How good are we and how fully do we support decent efforts to get in there

where you can hear and learn about these things and to protect America?

Q: Or make the friends that are going to give you the platforms to fulfill American foreign policy goals?

MONDALE: Yes. This is a national security issue.

Q: By the time Secretary Powell take up his assignment,, various gold ribbon studies suggested that the State Department foreign service personnel was up to 1,000 officers short. That was the peace dividend which Congress collected during the previous decade. A thousand people for 3M, nobody would even notice. But the Foreign Service is only approximately 5,200 people, so if you're missing 1,000 and you have to rotate people and nobody gets language. Secretary Powell, in fact, has spent the time to encourage Congress to restore most of that funding.

MONDALE: Yes, and that's great.

Q: But that's all part of the key: public understanding of that diplomacy function.

MONDALE: Right. And I think that's got to be worked on. I would have to say, I don't think the public understanding of what we're talking about is very deep.

Q: One could question the level of public discussion of foreign affairs, but I wonder about how issues are framed once they become part of domestic politics. Would you really get a domestic politician saying, "Well, we have to listen to the other guy, find out his interests?" Probably not because the politician from the opposite party would take a contrary position and say, "Ah, no, whack him on the other side of the head. The U.S. must be shown to be winning."

MONDALE: There is a current fever that may be abating that supports the idea that it's only simplistic macho slogan-type certainty that can tap American strength and influence abroad. It's the only thing that guarantees that we've got a he-man at work, that subtlety and nuance, the sorts of things that the best officers in the State Department help us achieve, are things that diminish national strength. I think that is horribly distorted to the point of risking national security, that understanding others – their languages, their histories, their compulsions, how their systems work, what's driving their sentiment, all of those things – must be understood in order to be strong.

Q: You would assume that would be an easy lesson for a commercial market society as ours to understand.

MONDALE: Because every businessman knows that.

Q: Exactly. And every businessman listens to his salesman who is his feedback mechanism to the market. And if the salesman comes back and say, "Hey, boss, I can sell more of these things, but you're got to paint them purple instead of blue," does the boss say, "Hey, that's fine because understanding our customers is going to make us rich?" Well, what if you get the response, "Well, my grandfather set up this company three generations ago and we've been making blue

widgets and we'll never... " You'd go out of business if you don't listen to the customers.

MONDALE: That's right.

Q: In our own world of commercialism and advertising we see people spending enormous amounts of money influencing other people after studying what the consumer wants.

MONDALE: To me, it's a question of respect. What I tried to do when I was ambassador was take every opportunity I had to build the sense that my interlocutors are people I respected and a country that I respected with a history that I respected with a potential that I respected. And you could feel it. I used to tell American VIPs when they came through – and they always had these talking points that you guys had prepared for them – and he'd say, "Well, I've got these 7 points..." I'd say, "Okay, that's good, but here's what I suggest. When this meeting starts, introduce yourself, tell them how happy you are to be there, and listen to him, let him talk. He may not want to talk, but the fact that you wanted to hear from him first will be noted by him and it'll make it easier for you to give your points than if you start right out, "This is our agenda." It's a respect thing. I believe that that's the great strength of America. There is an inexhaustible supply of dignity around. You can give it to people and there is more around to give to other people. You can show respect without reducing your supply of respect. And the idea that America wants to like others and to work with others wherever we can because we like them or we respect them is a subtle but powerful tool for us and for our future.

Q: When you were Ambassador, did you have the opportunity to have small groups into the residence and have these kinds of informal contacts?

MONDALE: I did. I would meet with them. We'd go out for dinner, which I liked. We would have them in the embassy. I'd meet them in their offices. We had sort of routine things like, I'd always have breakfast every week or every month with the vice minister of foreign affairs. We really tried to make these things go.

Q: So there was a regular pattern of interaction that you had set up so that was available to you if something were to-

MONDALE: Right. And I would go around and meet all the ministers. I'd go to the party headquarters and meet the leaders. You know what the ambassador does.

Q: But does the public know what the ambassador does, sitting there regally in his office? As you're saying, most of the gentlemen I worked with saw their job as getting out and creating a presence for the United States and a reputation. We would have small dinner parties at the ambassador's residence for key people. Again, that's what one does in a commercial society to maintain a human relationship with the client. It's just good business.

MONDALE: I think that commercial analogy is a very good one because people can understand what they're doing. But it leaves me a little cold because I think there's things about human connections that isn't commercial - I realize you're not saying that – that go more to respect and human vibes or something. But I placed a lot of emphasis on that. I think there's something

about living the life of a politician, if you're any good at it, that you find that side of human nature is... If you go at it right, you'll see the power of trust and respect to do things that you need to get done and may be difficult.

Q: The kinds of issues that you dealt with sort of had a natural life in and of themselves sometimes. But were there things that sprang from the American political process that some lobby group got in or something like that and this was a new issue then for you?

MONDALE: I felt like I was America's desk officer. You had a lot of people with a lot of agendas that would try to come in through different agencies or come to us directly to push their agenda. It might be a commercial agenda. It might be a weapon they wanted to sell. It might be any number of things. I always felt that it was my duty to look at the total relationship and respond to them based on what I thought best served our country. If I didn't like the idea, I didn't think it helped, I'd sometimes tell them. Sometimes I wouldn't tell them, I'd just handle it that way. I'd get orders, "Take this immediately to the prime minister" on something I knew was not appropriate at that level and something I knew the prime minister would think I was crazy, so I'd say, "We're going to get right to it" and I'd send some lower level assistant over there and tell them to leave a message or something. You had to do that. I think that's how an ambassador has to operate. If the government doesn't think he's doing it well, get somebody else, but I don't think you can just let this stuff come unfiltered into the country.

Q: Isn't that just the key thing that an ambassador offers, prioritizing your messages and making sure that they have the proper effect that you want?

MONDALE: Right. And sometimes you can't get decisions out of the government that have to be made quickly. When that girl was raped, I immediately apologized. I didn't wait for instructions from the federal government. I just went out and did it. When they had the 1995 annual memorial service for those killed in the firebombings of Tokyo that terrible night, I went to it. I wasn't taking sides in the war, but I let them know that Americans were sorry about what happened to innocent people, and I know it made a difference. I got a lot of bad mail from over here, but it was something that made us human, it showed that we cared, and I just did it.

Q: And of course handling the 50th anniversary of the end of the war was... There were ceremonies all over the place.

MONDALE: All over, but this was different. This one involved America's bombing Tokyo. I wasn't going to review that issue, but I wanted them to know that we were sorry that innocent people were killed. I think I got away with it.

RICHARD M. GIBSON
Japanese Language Training
Yokohama (1994-1995)

Principal Officer

Sapporo (1995-1996)

Richard M. Gibson was born in Florida in 1942. He received a bachelor's degree from San Jose State College in 1965 and his master's in 1966. He served in the US Navy from 1966-1971 as a lieutenant overseas and entered the Foreign Service in 1971. Mr. Gibson was assigned to Rangoon, Bangkok, Songhla, Yokohama, Okinawa, and Chiang Mai. In 1998, he was interviewed by Charles Stuart Kennedy.

GIBSON: I came over here to this wonderful campus and studied the six week economic course because I always wanted to take it. Then I did some refresher Japanese language training here and in January of '95 I went out to Yokohama for more refresher Japanese language training. In the summer of '95 I left Yokohama and went to Sapporo Japan as principal officer up there and stayed there until December of '96 when I decided that it was time for me to do something else with my life and quit. I am one of the few white male O1 political officers who quit rather than had their clock run out.

Q: Tell me about Sapporo. To identify it, it's the principal city of Hokkaido isn't it?

GIBSON: Yes, it's the principal city of Hokkaido. It is where the Hokkaido administrative apparatus is. It is like the capital. The consular district included the northern part of Honshu as well. I think the consular district was something like 27 percent of the land area of Japan or something like that. It is quite extensive, quite large. Hokkaido was an interesting place. I think it has 22 percent of the land area of Japan and it's got something like five percent of the population. It is thinly populated with beautiful forests. It is actually a beautiful country. Dairy farming and fishing are big up there. Coal mining is gone now. It is mainly agriculture. Some of it is rice because they grow rice everywhere in Japan but there are a lot of potatoes and onions and sort of western crops are grown there plus it is a big dairy area, the dairy capital of Japan. It's like our Wisconsin.

Q: What were the issues? What was the situation there when you were there?

GIBSON: It was all pretty calm and easy, kind of boring. It was actually the most boring job that I had in the Foreign Service. We had a beautiful facility occupied one half by the USIS branch office and we had the other half. Actually USIS had most of the building because they had an auditorium, library and that sort of thing. It was a very nice facility. Then there was us. The USIS thing got closed down after I left actually.

The main job that we had on the State side was trade promotion and that was basically our job. Our military would go up there and we'd do exercises with the Japanese self defense forces and that sort of thing. Every now and then there would be an incident up on the disputed area between Japan and Russia which we'd report on. We would also report a little bit on far eastern Russian developments, trade relations with Japan. Basically it was trade promotion. We were helping U.S. companies selling to Japanese companies. Our biggest market was building materials. In Hokkaido, because they had more space, there tended to be more western style homes built and two-by-four construction as opposed to post and beam construction which the

Japanese had traditionally used.

Q: This is tape five, side one with Dick Gibson.

GIBSON: Oregon, Washington and the Canadians too were selling a lot in there and so were the Swedes and various Scandinavians. The Australians were making a good effort too. Throughout northern Japan, northern Honshu and on Hokkaido, as I said two-by-four style construction was flourishing and our companies would sell better quality building materials shipped from the west coast to Japan and we could beat local Japanese prices.

Q: Did you have problems with Japanese regulations, custom, I mean a concerted effort to make sure that nothing got through?

GIBSON: That's right we did but you just keep plugging away at it. Tokyo was handling most of that. Tokyo was fighting that battle. All we were doing was we were cheering Tokyo on and if we got a particularly egregious case we would report it to the embassy and then they would use it in their negotiations with the Japanese. Certain things we were doing okay in and certain things we weren't. Wiring and plumbing, forget it. They had that one sewed up. The Japanese had all these little regulations on wiring and plumbing and stuff.

Q: You can draw up things so that you only have to use certain types of piping and wiring.

GIBSON: We were chipping away at it. We were doing real well on stuff like timber and on things like drywall, fiberboard, basic construction materials. Yes, it all had to be passed and this and that and everything. You know, you beat on the Japanese long enough, they give grudgingly with two steps forward, one step back but then you just keep pounding on them. We were working at it.

I think what we were trying to do was get a U.S. share of major construction projects. The biggest one that was going on there was the city of Sapporo was building a new stadium for the World Cup in 2000 or whatever it was going to be. We knew it was an uphill fight but we did a lot of lobbying with Sapporo officials and everything to get American companies to get a good shot at it. We knew we wouldn't get an American contractor in there, that would never happen. But we were working very hard to get an American engineering firm to have a role in there. As I understand after I left it came down that way. It started out as an American engineering firm and I think the Brits bought it out but it is still largely American in many ways I guess.

We were also doing pretty well in selling electricity producing things like generators and that sort of thing to the local electric companies because the utilities in Japan are under increasing pressure to become more cost effective and so they were looking for better ways to do it. We were having some success in that area and we were having some success with computer and high tech stuff. Other things surprisingly enough were helicopters. The various prefectures in Japan and major cities were on the kick of buying emergency helicopters, rescue helicopters for medics and that sort of thing. We had some pretty good luck selling Bell helicopters to the city of Sapporo and the province, state, whatever you want to call it, of Hokkaido and some of the other cities down in the northern Honshu area. But that is basically what we did. I spent a lot of my

time doing trade shows. We would do trade shows both in Sapporo and in Sendi which is the commercial center of northeastern Japan, the Tohoku area they call it. We were doing okay. We did pretty well. I was quite please with the performance of the guys doing that but basically that was all we did. No one cared about anything else up there.

Q: What about with trade and all, I would have thought that Wisconsin or Minnesota, you mentioned dairy, might be pretty good sending trade delegations there and all of that or maybe Idaho potatoes or something like that?

GIBSON: We got strawberries but not potatoes because Hokkaido grew plenty of potatoes and quite good ones. Wisconsin didn't participate. You take dairy farming at their own place, there is no way you can beat them.

Q: I was thinking of equipment or something like that.

GIBSON: Oh yeah, the dairy farming equipment, milking equipment and a lot of that stuff was American, very heavily American made stuff was there. But you know it is funny because I guess what was going on is the dairy industry in Hokkaido was consolidating while I was there and a lot of people were selling their farms and there were fewer and fewer farms and this sort of thing. Mom and dad would retire and Sally and Joey didn't want to be on the farm, they wanted to be in the city and they had left. When I would visit dairy farms you would see American milking equipment and various other things which I've sort of forgotten because I don't know anything about farming anyway. There would be Ford tractors and all this stuff. You would see a lot of American made equipment but we weren't at the time really engaged in selling them which told me that it was sort of a maintenance job. There was a local Ford rep. It had sort of gone on its own and it didn't really need any consulate intervention, trade boost and this sort of thing. I think that it was probably because it was a very stable market, or a shrinking market if anything. You are right. Our stuff was being used over there.

Q: When was the last time that you were in Japan?

GIBSON: Last month.

Q: No, I'm talking about a tour before this?

GIBSON: It had been '86 (if you count language school) to '89 in Okinawa.

Q: Did you notice any change in the Japanese? Up in that area were they more internationally oriented? Was there a change?

GIBSON: First of all I can't really say if there was a change and I'll tell you why. Okinawans are Okinawans, they are not mainland Japanese. Hokkaido people are not your average Japanese because Hokkaido is settled. It was a frontier area as late as the turn of the century so the people who went up to Hokkaido came from all parts of Japan so they are much more open and less closed than the people from the main islands of Japan. They are not really representative of the Japanese either. I found the Hokkaido folks in general to be much more open, easier to talk to.

Not easy but easier than most Japanese. Yes there is a very high interest in international things like music festivals, and Sapporo is building a world trade center. They would have exchanges with the Northern (tier) Group, countries that basically are at the top of the world.

Q: *Kind of cold.*

GIBSON: Yeah, kind of cold, the Scandinavian countries, Russia, Canada, U.S. through Alaska. They are constantly having meetings and conferences. Hokkaido and Sapporo are really good on dragging in international things. At the universities there they have a lot of sister school relationships with U.S., Australian, Russian, Chinese universities. Sister city programs are very popular. All of this, as there is toing and froing and this sort of thing, and does it make a real impact on the psyche of the average Japanese citizen in Hokkaido? No. They go through all the motions and everything, they are doing all this. My friends and I, the cynics that we are, we would always say the Japanese wouldn't know kokusaika if it bit them in the ankle. Kokusaika is the Japanese term for internationalization. They don't get it but they are trying real hard.

They had a program in Japan called JET program, I think it means Japan English Teaching or something like that. It is a government sponsored thing. Young Americans or other nationalities too go to Japan and some of them teach English in the schools and some of them they put in the city or the provincial administrative offices and they handle these international programs. In every province, (I use the term province. It's multidimensional, they are not even all the same in Japan but they are province like things for cities and all the major cities) they all have international programs and in the city there will be an international department. You know how exploded the bureaucracy in Japan is, so they've got all this tax money and they sponsor these. A great many of them have these foreign kids there. You meet some real nice young Americans, I met mainly Americans of course. Anyway they are very interested and the people of Hokkaido more so than most I think.

Hokkaido is basically a colony of mainland Japan. The Japanese sort of see them as the provider of milk, cheese, potatoes, onions and a market for their manufactured goods and this sort of thing. Very few Japanese companies will go up there and locate. The Hokkaido crowd are always trying to get foreign companies to come and invest in Hokkaido but they won't because transportation costs between the mainland and Hokkaido are prohibitive. The government regulates everything and won't give a break on airline fares, telephone calls. They won't give them a break on anything so they pay outlandish fees.

I'll give you an example of internal transportation and why factories won't locate in Hokkaido. You can ship a standard sea-land container of goods from say to Seattle to Yokohama Japan for x number of dollars. At Yokohama you put it on a ship to bring it up to a port in Hokkaido on the Pacific coast, we're not talking about the Sea of Japan side, we're talking about the Pacific coast. It will be 2x dollars. It will cost you twice as much to ship it internally and if you try to do it by road, it is going to be the same thing.

I used to love the internal phone thing. My wife was over here in the States while I was there, that was one of the reasons that I didn't do the full tour. I would call her, as I did most nights. The embassy has this tie line back to this area so once I got to the embassy operator my

telephone call to Virginia was free but the thing that limited our phone conversations was I had to pay the phone bill between Sapporo and Tokyo. It wasn't quite as bad as her calling me direct from here but it wasn't much cheaper. It was cheaper but not much. Anyway, nobody wants to locate up in Hokkaido and the Hokkaidan people are always pressuring the government to give them a break on this or that. Everything is regulated so if the government bureaucrats want to, they could make the long distance rates cheaper. It gets in the way of telegraph, e-mail, it affects everything up there.

Q: Did the dispute over the northern territory with what used to be the Soviet Union and is now Russia, intrude at all?

GIBSON: No, occasionally. The Japanese poached a lot in those islands. Their fishermen would go up there and start poaching and the Russians don't mess around. A patrol boat would go in and warn them a couple of times and if they didn't smartly get out of the waters or heave to for arrest, they'd shoot them. They would just open fire. There were a couple incidents where machine gun holes in the cabin and this sort of thing and boats would be arrested. In every case the Japanese were in the wrong. The Russians were in the right in the sense that they were protecting their territorial limits. You may not agree with their territorial limits because you may say that that's an island that really belongs to Japan, but not so. The islands we're talking about are right here where they've got a sort of hatch there. They would be around usually right around in this area just off Hokkaido. But sometimes they would be up here off Sakhalin and Sakhalin is not disputed. The Japanese were poaching. There would be occasional incidents but it would always be played down.

If you went up to that area of Hokkaido, the We Want Our Northern Territories Back movement or whatever, was really strong. They have museums there and they have road signs along the road which the Japanese right wing would have up showing basically Russian soldiers bayoneting nice Japanese babies on the islands, that sort of thing. It was really just funny propaganda. I used to take snapshots of the big signboards. You get away from there and nobody much cares, it's a dead issue. They are god forsaken islands and who wants them? At the museum they have a lot of historical photographs of Japanese families and workers. There is nothing up there. They are barren, cold, isolated and nobody in their right mind lives there. In fact the population has drained because once the Soviet Union broke down, the Russians don't have to stay there any more and they are heading back. There have been some earthquakes that have destroyed a lot. Nobody wants to live there, even the Russians don't want to live there, and there are no Japanese left there. They all were sent back down to the mainland and so nobody really cares except for these old codgers up there, the right wing.

A few years ago the Russians and the Japanese agreed to a system whereby several times a year without bothering with visas and everything, the Japanese can go up there and visit the ancestral graves. That took a lot of the wind out of it too. I think it is sort of the thing, oh yeah well great grandfather Hashimoto he is buried up there. That is great, you stay there Hashimoto-San and I'll stay down on Hokkaido where it's a lot nicer. It was a big Cold War issue at one point.

Q: It was a very handy thing for the old Cold War. It kept the Japanese from playing footsie with the Soviets. It was stupidity on the part of the Soviets but anyway it was their stupidity and not

ours.

GIBSON: What is interesting now is if you took a poll in Hokkaido, 90 percent of the people in Hokkaido would say let Japanese businesses invest in those islands because there are plenty of Japanese businesses that would like to invest in construction on those islands or in a fish canning processing plants and this sort of a thing. They see it as an opportunity for some profit but the Foreign Ministry won't let them because if the Japanese invest there, they have to get Russian permission which implies that it is Russian territory, and so on, and so on. The Hokkaidans are always pounding on Tokyo to the Ministry of Foreign Affairs saying hey, forget that let's just do a deal, but Tokyo won't do it. The people of Hokkaido they don't care.

ALOYSIUS M. O'NEILL
Consul General
Okinawa (1994-1997)

Mr. O'Neil was born in South Carolina and raised there and in other states in the U.S. He was educated at the University of Delaware and Heidelberg University. After serving in the US Army in Vietnam, Mr. O'Neill joined the Foreign Service in 1976 and was posted to Korea. He subsequently served three tours in Japan as student of Japanese and Consular and Political Officer. He also served in Burma, Korea and the Philippines as well as in Washington, where he dealt primarily with East Asian and Pacific Affairs. Mr. O'Neill was interviewed by Charles Stuart Kennedy in 2008.

Q: Al, I think this is a good place to stop. We'll pick this up the next time. You're off to Okinawa as consul general. When did that happen?

O'NEILL: I got there in August 1994.

Q: Okay. Today is the 7th of November 2008. This is with Al O'Neill. Al, I've had quite a few interviews relating to the battle of Okinawa. I'm not talking about the invasion of Okinawa in '45. I'm talking about the battle of Okinawa over a reversion treaty. Reversion was the term?

O'NEILL: Yes, that was.

Q: There was a very bitter battle between the Department of State and the Pentagon over a reversion agreement. You were there from when to when?

O'NEILL: I got there in August '94 and stayed till July '97.

Q: First place, how did you get the job?

O'NEILL: Charm, I suppose. I had had Japan experience. I was still considered a Japanese language officer although it had been 10 years since I'd used the language very much. I wanted

the job, and I knew people who were in a position to recommend me for the job, particularly Tom Hubbard who was our deputy assistant secretary.

I made clear that I wanted it, and the fact that I had Japanese language and previous experience in Tokyo was helpful. That was where I first worked with Tom Hubbard, who was the chief of the internal branch in political when I was Ambassador Mansfield's aide. Plus I'd been working for Tom for two years in the East Asia bureau. I was at the right grade. I wanted it for a lot of reasons, one of which was I wanted to be a principal officer and run my own post for a change. I thought that my military background would be helpful and I figured it would be a very interesting place. It turned out to be even more interesting than I thought.

Q: What was the situation in Okinawa? In the first place, when did the reversion come, and how stood things at this time, and where did Okinawa fit at this period in the Japanese political context?

O'NEILL: Well, reversion had taken place in May of 1972, 22 years before. Okinawa again became a prefecture of Japan as a result of reversion. Japanese was the official language. Many Okinawans, particularly the older ones, still spoke various Okinawan dialects which are quite different from Japanese. Okinawa was also the most visible symbol of the U.S.-Japan security relationship under the Mutual Security Treaty of 1960.

As a prefecture, Okinawa had an elected governor and elected prefectural assembly and elected mayors in the cities and towns and their own city councils, etc., from among the Okinawan populace. There were Okinawan representatives in the Diet in Tokyo. There were also numerous Japanese officials in Okinawa, including from what was then called the Japan Defense Agency or JDA, now the ministry of defense. Bank of Japan had an office there. Many of the organizations of the Tokyo bureaucracy were represented in Okinawa as they would be in other Japanese prefectures.

The U.S. military presence was huge. Okinawa prefecture consists of the main island of Okinawa and a line of much smaller islands stringing out north and south from Kyushu, the southernmost main island all the way to the island of Yonaguni. It is said that on a clear day you can see Taiwan from Yonaguni.

The bulk of the population and the bulk of the U.S. military presence were all on the main island of Okinawa which was only 67 miles long at its longest, the north-south axis, and then at the widest it's just 14 miles wide. Most other places it's a lot narrower than that. About 1.2 million Okinawans live on that island. In my time, there were also 29,000 U.S. military people packed into that island and a similar number of family members and Defense Department civilians including 900 people from the Defense Department school system. There were 13 DoD dependent schools on Okinawa including two four-year high schools; so it was an enormous U.S. presence on a pretty small island.

About 17,000 of the 29,000 military people were Marines from the 3rd Marine Expeditionary Force or MEF. The MEF commander was then a major general, a two star who was the senior U.S. military officer on Okinawa. He did not command the heads of the Army, the Navy, and the

Air Force components on Okinawa, but he was the senior officer and the Okinawa Area Coordinator. Each of them answered to component commanders at Yokota Air Base, Yokosuka for the Navy, and Camp Zama in the case of U.S. Army Japan. Most of the military forces on Okinawa were combat units of various kinds, so they trained constantly and tended to make a lot of noise. There were three F-15 fighter squadrons on Kadena Air Base, for example, and they were flying all the time. The units were always training for contingencies particularly in Korea and elsewhere in Asia as well. So, packed on a very tiny island, you had a U.S. military presence that affected everything because it was so large and noisy. The U.S. military also occupied also a lot of very prime land in central Okinawa.

Let me mention a couple of things about Okinawa's past. Until 1879, Okinawa was a separate kingdom, the Ryukyu Kingdom, a tributary state of China. It conducted its own trading relations with Java and Siam, Korea, etc., as well as China. They had a long history of being an essentially unarmed trading nation. They came under increasing Japanese control in the 1600s from a samurai clan in southern Kyushu, but they still were a tributary state of China. After the Meiji emperor was restored to being head of government in 1867, Japan moved to annex Okinawa as a prefecture. As a result of this there was always tension between the mainland Japanese and the Okinawans. The Okinawans were very much looked down upon by the mainland Japanese as being not really Japanese, as being mixtures of Chinese and Korean and Okinawan, etc., and were very much second class citizens through the war period.

The Battle of Okinawa was horrendous. It was one of the biggest battles of the entire Pacific war, 82 days of pretty much non-stop combat. The invasion took place on April Fool's Day, April 1, 1945. The naval force was larger than the one for the D-Day invasion of Normandy. The fleet was almost unimaginable. One thousand four hundred fifty seven warships took part including 40 aircraft carriers, 18 battleships and 430 troop ships and who knows how many cruisers and destroyers, and 50 submarines. There were 1,500 airplanes including B-29s. So this was a gigantic invasion of a very small place.

The purpose was to establish a base from which the U.S. could conduct the invasion of mainland Japan, starting in November 1945 with Kyushu and then the bigger invasion of the Tokyo plain which was planned for the spring of 1946. The Japanese probably didn't believe, based on the Pacific war to date, that they would be able to defeat the Americans and keep them from controlling Okinawa. Their intention was to cause as much damage to the American forces as possible to delay them and to make them think twice about the cost of invading the mainland which is, indeed, exactly what happened.

We had 14,000 people killed in that battle. The U.S. Navy lost more people in the Battle of Okinawa than in any other battle in its history, a total of 4,500. Kamikaze strikes took a huge toll on the Navy during the battle and sank and damaged a great number of ships. Most of the people who died were Japanese, of course. About 240,000 people were killed all together, more than half of them were Okinawans civilians. The rest were Japanese soldiers and Okinawans who were part of the Japanese forces. Most of the fighting took place in an area about 15 miles by 20 miles at the southern end of Okinawa. The Okinawans refer to this battle as the "typhoon of steel," very aptly.

Japan regained its sovereignty in 1952 with the San Francisco Treaty but we held on to Okinawa for another 20 years. We euphemistically referred to “U.S. administration” but, in fact, the senior U.S. official in Okinawa during that period was an Army lieutenant general, called the high commissioner for the Ryukyu Islands. A State Department officer was his political advisor or POLAD, but there was no doubt that the Army was in charge.

Over the intervening years the U.S. tended to consolidate or close a lot of their military bases on the main islands of Japan as they were no longer needed or as they became too difficult to train on, etc., because of domestic political pressures. There was consolidation in some of the military bases in Okinawa as well but just not on the same scale. In fact, during the ‘80s when I was in Tokyo there was a great consolidation along the Kanto Plain military bases in the Tokyo area: Yokohama, Yokosuka, etc., but less so on Okinawa. The idea was that by doing more consolidation on the mainland and less on Okinawa, the U.S. and the Japanese governments would be buying time for a continued base presence in Japan and, indeed, they did up until the 1990s when I got to Okinawa.

The situation that I had to deal with was fascinating in a lot of ways. For one thing, when you go to a Foreign Service post you normally figure you’re going to be dealing with one foreign culture or one different culture, anyway. In Okinawa, the consul general was dealing with *three* different cultures because there was the Okinawan culture which was pervasive and very interesting in its own right, but also there were the Japanese culture and the U.S. military culture.

In dealing with base issues, the consul general was a member of what was called the Okinawa Area Coordinating Committee or OACC which had the Army, Navy, Air Force, and Marine component commanders, and the Marine general who was the real estate commander, who oversaw the 13 Marine bases on Okinawa. The consul general ranked as a brigadier general. The OACC operated relatively informally. It was very valuable for coordinating among ourselves both in good and bad cases and to present a united front to the Okinawan prefectural government. The base issue was always at the top of the agenda on the U.S. side both in terms of dealing with the Japanese government and the Okinawan prefectural government and also the cities and towns that hosted the bases.

To get back to the battle for a second, the battle was always in the minds of Okinawans particularly the great number of Okinawans who had survived the battle. There were interestingly mixed feelings among Okinawans about the relative U.S. and mainland Japanese roles in the battle. We came there as the invaders and the conquerors and blew up the island and killed lots and lots of people. But relatively speaking, the Okinawans that we dealt with in the political world, the academic world, businesses, etc., had a better attitude toward the American role in that battle than they did to the mainland Japanese role because they knew the Japanese strategy.

The governor at the time was named Masahide Ota, an academic turned politician. He was a deep-dyed pacifist. He had fought in the battle as a student soldier, was very badly wounded and hadn’t surrendered until November 1945, two months after the Japanese formal surrender. He was illustrative of an Okinawan attitude of greater antipathy toward the central government in Tokyo than toward the Americans, although Ota was quite anti-base and would have been quite

happy to have all the U.S. bases out of Okinawa. But he operated as did many Okinawans from this bifurcated look at the relative roles of the Japanese and the U.S. in the battle and then also later on, too. I think — and this is a sort of very broad brush — Okinawans felt that the Americans on the island and in Washington were at least more willing to listen to them and their complaints and maybe try to do something about it than the central government in Tokyo. There were some interesting examples of that that cropped up on my watch.

Q: Where did Okinawa fit in the Japanese political spectrum and society?

O'NEILL: It fluctuated because there were periods in which the prefectural governor, prefectural assembly, and many of the larger city mayors were conservative and were aligned with the LDP, the national ruling party. Ota's predecessor was a two or three term governor named Junji Nishime who was conservative. There were other times when the pendulum swung the other way. Ota himself was very much identified with the Japan Socialist Party. There was the Communist Party and a home-grown leftist party called the Okinawa Socialist Masses Party. So you had divisions among Okinawans as well.

But when I was there, most of the mayors with a couple of exceptions, and most of the city assemblies, the prefectural assembly and the governorship were from the left, anti-base activists. But also, as I kept reminding my military colleagues, mainstream opinion in Okinawa wanted to press the Americans and the Japanese for a reduction in the both the number of military people there and the total land area occupied by these bases. So even very much pro-American, pro-base Okinawans always were in one way or another pressing for what could be done to reduce the base presence.

For reasons having to do with topography and also in some cases where the Japanese themselves had built bases during the war, a lot of the U.S. bases were concentrated in the central part of the island which was quite populated. The farther north you went, the more the population thins out and it's more mountainous. There were mostly fishing villages or excellent resort areas along the periphery, but in the areas where the bases were it was relatively flat and better land in general than you would have farther north.

Among Okinawans, not only were there real party differences but the political pendulum periodically swung. Later on after I left, Ota ran for a third term and was defeated by a businessman whom I knew quite well who had never been in electoral politics before. His wife had taught my wife Chinese character calligraphy. He defeated Ota and heralded a switch back to a more conservative line in the prefectural government and many of the cities. The political pendulum swung back and forth depending on a lot of things, in no small part depending on what various Okinawan administrations were able to get out of the central government in terms of largesse because Tokyo spent a huge amount of money on Okinawa in big infrastructure projects and on noise abatement measures. For example, in the houses around the bases the central government put in double pane windows and air conditioners to help keep down the noise of the KC-135 tankers and the F-15s that were taking off all the time.

Tokyo also paid large amounts for rent for base lands because another peculiarity of Okinawa is that most of the base land was privately owned. By contrast, the bases on the mainland were

almost all former Japanese imperial forces bases like Yokota, Yokosuka and Sasebo that had been built before and during World War II. The Americans just took them over. In Okinawa there were a handful of such former Japanese bases like Kadena Air Base but even that base had absorbed much private land as it was greatly expanded during and after the Korean War.

That was also another subplot because a lot of the landowners didn't necessarily want their land to be given up by the U.S. That's one of the reasons why over the years it often became difficult to return or consolidate bases even when we wanted to because the landowners objected. They knew they wouldn't get as much money or believed they would not get as much money from a sale or return of the land for some commercial use.

Q: For years the thorn in our side was the mayor of Naha who was quite left wing, either socialist or communist. Was he completely out of the picture at this time?

O'NEILL: Mayors are elected every four years, and you could have multi-term mayors. During my time, the mayor of Naha was named Oyadomari; he was in the socialist camp. I think you're talking about a famous case, which will give you an idea of American democracy in action in Okinawa during the period of "U.S. administration." In the 1950's a man named Senaga was elected by the people of Naha as their mayor, and the lieutenant general who was the high commissioner for the Ryukyu Islands, essentially the occupation commander, removed him on the grounds that he was a communist even though he had been duly elected. He was, indeed, in the communist party which was a legal party in Japan but didn't seem terribly legal to an U.S. Army lieutenant general.

Okinawans remember that kind of thing. They've got an intense sense of history. They think of things that happened in the 1950s much as they do of things that happened last week.

Q: Did the Japanese on the main islands go to Okinawa? Was this being in exile? Was there much commerce or intercourse between Okinawa and the rest of Japan?

O'NEILL: In tourism there was. By the time I got there Okinawa was a great tourist destination for mainland Japanese. In fact, tourism had long supplanted the bases as the principal direct money earner. One of the peculiarities of Okinawan tourism was it was almost exclusively aimed at mainland Japanese. There was not much in the way of an influx of Americans or Australians, etc., who would be tourists in Hong Kong, Singapore or Thailand, for example.

One of the reasons for this, that I kept reminding Okinawans about when they would talk of trying to compete with Hawaii, for example, was that they had to improve English language education among younger Okinawans. One of the things that surprised me was that even though the U.S. occupation had ended only 22 years before, relatively few Okinawans spoke much English at all.

So when you'd go to beautiful first class hotels on lovely stretches of the beach with sparkling blue water, you would rarely encounter any hotel staff who could speak much English in contrast to the top hotels in Korea. They had boxed themselves into tourism aimed at the Japanese mainland: honeymooners, scuba divers. There was world class scuba diving. That was one thing

that did attract people from Australia, U.S. etc., to the coral reefs. In fact, I once met Prince Philip, the Duke of Edinburgh in Okinawa. He was there as the president of the World Wildlife Federation, and he was particularly looking at the state of some coral reefs. He was not somebody you would expect to see there.

Q: Were the Okinawans at all ahead or behind the rest of Japan and in getting foreigners to come in to replenish the stock? Japan is renowned for getting older and older and not really reproducing itself.

O'NEILL: Well, I think the Okinawan birthrate was probably higher than the mainland birthrate. So were the divorce rate, the unemployment rate, and the basic income levels. That was always a constant source of complaint among the Okinawans towards the mainland, and they blamed this on the bases, too, which was not quite accurate at all.

In fact, I thought it was quite the opposite. My view was that it was the existence of these bases that put Okinawa on the map in terms of the central government in Tokyo. Had the bases not been there, I think Okinawa would have got a lot less attention because of the lingering prejudice toward Okinawans. I think some Okinawans understood this, that there was this weird paradox that the bases they were complaining about were the big ticket items as far as their influence in Tokyo was concerned.

Indeed, Okinawan politicians played this angle for everything they could because not only did you have the governor going to Tokyo to lobby for more goodies, like Ota's big idea for a monorail project and lots of other things. Everybody in Okinawa had big ideas that they wanted Tokyo to fund, and the individual mayors would lobby various offices in Tokyo for their projects in addition to whatever they wanted to do in terms of base realignment. There was no single voice in Okinawa. There was a fair amount of overlap in the kinds of things they wanted, but there was not an identity of desires, if you will, in dealing with Tokyo.

When I arrived, there were three main issues, *Sanjian* in Japanese, which Governor Ota was pushing with the central government and the headquarters of U.S. Forces, Japan. One of these was to relocate Naha Military Port which was run by the U.S. Army, to relocate it slightly up the coast alongside an existing Marine logistics base called Camp Kinser in Urasoe City, the next city north of Naha.

The second thing was to return a little air field called Yomitan Auxiliary Airfield which was no longer used for aircraft, but it was a site of parachute training for the Special Forces and the Marine airborne people. This was right behind the original invasion beaches in 1945. The third thing that Governor Ota wanted was to relocate the remaining artillery training from Okinawa to the mainland. About half of the artillery training that the Marines had done on Okinawa had been moved elsewhere, but there was still a minimal amount, literally firing guns from fixed positions at a mountain inside a gunnery range on Okinawa just to be able to know that the guns and shells actually worked. There was no realistic training in moving the guns into position, doing all the calculations for setting up firing positions and actually firing the way you would want to do at Fort Sill, Oklahoma or another large training area.

The Okinawans made a big deal about the artillery training. It was a very safe thing, in fact, but they made a big deal, and the governor wanted that moved, too. The Marines were quite willing to move the training to Mt. Fuji artillery range on Honshu which is where they did much of their training anyway. The Japanese government up until 1995 was unwilling to expend the political capital that was necessary to do the ground work in the communities around Fuji to allow for this additional influx of Marines and somewhat more noise and a few more firing days per year than the local inhabitants were normally dealing with. Tokyo simply did not want to do it. They eventually did as a result of that horrendous child rape incident in September 1995, which I'll go into in more detail later.

Let me mention one other factor during my first year there. The prime minister of Japan was Tomiichi Murayama, who in many ways was very peculiar in comparison to his predecessors. First, he was from the Japan Socialist Party and had become prime minister in a rather shabby deal that allowed the LDP to keep a measure of power in a coalition. Murayama was in his 70s which was not unusual for Japanese prime ministers, but he had spent his entire political life of 50 years as a pacifist fighting against the U.S.-Japan Security Treaty and against the existence of the Self Defense Forces which he considered unconstitutional. When he became prime minister, he had visited exactly one foreign country: North Korea. The Japan Socialist Party had links of various kinds, including financial, with North Korea over the decades. His CV boded badly for a lot of things in the coming year.

Nineteen ninety-five was, of course, heading into the 50th anniversary of the last year of World War II. For Japan this meant the appalling battle on the little island of Iwo Jima in February and March of 1945 and then the April through June bloodbath on Okinawa, the 50th anniversary of the atomic bombings of Hiroshima and Nagasaki and the 50th anniversary on August 15 of the surrender. The intent of all parties — the Okinawans, the central government in Japan and the American military, of course, was to commemorate the 50th anniversary of this huge battle, the last U.S. ground battle against Japan.

The issue of how it would be done caused a lot of nervousness among a lot of Okinawans because they were afraid we would be celebrating our victory which was far from the intent in either of the U.S. forces or, indeed, the American veterans of the battle. So we had a lot of preparatory work both to plan the events and also to reassure the Okinawans about U.S. intentions about the commemorations which were going to be centered in June. The landing was on April 1, but the idea was to do the commemorations over several days marking the very end of the battle in late June 1945.

As one example of the groundwork, I did an interview with NHK, the national TV network, a couple of months before the commemoration. My main point was that we were not going to celebrate a victory. First of all the American veterans' purpose was just to return to Okinawa where they had been through a horrendous experience and to remember their comrades who had been killed. They were not trying to celebrate anything. The overall U.S. idea was to remember the dead from all sides and also to emphasize the 50 years of a very productive relationship between the U.S. and Japan.

I think my NHK TV interview was helpful. I pointed out that NHK itself had done a program on

the Battle of Okinawa a few months earlier. They reported that the American invasion force had brought with them food and clothing for about 100,000 Okinawans plus many thousands of civil affairs specialists. The U.S. knew that the Okinawan population had not bombed Pearl Harbor, but had been basically caught up as innocents in the militarist plans of the Japanese government. So I played that back to the NHK interviewer. He found that earlier program and blended it in with my interview when it was broadcast. The intended tenor of the commemorations was the point I was making to NHK and continued to make to the Okinawan news media including the newspapers.

Fortunately by the time Okinawan concerns were rising we had had the commemorations on Iwo Jima in March. Even though Iwo Jima is in Tokyo's consular district rather than Okinawa's, the Marines on Okinawa planned and supported the commemorations on Iwo Jima. With the NHK interviewer, I was able to point to the commemorative nature of the 50th anniversary ceremonies on Iwo Jima as a practical example of our intentions concerning Okinawa. I had seen that first hand. My wife and I had flown to Iwo Jima on General Meyers's airplane. He was at the time a lieutenant general commanding U.S. Forces Japan, later became chairman of the Joint Chiefs and his deputy in Japan, Pete Pace, became his successor as Chairman.

At that time, Generals Pace and Meyers and Ambassador Walter Mondale, the former vice president, and his wife Joan came down to Okinawa the day before the flight to Iwo Jima. The Mondales stayed with us that night. There was a big formal dinner at the main Marine Officers' Club and we all flew to Iwo Jima on Meyers's airplane. Iwo Jima is a tiny place. It's about two miles by four miles, and at least 26,000 people were killed in six weeks, over 20,000 Japanese and 6,000 Americans. It's still an active volcanic island, a very unpleasant place but a real shrine for the Marines.

The Okinawa commemorations in June 1995 were quite an extraordinary series of events. The prime minister came, as well as the speaker of the Diet's lower house and the chief justice of the Supreme Court. There was quite a large turnout from the Japanese government, a lot of ceremonies marking the huge toll of Okinawans who died. There was the dedication of what was called the "Cornerstone of Peace," an elaborate monument or set of monuments at the very southern tip of Okinawa, where the battle ended when there was no more room to fight. These were a series of low granite walls, like Oriental screens, in which were carved the names of all 240,000 people, Okinawan, mainland Japanese, American, Taiwanese, Korean, and British, who had died in battle. It was quite an effort by the Okinawans to collect all these names. It is probably the most complete list of the battle dead that anybody could come up with. That was dedicated by the prime minister in the course of these commemorative events.

Of course, there were lots of things to be done on U.S. military bases for the veterans themselves. As I say, the Mondales were there. They were a big hit. General Mundy who was then commandant of the Marine Corps was there and also the commander in chief, Pacific Command plus lots of other high U.S. military officials. I was glad to be there during that time. As a baby boomer I had grown up in the shadow of WWII. Also, one of my uncles had commanded the Marines' 1st Amphibian Tractor Battalion during the entire battle of Okinawa, so there was that additional interest for me.

Q: I was wondering, how did you relate with the American military at this time? Was there any animosity between State and Defense?

O'NEILL: We normally worked quite closely together. I've mentioned the Okinawa Area Coordinating Committee (OACC) which was one of the most frequent means of interaction among the main players on the U.S. side, including me. As the OACC, we interacted quite a lot and, of course, we also talked a good bit on the phone and met each other individually both officially in our offices and at many social functions. So there was a good bit of interaction. There was also a lot of contact between the military people and the towns and cities whose land they were occupying.

Kadena Air Base, for example, was big. The base covers 5,000 acres and adjacent to it is a 6,000 acre ammunition storage area. It's now, I think, the largest air base certainly in the western Pacific and perhaps anywhere outside of the United States. There were two 12,000 foot parallel runways. As I said, they had three F-15 fighter squadrons. They also had the only tanker squadron in the entire western Pacific, 15 KC-135 tankers. Also the Navy operated P-3 Orion anti-submarine patrol planes out of Kadena, and that was a very active thing because they were watching the Chinese all the time.

The bases themselves had pretty well established channels with the towns. For example, Kadena base overlapped two towns and a city: Okinawa City, Kadena Town, and Chatan Town. Their mayors met regularly with senior Air Force officers who were tasked to deal with their complaints about noise, accidents, problems of various kinds, disciplinary problems, etc. Generally these things worked pretty well because, for one thing, the military I think generally understood that they were a very large presence, a noisy presence. They usually recognized that it was some imposition on the Okinawans even if the military people also were quite wrapped up in their missions which were largely directed toward a contingency in Korea. They did a lot of training in Korea; very realistic training. I think at the same time they did an overall good job at trying to manage the base issues as best they could. The mayors understood this, and I think generally the relationships were quite good. There were certainly difficulties and misunderstandings but they were usually manageable.

The commanders were thinking all the time that they may be called to go to war tomorrow, and they had to make sure their people are trained up as much as possible so first, they could do their mission and second, fewer on them would be killed than would be the case if they were poorly trained. So there was this kind of mission tension, if you will, between needing to keep the Okinawans as happy as they possible with a very large and active base presence and also their obligation as commanders to be able to "sound the charge" when they needed to.

To go back to these *Sanjian*, these three main cases that Governor Ota was pushing; as I said one was relocation of Naha Military Port. It was an old facility, and relatively small. A lot of ships couldn't use it because the ships had outgrown the port. It was also subject to silting that had to be dredged all the time. The U.S. military would have been delighted to give it up if they could have a replacement facility, and where they wanted it was, as I mentioned, Camp Kinser which was just a few miles up the road from Naha City. You had several things at play. Camp Kinser, the ideal site of the relocated military port was in Urasoe City. The Urasoe Chamber of

Commerce really wanted the port because they saw all sorts of benefits for what would become a dual use port for civilian use as well as military use. The mayor of Urasoe at the time was a nice man who was not terribly strong, and he was in favor of it, too. He wanted to get a brand new state-of-the-art military/civilian port, but his city council was majority leftist, and they would attack the mayor every time he supported the move to their city.

The Okinawan private citizens who owned the land that comprised the existing military port saw the same disadvantages to the old port that the U.S. military did. They thought, “Well, I’ll lose my base rent if this port is actually turned over to Naha City, so where’s my future income?” So they lobbied as hard as they could with Tokyo against turning back the port. This was one example of the tangle in Okinawa.

Here’s another thing about this Naha Military Port issue that illustrates a lot about relationships on Okinawa. Once, Chairman Uechi of the Urasoe Chamber of Commerce asked me as the U.S. consul general to arrange a meeting for him and his colleagues with the director of the Japanese government’s Defense Facilities Administration Bureau (DFAB) so they could lobby for moving the port.

The irony of this was that the DFAB director was a representative of Chairman Uechi’s own central government, his own defense ministry. And in terms of physical proximity, Chairman Uechi’s office was much closer to the DFAB office than it was to mine. Nonetheless, he asked me to arrange for him and his fellow Okinawans to meet with this Japanese official to promote an idea that presumably the Japanese government wanted as much as we, Chairman Uechi and the other businessmen did. So this is kind of illustrative of the weirdness which could occur in Okinawa. I was more than happy to arrange that meeting which took place in my office. The director of Naha DFAB and Chairman Uechi had a nice discussion in front of me. This was a little disorienting but an illustration of the distance that a lot of Okinawans still felt from the central government.

Q: Was the closing of our bases in the Philippines on the minds of Okinawans?

O’NEILL: It was on Governor Ota’s mind. I used to talk to him a lot and Ota used to talk about Subic Bay in particular. As I mentioned, when I was the deputy director for Philippine affairs a couple of years earlier I had visited Subic and talked with Dick Gordon, the chairman of the Subic Bay Metropolitan Authority. He was working to transform that huge former naval base into a free trade zone and a high tech hub.

Ota talked longingly about reproducing that in Okinawa. I kept reminding him of the huge difference between the Subic situation and Okinawa. President Ramos and that Philippine central government saw Subic in the same way the Dick Gordon did, which was that it was going to be a huge economic boon to the entire Philippines. I told the governor, “Nobody in Tokyo sees that as a big boost for the entire Japanese economy; it’s a totally different situation.” Nonetheless, Ota was in many ways a romantic thinker in his economic theories and he was persistent in all of this.

Q: Did the Okinawans operate like Japanese in not reaching a decision until you got consensus?

O'NEILL: That was more or less true in Okinawa as well. That much the Okinawans had in common with their Japanese brethren on the mainland as a concept anyway. The difficulty a lot of times, though, in Okinawa was there were so many players that there was often no unity of view among Okinawan political entities about what should be done in any given case. Each of the cities, for example, had elaborate drawings and plans for the post-base development of their city. Nobody in Okinawa coordinated all these, so basically each city in Okinawa that had a U.S. military base had a plan for a theme park and a shopping mall, and some other things. A couple of kilometers up the road the next town would have its plan for another theme park and shopping mall. It just wasn't very coordinated at all. The governor for all of his desire to get the bases out of Okinawa didn't really feel the need to do much coordinating of these plans.

Q: Okinawa, when you were there, was basically a dagger pointed at North Korea and China and maybe even Russia. Russia was falling apart at this point. Did events in North Korea or in China play any particular role, or was this too far away?

O'NEILL: China literally was not very far over the horizon. There's a dispute between China and Japan over a group of islands called the Senkakus or Diaoyutai to the Chinese, which are part of Okinawa prefecture, a sprinkling of islands out to the west in the direction of China. Taiwan also claims the Senkakus as the legitimate government of China. There were times when Taiwan patrol boats would come into the waters around the Senkakus and also around Yonaguni, the southwestern-most island in the prefecture. The Japanese government would protest against this invasion of their territorial waters.

Also, you may remember in 1996 there was going to be an election for the president of Taiwan. The Chinese declared they were going to be testing intermediate range missiles and fired missiles in the direction of Taiwan. Nobody missed the message. Some of these missiles actually came down quite close to Yonaguni and other Okinawan islands. They didn't hit land, fortunately. At that point the Clinton administration sent two aircraft carrier battle groups to that area to bolster the people on Taiwan, which was an unusual concentration of aircraft carrier battle groups.

The central government in Tokyo was quite upset about this Chinese missile firing. The major of Yonaguni was quite upset too. But when I talked to Governor Ota about it, he claimed that it wasn't important. It was just something out there in the distance. Okinawans didn't have to worry because the Chinese were friends. Ota, in one of his romantic schemes, was trying to revive an economic link between Fujian Province on the coast of China and Okinawa. When there was a Ryukyu Kingdom, its principal link with China was through Fujian Province. There are a lot of cultural influences in Okinawa that are from Fujian. He thought that it would be a great thing to revive this, and he had arranged to build an Okinawan trade office in Fujian, on which the Fujian authorities overcharged tremendously.

There were a couple of flaws in Governor Ota's ideas. For one thing, he saw this as a way of reviving Okinawa's economy by bringing back these artifacts of the past. But no one in the Okinawan business community thought that it was worth pursuing at all. They thought it was just sort of a pipe dream of an academic who had never done any business, and they were probably right. The biggest thing that nobody could explain was why the people in Fujian would do what

Ota wanted. He wanted them to export to Okinawa semi-finished products that Okinawans would finish and then sell for export. Nobody could quite explain why the people of Fujian Province wouldn't take the semi-finished products, finish them, and sell them, which is what they were doing.

Otherwise, on Okinawa the U.S. and Japanese militaries were very interested in China. In addition to the U.S. Navy P-3 Orions from Kadena, at Naha International Airport there were two Maritime Self-Defense Force Orion squadrons which worked very closely with our military, and they were doing the same thing, hunting for Chinese subs. I don't think anybody paid much attention to the Russians.

Q: I remember pictures about that time showing the Pacific Fleet, Soviet Pacific or now Soviet Pacific resting up in Vladivostok.

O'NEILL: The Navy rear admiral who was the commander of the 7th Fleet's Amphibious Force, Task Force 76, was based with in Okinawa with his battle staff. There were three in succession during my time in Okinawa. Their ships which were located on Sasebo in southern Kyushu were the helicopter carrier and the amphibious landing ships, etc., which would carry the Marines into a Korean contingency, for example. The ships came to White Beach on Okinawa quite a lot to pick up Marines for exercises in Thailand and Korea.

Among the things that started then with the Russians was ship visits to Vladivostok and humanitarian rescue training with the Russian Navy and what the Russians called the Naval Landing Forces, their equivalent of our Marine Corps. The first of the amphibious group commanders I knew, John Sigler, came back from an operation in Vladivostok where they went with the amphibious ships and trained with the naval landing forces, and came back to Okinawa. John said he had had "an out of body experience. I was looking down into the well deck of one of my amphibious ships and here are these Russian amphibious vehicles." He added, "I had spent my entire naval career getting ready to fight these people, and now we're cooperating in these humanitarian rescue operations." One of his successors who eventually went on to become commander of the Pacific Fleet, Walt Doran, had an even more interesting experience with the Russians. He took some ships to Vladivostok, too, for a similar exercise. Walt said they were tied up alongside the Pacific Fleet flagship, *Admiral Pantaleyev*. Some of his career sailors were scheduled to be reenlisted in the U.S. Navy. They came to Walt and said, "Admiral, can we get reenlisted on board the Russian flagship?" He said he would ask the Russian admiral.

Lo and behold! He and his sailors got permission to go aboard the Russian flagship for the reenlistment. The captain paraded his entire ship's company to watch this American ceremony. Through an interpreter Walt learned that his remarks included, "You see what the U.S. Navy does for its sailors? I want the Russian Navy to be this professional. This is what we need to move towards." That was pretty remarkable.

Q: I'm sure you had incidents. My brother was a naval captain graduate of the Class of '40 and was commanding officer of Navy pilots in the 1960's. He talked how he from time to time had to go, if a Navy plane crashed, had to go offer condolences to family. I assume that you who must have had drunks, rapes, murders, whatever. Did you get involved in any?

O'NEILL: Yes, I did, yes indeed. The main accident that I got involved in was only in the sense of attending a memorial service, but it's just a reminder of the cost to our people of operating with the very intense training tempo that they did. One of the squadrons at Kadena was HH-60s, search and rescue Blackhawk helicopters that would go out looking for downed pilots in combat and that sort of thing. They usually operated around Okinawa. However after dawn one morning in October 1994, I learned from the Air Force at Kadena that one of their rescue helicopters had been practicing night flying with night vision goggles near Osan, Korea. They hit a power line, the chopper crashed, and all five men were killed. That produced five widows and three orphans in an instant.

There was a big memorial service at Kadena. They brought the widows and everybody at Kadena went and obviously, naturally, I went. I remember the Wing deputy commander telling me afterwards "At three o'clock in the morning we got the word that they had been killed," and he said, "I was going around from door to door with the chaplain immediately to tell the wives. They don't pay me enough for that." It was pretty bad. On another occasion, a Marine helicopter crash killed a captain and another Marine. Naturally, I went to their memorial service up at Camp Schwab too.

But yes, there were crimes of varying magnitude on Okinawa. Any time you have 27,000 American military people in such a small area, unfortunately you have some who are pretty bad eggs and others who just get in trouble because they got drunk or something like that.

The general Okinawan reaction to various incidents was usually pretty measured. Okinawans were able to discern the difference between an accident — even a fatal traffic accident, for example — and a real crime. They understood the difference, and they usually reacted accordingly even though there were people who were always trying to take advantage of any incident. Particularly this was true in the Okinawa news media. But in general Okinawans knew the difference between a traffic accident and a rape.

I wound up dealing with the worst such crime probably since reversion. On Labor Day evening 1995 a Navy hospital corpsman and two Marines went out and searched for a schoolgirl to abduct and rape. They were caught within 48 hours by the U.S. Navy Criminal Investigative Service, NCIS. There was absolutely no doubt that these were the guys that did it in part because they had all been out in a rented car on Labor Day which was a day off. There were originally four of them altogether, three Marines and the hospital corpsman who was the ringleader. They began talking about kidnapping a schoolgirl and raping her. When the fourth guy began to realize that the other three were serious, he asked to be taken back to Camp Hansen where they were all stationed.

That night, the other three went out and found a 12 year old girl, and they had duct tape and rope and stuff that they had bought at the PX in preparation for this crime and they beat and raped her. When the NCIS began going around the barracks at Camp Hansen, the "fourth man" told his sergeant or NCIS that the other three had been talking about this, and he realized they had actually carried out the crime. So within 48 hours they were in the brig at Camp Hansen, each in solitary confinement. Monday was Labor Day; Wednesday is when these creatures were arrested.

The first I learned about it was that day in a serious incident report cable from the Marines back to their headquarters and to everybody throughout the military chain of command, copied to me.

That Wednesday afternoon I immediately called Embassy Tokyo, to the head of the political military branch in the political section. He said he already knew about it because the mayor of Kin Town, next to Camp Hansen, happened to be meeting with them that day. Mayor Yoshida of Kin told him that this had happened, so the embassy knew about it already. I was talking to my Okinawan chief political employee who was absolutely wonderful to work with on this whole terrible business. He said the Okinawan police were trying to keep the knowledge of this out of the press.

It turned out that the MEF commander Major General Wayne Rollings, the senior Marine and the ranking U.S military officer on Okinawa had left that Labor Day weekend, to go to Hawaii for a commanders' conference and see some of his own units in Hawaii. The III MEF was scattered all from Hawaii to Iwakuni in mainland Japan to Okinawa.

On that Friday, since General Rollings was gone, I called Brigadier General Mike Hayes the relatively newly arrived Marine Corps base commander, to talk about what to do because obviously it was going to become public at some point. While I was on the phone with General Hayes, my FSN came in with the Friday afternoon newspapers that had this appalling story all over the front pages. I told General Hayes that we needed to figure out what we were going to do to respond.

I was also in touch with the chief of staff to Governor Ota in the prefectural headquarters in Naha, as I did several times over the weekend. We agreed in the course of our discussion that I would go and meet with Governor Ota on Monday to apologize for this awful crime and apologize to the Okinawan people. It would also be an opportunity for me to explain what the judicial processes would be. I was also in contact with the embassy in Tokyo several times over that weekend.

When, later on Friday or over the weekend, I spoke again to General Mike Hayes about meeting the governor on Monday, he said General Rollings was not scheduled to be back in Okinawa until that following Monday night which would be a week after the rape. He said that if Rollings was not back that he, General Hayes, or the deputy commander of the Marine Expeditionary Force, another newly arrived brigadier general, would go with me to Governor Ota and apologize. My political FSN and I spent a lot of time on the phone mainly with the governor's staff that weekend arranging the mechanics of the Monday meeting. So on Monday morning I was really stunned when I heard from the General Hayes that General Rollings had come back Sunday instead of Monday night and had decided that neither he nor any of his generals would go with me to meet Governor Ota.

As background, I had been in Okinawa for 13 months by this time. General Rollings and I knew each other well. We worked together on many things. He had been the Marine Corps base commander when the MEF commander, Major General Carl Fulford, was reassigned to the Pentagon. Wayne he was promoted to major general to command the MEF and become the senior Marine general on Okinawa.

Wayne Rollings was, by way of background, a tremendously brave man. He had been awarded the Navy Cross in Vietnam which is our second highest medal for valor. He had the Silver Star twice, the third highest medal for valor. The Marines don't give away medals for valor. He had two Purple Hearts, and he was missing the two last fingers on his right hand. So Wayne was a real lion on the battlefield. But like many generals, he was really camera shy despite his demonstrated bravery in combat.

As further background, in the previous four or five months there had been a couple of cases where Marines had murdered people in Okinawa. In one case a Marine had beaten a woman to death with a hammer. Because this was not an on-duty crime, obviously, he was subject to the Japanese judicial system and was then on trial in Naha as far as I can remember. But there were no Okinawan protests, interestingly, about that murder and previous one. In neither case had I recommended that Wayne Rollings or his predecessor and I go see the governor. But I knew instinctively this gang rape of a child was going to be bad just from the very disgusting nature of the crime and that we needed to deal with it in an extraordinary fashion. At that moment though, I had no idea how bad it would be, the extent of the reverberations nationwide.

I called Wayne right away about going to see Ota and said, "We really need to do this. This is really very important." He said no; he had two reactions. One, that if he went with me to see Governor Ota then the press would "make the military look bad" and two, he said he was going to do something preemptive. He said he would send a letter of apology to Ota before there was a protest, and he thought that this would be a valuable gesture. I told him that would not work in this case, that this is really something very bad indeed. As soon as I could I called David Shear who was the political military branch chief in the embassy in Tokyo and told him that to my amazement that General Rollings would not go with me. I added that I was going to talk to him right away and rode immediately to Wayne's office at Camp Butler which was about 20 minutes away.

When I got to Wayne's office, he had about four or five colonels and his Japanese-American civilian public relations specialist with him. I went by myself and began lobbying General Rollings as hard as I could. I told him that by this time I'd been in Asia for 15 years and there's no place in Asia where apologies count for more than in Japan and it is really important for us to do this. He was very resistant. I even used the example from 1981 of that fatal accident where the U.S. submarine *George Washington* sank the *Nissho Maru*. As I told you, ultimately Mike Mansfield himself went to the Japanese foreign minister and apologized for that accident. There was a famous photograph of Mansfield bowing deeply in front of Foreign Minister Abe. I said that helped. It didn't solve the problem by any means, but it did help. While I was there he called General Myers who was the commander U.S. Forces Japan and said, "Al wants me to go with him to Governor Ota. It's going to be a public thing, sort of a press conference." It was not exactly a press conference, but I guess it was close enough for military purposes.

Now, anytime you met with Governor Ota in his office there were TV cameras all over the place. There were microphones stuck in your face and all that, and you were meeting in his big conference room in his office suite.

Myers gave him permission not to go, so I had to call back to the prefectural people and tell them that I was coming by myself and I had to make up excuses as to what exactly General Rollings had in mind. So in the end Wayne didn't go and I did. Meeting Ota on camera gave me the opportunity to convey directly to the Okinawan public the shock that we Americans all felt at this horrible crime, and I said that the suspects were in U.S. custody but they would indeed be turned over to Japanese jurisdiction when they were indicted, in accordance with the Status of Forces Agreement or SOFA.

Later I realized I'd made a critical mistake. Having worked closely with Wayne Rollings for over a year, and not having recommended going to the governor for every incident, even a murder; I mistakenly believed that Wayne would trust my political judgment on this one. I underestimated how much he hated cameras. During the previous few days that he was in Hawaii if it had occurred to me for a second that he would refuse, I would have called him in Hawaii. His subordinate generals would have gone with me and I am sure that his predecessor Major General Carl Fulford would have gone with me too.

As I was going to Ota's office from the elevator and afterward going back to the elevator, I was swarmed by the TV cameras and reporters demanding "Why don't you turn them over now?" I kept repeating that we would follow the procedure under the SOFA. They would be investigated by the Japanese police while they were in U.S. custody – which they were at that very moment – and as soon as they were indicted would be in a Japanese court. They would be turned over to the Japanese police for imprisonment prior to trial which in fact did happen. Beforehand, the Japanese police did investigate them very thoroughly.

The feelings among the Americans against that trio were almost indescribable. The annual Futenma Air Station flight line fair was about a week or so after this rape. All of the American military bases had a big open house every year with rides and food, etc., to display all their military equipment and allow the Okinawan public on the bases. My political military officer was at Futenma that day. He just casually asked some of the Marines who were with a helicopter display what they thought about the rapists. One said, "We'd like to kill them."

Q: This was in a way...

O'NEILL: Pretty intense to say that, but that was the kind of feeling that Americans had.

Q: What was in these guys' minds? The idea of going after some teenage...

O'NEILL: A 12 year old sixth grader. I don't know that we ever found out exactly what motivated them other than just really twisted minds. It was really — and still is — sickening to talk about. Of course, we had an unbelievable wave of protest groups coming into the consulate general. Everybody from one end of Okinawa to the other all sorts of groups, political, non-political, business, you name it, to the point where most days for weeks after this crime became public we had to line up the protest groups in our consular waiting room on the first floor and bring them up one group after the other to meet with me on the second floor. People were really angry as they had every right to be. There was nothing feigned about this. It was the worst thing that happened since reversion, and it sparked the largest series of demonstrations.

There was another aspect to it, too, which was because of the very fragile state of Japan itself, this child rape incident really caught on nation-wide. You had this whole series of bad occurrences in Japan during 1995 which added strength to the Okinawan protests. They reverberated in Tokyo and throughout Japan. When the Okinawans finally saw some of their pain and tribulations were gaining traction in mainland Japan, which spurred them on to more protests that kept feeding back and forth.

These were the factors in Japan in 1995: You had an extremely weak prime minister, Tomiichi Murayama, who as I mentioned before was a pacifist who had fought against the security treaty for 50 years. Also, Japan was in the fifth or sixth year of a recession which seemed to have no end to it. In February, you had had a gigantic earthquake in the Osaka-Kobe area which was extremely destructive. It was not only destructive in terms of about 5,000 people being killed and great damage being done to Japan's number one port area but also a psychological blow. The Japanese had looked at the earthquakes that we had in Los Angeles and San Francisco and said, "Americans don't really know how to deal with earthquakes. Well, we Japanese know."

March brought not only the 50th anniversary of Iwo Jima but also the truly bizarre sarin nerve gas attacks in the Tokyo subway system engineered by the weird cult named Aum Shinrikyo. They killed 15 or so people and sickened quite a number. It would be like a nerve gas attack at Metro Center in DC.

Then there was the trauma over the 50th anniversary of the Okinawa battle and the two atomic bombings followed by the surrender. So that was the Japan that in September of 1995 was faced with this horrendous rape case.

I was in touch with the prosecutor in Okinawa, a Japanese central government official. He told me he was quite pleased with the cooperation of the U.S. military authorities and the course of the police investigation. He had no problem at all; the police had access to the suspects for as long and as frequently as they wanted. The police were taking the three suspects to the scene of the crime and to the nearest police station and were investigating them. There were always U.S. Marine escorts with them to the best of my knowledge every time they went for police interrogation. The Japanese police operate very differently than ours do. They don't allow lawyers to be present during interrogations anywhere in Japan. It has nothing to do whether it was military or civilian. So we had to provide more protection to these creatures than would normally have been the case, but the Marines felt obligated to do it. Otherwise, they were in solitary confinement in the Camp Hansen brig.

But meanwhile the Okinawan press was spreading lurid stories about how these three were free to roam around Camp Hansen which was an absolute lie. Frankly, if they had been out free they might have been killed, as I said, by their fellow Marines. The news media were spinning all sorts of lies; so ultimately I got the Marines to bring the press onto Camp Hansen to show them the brig and show where the three were being kept. After the news media had done so much damage by spreading lies, they did finally report the facts.

This crime also was reverberating in the central government in Tokyo, and also in DoD. The

defense secretary at the time was William Perry who by coincidence had been an Army engineer in Okinawa right after World War II; so he had some feeling for the place and Okinawan people that the average secretary of defense would not have had. Perry was incensed at the child rape. He directed the Commandant of the Marine Corps to order the Marines on Okinawa to have a two day stand-down. They'd stop all training. The idea was they would have a couple of days of reflection about this vile crime and what might have caused it, etc. Ota himself went to see Ambassador Mondale after I saw Ota. General Myers from U.S. Forces Japan was with Ambassador Mondale when the session with Ota took place. Beforehand, the ambassador was good enough to talk on the phone with me quite a bit to ask what was Ota like, what to do, and how to handle the meeting. He was quite willing to take some of my advice on how to deal with Ota.

General Wayne Rollings took one step on his own that was very helpful, and I told Ambassador Mondale so. There was artillery training coming up, and he cancelled that before anybody mentioned it so it would not be a focus of more demonstrations.

Also, I knew that a pacifist organization called the Okinawa Peace Movement Center headed by a man named Arakaki Zenshun was going to hold a demonstration which was supposed to end up at the gates of Camp Butler, the Marine Corps headquarters, in the central part of the island right near Kadena Air Base. I kept in touch with General Rollings about this, telling Wayne what we knew. I told him I would invite Arakaki to talk with me about the demonstration and his plans. So I got my political Foreign Service National, FSN, to invite Arakaki to talk, which he was quite happy to do. Arakaki was a gentleman, a long-time pacifist, very much anti-base but a decent man. We had a long chat. The thing I was most concerned about was the march to the base gate. I wanted to know how the march was going to be controlled and how it was going to be controlled afterward so there was no opportunity for any mischief or misunderstanding. I also wanted to know what the objective was. What did Arakaki want to get out of this demo?

He explained they would march from assembly areas and have marshals for each subgroup. He was expecting 6,000 in all. When I said, "We really want this to be a peaceful march." He smiled and said, "We have a lot of experience with demonstrations." He didn't want anything untoward to happen either. There were a couple of tiny extreme leftist radical groups on Okinawa, offshoots of ones from mainland Japan, and he said he was going to make sure that those people were not part of the march because he didn't want anything to put a blot on it. He said when they got to the gate at Camp Butler he just wanted a Marine to take their protest petition. He said he didn't care who it was, just somebody at the gate to take the petition. Then the march would break up, and he had plans for moving everybody back in an orderly way.

The American news media on the other hand had gotten wind of this planned demonstration and were hoping for firebombs and blood. CNN was gathering and so were others. They were really hoping for something really messy. Our collective idea was to disappoint them. Right after this very productive meeting with Arakaki, I called Wayne Rollings and described the discussion. When I told him what Arakaki wanted, Wayne said, "I'll send Colonel Stu Wagner," his public affairs chief, "Stu Wagner will be at the gate to take the petition." That was great because Stu was very savvy when it came to handling these kinds of things.

In fact, that demonstration of about 6,000 people in a very congested area, in the midst of several military bases, went off without a hitch. CNN and all the rest were absolutely disappointed, which was a great achievement. That was the beginning of what turned out to be quite a large number of demonstrations of various kinds, over a long span of many weeks, all of which were non-violent.

The biggest one took place on my birthday, October 21, six weeks after the rape. It was held in a large sports field not far from my office. It turned out to be the largest demonstration in Okinawa since reversion in 1972. People from the embassy came down to observe, as did several of my people. I didn't go; I was watching on television from my house and was on the phone with Ambassador Mondale and the deputy chief of mission Rust Deming and getting reports from the scene. By that time I was recognizable enough that it would not have been helpful for me to be there.

We figured, given the size of the field and also the number of buses that you could observe, there were probably 25,000 people which was a significant portion of the population of Okinawa. The police eventually estimated 58,000 counting the crowd at the field and people as far as they could see in the general vicinity. The Okinawan press printed the figure of 85,000 which then passed into legend, and became the accepted figure among Okinawans. Wildly inflated, but there it was.

Nonetheless, as I pointed out to Embassy Tokyo, CINCPAC and Washington in a cable that day, even if our low estimate was correct it was still the biggest demonstration since 1972. That was the important thing. Just about every Okinawan group was represented there. The main speaker was the speaker of the prefectural assembly. The business community was even represented which was quite interesting. The business representative was Keiichi Inamine who eventually replaced Masahide Ota as governor. The only group that stayed away was the conservative base land owners.

The whole thing was absolutely peaceful except for one woman, an anti-base activist from Osaka on the mainland. She wanted to burn the American flag on the dais where the dignitaries all were lined up. The speaker of the prefectural assembly prevented her from doing that because he didn't want that kind of thing to mar their demonstration. So she went off to a far corner of the field and set fire to the flag. The next issue of Time International had a close-up of the burning flag as the cover photo. I still have that issue of the magazine. That cover photo was a good example of what the news media wanted.

The demonstrations continued. The main upshot of all this was the formation by the U.S. and Japanese governments of something called the Special Action Committee on Okinawa or SACO which included the State Department, Defense Department, Foreign Ministry, and Japanese Defense Agency policy level a major effort to decide what could be done to ameliorate the base situation in Okinawa. The idea was to reduce the so-called footprint of bases in terms of land area and also to reduce training and noise and disruptive training to the minimum allowable; in a word, to still keep the troops ready for the missions in Southeast Asia and Korea. We had floods of Japanese and American officials coming out of Washington and Tokyo to Okinawa to look at what could be done. Most of them had never seen the bases or at least hadn't looked at them

through any kind of a fresh eye, so this was quite a new thing for them.

One of the amazing things was that few Japanese officials from Tokyo whether they were in the foreign ministry or even the Japan Defense Agency understood the way the U.S. military operated, or understand the command relationships. They thought, for example, that Wayne Rollings as the major general commanding the Marines also commanded Brigadier General Tom Hobbins the Air Force wing commander and the rest which was not true. In reality, each of the senior service commanders on Okinawa answered to their service component commanders on the mainland. The top Marine general was simply the coordinator. So an awful lot of education was needed on just in terms of dissuading some Japanese officials from some bright ideas they had that were predicated on the idea that the senior Marine commanded everybody else.

In the midst of all the protests, the mayor of Kin Town where the little girl lived used to come see me fairly frequently. I knew Mayor Yoshida well. He'd come to see me dressed in a polo shirt, jeans and running shoes but not as the leader of a protest delegation. We'd just sit and talk. He unfortunately knew the little girl and her parents very well and that made it worse. He wanted to talk it out. It was a nauseating crime.

Q: Had anybody made an official apology to the parents?

O'NEILL: There were public apologies from me, Ambassador Mondale and Lieutenant General Myers, the U.S. Forces Japan commander. These weren't made directly to the parents. For one thing, Mayor Yoshida and the family did not want the girl's name to come out at all. He kept telling me that the Tokyo weekly news magazines were desperately trying to find her name because they wanted to have that big scoop. He was doing everything he could, and I think the people of Kin were doing everything they could, to prevent that. To the best of my knowledge, the little girl's name never came out.

Of course, U.S. Forces Japan provided what is called a "solatium payment" as an initial token gesture. The military families, the various military families' organizations throughout Okinawa and the rest of Japan were putting together voluntary donations for scholarship funds for the girl. I can't remember the total amount collected or the exact mechanics of how this was done, but it was substantial. There was an arrangement whereby these funds were given in a way that did not reveal the family's name. It was really hard to describe how the Americans felt about this. The ordinary rank and file Marines were as disgusted by the rapists as anybody else would be. We knew that those creatures were lucky they were in solitary confinement in the Camp Hansen brig.

Q: Maybe it was after you left, but what happened to the Marines, the perpetrators?

O'NEILL: Well, usually the Japanese judicial system is extremely slow. It goes on and on. Between being charged and actually being indicted and then tried in the Japanese system can take months or years. Those three were indicted in record time for several crimes. The actual names of the crimes in Japanese law sound kind of peculiar to us. One was something like apprehension which was roughly equivalent to kidnapping, and then there was one that equated to sexual assault. But those were just about the only charges.

Once the police investigation was finished, the three were certain to be indicted. They would then go straight into Naha District Prison. They were indicted, tried and convicted all in record time. I think it was not later than mid-November that they were convicted of these several crimes. The Japanese prosecutors were asking for what they thought was a tough sentence. They wanted 10 years each, if you can imagine that in such a case. In the end, two of them got seven years in Yokosuka civil prison, and one of them got six and a half years. They got amazingly light sentences by American standards although these were considered relatively heavy sentences for child rape in Japan. In fact, a few months earlier in June 1995 two Japanese men had abducted and raped a 15 year old Okinawan girl. Just by coincidence, they were convicted shortly after the September rape. Those two Japanese got two and a half and three years for abducting and raping a 15 year old.

If the Marine Corps had been able to try those people they would have been jailed for the rest of their lives, in part because there would have been so many more charges that a Marine general court martial could have brought against them. There really are no conspiracy statutes in the Japanese legal system, for example. So even though they conspired to kidnap, conspired to assault and conspired to rape, that wasn't part of the legal equation in the Japanese system. The Marines could have gotten them on all those charges plus any number of other ancillary charges that really would have added to their sentences. I couldn't imagine them getting less than 50 years each and they probably would have all would have gotten life at least as an initial sentence of a Marine general court martial. Two of them were married, so the Marines could even have, if they thought about it, charged two of them with adultery on top of everything else. But they would have put them away forever.

Some Okinawans understood this, but with the intense emotion of the time, there was no conceivable way the Marines could have tried those people. The demand throughout Japan was to follow the SOFA and have them tried in a Japanese court which was exactly what we intended from the start. There was absolutely no question in our mind that that was going to happen – a Japanese criminal trial.

Q: I'm looking at the time now, Al, and it's probably a good place to stop. We'll pick it up... Is there anything more you want to talk about after that just to mention a little about what we'll be doing?

O'NEILL: Not now, but later on we can talk about the process, the results such as they were, of the SACO process and the changes that took place in Okinawa, the involvement of President Clinton and Prime Minister Hashimoto in signing the agreement in the spring of 1996.

Q: Today is the 26th of November 2008 with Al O'Neill. Al, we were talking about the aftermath of his horrible rape. You've gone through the legal things, but just one last question on that. Do you know what the final fate? Did these guys get out or what?

O'NEILL: I'm sure they're out because they had very light sentences of seven years in the case of two of them and six and a half years in the case of the third one. They served this in a civil prison in Yokosuka in the same town where the big naval base is. I'm sure, although I've lost track, that all of them were released at the end of their sentences. I would be surprised if they had

gotten out early. After release they would have gotten dishonorable discharges from the Navy and Marine Corps. The ringleader was a Navy hospital corpsman of all things, and the other two were Marines. I think it would have been legally possible for the U.S. forces to prosecute them further without double jeopardy because there several crimes that they had committed that aren't even in the Japanese legal system: conspiracy to kidnap, conspiracy to assault and conspiracy to rape. I think the Marines reluctantly just decided they had better just let things go with the Japanese punishment, mild as it was by our standards for such a loathsome crime.

The three rapists certainly triggered almost an earthquake you might say, in U.S.-Japan security relations. As I explained earlier, Japan was very vulnerable in September of 1995 when this rape took place and when the Okinawans began protesting as they naturally would at such a disgusting crime, it resonated unusually strongly in Tokyo and elsewhere in Japan. The Okinawans found themselves getting an unusual amount of support for their protest against the American military presence, more so than they did when they were protesting against accidents or other crimes in times past. That further encouraged particularly the anti-base Okinawans led by Governor Ota to further protests and to further attempts to parlay this horrible crime into decisions by the national government to curtail training, to demand the return of training areas, etc., and other base areas to Okinawa. This reverberation back and forth continued for some while.

Prime Minister Murayama quit in the first week of January 1996. He just couldn't handle the conflicts between his 50 year long pacifist ideological stance and the demands of being prime minister of Japan and, therefore, a defender of the security relationship. His replacement was from the LDP, Ryutaro Hashimoto who was a conservative politician in the LDP mold but who realized that there had to be visible adjustments in the security relationship in order to preserve it.

Even before Murayama quit, the two governments had formed what they called the Special Action Committee on Okinawa known as SACO or "Sacko." This was headed on the U.S. side by deputy assistant secretary of defense Kurt Campbell and on the Japanese side by North American Affairs deputy director general Hitoshi Tanaka. It involved State and DOD and U.S. Forces Japan on our side and the Japan Defense Agency with the Foreign Ministry in the lead on the Japanese side.

The deliberations of SACO continued for several months. The initial stage of negotiation between the Japanese and the U.S. sides, took place mostly in Tokyo there were lots of visits to Okinawa by everybody. The foreign minister was coming down; lots and lots of members of the Diet, particularly those Diet members who fancied themselves as experts on the security relationship were coming down in quite good numbers. I learned from dealing with them that some of these experts knew a lot less about the mechanics of the security arrangements than they thought they did.

But anyway, it was an opportunity to try to instruct, and so I wound up going with more than a few Japanese visitors to meet with my military counterparts. There was value in this anyway in terms of a learning experience for the Japanese and also to bring home — though I don't think it needed to be — to the U.S. military people just how serious this whole thing was. The SACO

process produced a statement that was ultimately endorsed in April of 1996 by President Clinton and Prime Minister Hashimoto to curtail a number of training activities, remove certain training activities to other locations, and make commitments to reduce the size of bases and training areas.

This interim SACO report that was issued when President Clinton came to Japan in the spring of 1996 was followed up by a final report in December of 1996. I'll just run down some of the main items. There were 30 major recommendations on training and on facilities. One of the biggest, the centerpiece of these SACO decisions, a decision in December of 1996 that has still not been carried out as of November 2008 was to return Marine Corps Air Station Futenma after a suitable replacement was completed in northeastern Okinawa. Futenma is still in operation. It's a very important facility for the Marines and also gets some use by the Air Force under certain circumstances, but it is right in the middle of the City of Ginowan.

Just as an aside, every consul general since reversion in 1972 had a very clear view of Futenma and its operations because the consul general's residence is on a ridge which is one kilometer from the south end of the Futenma runway. The house is on a straight line to the end of the runway, so every airplane that either lands or takes off from Futenma goes over the consul general's residence.

SACO was the big issue and it still hasn't been completed. About half of the northern training area which is in a very remote rugged area in northeastern Okinawa, the Pacific coast side, was to be returned, and I think some of that at least has been. The northern training area can't be developed commercially because it's so rugged and forested. It's also the watershed area for Okinawa, which suffers from water shortages from time to time. They did move parachute training from Yomitan Auxiliary Airfield which is at the 1945 invasion site. The parachute training, which was the minimum possible to allow people to remain qualified, was moved over to Ie Shima, an island which can be seen just off the coast from Yomitan.

Q: That was where Ernie Pyle was killed?

O'NEILL: Exactly. That is where the famous war correspondent Ernie Pyle was killed in 1945. There's a little monument there. I've been to that, too. Also at Yomitan there was — probably still is — a large antennae array called the "elephant cage." This is run by the U.S. National Security Agency for its purposes. Under SACO it was to be returned once a much smaller more modern facility was built within Camp Hansen, a Marine base.

The Marines had been asking for years to move their very minimal artillery training to one of the mainland artillery ranges for more realistic training and the Japanese finally agreed. The reason for the delay was that until the rape case and the uproar over it, Tokyo was simply not willing to spend the political capital to persuade the Japanese towns near the mainland ranges to accept a few more days of gunfire noise. In the aftermath of that horrible event they finally mustered the courage to do this.

The last big ticket item, if you will, was to relocate Naha Military Port just up the west coast from Naha to the next city which was Urasoe. To the best of my knowledge that still hasn't been

done even though, as I explained before, the Urasoe Chamber of Commerce welcomed the idea for a new port that would be dual use; that is, both for military purposes and for their purposes.

It might be worthwhile to talk a little bit about why some of these base returns take so long; not just Futenma. But some of the points are also germane to relocating Futenma out of the center of Ginowan City and moving the air operation up the east coast to Camp Schwab which is where the Marine infantry division's units are based now.

One factor is that in some cases the Japanese government is unwilling to pay the costs whether they're financial or political, or both. Another factor is Japanese requirements for environmental studies which can take a minimum of three years. These regulations often involve not only Tokyo's equivalent of the Environmental Protection Agency but also the prefectural government and in some cases cities have their own environmental rules.

There were also numerous NGO's — Non Governmental Organizations — on Okinawa, and others from the mainland that has been active in trying to block the move of Futenma's operations to the new location near Camp Schwab. They profess concern about coral reefs in the area, for manatees and other marine life. Then sometimes there are cases where the U.S. military force involved is reluctant to make the change on the grounds that it could be disadvantageous for training and readiness.

There were also political and economic cross currents within Okinawa itself. One good example concerns Futenma. The anti-base activists wanted Futenma to be closed immediately whether or not there was a replacement facility which would allow the helicopters to work. It's important to note that when you have Marine infantry you've got to have Marine helicopters because the helicopters move the infantry in Marine Corps doctrine. You couldn't, for example, keep the infantry in Okinawa and move the helicopters to Hawaii or to the mainland of Japan. That would be one of the virtues of moving the helicopters to Camp Schwab where they would be co-located. Instead of flying from central Okinawa to northern Okinawa simply to pick up the Marines and move them to the northern training area, they would be right near the troops and the training area. So this move would be an improvement, if it ever happens.

Another example of the cross currents in Okinawa was also related to Futenma relocation. Governor Ota and his anti-base activist following wanted to get Futenma returned by moving the Marine aviation operations to Kadena Air Base which is just a couple miles away. Ota was busily lobbying Prime Minister Hashimoto, the Japan Defense Agency, and the Foreign Ministry to co-locate the Marine air units to Kadena and then to close Futenma right away and return it. He was forcefully ignoring the mayors and the people of the three towns whose land comprises Kadena Air Base: Kadena Town, Chatan Town, and Okinawa City. Those mayors were adamantly opposed to taking on Ginowan's aviation burden when they already had three F-15 squadrons, an air refueling squadron, P-3s and other air units operating out of Kadena.

Since I was talking with the mayors, I knew this directly. They kept trying to go see Governor Ota to present their opposition to him. He adamantly refused to see the three mayors. He didn't want to hear from them because he wanted to get the credit for closing Futenma faster than anybody thought possible. A big part of my job was to explain these complexities through

reporting cables to Embassy Tokyo, U.S. Forces Japan and Washington agencies because Ota was the one who had the bully pulpit as the governor. He was the most famous Okinawan figure outside the prefecture. We had to make sure U.S. officials knew that not everything that Governor Ota said was shared throughout Okinawa, especially about Futenma.

The three mayors were all very nice people and fundamentally accepting of the need for the bases despite their constant lobbying for restrictions on training and other measures that would have reduced the burden of the bases on their people. Ota's idea was a non-starter for them; Mayor Miyagi of Kadena for example, told me that if Tokyo and Washington decided to move the Futenma air operations to Kadena, the people of Kadena Town led by him would block the entrances to the base to prevent it from happening. He said it in the very nicest way, and he would have done it in the very nicest possible way, and there would be no animosity toward the Americans on the bases. After they were repeatedly stonewalled by Governor Ota the three mayors saw their chance when Prime Minister Hashimoto went to a conference in Okinawa. The three mayors cornered him at the meeting site and made clear that none of them or their people supported Ota's plan. I might add, too, that the total population of these three municipalities that hosted Kadena was about 12% of the population of the island, so it's not insignificant in voting terms.

But Ota was prey to other influences. Ota himself was a very complex character. In the beginning of 1996 I wrote a long biographical cable about Ota which I sent to everybody in Washington and all the military addressees from Japan to Hawaii giving his background including his combat service during the war. Even though he was wounded, Ota the student soldier didn't surrender till November 1945, two months after the surrender of the rest of the Japanese forces. He was one of the holdouts. Also, after the war he went to Syracuse University on an U.S. scholarship.

Ota was a pacifist, and he came I think by his pacifism reasonably honestly even though he was sort of a charlatan in certain respects. Kurt Campbell, the DOD deputy assistant secretary for Asia, told me one time that Anthony Lake, the national security advisor, had said that President Clinton had read my cable on Ota. So our reporting which was voluminous was getting a pretty good audience. People were really beginning to look at reporting from this little tiny post in the middle of nowhere. Winston Lord was the Assistant Secretary of State for East Asian and Pacific Affairs and during the remainder of my tenure there, we got more than a few personal cables from him congratulating us on the quality of our reporting. That made very pleasant reading.

Added to the complex currents regarding Futenma was that Nago City, the northernmost large city in Okinawa, was to get the replacement aviation facility and they were basically lobbying for it. There was some opposition from some groups within Nago but Nago's mayor and the generally conservative people of northern Okinawa saw this as a big opportunity for jobs, for business. They expected that the air facility would be dual-use both for civil and military, and they resented Ota for hogging too much of Japanese government largesse in central and southern Okinawa where there were more people and, therefore, more voters. So there were lots of reasons why the good folk in Nago were interested in getting this new facility and they were doing what they could for it.

One of the things that Tokyo did to assuage Okinawan feelings in the aftermath of the rape was to have the Foreign Minister set up a Foreign Ministry office in Okinawa. Since Okinawa was a Japanese prefecture that was somewhat like a U.S. embassy in Hawaii. But anyway, that's what they did with an ambassador in charge. He had two or three diplomats with him.

When this was announced, the U.S. generals and admirals were alarmed because they saw themselves as getting dragged into an arena that they didn't want to be in at all. They worried about what this new office would do and how it would interact with them. So I asked the DCM in Tokyo, Rust Deming, to make sure the foreign ministry understood that as the U.S. consul general I was to be the counterpart of the head of this MOFA office, not the generals. The first chief of the office was an ambassador named Harashima who was a fine person to work with. He was also a real aficionado of American western movies to a degree that no American could possibly fathom!

So I relieved the generals of their worries on this score. In addition to the new Foreign Ministry office, there were other three institutions of much longer standing that dealt in one fashion or another with Okinawa base issues. The first one was called the Joint Committee which was set up under the U.S.-Japan Status of Forces Agreement or SOFA, for dealing with issues related to military bases, military training, and military operations. That organization of course dealt with U.S. Forces Japan countrywide, not just in Okinawa and I would say that the Okinawans didn't understand it very well. Nonetheless, when the SACO final report was issued in September of 1996 the U.S.-Japan Joint Committee was designated by the U.S.-Japan Security Consultative Committee (the foreign minister, the defense agency director, the secretary of state, and the defense secretary) to be the implementing agency for the SACO process.

There was also a U.S.-only grouping called the OACC or the Okinawa Area Coordinating Committee. It was made up of the senior Marine officer, the Marine Expeditionary Force commander, then a two star general; the Marine Corps base commander who was usually a brigadier general; the consul general; the commander of the Army's Tenth Area Support Group and the Navy captain who commanded Fleet Activities Okinawa. In addition, the commander of the amphibious forces Seventh Fleet was normally invited to these meetings. He was located on Okinawa for ease of planning with the Marines, although his ships were at Sasebo on the mainland.

That committee met both formally and informally usually quarterly but other times as needed. It was kind of the central means for doing two things: One was working out some fairly large issues with the prefectural government and also sometimes coordinating within the services certain things that needed to be worked out because of what might be called cultural differences between, for example, the Air Force and the Marines. The OACC also handled things that overlapped the various services, and there was a lot of this. When you look at the names of the bases on Okinawa, you see one is a Marine base, another one is an Army post and another's an Air Force base, but in fact almost all these bases had people of the other services on them. For example, at Kadena you had the Navy P-3 Orion squadron and the headquarters of the Navy's Fleet Activities Okinawa. When the 7th Fleet's carrier would go into port at Yokosuka, the carrier air group would often do bombing practice off the west coast of Okinawa. The Marine air wing from Iwakuni sometimes would have its F/A-18s go down for the same purpose.

One example of OACC action involved Chatan Town, which comprised the west side or East China Sea side of Kadena Air Base. There was a good bit of graffiti writing and trash, etc., along Chatan's sea wall. There were also some incidents of drunken U.S. service members urinating in people's yards, which was totally unacceptable anywhere. So when the mayor of Chatan brought this to the Kadena Air Base commander's attention we knew this would involve all the services. We had an OACC meeting very quickly.

Two things happened: One, the OACC imposed a curfew on military people in Chatan Town and perhaps some of the other areas, too, to limit the amount of time they were allowed to be out at night. Two, there was a very visible cleanup campaign where service members volunteered their time to clean up the graffiti off the seawall, clean up trash, which went over very well with the local population. I remember some of the generals saying in the media that they're homeowners, too. They wouldn't put up for any of this bad behavior in our own neighborhoods. Why should the people of Chatan have to, especially with foreign military people? So there was no question about the need for action, and that was one of the things that the OACC handled.

There was another more specialized group; I suppose you could say, the Tripartite Liaison Committee or TLC which combined the OACC, the prefectural government represented by the governor and his senior staff and the Japanese government which was represented by the Defense Facilities Administration Bureau in Naha, an organization under the Japan Defense Agency. Those were the officials who worked on base issues for the Japanese government with the towns and the prefectural government.

This TLC had been set up originally at the behest of the long-serving conservative governor Junji Nishime in the 1980s, and its purpose was to bolster Governor Nishime's credentials as somebody who could deal with base issues. In other words, it gave U.S. support to a conservative governor of Okinawa who was indeed still trying to limit training and to get land returned where possible but was going at it from a perspective that was in favor of the security treaty and recognized the need for the continued existence of certain essential bases.

During the time that I was there, you had largely leftist, or reformist as they're called, mayors in most of the major cities in Okinawa and a very reformist, pacifist governor who was very active in anti-base issues. This was sort of a different situation for the TLC. The TLC met only one time during the three years that I was in Okinawa, on St. Patrick's Day in 1995. Basically the military people were quite reluctant to give Governor Ota a big forum for his anti-base activism. I supported them because I'd been dragged in with Governor Ota to some examples of his on-camera anti-base activism, so to my mind the TLC was not a useful organization during his tenure. I think it was revived under his successor, Governor Inamine, who was a more moderate person on base issues.

These were all institutions that were peculiar to Okinawa to address base issues. In addition it's important as I've touched on a couple of times, to note that frequently during the course of a week and sometimes almost daily, there was contact between the mayors of the various towns that hosted the bases and senior base personnel in things large and small. The issue could be a complaint about some particularly loud noise or an accident that took place or a request to curtail

certain training because school examinations were taking place. Almost invariably, unless there was some crucial training reason why they could not agree, the bases acceded to whatever adjustment that was needed.

As one example of this continuing cooperation between the bases and townships, one of the high schools in Ginowan City was having its gym rebuilt, and the school officials asked the Futenma commander if the kids could use one of the gyms on Futenma for their gym classes while construction was underway, and it was done. This was typical.

I left in July 1997 after a very good tour. I want to mention several items that happened there, one of which was a very sad situation and the other three were kind of unexpected for Okinawa. A few months before we left in 1997, my wife and I went to a concert by the Leningrad Philharmonic Orchestra in one of Okinawa's very fine concert halls. On another occasion, I met the Duke of Edinburgh, Prince Philip who was there in his capacity as the president of the World Wildlife Federation looking at endangered coral reefs. Separately from his visit, the royal yacht *HMS Britannia* came to Naha civilian port, and the Commodore Royal Yacht Squadron invited all the generals and their wives and me and my wife to a reception aboard *Britannia* which was a 450-some foot long yacht, now out of service. They had a small Royal Marine band contingent on board, and after the reception they did a formal "beating of retreat" twilight ceremony on the dockside, too. It was quite an unusual thing, totally unexpected for Okinawa.

The sad story is an example of the kind of thing that can crop up in any Foreign Service post, I suppose. It was a miniature tragedy in August of 1996. One Friday night about midnight I got a call from my newly arrived vice consul. The Kadena command center had just told him that a C-141 transport had arrived from Ulaanbaatar, Mongolia. In the nose wheel well of the airplane the crew found two Mongolian kids one of whom was dead and the other of whom the Air Force security police managed to revive on the tarmac. The two were transported immediately to Lester Naval Hospital next to Kadena.

I told him to call the Department's Op Center, of course, to be put through to our embassy in Ulaanbaatar immediately to say that this had happened. Also, to tell them that I was going to call the Mongolian ambassador in Tokyo in the morning, Saturday, and ask him to send an embassy officer down to Okinawa that day so we could deal with this. I also called our embassy's duty officer right away, and I called our deputy chief of mission (DCM) on Saturday morning and told him what happened. I did get in touch with the Mongolian ambassador and explained who I was and what had happened, and asked for an officer to come down. I said I would meet the officer at the airport. He sent a Mrs. Nasanbuyan, their commercial attaché to Naha that Saturday night. She spoke very good English and she stayed overnight at my house.

The first thing Sunday morning I took her to Lester Naval Hospital where Captain Don Anderson the hospital commander escorted us to see the kids, the body of the one that was in the mortuary and the other boy who was in the Intensive Care Unit (ICU). One boy had on shorts, a short sleeve shirt and shower shoes, and the other one had sneakers, a long sleeve shirt, and long pants. They looked like they were about 12 years old. They had no identification, so we had no idea who the boys were.

The hospital people took photographs of both of them which we had faxed to our embassy in Ulaanbaatar so that they could put the photographs on Mongolian national TV in hopes that somebody could identify them. The hospital people were doing just everything they could. The pediatric doctors in the intensive care unit were briefing Mrs. Nasanbuyan and answering all her questions about the surviving boy who was in a coma.

I then drove her up to Kadena where we met Brigadier General John Baker, the 18th Wing commander, and a colonel from Military Airlift Command because the C-141 transport was a Military Airlift Command plane. Before the four of us went out to see the airplane, John Baker gave a briefing of the flight from Ulaanbaatar. Basically, for more or less five hours those kids had been at the elevation of Mt. Everest because the plane was mostly at about 29,000 feet and sometimes higher. Of course, they had no oxygen. They had no proper clothing. General Baker and the colonel took us to the tarmac to see the airplane, and Mrs. Nasanbuyan looked into the nose wheel well, and could see where the boys stowed away. She met the air crew and also the Air Force security policeman who had revived the one boy.

Then, in relatively short order two things happened: One, the boy who was on life support died, which sadly was a blessing because he would have stayed in that condition, if he had been moved back to Mongolia somehow. Also the Mongolian authorities identified the boys fairly quickly. It turned out they were not brothers as they seemed, and they were teenagers, a bit older than they looked.

It turned out that they lived on the outskirts of the Ulaanbaatar airport, and the older boy had seen a movie called Passenger 57 with Wesley Snipes. In the movie he's a counter terrorist operative. A 747 is hijacked and the hero gets into the nose wheel well of the 747, gets inside the airplane, and eventually overcomes the hijackers and wins the day. Over the following days, I got more information through our embassy in Ulaanbaatar and also from Mrs. Nasanbuyan during the night or two that she was at my house and calling back to the Foreign Ministry. The older boy came up with the idea that they would fly to Germany. So while the crew was offloading the humanitarian aid from the rear of the airplane, the two kids managed to get through the security fences, and into the nose wheel well. The crew chief, when he did his preflight check, just couldn't see them.

The crew was devastated. They were staying at Kadena because there was going to be an investigating officer flown out from Dover Air Force Base. I met with them and made clear that the Mongolian government did not blame them at all. In fact, it fired the airport security chief at Ulaanbaatar Airport and punished several other officials involved but did not blame the air crew. Then we had to work with the mortuary people at Kadena to get the bodies back to Ulaanbaatar. In Okinawa, you just never knew what was going to be in store when you picked up the telephone late at night.

By the way, there was a chapel service for the Mongolian boys at one of the Kadena chapels. The Officers' Wives Club organized a service for them. I sent the leaflet from the service to the Mongolian embassy in Tokyo. It was a sad little story, and that is where it came from — a movie. Mrs. Nasanbuyan, when she was first looking at the boys in the hospital said sadly "We teach our boys to be brave."

Q: Al, was there any... You may have covered this right from the beginning, but what was the rationale for our troops on Okinawa? Was this ever questioned, moving to Guam or something like that, while you were there?

O'NEILL: Oh, well, it is now. The bases are a combination of both history and geography. The U.S. forces occupied Okinawa after perhaps the bloodiest battle of the entire Pacific war. In 82 days of constant combat, 240,000 were killed; most of them were Okinawan civilians. A huge base complex was built up particularly during and after the Korean War. The U.S. kept Okinawa under occupation for another 20 years. Reversion didn't take place until 1972.

While I was in the embassy in Tokyo from 1980 to '84, there was a considerable consolidation of U.S. bases in the Tokyo area and Yokohama, from north to south, Tokyo to Yokohama to Yokosuka. Even during that same approximate period there were some consolidations of U.S. military bases and closings of U.S. military bases on Okinawa but it was not nearly as sweeping.

To hop back in time a bit, during the Vietnam War those Okinawan bases were very valuable because we had B-52s stationed there which were taking off from Kadena and doing bombing missions in Vietnam. That could not have happened had reversion taken place. So again, there was this enormous feeling of the importance of these bases. If you look at a map you can see Okinawa is closer to Pusan than it is to Tokyo, and so it's also straddles the space between Kyushu, the southernmost main island of Japan and Taiwan. It's a keystone between northeast Asia and Southeast Asia in a physical sense. From a strategic standpoint, it's a thousand miles closer to the mainland than Guam. All these strategic, historical, and political factors militated towards continuing a large and robust base presence on Okinawa even while there were returns and cutbacks, etc.

You asked about Guam. In the meantime, and I don't know exactly the time frame but certainly after the Vietnam War and all the Indochina involvement was over, we largely closed down a lot of the facilities in Guam. This was in part because of Guamanian opposition to the bases. Even while I was in the Philippines from 1997 to 2000, to the best of my recollection there were no U.S. Air Force flight units assigned to Anderson Air Force Base in Guam, and few if any U.S. warships at the naval base. There were pre-positioned ships which are large supply ships that can be sent anywhere. They've got vehicles and repair parts and all kinds of supplies, but overall there was a much reduced military presence on Guam while that significant presence continued in Okinawa.

I don't think I mentioned this before but there is in Japan something called the UN Command Rear which is directly linked to Korean contingency planning and the UN Command in Korea. These UN Command Rear bases include Yokota Air Base in Honshu and Sasebo in Kyushu, where the amphibious force ships were based. On Okinawa, Kadena, White Beach Naval Station, and Futenma Marine Corps Air Station were the UN Command Rear installations. They flew the U.S., Japanese and UN flags to symbolize that status. There was a separate SOFA or Status of Forces Agreement with the Japanese that governed the use of these UN Command Rear bases. So you had this factor as well, the concern about the availability of the bases in Okinawa for a Korean contingency. In fact, there's a 6,000 acre ammunition storage area adjacent to the 5,000

acre Kadena Air Base, where a huge amount of ammunition for a Korean contingency was stored.

Following through from the SACO process, the two governments have reached some agreements on relocating some of the Marine units from Okinawa to Guam. I think there's a target date of 2013. In any case, in the natural course of things in the SACO process I think it's fair to expect that any such plans are going to be slipped by many years. The Japanese government is supposed to spend several billion dollars, and it may be six billion, but don't quote me. Several billion dollars to build facilities on Guam for the forces that will be relocated out of Okinawa. This would result in a significant reduction in the manpower in Okinawa and, therefore, the noise levels and the kinds of disruption that the noise levels produce. A very visible gesture, assuming it takes place.

Q: Was having this force there in some manner a warning to China about Taiwan?

O'NEILL: There were various operations out of Okinawa aimed at learning about what the Chinese were up to, including the operations of the P-3 Orion anti-submarine squadrons there. Not only was there the U.S. P-3 squadron at Kadena but the Japanese Maritime Self-Defense Force had two squadrons of P-3s at Naha International airport. There was also what I'll euphemistically refer to as the acquisition of information through some of the U.S. facilities on Okinawa which I'm sure involved the Chinese.

Q: Actually, one of those planes landed on Hainan Island.

O'NEILL: That was, of course, much later, and that was an EP-3. The ones that normally operated out of Okinawa were plain P-3 anti-submarine planes. The EP-3 that was involved in this collision with the Chinese fighter in what, spring of 2001, was strictly surveillance. It had no weapons as the regular P-3s can carry. It was also marked very differently, too. The U.S. news media very annoyingly called the EP-3 a spy plane. Well, the P-3s on anti-submarine patrol are painted a pale flat grey with slightly darker grey U.S. markings on them, very low visibility. The EP-3 that was knocked down by the Chinese fighter was painted a bright glossy white on top, with shiny dark grey undersides and big red, white, and blue U.S. markings on the sides and the wings. They were not trying to hide anything.

Anyhow, China figured more in national thinking at the Tokyo level than it did in the thinking of Okinawans. The 7th Fleet amphibious group did at least one visit to Shanghai, and the group commander at the time, Rear Admiral Walt Doran, told me that as they were heading into the roads at Shanghai, he didn't know if the port visit was on or not. There was always something going on in U.S.-China relations that made these things uncertain but that particular port visit to Shanghai did take place. So there was a combination of positive interaction and also watchfulness, I guess, with respect to the Taiwan Strait situation and China on the part of the U.S. forces in Okinawa. It was an enormously interesting place. I couldn't have asked for a better assignment.

Q: With your Japanese experience, did you sense any changes in the way the mainland Japanese regarded Okinawa? I'm thinking that Okinawa was treated the same way that the Germans in

the northern part of Italy were viewed from Rome, as being a bunch of peasants who didn't really speak the language, etc. Did you see any change in this?

O'NEILL: There was a certain amount of change. To my mind the prejudice that you're speaking of toward Okinawa was quite strong, and I think that something of a change occurred in the aftermath of the horrible child rape case in September 1995. There was more sympathy on the part of mainlanders for the Okinawan situation in the aftermath, which was a good thing because largely the mainlander view of Okinawa was just similar to what you mentioned: They're not exactly Japanese; they speak funny, and they have weird customs and all that. In their dialect, the Okinawans call the mainland Japanese *Yamatunchu* or Yamato people and themselves *Uchinanchu*.

A lot of prejudices continued to linger particularly among the older generation of mainlanders. That awful crime did generate a certain amount of sympathy and a recognition that there did have to be adjustments in the base situation. Part of the equation was the NIMBY syndrome, the "not in my backyard" syndrome: "We're so glad those bases are down in Okinawa because that's what Okinawans are for. We don't want Marines and airmen wandering around our neighborhoods and making noise nearby."

During that time, and it may have been coincidental, maybe not, Okinawan musical groups playing Okinawan music got a much wider hearing and much larger audiences in Tokyo and Osaka for concerts and for CD sales and all that. So there was a beginning of greater appreciation of the richness of Okinawan culture. In lots of ways despite the small population and tiny size, it's very rich in sculpture and pottery, weaving, textile dying, and distinctive lacquer work that's often very pretty.

There's also a generational element into it, too to mainland Japanese thinking about Okinawans. Younger Okinawans tend to be non-political to a degree that was surprising to anybody who served in Seoul and knows how spectacularly political younger Koreans have traditionally been. Also, I think, younger mainland Japanese, are more accepting and open to Okinawans particularly because of tourism. The largest component of the Okinawan economy in recent decades — the last 15 or so years — has been tourism, which is almost all from other islands of Japan, rather than from the outside. So younger Japanese have been there for tourism, for honeymoons, etc., and they have encountered Okinawans as being Japanese like themselves, people who do not think that they should be separate from Japan. So that's been a leavening influence as well, a good effect.

Q: Speaking of cultural changes and all, I've seen reports from time to time that Japanese teenagers, particularly girls, seem to get on to fads, which has become quite an element in Japanese society. How did the teenage girls from Okinawa and our troops there get along?

O'NEILL: Well, they often were very friendly, and there were more than a few marriages of service members and Okinawan young women. There was the usual bar culture, too, that you have around any military installation of any nationality anywhere in the world and any time, going back to Caesar's legions. This was less prevalent in Okinawa than it had been, say, during the Vietnam War era. The reduction in such activities from an economic standpoint, whatever the

concern from a moral standpoint may be, had a very depressing effect on a number of the towns of Okinawa that didn't necessarily have a lot of other things to substitute for the townspeople's livelihoods.

The number of marriages between Okinawan women and American servicemen was perhaps less than in the past because a lot of the American military people were on accompanied tours. The Department of Defense school system ran 13 schools on Okinawa including two four-year high schools. The consulate general used to issue 100 "reports of birth abroad" per month, month after month, year after year, because of births at Lester Naval Hospital. Lester Hospital also had extremely good neo-natal intensive unit. Despite the fact that the hospital itself was rather shop-worn, its people and equipment were really first rate.

In the Okinawan language the word for a stir-fry dish is *champururu*, and they call their culture "*champururu* culture" because they have mixed in so many elements from different places in the world including Southeast Asia. They're allowed to import Thai rice to distill *awamori* which is their rice whiskey. Nobody else in Japan could import foreign rice, but the Okinawans for historical reasons are allowed to do it for that purpose. Some of their musical instruments look similar to ones from Southeast Asia. Some of the original court dress and the formal dress have Southeast Asia elements particularly the caps that resembled the ones that used to be worn by Vietnamese mandarins. Their tombs that they call "turtleback tombs" are unique to Okinawa. You don't see them anyplace else in Japan. They're from Fujian Province in China across the East China Sea.

Okinawans who were descended from Korean potters or Japanese or Chinese traders would tell you this with some pride. If you had that situation among mainland Japanese, they'd hide it from you. One of the stir-fry dishes in Okinawa has vegetables and corned beef hash in it which is obviously not a traditional Japanese delicacy, but that's a literal example of their "stir-fried culture." They're a very easygoing people. There were Americans who married Okinawan women before reversion and after, and these mixed families and their children are not seen as odd by Okinawans. It's a very refreshing situation in comparison to the generally more rigid views of mainlanders on such things.

Q: One last question on this. How did you find the relations with the embassy? Was the embassy happy that you were there? But sometimes the greatest joy of a consul general is not to have to have the embassy pay much attention to him or her.

O'NEILL: Well, it was basically inevitable that the embassy would pay a lot of attention to Okinawa during that period. I was very fortunate. Ambassador Walter Mondale was wonderful. He was a great believer in the U.S.-Japan security relationship.

He and Mrs. Mondale, Joan Mondale, were great people to be with, too, and they made several visits mostly for ceremonial occasions having to do with the Iwo Jima 50th anniversary and the Okinawa 50th anniversary. During the June 1995 50th anniversary events, they stayed at our house for three nights. Mrs. Mondale, who is an artist and a potter in her own right, was very interested in all the arts of Okinawa. She came down one time on a visit of her own — she was with us for two or three days, visiting potters and weavers, etc., and it was a tremendous thing,

got huge publicity in Okinawa. That the wife of the American ambassador and ex-vice president was clearly interested in the arts in Okinawa was tremendous. We couldn't have designed something better than that.

Rust Deming, the DCM, was one of the foremost Japan hands in our Foreign Service his entire career. His father, Ambassador Olcott Deming, had been on Okinawa; his title probably was political adviser to the U.S. military commander. He — Olcott Deming — was very fondly remembered even by people like Governor Ota, the scholar and pacifist, for what he had done to try to ease the base burden on Okinawa in the 1950s.

Another thing, in consular operations we had one potential problem that I was able to defeat with the support of the embassy consular and administrative sections and ultimately, the ambassador and DCM. The Department was moving toward electronic visas that would be printed out on a serial-numbered visa sheet and then pasted into the passport as opposed to being stamped as the old non-immigrant visas were. These things would have a photo of the visa applicant electronically imprinted in the visa itself.

As the State Department was moving to this system worldwide, its initial view was that non-immigrant visa processing at Consulate General Naha would end. Okinawans would have to go to Fukuoka on Kyushu to get their visas, not the most convenient place. I argued that we should continue the non-immigrant visa operation. My argument was that much of what the U.S. represents to most Okinawans is the bases. There are a few narrow areas in which we could do something other than operate bases. An obvious one was convenience of visa processing for Okinawan visitors. I forget the exact number, but it was a reasonable number. It would have sent a bad signal in that era to take it away from them and say they had to make a special trip to Kyushu and then maybe fly to Tokyo and then to the U.S., because direct flights from Okinawa to the U.S. were closing out. There were just a lot of reasons, and fortunately the embassy agreed with me, lobbied the State Department, and we retained the non-immigrant visa processing. So that worked out well.

EDWARD W. KLOTH
Deputy for Environment, Science, and Technology
Tokyo (1997-2000)

Mr. Kloth was born in North Carolina and raised in New York. After service in the Peace Corps and private business, he worked with the Department of Defense, later joining the State Department. In his career with State, Mr. Kloth served several tours in Japan and Korea, In Washington assignments he dealt with East Asian, Political/military, Economic and Environment matters. He also spent two years on Capitol Hill as Department of State Pearson Fellow. After retirement, Mr. Kloth continued as advisor to the Department on variety of matters and served a tour in Iraq as Economic Officer. Mr. Kloth was interviewed by Charles Stuart Kennedy in 2008.

Q: In '97 you are off to...?

KLOTH: To Tokyo. I took a job as deputy in the environment, science and technology (EST) section from 1997-2000. I like to say it was going from bad science to good science, meaning from the use of science to create very nasty weapons to the use of science to advance the human condition in happier ways. I was also coordinator for the U.S.-Japan Common Agenda, an effort to increase and highlight for our two publics cooperation on a wide variety of issues from development to the environment to international crime. We had six officers and a very good Office Management Specialist; a minister counselor was the head of section. We also had what we called the "science cluster," which included a National Science Foundation office, an Department of Energy officer and the USAID representative. USAID was in our cluster is because our section and I, in particular, was the coordinator in the embassy for the U.S.-Japan Common Agenda. When an unexpected year long gap in the USAID position, I filled in. The EST section also had three top-notch FSNs. NSF and USAID also had excellent Japanese staff in addition to the American officers.

The Common Agenda started in 1993 was an initiative by the Japanese, and the thought was that there are three pillars to the relationship: security, trade and cooperation on many global issues. Security and trade issues usually got the headlines, meaning negative headlines, so the Japanese government wanted to highlight positive cooperation through the "Common Agenda" name plate. They also wanted to see both governments get more bang for the buck or yen through increased coordination. We agreed.

Q: This is what the press is all about.

KLOTH: Right and, in particular, the Common Agenda covered a wide range of important but little appreciated areas from cooperation on development to scientific and technological research and the Kyoto process. You remember the Kyoto Conference on Climate Change was in the late fall of '97.

Q: So that was your kind of arrival?

KLOTH: I arrived in August, so we were in the final run up to the Kyoto Conference.

Q: Why don't we talk about the Kyoto Conference? What was that all about?

KLOTH: I arrived in August of 1997, and we were in the final run up to the Kyoto Conference on climate change. We had a very sharp officer who had been there a year already working on Kyoto and knew it very, very well.

Q: Who was that?

KLOTH: A guy by the name of Allen Yu. Unfortunately, Allen had to take emergency leave, I took over for the last major pre-Kyoto Conference meeting. Undersecretary Wirth, former Senator Tim Wirth, led a U.S. delegation out. There was a lot of contention between us and the Europeans as to the level at which the goals, the targets, should be set. Another huge issue was

that the Chinese, Indians, Brazilians, and others in the developing world didn't want to have targets levied on them at all, lest such obligations slow their development. Of course, the underdeveloped countries argued that the greenhouse gas problem was literally manufactured in the developed world and that, as developing countries they couldn't afford all the expensive technology to, for instance, clean up emissions from coal plants. Indeed they needed to get as many coal fired plants up and running to provide the electricity they needed for development at the lowest possible immediate cost.

Between the United States and the Europeans, there was disagreement about the levels of emissions targets that should be accepted by the developed countries. It was my first experience at a UN conference. The U.S. delegation was in constant communication before they came out with both American businesses and American environmental NGOs; listening to both sides very carefully and trying to craft a position that would enable us to cut down our emissions without adversely affecting our economy.

In Europe the political mix meant their governments seemed more concerned with cutting emissions. As I looked at this getting ready for the preparatory meeting and the Kyoto Conference, in both the press and the reporting from our posts in Europe, we didn't seem to hear much from the European business side or the economists who were concerned about the impact on business. It was also my first experience seeing the dance between representatives of both individual European states and the EU. There were times, I think, when the American delegation and other national delegations found this a little frustrating because both the EU and individual states wanted to talk and courted. Fortunately, Allen was back for Kyoto, where we certainly needed his expertise. The huge U.S. delegation included executive branch officials from many agencies as well as members of Congress. Representatives from U.S. business and environmental NGOs attend too. The Vice President zoomed in for the finale. Kyoto was an enormous undertaking logistically for an embassy. We mobilized administrative, political and economic section officers, and even our defense attaché mobilized before we were done.

My boss and I did a tag team, because the conference was, as I recall, 7-9 days. My boss went down at the beginning and the end, and I was there in the middle to give whatever additional help was needed. When I first arrived on maybe the third or fourth day, all the delegations were very, very busy, but were in pretty good humor. By the end, however, people were tired; jet lag hit like a club - they had flown in from all over the world. Most importantly, the issues were narrowing down along predictable lines, and it was not clear how a compromise was going to be reached. The tension level among the Japanese delegation, who as hosts wanted a success most of all, had gone well above the roof. This was a tremendous big deal for them, and the idea that the conference could somehow end without a Kyoto agreement was for them taken very personally.

Q: Well, you know as this thing reached its end, how did you personally and your colleagues and also to the American delegation view this thing? The Kyoto thing is still, well, it hasn't been ratified, meaning that it still is a bone of contention, but how did you view it as it was coming to an agreement?

KLOTH: Everyone on the U.S. delegation was working hard, but many were frustrated because

of an underlying sense that no matter what agreement came out, it was not going to be ratified on the Hill. The U.S. would sign on but would not get the legislative support that it needed. As we went running up to it, Under Secretary Wirth, who had come to the preparatory meeting in Tokyo resigned as the Under Secretary for Global Affairs, and took a job with Ted Turner's new UN organization. While U/S Wirth insisted he was driven by the opportunity, many and certainly many Japanese officials felt it was an ominous omen for the Kyoto process. The Japanese first question to us was: does this mean he thinks this agreement is not going to happen, that this conference will be unsuccessful, and he doesn't want to be associated with it?

Q: It strikes me that this wasn't very gracious on the part of Wirth.

KLOTH: From where I sat in Tokyo and then Kyoto, the timing wasn't helpful. But, as you well know, we diplomats spend a lot of time holding other people's hands.

The U.S. delegation, including the senators and representatives who came out, worked hard. The acting under secretary, who was the assistant secretary, not only had to work with the foreign delegations, but met every day with the environmental groups and the U.S. business groups, separately, of course. She would brief them on what was happening and then take their comments and suggestions. Often what one liked, the other hated, although not always. The new world of multi-constituent diplomacy is a challenge.

Q: Did you find an awful lot of you might call "ideology" or very firm ideas on this? I mean the business delegation said, "What are you trying to do ruin us?" The scientific people were saying, "You are going to ruin the world if you don't do something."

KLOTH: I think the question for the business people was what are the costs involved and what's the impact those costs are going to have on American businesses competitiveness, particularly vis a vis firms in countries such as China or India that do not take on environmental obligations. The representatives from NGOs were vociferous in demands for tough targets.

Let me add to that we also had on the U.S. delegation a delegate from the Pentagon, I believe a Navy officer. Our armed forces operate globally ships, airplanes and other vehicles. The services were very concerned about the impact of an agreement on their operations and costs. I would not say they were negative. They understood the need for a green environment, after all the sailors and the airmen are in the air and on the seas. The issue was costs and a key part of that was whether there would be a global standard or individual national standards; the latter could be a nightmare for our military operations.

Q: How about the Japanese? I mean the Japanese are a big business power obviously.

KLOTH: The Japanese government had clearly committed itself to an agreement. Japanese had, after a number of awful incidents, cleaned up a lot of their own industry. There was concern among Japanese business about the potential cost and the impact on competitiveness. Japanese are very sensitive about how the world sees them. Japan was hosting the conference, so most Japanese wanted success. Nevertheless, Japanese business was calculating the costs for different options carefully.

Q: Mercury.

KLOTH: Mercury pollution too, that was one of the big ones.

Q: Or that horrible situation in some village.

KLOTH: Minamata? I went to a U.S.-Japan-China-Korea waste disposal conference there hosted by the University of Montana's Mansfield Center. Minamata is an out of the way place. It had a museum with the history of the problem with mercury poisoning. I saw horrific photos of what had happened to those poor people. So the Japanese were very conscious those problems. I think by the fall of '97, many Japanese businessmen were as concerned as the broader public that this Kyoto process be successful. I suppose that, given the politics in Japan as host, opponents of an agreement were not likely to be as publicly vocal as say some of the American business people.

Q: Also, were the Japanese looking towards the new world as regards anti-pollution manufacturing devices and things of this nature?

KLOTH: Japanese industry is very sharp at seeing which way the wind is blowing and sailing with it, not against it. Think back to the first oil shock in '73. I was out in Seattle, a graduate student. One joke that went around was that when Congress proposed gas mileage consumption limits, U.S. auto maker hired lobbyists. The Japanese hired engineers. I'm not sure that's really changed three decades later.

To finish off Kyoto, the Conference was at deadlock when it was time for me to get on the bullet train back to Tokyo. My boss and I sat down in the coffee shop at the Kyoto railroad station. I briefed him on what was going on. Vice President Gore then made a dramatic arrival and broke the deadlock, putting forward U.S. agreement on a standard, so consensus was reached except, although China and the developing countries remained outside. Congress never ratified.

The discouraging part after such high theater were the reports afterwards that the Administration knew Congress wouldn't support what was put on the table and, therefore, was not going to push it forward on the Hill. While the Japanese were delighted the Vice President had made "their" Kyoto conference a success, for the next two and a half years, we were frequently asked by Japanese in and out of government, why the U.S. hadn't ratified yet.

Q: Did you explain this to the Japanese, your counterpart?

KLOTH: The Japanese watch U.S. politics a lot more closely than we watch Japanese politics. Japanese officials understood, although they were very frustrated.

Q: Well then, after the Kyoto Conference what were you up to?

KLOTH: Okay, well then my focus was on the Common Agenda, as embassy coordinator, and on oceans-related science issues. We would have Common Agenda meetings once a year at the Under Secretary level home and away. We had them twice in Tokyo and once in Washington

when I was there.

At high level meetings, the top officials always want new initiatives every year, but there is not necessarily money for new initiatives. Worse yet for us State Department worker bees, State had no money of its own for projects. Other agencies funded. USAID was perhaps the biggest gorilla in the room on the work with our Japanese counterparts. Nevertheless, AID didn't have new funds for new projects every year, so there was always a scramble before the meetings to come up with "significant new initiatives" that could be taken that wouldn't involve new monies. Of course, our Japanese foreign ministry colleagues did not have new monies every year either, so we were partners in pain. Working with Japanese and American NGOs on projects that were funded was fun, however.

Another factor was that Japanese assistance budgets were coming under increasing pressure from the Diet. The Japanese economy was doing poorly. Diet members were asking why taxpayers' money should be spent on foreigners, not their constituents.

Q: Did you find just in all this type of thing you've got a bunch of people particularly at the top trying to do things when a lot of things that they were doing really required at a certain point you saying, okay we've done that, now let the people who actually manage it do it, and it is going to take a couple years and let's keep our hands off?

KLOTH: The issue was not that the top wanted to monkey with on-going projects, but that they wanted new initiatives and didn't have the money to pay for new stuff.

Q: What did you do on the oceans side.

KLOTH: I worked closely with some great people at the National Oceanographic and Atmospheric Agency (NOAA) in my role as oceans attaché. This slot was for many years a separate position in the economic section, filled by a non-State expert from the Fisheries service. The oceans attaché was very important to the U.S. and the Japanese when the United States let foreign fleets come in to the American Exclusive Economic Zone (EEZ) to catch a set quota of fish. The attaché was the go-between between Washington and the Japanese government on fisheries and, in particular, quota issues. He was also the go-between on highly contentious whaling issues. By the mid-'90s, foreign vessels could not fish our waters, and maritime environmental issues were at the top of the pile, so the position was moved to the EST section and environment and scientific issues were an important part of my portfolio.

NOAA in the late '90s had a project called the Argos Project which put floats out all over the world's oceans to collect data. While 70 percent of the world's surface is covered by water, we know very little about it in terms of the science of it. This also relates to not only to climate change but daily weather, storm predictions, health of the oceans, fisheries, there is a wide range. Fisheries issues were still in my portfolio. They were chiefly focused on the challenge of trying to protect the resource with large. We did have some fisheries protection treaty negotiations that I was involved in.

The whale issue was highly contentious. It's a terrific example of a diplomat's worst nightmare.

The diplomat's job is to make deals. I'm being a little facetious here. How do you make a deal when one side sees whales as, if not your brothers and sisters, then your cousins, while the others - the Japanese, Norwegians and Icelanders - sees whales as cows and pigs, a food source. Of course, you don't want to kill them all, because then there won't be any left to eat tomorrow. You can agree to manage them wisely, but eating them is no worse than eating a cow or a pig. If whales are your cousins, just eating a few is unacceptable. Where's the space everyone to give a little and get a little?

Q: How important were whales in say the Japanese diet?

KLOTH: By the late '90s, whale meat was a pricey delicacy. The Japanese only did some "scientific" hunting, so supply was limited.

Q: Well, it is just like back in the turn of the last century, chicken was the main meal on Sunday, a book even called Chicken Every Sunday. Chicken was a pretty fancy item; we didn't have the great chicken farms.

KLOTH: Right, right. After World War II the American occupation government had encouraged the Japanese to whale to supply protein to the diet. But by the late '70s, early and late '80s, the whaling moratorium became for many in Japan a symbol of cultural imperialism on the part of Americans. Americans are chomp away on their burgers and their fried chicken, and badmouth Japanese for wanting to eat whale.

We also had a NASA representative in our office. Every time NASA does a space launch with foreign crew members, the crew visits the foreign country afterwards, so we had two visits to Japan. The second one was the one in which John Glenn also flew and the Japanese crewmember was a woman, so that got a lot of attention in Tokyo. Everyone in the section usually worked in some way on the visits which were fun and highlighted U.S.-Japan cooperation.

The NASA representative was a full member of our section. He was a GS-13, I think. NASA management was sharp. Some agencies think having stand-alone offices staffed by their own mid-level or even senior people increases their local clout, perhaps at the specialized ministry but not across the Japanese government. NASA released that our arrangement gave them a solid expert on the ground, plus the services and clout of the EST minister-counselor, a high ranking diplomat, which impressed our Japanese counterparts in the scientific as well as other ministries. Because inter-ministerial communication is often difficult in Japan, the title "career diplomat" can enable you to move horizontally in ways not so simple for what the Japanese bureaucracy see as "detailees" from U.S. functional agencies. The diplomat needs, however, to demonstrate that he or she has the support of the U.S. agency to be effective.

Q: Yeah, this is something we often forget about. We think in terms of our own bureaucracy and not...

KLOTH: Not how it looks to the host country officials. Further, the NASA representative working on our section's issues, like high-level visits, gave him experience outside his usual box and a useful perspective on how, say, NASA's work supports and is supported by broader U.S.

interests in Japan.

Q: Well, looking at the time you were, there how would you describe the flow of scientific knowledge between the United States and Japan? Was anybody ahead or behind? How was it working?

KLOTH: First of all, the amount of contact that goes on is far beyond what I had imagined. When our minister counselor and I visited Tsukuba, Japan's science city, and its nuclear research facility, we were startled to be shown around by two American professors from Princeton and Cornell who come over every year with their students to use the facility, one of only a few available in the world. The global demand exceeds the supply, and they were happy to get time on the Japanese machines. So there's a lot that goes on. We don't hear about it in the embassy because they don't have problems.

Language is a big barrier in terms of foreigners having access to Japanese research data. The Japanese are also very concerned about this being a barrier to their access to foreign research. The science faculties want to make sure that their students can read, write and speak English, so that they can participate actively in the global scientific community. So, for example, at Tokyo University, which is Japan's primo university, the MA students present their MA thesis in English.

While, as I noted, some Americans went to Japan to do research, I'm sure many more Japanese came and come to work in our facilities. They come over; they do research in U.S. facilities and certainly make contributions. While there was Japanese government money for research, Japanese scientists complained of bureaucratic entanglements. They still looked to the United States as the most hospitable place for researchers.

For example, Japanese scientists told me that the Japanese government would identify an outstanding scientist or what was felt to be the cutting edge technology or cutting edge research topics, and provide government funds to set up a research institute, often getting very good results from it. But, let's say five years down the road, that would no longer be the cutting edge and the reward, the cost benefit analysis, would've shifted to another area. But the bureaucratic and political system militated against open competition for grants, so that individual or institute would continue to get funding regardless, and at the expense of innovative research by lesser-knowns. Our National Science Foundation folks argued that the U.S. system was much more nimble.

Before we leave Japan, let me make another point about the Common Agenda. One of the frustrating things with the Common Agenda and one of its goals was to highlight all the good things, good cooperation going on in other areas other than defense and trade. Overall our security alliance had kept the peace in Northeast Asia since 1953. Americans and Japanese were benefiting mightily from trade. Nevertheless, issues such as base locations or incidents of crime by U.S. military members or trade disputes grabbed headlines. It was very difficult to do highlight cooperation because it wasn't bad news.

I and my Japanese Foreign Ministry colleagues thought a lot about the problem. We could

usually get a small paragraph in the press when the meetings took place but it was hard to imagine many people even noticed. In the final meeting of my tour in 2000, we had a breakthrough and got front page coverage in the Tokyo papers of the NOAA Argos oceanographic research float project which Japan joined. The breakthrough came when the powerful Ministry of Transportation (MOT) heard about the project and invited me to come over and brief them. They became very enthusiastic, because Japan is, after all, an island nation dependent on maritime transport. MOT wanted in. There was some hesitancy on the NOAA and Japanese scientists' side, because the transportation ministry is clearly not a science research organization. There was concern that the scientific research part might get deflected or diminished.

Because I understood NOAA's interests and was in Tokyo and could meet with the Japanese S&T Agency as well as the MOT officials, I was able to get everyone to focus on the advantages to all of working together. A key point was that MOT had a great deal of clout in the Japanese government's budget process. Well, NOAA brought out a model of the float to the 2000 Common Agenda meeting. MOT held a press conference highlighting the project with the float there as a visual aid. Their press corps was very much plugged in to not only the editorial boards of their papers but also the Diet, so we had a front-page newspaper story with an artist's rendition of the float, fully deployed! It was a very good feeling and also very frustrating. When things go well, few much care.

EDWARD M. FEATHERSTONE
Director, Japanese Area and Language Training
Yokohama (1998)

Mr. Featherstone was born in New York City and raised there and in Japan. After graduating from the University of Pennsylvania and serving in the US Army, in 1961 he entered the Foreign Service. As a Japanese language and area specialist Mr. Featherstone served primarily in Japanese posts, including Kobe-Osaka, Yokohama, Niigata, Okinawa (Consul General) and Tokyo. He also served in Barbados and in Washington. Mr. Featherstone was interviewed by Thomas Dunnigan in 1999.

Q: You went to Yokohama as Director of Japanese Area and Language Training, which is an important outfit, which you were a graduate of, I gather.

FEATHERSTONE: That's right. I graduated from the school in 1965.

Q: How large was the center when you took it over?

FEATHERSTONE: We had about 18 to 20 students at the time, something like that. These are not only Americans, but we had New Zealanders and Australians. We had a few people from other agencies, a couple students. But we trained them in Japanese for one year.

Q: *I was going to say, is it a two-year course or one year?*

FEATHERSTONE: It is a two-year course, but we gave them the second year. The first year they went elsewhere. The first year they were in New Zealand, Australia, or FSI/Washington. We would get them the second year.

Q: *Were you funded adequately to do your job?*

FEATHERSTONE: I want to say that you can always use more funding. We had enough money to do our job. There were certain things we didn't have enough of. We could have used some more text books. We could have used some more tape recorders, that sort of thing, but we had a sufficient number to do the job. We certainly were not hurting.

Q: *What were your relations with the embassy?*

FEATHERSTONE: Well, we were 25 miles away from the embassy, so they were pretty good. The farther the better.

Q: *Did you get any visits from the ambassador or any other senior officers there?*

FEATHERSTONE: Senior officers, yes. I'm not sure that the ambassador ever came down, frankly. I think we invited him two or three times, but... I think it was Mike then.

Q: *It was Foley, I think, then.*

FEATHERSTONE: Maybe it was Foley.

Q: *He must have come during your period there.*

FEATHERSTONE: He probably came at the end of my period, but I don't think he was around very much when I was there. It was right toward the end, I think, when Foley came. I think that was one of the areas where we could have used more visits from higher level people just to get some visibility, and give the students a chance to talk with them. I don't think we had enough high-level visits. I must say that I had a good time there. It was a well-run operation.

Q: *So, I gather that you think this Japanese language school is a very good investment for the U.S.*

FEATHERSTONE: The only way that you will be able to train language officers... Well, not the only way, you could send someone to college in Japan and so forth, but that requires even greater knowledge of Japanese, before you can do that. There are people now coming into the Foreign Service who have been to Japanese universities. They come in with far greater language skills than the people we train.

Q: *Oh, you mean they have actually studied in Japan?*

FEATHERSTONE: Exactly. Some of them have Japanese mothers, or something like that, but many of them are coming in with substantial language skills. This is a very good thing. But, of course, many of them won't come into the Foreign Service, necessarily when they get these language skills. They may rather go to a big company, or whatever.

Q: Are we getting enough candidates in these Japanese language schools, or not?

FEATHERSTONE: Well, being away from it, I can't say, Tom. It's hard for me to give you a real good answer on that. I have been away too long. I don't know. I suspect not because those who go to Japanese universities and acquire really good Japanese language skills probably aren't going to come to the Foreign Service. It is a real problem. I think you always need a cadre of Japanese language officers. The question is what is the best way to get that. You can seek out these people who have studied abroad or you can try to train them yourself. You will probably always need a training facility for Japanese for a long time to come, I think.

Q: What was the quality of the American students you had in the training center?

FEATHERSTONE: Pretty good. Some of the top students we had were New Zealanders or Australians, but we had some good Americans also. They were pretty careful about the people they selected. On the whole, I can't say they would get duds, not in that program.

Q: Did you have any big problems in those years, or not?

FEATHERSTONE: No, it was supported pretty well. Like a lot of places, we could have always used more money for this, that and the other thing, but I wouldn't say there were problems that hampered our operation. We were funded pretty well.

Q: Well, at the end of that period, in 1998, retirement came to you again.

FEATHERSTONE: That's right. I forget whether that was the second or third time I retired, but this time I made it stick.

ROBIN WHITE
Director, Office of Japanese Affairs
Washington, DC (1998-2001)

Ms. White was born and raised in Massachusetts and educated at Georgetown University. After graduation she worked briefly on Capitol Hill before joining the Foreign Service in 1973. A Trained Economist, Ms. White served at a number of foreign posts as Economic and Commercial Officer. In the State Department in Washington, she occupied several senior positions in the trade and economic fields. Ms. White was also a Japan specialist. Ms. White was interviewed by Charles Stuart Kennedy in 2005

WHITE: Then I became Director of the Japan desk and I was there from '98 to 2001. This was in the East Asia bureau (EAP.) It was an excellent job at this time of my career with a lot of management responsibilities. Also, for the first time, I worked a great deal on security and political issues, much more so than economic issues, so it was an interesting challenge to get up to speed quickly.

Q: What were the major security issues?

WHITE: In September 1998, about a month after I began the position, the North Koreans shot a type of long-range missile, the Taepodong, which they claimed was a test or a launch of a satellite that failed. It flew over Japan and the Japanese reacted very strongly to that. It made them feel very vulnerable. Before that, the public hadn't really felt that Japan as a country could be a target. During the Cold War the feeling was that if Japan were to be a target, it would be because the Soviet Union was targeting American bases in Japan. With the missile shot and North Korea's nuclear ambitions, they suddenly realized that Japan itself could be a target. They needed a lot of reassurance that they were still under our nuclear umbrella and that we would come to their aid. One Japanese official told me that the Taepodong missile had the same effect on Japan as the takeover of the embassy in Tehran had on the U.S. It made a country realize its vulnerability.

The North Korean issue was very important throughout my three years on the desk. At that time former Secretary of Defense William Perry had started a process called the Trilateral Coordinating Group (TCOG) which brought the South Koreans and the Japanese together before and after each U.S. negotiation with the North Koreans. He was followed by State Department Counselor Wendy Sherman, who was well respected. There was a great deal of coordinating work; it worked well to keep the Japanese and South Koreans assured that they were informed of everything going on in bilateral talks. The personalities involved worked well together and I think it was an excellent exercise in diplomacy.

Q: How did you find the Japanese and South Korean relationship?

WHITE: It has always been a difficult relationship because Japan colonized Korea in 1905 and there are still many negative feelings. The Koreans remember that the Japanese punished Koreans for speaking Korean during that period. Many Koreans were sent to Japan almost as slave laborers during World War II and the comfort women issue remains very painful. However the animosity wasn't as strong then as it is today. The TCOG process was significant because the Japanese and Koreans met together with the Americans and put aside the history problems to work toward a common goal, dealing with North Korea. It is sad that those good working relationships never spread to a wider number of officials or to the general public in both countries.

Q: What was our position at that time and what were the North Koreans up to?

WHITE: The Agreed Framework was in place at that time so the plutonium that the North Koreans had been reprocessing was under International Atomic Energy Agency (IAEA) supervision. There were IAEA inspectors at the nuclear plant in North Korea and the plutonium

was in fuel rods under constant surveillance. The question was who was going to pay for the quid pro quo. KEDO, the Korean Economic Development Organization, had been set up after the 1994 crisis to provide energy to North Korea through construction of two light water reactors. I'll leave the details of that to the Korea experts, but it was important to Japan because Japan and South Korea were going to pay the bulk of the money to construct the power plants to replace the nuclear program the North Koreans gave up. There were a lot of delays in that for one reason or other. The U.S. Congress never like it and delayed sending heavy fuel oil, there was suspicion about the North Koreans having an underground testing facility that had to be investigated, and the North Koreans were not particularly receptive to the South Korean technicians coming in. It went very slowly. However at least the North Koreans were not making nuclear bombs, which is not the case today unfortunately.

Q: Yes. Did the Russian occupation of the northern islands come up while you were there?

WHITE: Yes, the Northern Territories issue has been a constant problem and Japan doesn't have a peace treaty with the Russians from World War II because of this territorial complaint. The Soviet Union took over four islands north of Hokkaido just at the end of the war.

When I was following Japan's relationship with the Soviet Union back in the '80s there was a sense that if only the two countries could have better relations it would benefit both; Japan had the money and the technology and the Soviet Union had the resources. It was always thought that the big turnaround was just around the corner. When they could finally get things resolved politically and the Russians became a little more reliable in their bureaucratic and legal policies, people could do business. Well, that's never happened, largely because the Northern Territories issue remains unresolved. Putin has gotten even more hard line than people in the '80s. I don't see a political solution coming anytime soon.

Q: Were we playing any role in trying to help them resolve the problem?

WHITE: I don't know what U.S. officials were saying to the Russians. We hoped for resolution and we supported the Japanese, but there was not really a useful role that we could play.

Q: The Northern Territories seem to be sparse and bare.

WHITE: Not many people live there. But like so many of these little rocks or islands, they have fish and other resources around them so whoever can claim them gains fishing rights and possibly access to oil. There are also questions of maritime passage and it becomes very symbolic of one's sovereignty.

Q: How about our troops on Okinawa and other bases in Japan?

WHITE: The U.S. military presence on Okinawa has been controversial for some time. The U.S. held the islands after World War II and it wasn't until 1972 that Okinawa reverted to Japan. The reversion talks were interesting, a successful diplomatic effort at a time when the military hadn't wanted to return Okinawa. It was in the middle of the Vietnam War. There were many troops

based in Okinawa who were flying to Vietnam, maybe not directly on bombing runs, but certainly it was a key area for the military.

The Okinawa issue continued to be difficult, however, because even after reversion the Okinawans were left with such an enormous proportion of military forces on their very small islands. There are about three main roads which tend to be choked with military vehicles. It's very noisy there with helicopters and planes constantly taking off and landing. The American bases are prime real estate. The Okinawans see the country clubs and the nice housing and compare it to their often cramped towns.

On the other hand the bases are very important geographically because troops there can reach all parts of Asia much more quickly than they could from Guam or other places. They are an important part of the contribution that the Japanese government makes to the U.S.-Japan military relationship. The Japanese either provide the land free of charge to the U.S. government or they pay the rent to the landowners. In Okinawa there are a number of landowners who have tiny plots of land that they rent to the Japanese government for U.S. bases and some of them are making a pretty good living out of that. The question of returning bases has long been difficult in Okinawa.

The American career military knows how important the bases are. Many genuinely believed that the negative attitudes toward U.S. forces really came from a small group of press and local politicians, while the bulk of the people really liked having them there. To a certain extent people did benefit, the shopkeepers and the people getting rents, but I think the military tended to close their minds to the fact that the average citizen resented the noise and the confusion and the occasional very upsetting incident.

Nonetheless I think everybody recognizes that something needs to be done and at the time I was on the desk the return of Futenma Marine Air Station major issue was the major issue. Unfortunately, even today it remains unresolved. Futenma Marine Air Station is basically a helicopter base located in the middle of a very populated area. It is down in a bowl with houses all around it. People have said for years that it's an accident waiting to happen which would be horrific because of the density of population. Under the SACO agreement, Special Advisory Committee on Okinawa, it was agreed that the Japanese government would facilitate the relocation of this base to another place in Okinawa.

At the time I came in one proposal was for an offshore facility to be used as this helicopter base. A number of Japanese construction companies and steel companies were pleased with this idea because it would have been an enormous construction project, but even here in the U.S. some doubts were raised about the feasibility of it, the cost of it and particularly the environmental impact. That idea was on the way out when I came in.

The new proposal was to create a new base in the Nago area, which was a bit outside the more populated cities. During my time talks continued with the Japanese government on that. The complicated fact was that the Okinawan people didn't feel that the Japanese government was taking their wishes into account. While we never negotiated directly with Okinawan local leaders and groups, we often met with them and heard their concerns. Local press and politicians were

very vocal and their basic position was that they had the burden of too many bases. Given the concentration there, their position was that if the base was vital for the relationship, move the base somewhere else in Japan. That of course ran into the “not in my backyard” syndrome which was very strong in Japan. The governor said they would accept Nago as a site, but only with a 15 year limit after which U.S. forces would have to leave that base. That’s something the U.S. could not accept and never did agree to.

State (EAP) worked very closely with the Office of the Secretary of Defense (OSD) in talks with the Japanese government and efforts to accommodate the Okinawan people as much as possible. Two key players were EAP Deputy Assistant Secretary Rust Deming and OSD Deputy Assistant Secretary Kurt Campbell. Both knew Japan well and worked hard and well to maintain the relationship. One way the Japanese government tried to gain local agreement was to pour a lot of money into Okinawa. The people in the Nago area were being promised a lot of central government funding. When the 2000 G-8 Summit was in Japan, the Japanese government decided to hold it in Okinawa. That was to recognize the role of Okinawa, but also, in a sense to bring publicity and money and try to smooth the way for a base. The hotel where the Clinton administration stayed in was in Nago in a beautiful area with nice lagoons.

Q: Did you sense a distance between the Japanese establishment in Tokyo and people in Okinawa?

WHITE: The Okinawans feel that the Japanese government discriminates by burdening them with bases and that mainland Japanese look down on them. And the wartime memories are very painful. There was terrible suffering during the Battle of Okinawa. Just about every family lost family members and they blamed much of that on the Japanese military, not on the Americans, for putting them through it. The Okinawans considered that they were looked down upon as being a bit racially different; the dialect is different. They felt like poor cousins and thought that that’s why they ended up with all the bases because they could be sort of out of sight, out of mind. Also, economically the Japanese government has poured a lot of money in and there was domestic tourism, but they haven’t done some basic things that would really help the economy like deregulating airlines enough that there could be some start up carriers offering competitive flights outside of tour packages. It’s very expensive to get to Okinawa, so businesses aren’t locating there.

Q: Any other major military-related issues?

WHITE: An important and tragic incident took place in February, 2001, when the American submarine the USS Greenville hit and sunk the Ehime Maru in Hawaiian waters. The Ehime Maru was a Japanese fishing vessel, but it was also a training vessel where teenagers were being trained to be fishermen or maritime officers. They had been training near Hawaii and had enjoyed some tourism before resuming their work.

There in Hawaiian waters the American submarine surfaced suddenly in an exercise of rising quickly to the surface. It rammed right into the Ehime Maru and the boat sank almost immediately. Nine people were killed, including four 17-year-olds. It was a terrible incident from many angles. First, there were all these deaths, and they were so young. Second, the submariners

were at fault for failing to make sure that there were clear waters all around before suddenly surfacing. Also, it was actually a demonstration for VIPs so had the aspect of a joy ride.

I was on vacation when it happened and it was shocking to see it on the television news. I got back a day later to find the State Department had to closely monitor what the military was doing. DOD and the Navy were doing all they could to find survivors and remains, but while well intentioned, they didn't have a particularly diplomatic touch with their public relations.

First they wouldn't let the captain of the submarine vessel apologize, though an early and sincere apology would have meant a great deal to the Japanese families and public. Military lawyers were concerned that their legal position would be compromised and that if the captain said he was sorry that would be taken as an admission of guilt -- though there was no question about who was at fault. Right away the American and the Japanese cultures clashed. If he had come out and bowed deeply to the families right at the beginning, a lot of the resentment and bad feelings could have been avoided in my view. Later, after he left the Navy, he said that he had wanted to do this. During a later court of inquiry, he apologized to the Ehime Maru crew and some families. Some months later he went to Japan and met families to offer his apology, but by then it was too late to head off a firestorm of anger and grief.

It was a major story for weeks -- there were front page pictures in newspapers for many days showing pictures of the young students in their aloha shirts in Hawaii. It was terribly painful. The military did well to continue the search for survivors/bodies for a long time. At one point, a week or two after the incident, they sent word through to the Japanese government that they planned to end the search as there was no hope of finding anyone. A Ministry of Foreign Affairs official called me in the middle of the night to tell me they were sending a deputy minister to the U.S. to stress how important it was for the search to continue. He was about to get on a plane but we managed to convince them that it would not be useful. In the end the military continued the search at great expense throughout wider and wider areas in order to make the Japanese feel that we were doing all we could.

Another incident showed the different cultures between State and the military. DOD drafted a presidential letter of condolence. When it came for clearance I was a little upset by it because the first paragraph was a well worded sentiment of condolence and grief. But then the letter went on for four paragraphs listing all the Navy was doing in the search. It set totally the wrong tone, so we managed to get it cut back to a very simple condolence, not a self-justification. That showed the importance of working together because the military was looking at the problem from their own point of view and doing their best, but they didn't have a good sense of what the wider impact would be on the Japanese public when this was made public.

Q: Yes. The fact that the captain didn't apologize early on became quite a point of conflict. It does point out that as a rule, the Pentagon lawyers tend to be very protective. They have their reasons, but the point is that often it is the wrong thing.

WHITE: Yes, as I said, the absence of an immediate and personal apology really hurt. The Pentagon quickly realized they had to compensate the victims and they did pay compensation to

the parents. There wasn't a lot of arguing about the amounts, but still that was a little later in the game and the public reaction to U.S. Navy maneuvers and methods remained very negative.

Q: Can you talk about your impressions of this G-8 summits?

WHITE: For the Okinawa Summit, I worked mainly on the bilateral side of the visit. There was a different group in the White House and the European and Economic Bureaus who worked on the multilateral side. While I was there for the whole summit, I was concentrating on the events that President Clinton did with the Okinawan people. The main event was a visit to the Peace Park. This is a park at the edge of the ocean where some of the most fierce fighting took place toward the end of the Battle of Okinawa. Many Japanese either died or committed suicide in the caves near there. It's very moving because there are a number of marble plaques with the names of all the dead, not just the Japanese soldiers but the Okinawan civilians and the Americans, Australians, New Zealanders and others who died in the fight. Clinton gave a very good speech at that park in broiling hot weather to a large crowd.

Q: How did the Clinton administration and Clinton himself get along with the Japanese? How was the relationship during the time you were there?

WHITE: Like most presidents, Clinton wanted to develop a personal relationship with his counterparts, but in his two terms he met seven Japanese prime ministers. Just about every time he went to Japan or to a G-8 Summit it was a different person, so he never really developed a personal relationship. There is such a difference in the Koizumi- Bush relationship because Bush sees him a lot so of course they have developed a friendship. Clinton never had a personal interest. He wasn't negative toward the Japanese, though not particularly warm either. Early in the administration there had been a lot of more trade friction, but I wasn't involved at that time. On the desk we worked well and closely with the Asia group at the NSC but among the top people of the Clinton administration there weren't many with strong Japan ties.

Q: What was happening with the Japanese political system? Did we see changes in it? The Liberal Democratic Party (LDP) had been around for a long time and I was wondering whether Japan might be becoming more independent from the United States.

WHITE: At that time there was a lot of intellectual debate about Japan becoming a "normal nation," meaning Japan should take on more responsibility for its own security. I think most of the Japan hands in the U.S. government thought that it would be a good idea for them to become more self-reliant. We had encouraged the Self Defense Forces to take more forward leaning roles as peacekeepers in various regions. There was concern among pundits that if Japan became a more normal, more independent nation, it could mean that they wouldn't always follow our lead on a lot of issues. Most Japan specialists saw that possibility but felt it would be a healthy development. The alliance was strong enough to manage some disagreement and we had the same core values.

One incident that illustrates this is that after the North Korean Taepodong missile crisis, the Japanese decided they needed their own intelligence satellites. They thought they hadn't been given enough intelligence by the Americans -- although they probably had and certain agencies

just didn't share it widely. When the idea was proposed, it seemed that a lot of the Japanese press expected the U.S. to step in and object, saying that Japan didn't need its own intelligence satellites. They seemed geared up to complain that the U.S. wouldn't give them the technology needed to build them. That didn't happen.

At State and DOD, we argued that the USG should support Japan. They needed the satellites for their own self-image and sense of pride, and to make them feel they were full partners in the relationship. It would have been harmful to insist on what was in fact the case, that the intelligence we were giving them was better than what they could get by building their own satellites; also it would have been a lot cheaper. So they went forward with a plan to build four satellites at enormous expense.

We had to negotiate an export control agreement to allow them to get some sophisticated technology. I worked with very good people in the Political Military Bureau who took the lead. It required a lot of interagency coordination because there were other satellite related negotiations going on with European countries and people were concerned that the Japan talks would set a precedent about the type of technology we'd share. They finally built the satellites at great expense. Ironically, I've have been told that commercial satellite companies now produce photos as good or better than what they're getting from their own satellites, but nonetheless it was important that they be able to do it as a "normal nation."

Q: How did the Clinton administration view the whole relationship with Japan at that time?

WHITE: They had come into office very hard-line on the trade issues which at the beginning of the '90s were considerably more in the American public eye than they were toward the end of the '90s. They had tried for a few agreements that had numerical targets but the Japanese resisted mightily and it caused a lot of bad feeling between officials of both countries. By the late '90s the concern was much more that Japan's economy was floundering. The economic giant that was going to take over the U.S. was now an enormous drag on Asia. Their growth rates were so low they were not providing any stimulus to growth in other countries and that became much more a focus. The attention shifted in a sense from what USTR could do on specific trade issues to more concern about what Treasury and U.S. businesses could do to urge Japan to get its economic house in order. The banking system had huge amounts of non-performing loans, but it was very difficult to get them to change because there's nothing more domestic than monetary and economic policy. The U.S. government's policy at that time was to promote deregulation of various sectors in hopes that a more free market economy, while painful at first, would give Japan a chance to restructure and use its assets more effectively and efficiently.

Q: Were we pushing for something that today is very much in the forefront, deregulating the postal bank, which is the main banking engine in Japan?

WHITE: Postal reform has been Prime Minister Koizumi's main issue. At the time I was on the desk we were not pushing hard to deregulate it completely because that seemed politically unrealistic. What we were looking at then was the insurance sector, which was related to the postal system. Because they were such a big government organization they were able to offer various kinds of insurance and banking services very cheaply, while we were trying to create

opportunities for American companies to compete. There were wider macroeconomic implications, as postal savings money deposited by households in low interest accounts was used to support favored industries and channeled to quasi-governmental organizations. Koizumi later worked to break the system, which is having considerable political impact within the LDP and the way they have operated.

Q: Also on the economic side, they've got two things which seem to be rather inhibiting. One is the role of women in society. The other one is the low fertility rate and the lack of interest in immigration to augment the work force. Do you see any changes in these things?

WHITE: Well, they're connected. It's interesting that the most traditional societies where women do tend to stay at home like Italy and Japan have the lowest fertility rates of developed countries. Places where women are welcomed in the work force and well supported like the Scandinavian countries and to some degree the U.S. have much higher fertility rates. So, Japan's situation indicates that stay-at-home wives are not having many children; it may be because it is expensive to educate children, there is little childcare, and husbands are still expected to work long hours. People have been talking for years about the underutilization of educated Japanese women. You would think that would change because they are having a shortage of labor. Instead of bringing in immigrants, which they aren't comfortable with, why don't they just give support to women?

The role of women is changing certainly in areas where they can be more independent as doctors, as small business people, as academics. Those women are doing much better than they are in the corporate world, not surprisingly. The fertility rate would probably improve if women find that there is child care support and support for aging parents and better social services. Exhorting people to have children as a civic duty doesn't help.

It will be interesting to see how that develops because more and more young Japanese women just aren't interested in getting married. We see many bright women marrying foreigners or going to work for foreign companies. The embassy has certainly benefited from that, as some of the best FSNs are women who prefer the embassy to Japanese institutions.

Q: When you were on the Japanese desk at this time did you find that in a way you were in competition with the China desk? In other words, with China being a newly emerging power, a huge power, and Japan suffering from economic troubles, did you have fight for attention from higher levels?

WHITE: Certainly the Japanese felt that way. They used the phrase "Japan passing" throughout the Clinton administration, claiming that Washington wasn't paying much attention to them compared to China. I often responded that it was because China was a problem. If you have a problem, you're naturally going to spend more time working the problem as opposed spending time with the good, steady, strong ally.

It sometimes was difficult to set up meeting with high level Japanese and senior USG officials. For example there is a regular meeting called the Two plus Two which we try to have annually. The four are the Secretary of State and the Secretary of Defense plus the Minister of Foreign Affairs and the head of the Japanese Defense Agency. We usually tried to do it in New York at

the time of the UN General Assembly. You could always be sure of having the Japanese Foreign Minister and the Secretary of State there, but coordinating schedules for all four people was always very difficult. Some of the Secretaries of Defense felt it was just a formality and really not that interesting.

Q: During the 2000 election campaign, when Gore and Bush were running against each other, did China come up as an issue?

WHITE: I don't think Asian issues were very important, though it seemed to be a fashion for one side to accuse the other of being soft on China, then when a new group comes to office they realize that reality is tougher to deal with than rhetoric. There was only one mention of Japan in the debates as far as we could tell, so Japan was clearly not a campaign issue.

Q. Did you get involved in the transition with the Clinton and Bush administrations?

WHITE: Yes, but in a fairly routine way. We prepared paper and briefed people. There was a fairly smooth transition at the NSC because they had a strong Japan person, Michael Green, who headed the Asia office. He'd been an academic as well as in and out of government and he knew all the players. The new Deputy Secretary was Richard Armitage who had a strong Japan background and many personal contacts. He had spent a lot of time in Japan both in his navy days, as a consultant and at DOD. He understood Japan and he understood the importance of meeting and greeting visiting delegations. Access to the 7th floor by visiting delegations of Japanese politicians, for example, really improved because Rich was always ready to sit down and talk to them -- he knew most of them anyway. The Japanese were very pleased. They saw quite a shift from what they saw as benign neglect under the Clinton administration to having strong connections in the administration. Jim Kelly who became Assistant Secretary of State had been at the East West Center in Hawaii and also was very familiar with Japan and Japan issues. In that sense you had real experts coming in and we certainly didn't need to do a lot of briefing up on the major issues, particularly in the security area.

One of the final things I did was to work with Howard Baker to prepare for his ambassadorial hearings. He was part of a long time of really superb ambassadors that Japan has had.

Q: We've made a real point of putting our top people there.

WHITE: Yes. They include Mike Mansfield, Mike Armacost, Walter Mondale and Tom Foley. Ambassador Foley, who had been Speaker of the House, served in the last years of the Clinton Administration. The Japanese were pleased that he was followed by Howard Baker from the Senate side, who was well respected by Democrats and Republicans. He was an excellent nominee. As his wife was Senator Nancy Kassebaum Baker, most people thought either one of them would have been a superb ambassador. His confirmation hearing was like a coronation. The room was filled and all the senators on the committee were there. Nobody had any questions. They basically just wanted to make their speech saying what a great choice Howard Baker was. It was fun to watch and a nice change from so many difficult ambassadorial hearings.

Q: Had he had much experience dealing with Japan from the Senate side?

WHITE: He had a reasonably good background in Japan without being an Asia expert. He traveled there and had a lot of contact with Japanese politicians and business people. He had been serving as a lawyer in Washington since leaving the Senate so he was well aware of the key issues and the concerns of Washington.

Q: When did you leave the desk?

WHITE: In June of 2001.
